Description	The value in this register reflects Mode Register 4 (MR4) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR3 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_4_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 4 RP2 Register
Mnemonic	IOM0.DDRPHY_PC_MR4_RP2_P2
Address	8000C2200701183F (SCOM)
Description	The value in this register reflects Mode Register 4 (MR4) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR3 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description

0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_6_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 7 RP2 Register
Mnemonic	IOM0.DDRPHY_PC_MR7_RP2_P0
Address	8000C2230701103F (SCOM)
Description	This register is provided solely for debugging firmware. It reflects the value that was snooped on the last mode register set (MRS) command sent to the DRAM. The PHY uses only the information contained in the PC Mode X Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_7_VALUE: Reserved.

Register Name	PC Mode 7 RP2 Register
Mnemonic	IOM0.DDRPHY_PC_MR7_RP2_P1
Address	8000C2230701143F (SCOM)
Description	This register is provided solely for debugging firmware. It reflects the value that was snooped on the last mode register set (MRS) command sent to the DRAM. The PHY uses only the information contained in the PC Mode X Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_7_VALUE: Reserved.

Register Name	PC Mode 7 RP2 Register
Mnemonic	IOM0.DDRPHY_PC_MR7_RP2_P2
Address	8000C2230701183F (SCOM)
Description	This register is provided solely for debugging firmware. It reflects the value that was snooped on the last mode register set (MRS) command sent to the DRAM. The PHY uses only the information contained in the PC Mode X Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_7_VALUE: Reserved.

Register Name	PC Mode 7 RP2 Register
Mnemonic	IOM0.DDRPHY_PC_MR7_RP2_P3
Address	8000C22307011C3F (SCOM)
Description	This register is provided solely for debugging firmware. It reflects the value that was snooped on the last mode register set (MRS) command sent to the DRAM. The PHY uses only the information contained in the PC Mode X Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_7_VALUE: Reserved.

Register Name	PC Mode 0 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR0_RP3_P0
Address	8000C31C0701103F (SCOM)
Description	The value in this register reflects Mode Register 0 (MR0) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value that is intended for MR0 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). In multiple rank systems, the read latency and write latency values (that is CL, AL, and CWL) must be equal in all ranks. The values used by the DDR PHY are from the Rank Pair 0 Register for all read/write accesses.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_0_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 0 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR0_RP3_P1
Address	8000C31C0701143F (SCOM)
Description	The value in this register reflects Mode Register 0 (MR0) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value that is intended for MR0 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). In multiple rank systems, the read latency and write latency values (that is CL, AL, and CWL) must be equal in all ranks. The values used by the DDR PHY are from the Rank Pair 0 Register for all read/write accesses.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_0_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 0 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR0_RP3_P2
Address	8000C31C0701183F (SCOM)
Description	The value in this register reflects Mode Register 0 (MR0) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value that is intended for MR0 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). In multiple rank systems, the read latency and write latency values (that is CL, AL, and CWL) must be equal in all ranks. The values used by the DDR PHY are from the Rank Pair 0 Register for all read/write accesses.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_0_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 0 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR0_RP3_P3
Address	8000C31C07011C3F (SCOM)
Description	The value in this register reflects Mode Register 0 (MR0) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value that is intended for MR0 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). In multiple rank systems, the read latency and write latency values (that is CL, AL, and CWL) must be equal in all ranks. The values used by the DDR PHY are from the Rank Pair 0 Register for all read/write accesses.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_0_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 1 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR1_RP3_P0
Address	8000C31D0701103F (SCOM)
Description	The value in this register reflects Mode Register 1 (MR1) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR1 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_1_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 1 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR1_RP3_P1
Address	8000C31D0701143F (SCOM)
Description	The value in this register reflects Mode Register 1 (MR1) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR1 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_1_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 1 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR1_RP3_P2
Address	8000C31D0701183F (SCOM)
Description	The value in this register reflects Mode Register 1 (MR1) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR1 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_1_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 1 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR1_RP3_P3
Address	8000C31D07011C3F (SCOM)
Description	The value in this register reflects Mode Register 1 (MR1) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR1 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_1_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 2 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR2_RP3_P0
Address	8000C31E0701103F (SCOM)
Description	The value in this register reflects Mode Register 2 (MR2) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR2 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY core snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_2_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 2 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR2_RP3_P1
Address	8000C31E0701143F (SCOM)
Description	The value in this register reflects Mode Register 2 (MR2) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR2 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY core snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_2_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 2 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR2_RP3_P2
Address	8000C31E0701183F (SCOM)
Description	The value in this register reflects Mode Register 2 (MR2) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR2 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY core snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_2_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 2 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR2_RP3_P3
Address	8000C31E07011C3F (SCOM)
Description	The value in this register reflects Mode Register 2 (MR2) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR2 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY core snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_2_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 3 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR3_RP3_P0
Address	8000C31F0701103F (SCOM)
Description	The value in this register reflects Mode Register 3 (MR3) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR3 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_3_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 3 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR3_RP3_P1
Address	8000C31F0701143F (SCOM)
Description	The value in this register reflects Mode Register 3 (MR3) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR3 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_3_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 3 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR3_RP3_P2
Address	8000C31F0701183F (SCOM)
Description	The value in this register reflects Mode Register 3 (MR3) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR3 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_5_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 5 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR5_RP3_P3
Address	8000C32107011C3F (SCOM)
Description	The value in this register reflects Mode Register 5 (MR5) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR3 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_5_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 6 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR6_RP3_P0
Address	8000C3220701103F (SCOM)
Description	The value in this register reflects Mode Register 6 (MR6) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR3 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_6_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 6 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR6_RP3_P1
Address	8000C3220701143F (SCOM)
Description	The value in this register reflects Mode Register 6 (MR6) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR3 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_6_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 6 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR6_RP3_P2
Address	8000C3220701183F (SCOM)
Description	The value in this register reflects Mode Register 6 (MR6) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR3 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_6_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 6 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR6_RP3_P3
Address	8000C32207011C3F (SCOM)
Description	The value in this register reflects Mode Register 6 (MR6) for the primary rank of the targeted rank pair as defined in PC rank pair 0 and PC rank pair 1. The value in this register must reflect the operational value intended for MR3 of the targeted rank of memory. The contents of this register are updated when written, or when a mode register set (MRS) command is sent from the memory controller (that is, the DDR PHY snoops the command as it is sent to the memory). Snooped Mode Register programming for RP0 primary is used to configure PHY latencies for all ranks. Therefore, the RP0 primary rank Mode Registers must be correctly programmed for proper PHY functionality. In multiple rank systems, the read latency and write latency values (that is, CL, AL, CWL, and PL) must be consistent in all ranks and rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_6_VALUE: The values in this register must match the values in the DRAM. Refer to the JEDEC DDR4 standard for details of the contents.

Register Name	PC Mode 7 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR7_RP3_P0
Address	8000C3230701103F (SCOM)
Description	This register is provided solely for debugging firmware. It reflects the value that was snooped on the last mode register set (MRS) command sent to the DRAM. The PHY uses only the information contained in the PC Mode X Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_7_VALUE: Reserved.

Register Name	PC Mode 7 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR7_RP3_P1
Address	8000C3230701143F (SCOM)
Description	This register is provided solely for debugging firmware. It reflects the value that was snooped on the last mode register set (MRS) command sent to the DRAM. The PHY uses only the information contained in the PC Mode X Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_7_VALUE: Reserved.

Register Name	PC Mode 7 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR7_RP3_P2
Address	8000C3230701183F (SCOM)
Description	This register is provided solely for debugging firmware. It reflects the value that was snooped on the last mode register set (MRS) command sent to the DRAM. The PHY uses only the information contained in the PC Mode X Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_7_VALUE: Reserved.

Register Name	PC Mode 7 RP3 Register
Mnemonic	IOM0.DDRPHY_PC_MR7_RP3_P3
Address	8000C32307011C3F (SCOM)
Description	This register is provided solely for debugging firmware. It reflects the value that was snooped on the last mode register set (MRS) command sent to the DRAM. The PHY uses only the information contained in the PC Mode X Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RW	MODE_REGISTER_7_VALUE: Reserved.

8. DDRPHY: RC Registers

This section contains the registers located in the read control (RC) logic. The RC registers are listed alphabetically by mnemonic in the following address table.

The RC registers are listed in the following tables.

Register Name	RC Configuration 0 Register
Mnemonic	IOM0.DDRPHY_RC_CONFIG0_P0
Address	8000C8000701103F (SCOM)
Description	This register contains global configuration information to control the read control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:51	RW	**Note:** This field is not used functionally in the POWER9 design. However, it must be programmed correctly to load the debug bus into the trace array and to compute the rdtag_dly value used by the memory controller. GLOBAL_PHY_OFFSET: Global PHY Offset (GPO). This field is the number of memory clock cycles added to the total read latency in the PHY. GPO = 7 + System_delay + tDQSCK + RCD_Delay + DB_Delay Where: System_delay is the round-trip delay in the memory system and includes: • The delay from the POWER9 memory clock output pin to the DRAM input pin • The delay from the DRAM DQS output pin to the POWER9 DQS input pin tDQSCK is taken from the JEDEC DDR4 specification. RCD_Delay is the clock delay through the RCD device. DB_Delay is the DQS delay through the data buffer device (LRDIMMs only). Using typical board wiring and the DRAM specification for RDIMMs, the GPO is: • 12 at 1866 Gbps • 12 at 2133 Gbps • 13 at 2400 Gbps • 13 at 2666 Gbps
52	RW	Reserved.
53	RW	PER_DUTY_CYCLE_SW: Set to 0 for normal function. Read commands are generated during periodic calibration with a 50% duty cycle. When set to 1, periodic calibration issues read commands continuously.
54:56	RW	NUM_PERIODIC_CAL: Each time a periodic calibration request occurs, each enabled periodic calibration routine is executed NUM_PERIODIC_CAL + 1 times. This applies to the SysClk/RdClk alignment, DQS alignment, and read-centering periodic calibration routines.
57:61	RO	Reserved.
62	RW	PERFORM_RDCLK_ALIGN: This bit must be set to 1b in hardware. This bit provides a method for behavioral simulations to skip the SysClk/RdClk alignment calibration step. 1 = The SysClk/RdClk alignment calibration must be performed for correct operation. 0 = In a zero wire delay behavioral simulation, the RTL ignores the register settings associated with SysClk/RdClk alignment. Values in the DP16 DQS Read Phase Select Register have no effect. The SysClk/RdClk alignment calibration fails if it is run.
63	RW	STAGGERED_PATTERN: 0 = A[12:11], MPR Read Format, of the Mode Register 3 (MR3) register in DDR4 memory modules is set to serial mode by the DDR PHY during custom read centering or initial pattern write. 1 = A[12:11], MPR Read Format, of the MR3 register in DDR4 memory modules is set to staggered mode by the DDR PHY during custom read centering or initial pattern write. **Note:** The A bits represent bit positions 15:0 in the mode register.

48	RW	RD_ERROR: 1 = Read control (RC) error.
49	RW	DP16_ERROR: 1 = An error from DP16 was detected. See the DP16 Read Status 0 Register for more information.
50	RW	CNTR_UNDERFLOW_ERROR: 1 = An error from counter underflow was detected.
51	RW	CNTR_OVERFLOW_ERROR: 1 = An error from counter overflow was detected.
52:63	RO	Constant = 0b0000000000000000

Register Name	RC Error Mask 0 Register
Mnemonic	IOM0.DDRPHY_RC_ERROR_MASK0_P0
Address	8000C80607011O3F (SCOM)
Description	This register masks errors in the RC Error Status 0 Register. It prevents the RC_ERROR bit from being set in the PC Error Status 0 Register and the appropriate bit from being set in PC Initial Calibration Error Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	RD_ERROR_MASK: 1 = Mask RD_ERROR.
49:63	RO	Constant = 0b0000000000000000

Register Name	RC Error Mask 0 Register
Mnemonic	IOM0.DDRPHY_RC_ERROR_MASK0_P1
Address	8000C8060701143F (SCOM)
Description	This register masks errors in the RC Error Status 0 Register. It prevents the RC_ERROR bit from being set in the PC Error Status 0 Register and the appropriate bit from being set in PC Initial Calibration Error Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	RD_ERROR_MASK: 1 = Mask RD_ERROR.
49:63	RO	Constant = 0b000000000000000

Register Name	RC Error Mask 0 Register
Mnemonic	IOM0.DDRPHY_RC_ERROR_MASK0_P2
Address	8000C8060701183F (SCOM)
Description	This register masks errors in the RC Error Status 0 Register. It prevents the RC_ERROR bit from being set in the PC Error Status 0 Register and the appropriate bit from being set in PC Initial Calibration Error Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	RD_ERROR_MASK: 1 = Mask RD_ERROR.
49:63	RO	Constant = 0b000000000000000

Register Name	RC Error Mask 0 Register
Mnemonic	IOM0.DDRPHY_RC_ERROR_MASK0_P3
Address	8000C80607011C3F (SCOM)
Description	This register masks errors in the RC Error Status 0 Register. It prevents the RC_ERROR bit from being set in the PC Error Status 0 Register and the appropriate bit from being set in PC Initial Calibration Error Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	RD_ERROR_MASK: 1 = Mask RD_ERROR.
49:63	RO	Constant = 0b000000000000000

Register Name	RC Configuration 3 Register
Mnemonic	IOM0.DDRPHY_RC_CONFIG3_P0
Address	8000C8070701103F (SCOM)
Description	This register contains global configuration information to control the read control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:50	RW	FINE_CAL_STEP_SIZE: Fine calibration step size: 000 = 1/128. 001 = 1/64. 010 = 3/128. 011 = 1/32. 100 = 5/128. 101 = 3/64. 110 = 7/128. 111 = 1/16.
51:54	RW	COARSE_CAL_STEP_SIZE: Coarse calibration step size: 0000 = 1/128. 0001 = 1/64. 0010 = 3/128. 0011 = 1/32. 0100 = 5/128. 0101 = 3/64. 0110 = 7/128. 0111 = 1/161. 1000 - 1111 = Reserved. When DIGITAL_EYE_EN is 1b in the DP16 DFT Digital Eye Register: bit 51:52: Reserved. bit 53: DIGEYE_16_NOT_1: 1 = A block of 16 BL8s is issued during each outer loop iteration of "digital eye." 0 = One BL8 read is issued during each outer loop iteration of "digital eye." bit 54: DIGEYE_REFRESH: 1 = Issues a precharge and refresh during every outer loop iteration of "digital eye." 0 = Issues a precharge and refresh at least once every 16 outer loop iterations of "digital eye."
55:56	RWX	DQ_SEL_QUAD: The quadrant within the DP16 being calibrated (read calibrations). Can also be set statically for "digital eye." This field must not be modified while the calibration is running. This field is part of a counter that automatically increments during some types of calibrations.
57:59	RWX	DQ_SEL_LANE: The data bit within the DP16 being calibrated (read calibrations). Can also be set statically for "digital eye." This field must not be modified while the calibration is running. This field is part of a counter that automatically increments during some types of calibrations.
60:63	RO	Constant = 0b0000

Register Name	RC Configuration 3 Register
Mnemonic	IOM0.DDRPHY_RC_CONFIG3_P1
Address	8000C8070701143F (SCOM)
Description	This register contains global configuration information to control the read control logic.

60:63	RO	Constant = 0b0000

Register Name	RC Read VREF Configuration 0 Register
Mnemonic	IOM0.DDRPHY_RC_RDVREF_CONFIG0_P0
Address	8000C8090701103F (SCOM)
Description	This register controls the read VREF calibration logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	WAIT_TIME: This 16-bit integer denotes the number of memory clock cycles to wait for the analog D/A converter to settle to a value. The digital value in the D/A converter can change every 500 KHz, so the frequency of dphy_gckn divided by the number in this register must be less than 500 KHz. Due to changing state machine states happening during this period, it is recommended to ensure that the value used slightly exceeds the 500 KHz threshold. For example, a 1333 MHz clock must have a value that is slightly more than 1333 MHz / 500 KHz = 2,666 MT/s, rounded up to a final value of 2,700 MT/s. Set to ‘0B74’h for 2666 MT/s. Set to ‘0A50’h for 2400 MT/s. Set to ‘092A’h for 2133 MT/s. Set to ‘0804’h for 1866 MT/s.

Register Name	RC Read VREF Configuration 0 Register
Mnemonic	IOM0.DDRPHY_RC_RDVREF_CONFIG0_P1
Address	8000C8090701143F (SCOM)
Description	This register controls the read VREF calibration logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Register Name	RC Read VREF Configuration 0 Register
Mnemonic	IOM0.DDRPHY_RC_RDVREF_CONFIG0_P3
Address	8000C80907011C3F (SCOM)
Description	This register controls the read VREF calibration logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:63	RW	WAIT_TIME: This 16-bit integer denotes the number of memory clock cycles to wait for the analog D/A converter to settle to a value. The digital value in the D/A converter can change every 500 KHz, so the frequency of dphy_gckn divided by the number in this register must be less than 500 KHz. Due to changing state machine states happening during this period, it is recommended to ensure that the value used slightly exceeds the 500 KHz threshold. For example, a 1333 MHz clock must have a value that is slightly more than 1333 MHz / 500 KHz = 2,666 MT/s, rounded up to a final value of 2,700 MT/s. Set to '0B74'h for 2666 MT/s. Set to '0A50'h for 2400 MT/s. Set to '092A'h for 2133 MT/s. Set to '0804'h for 1866 MT/s.

Register Name	RC Read VREF Configuration 1 Register
Mnemonic	IOM0.DDRPHY_RC_RDVREF_CONFIG1_P0
Address	8000C80A0701103F (SCOM)
Description	This register controls the read VREF calibration logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:55	RW	CMD_PRECEDE_TIME: This 8-bit integer denotes the number of cycles the read command is sent to the memory before the D/A converter is sampled. The recommended setting is (Additive Latency + CAS Latency + 12).
56:59	RW	MPR_LOCATION: This field configures which MPR location holds all the MPR patterns used in read calibrations. Bits 56:57 are the location used in read VREF, and must be all zeros. Bits 58:59 are the location used in read centering, and must be alternating 1s and 0s.
60	RW	CALIBRATION_ENABLE: When 1, read VREF calibration is run before read centering. For this to have an effect, read centering must be enabled in the PC Initial Calibration Config0 Register. When 0, read VREF calibration is not run and the pre-existing values in the DP16 configuration registers are used as the VREF threshold.
61	RW	SKIP_RDCENTERING: When 1, when read VREF calibration is finished, the calibration algorithm inside the RC is immediately finished. Read centering does not run. This allows the user to only run the read VREF calibration step. When 0, the read-centering calibration algorithm is run after read VREF. Note that if CALIBRATION_ENABLE = 0, this bit has no effect and read centering runs as configured.
62:63	RO	Constant = 0b00

Register Name	RC Read VREF Configuration 1 Register
Mnemonic	IOM0.DDRPHY_RC_RDVREF_CONFIG1_P1
Address	8000C80A0701143F (SCOM)
Description	This register controls the read VREF calibration logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:55	RW	CMD_PRECEDE_TIME: This 8-bit integer denotes the number of cycles the read command is sent to the memory before the D/A converter is sampled. The recommended setting is (Additive Latency + CAS Latency + 12).

Bits	SCOM	Field Mnemonic: Description
56:59	RW	MPR_LOCATION: This field configures which MPR location holds all the MPR patterns used in read calibrations. Bits 56:57 are the location used in read VREF, and must be all zeros. Bits 58:59 are the location used in read centering, and must be alternating 1s and 0s.
60	RW	CALIBRATION_ENABLE: When 1, read VREF calibration is run before read centering. For this to have an effect, read centering must be enabled in the PC Initial Calibration Config0 Register. When 0, read VREF calibration is not run and the pre-existing values in the DP16 configuration registers are used as the VREF threshold.
61	RW	SKIP_RDCENTERING: When 1, when read VREF calibration is finished, the calibration algorithm inside the RC is immediately finished. Read centering does not run. This allows the user to only run the read VREF calibration step. When 0, the read-centering calibration algorithm is run after read VREF. Note that if CALIBRATION_ENABLE = 0, this bit has no effect and read centering runs as configured.
62:63	RO	Constant = 0b00

Register Name	RC Read VREF Configuration 1 Register
Mnemonic	IOM0.DDRPHY_RC_RDVREF_CONFIG1_P2
Address	8000C80A0701183F (SCOM)
Description	This register controls the read VREF calibration logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

IOM0.DDRPHY_SEQ_RESERVED_ADDR4_P0	0x8000C4070701103F	913

The SEQ registers are listed in the following tables.

Register Name	**SEQ Read/Write Data 0 Register**
Mnemonic	IOM0.DDRPHY_SEQ_RD_WR_DATA0_P0
Address	8000C4000701103F (SCOM)
Description	The data in these registers is used to write the custom training pattern into a specified memory location during calibration operations. The data in these registers is also used as comparison data during calibration operations that perform a read operation that requires the incoming read data to be compared. This register must be programmed to the predefined pattern for protocols that provide a predefined pattern for read calibrations. For the most robust centering solution, custom patterns for data strobe (DQS) centering must have data transitions at all beats. Each bit lane can have a different pattern, but the composite pattern must have transitions at each beat. This register contains the test pattern that is wrapped through the address (ADR) and data path 16 (DP16) pins during a design for test (DFT) wrap test.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:63	RW	RD_WR_DATA_REG0: These registers define the values written to memory modules during initial pattern write and custom write centering when CUSTOM_INIT_WRITE = 1. These registers also define the expected data used during custom read centering and custom write centering. Custom write centering always uses reserved memory and does not use multipurpose registers (MPRs). During initial pattern write when CUSTOM_INIT_WRITE equals 1b: Bits 48:55 of the SEQ Read/Write Data 0 Register are written to MPR0. Bits 56:63 of the SEQ Read/Write Data 0 Register are written to MPR1. Bits 48:55 of the SEQ Read/Write Data 1 Register are written to MPR2. Bits 56:63 of the SEQ Read/Write Data 1 Register are written to MPR3. During custom read centering and custom write centering: The READ_CENTERING_MODE field of the DP16 IO RX Configuration 0 Register is set to 11b for DDR4 custom read centering, and is set to 00b otherwise.

Register Name	SEQ Read/Write Data 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_RD_WR_DATA0_P1
Address	8000C4000701143F (SCOM)
Description	The data in these registers is used to write the custom training pattern into a specified memory location during calibration operations. The data in these registers is also used as comparison data during calibration operations that perform a read operation that requires the incoming read data to be compared. This register must be programmed to the predefined pattern for protocols that provide a predefined pattern for read calibrations. For the most robust centering solution, custom patterns for DQS centering must have data transitions at all beats. Each bit lane can have a different pattern, but the composite pattern must have transitions at each beat. This register contains the test pattern that is wrapped through the ADR and DP16 pins during a DFT wrap test.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RD_WR_DATA_REG0: These registers define the values written to memory modules during initial pattern write and custom write centering when CUSTOM_INIT_WRITE = 1. These registers also define the expected data used during custom read centering and custom write centering. Custom write centering always uses reserved memory and does not use MPR registers. During initial pattern write when CUSTOM_INIT_WRITE equals 1b: Bits 48:55 of the SEQ Read/Write Data 0 Register are written to MPR0. Bits 56:63 of the SEQ Read/Write Data 0 Register are written to MPR1. Bits 48:55 of the SEQ Read/Write Data 1 Register are written to MPR2. Bits 56:63 of the SEQ Read/Write Data 1 Register are written to MPR3. During custom read centering and custom write centering: The READ_CENTERING_MODE field of the DP16 IO RX Configuration 0 Register is set to 11b for DDR4 custom read centering, and is set to 00b otherwise.

Register Name	SEQ Read/Write Data 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_RD_WR_DATA0_P2
Address	8000C4000701183F (SCOM)
Description	The data in these registers is used to write the custom training pattern into a specified memory location during calibration operations. The data in these registers is also used as comparison data during calibration operations that perform a read operation that requires the incoming read data to be compared. This register must be programmed to the predefined pattern for protocols that provide a predefined pattern for read calibrations. For the most robust centering solution, custom patterns for DQS centering must have data transitions at all beats. Each bit lane can have a different pattern, but the composite pattern must have transitions at each beat. This register contains the test pattern that is wrapped through the ADR and DP16 pins during a DFT wrap test.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RD_WR_DATA_REG0: These registers define the values written to memory modules during initial pattern write and custom write centering when CUSTOM_INIT_WRITE = 1. These registers also define the expected data used during custom read centering and custom write centering. Custom write centering always uses reserved memory and does not use MPR registers. During initial pattern write when CUSTOM_INIT_WRITE equals 1b: Bits 48:55 of the SEQ Read/Write Data 0 Register are written to MPR0. Bits 56:63 of the SEQ Read/Write Data 0 Register are written to MPR1. Bits 48:55 of the SEQ Read/Write Data 1 Register are written to MPR2. Bits 56:63 of the SEQ Read/Write Data 1 Register are written to MPR3. During custom read centering and custom write centering: The READ_CENTERING_MODE field of the DP16 IO RX Configuration 0 Register is set to 11b for DDR4 custom read centering, and is set to 00b otherwise.

Register Name	SEQ Read/Write Data 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_RD_WR_DATA0_P3
Address	8000C40007011C3F (SCOM)
Description	The data in these registers is used to write the custom training pattern into a specified memory location during calibration operations. The data in these registers is also used as comparison data during calibration operations that perform a read operation that requires the incoming read data to be compared. This register must be programmed to the predefined pattern for protocols that provide a predefined pattern for read calibrations. For the most robust centering solution, custom patterns for DQS centering must have data transitions at all beats. Each bit lane can have a different pattern, but the composite pattern must have transitions at each beat. This register contains the test pattern that is wrapped through the ADR and DP16 pins during a DFT wrap test.

This register contains the test pattern that is wrapped through the ADR and DP16 pins during a DFT wrap test.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RW	RD_WR_DATA_REG1: These registers define the values written to memory modules during initial pattern write and custom write centering when CUSTOM_INIT_WRITE = 1. These registers also define the expected data used during custom read centering and custom write centering. During initial pattern write when CUSTOM_INIT_WRITE equals 1b: Bits 48:55 of the SEQ Read/Write Data 0 Register are written to MPR0. Bits 56:63 of the SEQ Read/Write Data 0 Register are written to MPR1. Bits 48:55 of the SEQ Read/Write Data 1 Register are written to MPR2. Bits 56:63 of the SEQ Read/Write Data 1 Register are written to MPR3. During custom read centering and custom write centering: The READ_CENTERING_MODE field of the DP16 IO RX Configuration 0 Register is set to 11b for DDR4 custom read centering, and is set to 00b otherwise.

Register Name	SEQ Configuration 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_CONFIG0_P0
Address	8000C4020701103F (SCOM)
Description	This register contains the configuration settings for the sequencer (SEQ) logic block.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RW	MPR_PATTERN_BIT: Read and write calibration algorithms are based on 8-beat bursts. This register controls the read/write burst data pattern. For write data: The MPR_PATTERN_BIT value is available on all bit lanes of beats 1, 3, 5, and 7, and the inverse of the MPR_PATTERN_BIT on all bit lanes of beats 2, 4, 6, and 8. This ensures that all bit lanes toggle consecutive beats. If the protocol requires a burst length longer than eight beats, the pattern in this register is repeated until all data beats are defined. For read data: Bit 48 is brought out as output of the sequencer, and DP16 composes the expected pattern from this output.
49	RW	TWO_CYCLE_ADDR_EN: 1 = During calibrations, the address and command are driven onto the address/cmd bus for two memory clock cycles, while the appropriate chip selects are active only during the second memory clock cycle of the command. 0 = During calibration, the address and command and chip selects are driven and active for one memory clock cycle.
50:53	RW	MR_MASK_EN: PC Mode Register mask enable. This register masks, or disables, the PC Mode Register access by the calibration algorithms. Bits 50 - 53 map to PC Mode Registers 0 - 3.
54	RW	DELAYED_PAR: 1 = During calibration algorithms, the parity bit is driven one cycle after the command is driven on the memory command bus. 0 = During calibration algorithms, the parity bit is driven the same cycle the command is driven on the memory command bus.
55	RW	LRDIMM_CONTEXT: The value of the context bit to be used during F[0]RC12 LRDIMM control word commands.
56	RW	FORCE_RESERVED: 0 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write use the DDR4 MPR registers. 1 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write use the reserved location in memory. If the PROTOCOL field in the PC Configuration 0 Register does not equal DDR4, this bit is not used and is a don't care.
57	RW	HALT_ROTATION: 0 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write rotate through the use of all four MPR registers by changing BA[0:1] during the calibration. 1 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write set BA[0:1] = 00b. The same 8 beats are read repeatedly on a particular DQ lane. The expected data is not rotated through the 4 bytes of the SEQ Read/Write Data {0-1} Register every 8 beats. If the PROTOCOL field in the PC Configuration 0 Register does not equal DDR4, this bit is not used and is a don't care. If this bit is 1b, STAGGERED_PATTERN must be 0b in the RC Configuration 0 Register.
58:59	RW	Reserved.
60	RW	PAR_INVERT: 0 = Normal operation. 1 = For DDR4 registered dual in-line memory module (RDIMM) systems where CID2:0 has been configured to a nonzero value for calibrations, set this bit to the value of CID2 XOR CID1 XOR CID0.
61	RW	IPW_SIDEAB_SEL: 0 = Initial pattern write (IPW) is performed to MPRs on side A DRAMs. 1 = IPW is performed to MPRs on side B DRAMs. (This bit is only used in DDR4 when the MEMORY_TYPE field in the PC Configuration 1 Register equals 1XXX.)
62	RW	PAR_A17_MASK: 0 = The A17 bit is used to generate parity. 1 = The A17 bit is excluded from parity generation. This bit is used for DDR4 only.

Bits	SCOM	Field Mnemonic: Description
63	RW	CW_MIRROR: 0 = Address mirroring is not applied to LRDIMM control words. 1 = Address mirroring is applied to LRDIMM control words if enabled for the rank.

Register Name	SEQ Configuration 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_CONFIG0_P1
Address	8000C4020701143F (SCOM)
Description	This register contains the configuration settings for the SEQ logic block.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	MPR_PATTERN_BIT: Read and write calibration algorithms are based on 8-beat bursts. This register controls the read/write burst data pattern. For write data: The MPR_PATTERN_BIT value is available on all bit lanes of beats 1, 3, 5, and 7, and the inverse of the MPR_PATTERN_BIT on all bit lanes of beats 2, 4, 6, and 8. This ensures that all bit lanes toggle consecutive beats. If the protocol requires a burst length longer than eight beats, the pattern in this register is repeated until all data beats are defined. For read data: Bit 48 is brought out as output of the sequencer, and DP16 composes the expected pattern from this output.
49	RW	TWO_CYCLE_ADDR_EN: 1 = During calibrations, the address and command are driven onto the address/cmd bus for two memory clock cycles, while the appropriate chip selects are active only during the second memory clock cycle of the command. 0 = During calibration, the address and command and chip selects are driven and active for one memory clock cycle.
50:53	RW	MR_MASK_EN: PC Mode Register mask enable. This register masks, or disables, the PC Mode Register access by the calibration algorithms. Bits 50 - 53 map to PC Mode Registers 0 - 3.
54	RW	DELAYED_PAR: 1 = During calibration algorithms, the parity bit is driven one cycle after the command is driven on the memory command bus. 0 = During calibration algorithms, the parity bit is driven the same cycle the command is driven on the memory command bus.
55	RW	LRDIMM_CONTEXT: The value of the context bit to be used during F[0]RC12 LRDIMM control word commands.
56	RW	FORCE_RESERVED: 0 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write use the DDR4 MPR registers. 1 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write use the reserved location in memory. If the PROTOCOL field in the PC Configuration 0 Register does not equal DDR4, this bit is not used and is a don't care.

Bits	SCOM	Field Mnemonic: Description
57	RW	HALT_ROTATION: 0 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write rotate through the use of all four MPR registers by changing BA[0:1] during the calibration. 1 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write set BA[0:1] = 00b. The same 8 beats are read repeatedly on a particular DQ lane. The expected data is not rotated through the 4 bytes of the SEQ Read/Write Data {0-1} Register every 8 beats. If the PROTOCOL field in the PC Configuration 0 Register does not equal DDR4, this bit is not used and is a don't care. If this bit is 1b, STAGGERED_PATTERN must be 0b in the RC Configuration 0 Register.
58:59	RW	Reserved.
60	RW	PAR_INVERT: 0 = Normal operation. 1 = For DDR4 RDIMM systems where CID2:0 has been configured to a nonzero value for calibrations, set this bit to the value of CID2 XOR CID1 XOR CID0.
61	RW	IPW_SIDEAB_SEL: 0 = IPW is performed to MPRs on side A DRAMs. 1 = IPW is performed to MPRs on side B DRAMs. (This bit is only used in DDR4 when the MEMORY_TYPE field in the PC Configuration 1 Register equals 1XXX.)
62	RW	PAR_A17_MASK: 0 = The A17 bit is used to generate parity. 1 = The A17 bit is excluded from parity generation. This bit is used for DDR4 only.
63	RW	CW_MIRROR: 0 = Address mirroring is not applied to LRDIMM control words. 1 = Address mirroring is applied to LRDIMM control words if enabled for the rank.

Register Name	SEQ Configuration 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_CONFIG0_P2
Address	8000C4020701183F (SCOM)
Description	This register contains the configuration settings for the SEQ logic block.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	MPR_PATTERN_BIT: Read and write calibration algorithms are based on 8-beat bursts. This register controls the read/write burst data pattern. For write data: The MPR_PATTERN_BIT value is available on all bit lanes of beats 1, 3, 5, and 7, and the inverse of the MPR_PATTERN_BIT on all bit lanes of beats 2, 4, 6, and 8. This ensures that all bit lanes toggle consecutive beats. If the protocol requires a burst length longer than eight beats, the pattern in this register is repeated until all data beats are defined. For read data: Bit 48 is brought out as output of the sequencer, and DP16 composes the expected pattern from this output.
49	RW	TWO_CYCLE_ADDR_EN: 1 = During calibrations, the address and command are driven onto the address/cmd bus for two memory clock cycles, while the appropriate chip selects are active only during the second memory clock cycle of the command. 0 = During calibration, the address and command and chip selects are driven and active for one memory clock cycle.
50:53	RW	MR_MASK_EN: PC Mode Register mask enable. This register masks, or disables, the PC Mode Register access by the calibration algorithms. Bits 50 - 53 map to PC Mode Registers 0 - 3.

Bits	SCOM	Field Mnemonic: Description
54	RW	DELAYED_PAR: 1 = During calibration algorithms, the parity bit is driven one cycle after the command is driven on the memory command bus. 0 = During calibration algorithms, the parity bit is driven the same cycle the command is driven on the memory command bus.
55	RW	LRDIMM_CONTEXT: The value of the context bit to be used during F[0]RC12 LRDIMM control word commands.
56	RW	FORCE_RESERVED: 0 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write use the DDR4 MPR registers. 1 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write use the reserved location in memory. Register Name	SEQ Configuration 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_CONFIG0_P3
Address	8000C40207011C3F (SCOM)
Description	This register contains the configuration settings for the SEQ logic block.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RW	MPR_PATTERN_BIT: Read and write calibration algorithms are based on 8-beat bursts. This register controls the read/write burst data pattern. For write data: The MPR_PATTERN_BIT value is available on all bit lanes of beats 1, 3, 5, and 7, and the inverse of the MPR_PATTERN_BIT on all bit lanes of beats 2, 4, 6, and 8. This ensures that all bit lanes toggle consecutive beats. If the protocol requires a burst length longer than eight beats, the pattern in this register is repeated until all data beats are defined. For read data: Bit 48 is brought out as output of the sequencer, and DP16 composes the expected pattern from this output.
49	RW	TWO_CYCLE_ADDR_EN: 1 = During calibrations, the address and command are driven onto the address/cmd bus for two memory clock cycles, while the appropriate chip selects are active only during the second memory clock cycle of the command. 0 = During calibration, the address and command and chip selects are driven and active for one memory clock cycle.
50:53	RW	MR_MASK_EN: PC Mode Register mask enable. This register masks, or disables, the PC Mode Register access by the calibration algorithms. Bits 50 - 53 map to PC Mode Registers 0 - 3.
54	RW	DELAYED_PAR: 1 = During calibration algorithms, the parity bit is driven one cycle after the command is driven on the memory command bus. 0 = During calibration algorithms, the parity bit is driven the same cycle the command is driven on the memory command bus.
55	RW	LRDIMM_CONTEXT: The value of the context bit to be used during F[0]RC12 LRDIMM control word commands.
56	RW	FORCE_RESERVED: 0 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write use the DDR4 MPR registers. 1 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write use the reserved location in memory. If the PROTOCOL field in the PC Configuration 0 Register does not equal DDR4, this bit is not used and is a don't care.
57	RW	HALT_ROTATION: 0 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write rotate through the use of all four MPR registers by changing BA[0:1] during the calibration. 1 = When the PROTOCOL field in the PC Configuration 0 Register equals DDR4, custom read centering and the initial pattern write set BA[0:1] = 00b. The same 8 beats are read repeatedly on a particular DQ lane. The expected data is not rotated through the 4 bytes of the SEQ Read/Write Data {0-1} Register every 8 beats. If the PROTOCOL field in the PC Configuration 0 Register does not equal DDR4, this bit is not used and is a don't care. If this bit is 1b, STAGGERED_PATTERN must be 0b in the RC Configuration 0 Register.
58:59	RW	Reserved.
60	RW	PAR_INVERT: 0 = Normal operation. 1 = For DDR4 RDIMM systems where CID2:0 has been configured to a nonzero value for calibrations, set this bit to the value of CID2 XOR CID1 XOR CID0.
61	RW	IPW_SIDEAB_SEL: 0 = IPW is performed to MPRs on side A DRAMs. 1 = IPW is performed to MPRs on side B DRAMs. (This bit is only used in DDR4 when the MEMORY_TYPE field in the PC Configuration 1 Register equals 1XXX.)
62	RW	PAR_A17_MASK: 0 = The A17 bit is used to generate parity. 1 = The A17 bit is excluded from parity generation. This bit is used for DDR4 only.

Bits	SCOM	Field Mnemonic: Description
63	RW	CW_MIRROR: 0 = Address mirroring is not applied to LRDIMM control words. 1 = Address mirroring is applied to LRDIMM control words if enabled for the rank.

Register Name	SEQ Reserved Address 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR0_P0
Address	8000C4030701103F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs. Each read or write access by the DDR PHY during calibration algorithms receives or sends eight beats of data, starting at the address defined by the SEQ Reserved Address Registers. Bank addressing: For a single read or write command, the bank address is defined by the SEQ Reserved Address Registers. For a series of multiple back-to-back read or write commands, the first read or write is to the bank address defined by the SEQ Reserved Address Registers. The bank address is incremented by 1 for each subsequent read or write command.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR0: Reserved address field 0. Bits 48 - 63 map to A0 - A15. The lower 2 bytes of the row address are used. **Note:** A7:A0 must be less than or equal to ‘F8’h. Therefore, if bits 51:55 = ‘11111’b, bits 48:50 must be ‘000’b.

Register Name	SEQ Reserved Address 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR0_P1
Address	8000C4030701143F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs. Each read or write access by the DDR PHY during calibration algorithms receives or sends eight beats of data, starting at the address defined by the SEQ Reserved Address Registers. Bank addressing: For a single read or write command, the bank address is defined by the SEQ Reserved Address Registers. For a series of multiple back-to-back read or write commands, the first read or write is to the bank address defined by the SEQ Reserved Address Registers. The bank address is incremented by 1 for each subsequent read or write command.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR0: Reserved address field 0. Bits 48 - 63 map to A0 - A15. The lower 2 bytes of the row address are used. **Note:** A7:A0 must be less than or equal to ‘F8’h. Therefore, if bits 51:55 = ‘11111’b, bits 48:50 must be ‘000’b.

Register Name	SEQ Reserved Address 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR0_P2
Address	8000C4030701183F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs. Each read or write access by the DDR PHY during calibration algorithms receives or sends eight beats of data, starting at the address defined by the SEQ Reserved Address Registers. Bank addressing: For a single read or write command, the bank address is defined by the SEQ Reserved Address Registers. For a series of multiple back-to-back read or write commands, the first read or write is to the bank address defined by the SEQ Reserved Address Registers. The bank address is incremented by 1 for each subsequent read or write command.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR0: Reserved address field 0. Bits 48 - 63 map to A0 - A15. The lower 2 bytes of the row address are used. **Note:** A7:A0 must be less than or equal to ‘F8’h. Therefore, if bits 51:55 = ‘11111’b, bits 48:50 must be ‘000’b.

Register Name	SEQ Reserved Address 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR0_P3
Address	8000C40307011C3F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs. Each read or write access by the DDR PHY during calibration algorithms receives or sends eight beats of data, starting at the address defined by the SEQ Reserved Address Registers. Bank addressing: For a single read or write command, the bank address is defined by the SEQ Reserved Address Registers. For a series of multiple back-to-back read or write commands, the first read or write is to the bank address defined by the SEQ Reserved Address Registers. The bank address is incremented by 1 for each subsequent read or write command.

0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR0: Reserved address field 0. Bits 48 - 63 map to A0 - A15. The lower 2 bytes of the row address are used. **Note:** A7:A0 must be less than or equal to ‘F8’h. Therefore, if bits 51:55 = ‘11111’b, bits 48:50 must be ‘000’b.

Register Name	SEQ Reserved Address 1 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR1_P0
Address	8000C4040701103F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR1: Reserved address field 1. Bits 48 - 52 map to A16 - A20; bits 53 - 63 are reserved. This protocol uses the upper bit of the row address.

Register Name	SEQ Reserved Address 1 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR1_P1
Address	8000C4040701143F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR1: Reserved address field 1. Bits 48 - 52 map to A16 - A20; bits 53 - 63 are reserved. This protocol uses the upper bit of the row address.

Register Name	SEQ Reserved Address 1 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR1_P2
Address	8000C4040701183F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR1: Reserved address field 1. Bits 48 - 52 map to A16 - A20; bits 53 - 63 are reserved. This protocol uses the upper bit of the row address.

Register Name	SEQ Reserved Address 1 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR1_P3
Address	8000C40407011C3F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR1: Reserved address field 1. Bits 48 - 52 map to A16 - A20; bits 53 - 63 are reserved. This protocol uses the upper bit of the row address.

Register Name	SEQ Reserved Address 2 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR2_P0
Address	8000C4050701103F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs. Address mirroring, if enabled, does not alter the address bit mapping of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:63	RW	RESERVED_ADDR2: Reserved address field 2. This register controls the lower 2 bytes of the column address. Some address pins depend upon the value of DDR4_CMD_SIG_REDUCTION in the PC Configuration 0 Register. Writes with DDR4_CMD_SIG_REDUCTION = 1b: A15 (CAS_n) = 0b. A14 (WE_n) = 0b (for write). A13 = bit 61. A12 (BL8) = 1b. A11 = bit 59. A10 (AP) = 0b. A0:A9 = bits 48:57. Reads with DDR4_CMD_SIG_REDUCTION = 1b: A15 (CAS_n) = 0b. A14 (WE_n) = 1b (for read). A13 = bit 61. A12 (BL8) = 1b. A11 = bit 59. A10 (AP) = 0b. A3:A9 = bits 51:57. A0:A2 = 000b. Refresh: A11:A15 = bits 59:63. A10 (AP) = 1b. A0:A9 = bits 48:57.

Register Name	SEQ Reserved Address 2 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR2_P1
Address	8000C4050701143F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs. Address mirroring, if enabled, does not alter the address bit mapping of this register.

Bits	SCOM	Field Mnemonic: Description

48:63	RW	RESERVED_ADDR3: Reserved address field 3.

Register Name	SEQ Reserved Address 3 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR3_P3
Address	8000C40607011C3F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs. Address mirroring, if enabled, does not alter the address bit mapping of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR3: Reserved address field 3.

Register Name	SEQ Reserved Address 4 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR4_P0
Address	8000C4070701103F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs. Address mirroring, if enabled, does not alter the address bit mapping of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR4: Reserved address field 4. Bank address. Bits 48 - 49 map to BA0 - BA1, and bits 50 - 51 map to BG0 - BG1. Bits 52 - 63 are reserved. MPR reads performed by the internal calibration routines: BA0 - BA1 are forced to 00b to access MPR0. Reads performed by the internal calibration routines: BG1 is toggled (both values of BG1 are used/reserved) and all banks are accessed (all BA0 - BA1 are addressed used/reserved).

Register Name	SEQ Reserved Address 4 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR4_P1
Address	8000C4070701143F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs. Address mirroring, if enabled, does not alter the address bit mapping of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR4: Reserved address field 4. Bank address. Bits 48 - 49 map to BA0 - BA1, and bits 50 - 51 map to BG0 - BG1. Bits 52 - 63 are reserved. MPR reads performed by the internal calibration routines: BA0 - BA1 are forced to 00b to access MPR0. Reads performed by the internal calibration routines: BG1 is toggled (both values of BG1 are used/reserved) and all banks are accessed (all BA0 - BA1 are addressed used/reserved).

Register Name	SEQ Reserved Address 4 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR4_P2
Address	8000C4070701183F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs. Address mirroring, if enabled, does not alter the address bit mapping of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR4: Reserved address field 4. Bank address. Bits 48 - 49 map to BA0 - BA1, and bits 50 - 51 map to BG0 - BG1. Bits 52 - 63 are reserved. MPR reads performed by the internal calibration routines: BA0 - BA1 are forced to 00b to access MPR0. Reads performed by the internal calibration routines: BG1 is toggled (both values of BG1 are used/reserved) and all banks are accessed (all BA0 - BA1 are addressed used/reserved).

Register Name	SEQ Reserved Address 4 Register
Mnemonic	IOM0.DDRPHY_SEQ_RESERVED_ADDR4_P3
Address	8000C40707011C3F (SCOM)
Description	This register contains the reserved address to be used during calibration algorithms in the memory devices. This address is used within all primary ranks of rank pairs. Address mirroring, if enabled, does not alter the address bit mapping of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	RESERVED_ADDR4: Reserved address field 4. Bank address. Bits 48 - 49 map to BA0 - BA1, and bits 50 - 51 map to BG0 - BG1. Bits 52 - 63 are reserved. MPR reads performed by the internal calibration routines: BA0 - BA1 are forced to 00b to access MPR0. Reads performed by the internal calibration routines: BG1 is toggled (both values of BG1 are used/reserved) and all banks are accessed (all BA0 - BA1 are addressed used/reserved).

Register Name	SEQ Error Status 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ERROR_STATUS0_P0
Address	8000C4080701103F (SCOM)
Description	This register contains error and status information about the sequencer logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RWX	MULTIPLE_REQ_ERROR: 1 = Error: Multiple requests received at the same time.
49	RWX	INVALID_REQTYPE_ERROR: 1 = Error: In the current state, this request is not expected.
50	RWX	EARLY_REQ_ERROR: 1 = Error: A new request arrived before acknowledgment of the previous request.
51:53	RWX	MULTIPLE_REQ_SOURCE: If MULTIPLE_REQ_ERROR is flagged, the source of the request is indicated by these bits. Bits 51:53 = {PC_REQ, RC_REQ, WC_REQ}.
54:57	RWX	INVALID_REQTYPE: If INVALID_REQTYPE_ERROR is flagged, the type of request is indicated by this register.
58:60	RWX	INVALID_REQ_SOURCE: If INVALID_REQ_ERROR is flagged, the source of the request is indicated by these bits. Bits 58:60 = {PC_REQ, RC_REQ, WC_REQ}.
61:63	RWX	EARLY_REQ_SOURCE: If EARLY_REQ_ERROR is flagged, the source of the request is indicated by these bits. Bits 61:63 = {PC_REQ, RC_REQ, WC_REQ}.

Register Name	SEQ Error Status 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ERROR_STATUS0_P1
Address	8000C4080701143F (SCOM)
Description	This register contains error and status information about the sequencer logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RWX	MULTIPLE_REQ_ERROR: 1 = Error: Multiple requests received at the same time.
49	RWX	INVALID_REQTYPE_ERROR: 1 = Error: In the current state, this request is not expected.
50	RWX	EARLY_REQ_ERROR: 1 = Error: A new request arrived before acknowledgment of the previous request.
51:53	RWX	MULTIPLE_REQ_SOURCE: If MULTIPLE_REQ_ERROR is flagged, the source of the request is indicated by these bits. Bits 51:53 = {PC_REQ, RC_REQ, WC_REQ}.
54:57	RWX	INVALID_REQTYPE: If INVALID_REQTYPE_ERROR is flagged, the type of request is indicated by this register.
58:60	RWX	INVALID_REQ_SOURCE: If INVALID_REQ_ERROR is flagged, the source of the request is indicated by these bits. Bits 58:60 = {PC_REQ, RC_REQ, WC_REQ}.
61:63	RWX	EARLY_REQ_SOURCE: If EARLY_REQ_ERROR is flagged, the source of the request is indicated by these bits. Bits 61:63 = {PC_REQ, RC_REQ, WC_REQ}.

Register Name	SEQ Error Status 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ERROR_STATUS0_P2
Address	8000C4080701183F (SCOM)
Description	This register contains error and status information about the sequencer logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RWX	MULTIPLE_REQ_ERROR: 1 = Error: Multiple requests received at the same time.
49	RWX	INVALID_REQTYPE_ERROR: 1 = Error: In the current state, this request is not expected.
50	RWX	EARLY_REQ_ERROR: 1 = Error: A new request arrived before acknowledgment of the previous request.
51:53	RWX	MULTIPLE_REQ_SOURCE: If MULTIPLE_REQ_ERROR is flagged, the source of the request is indicated by these bits. Bits 51:53 = {PC_REQ, RC_REQ, WC_REQ}.
54:57	RWX	INVALID_REQTYPE: If INVALID_REQTYPE_ERROR is flagged, the type of request is indicated by this register.
58:60	RWX	INVALID_REQ_SOURCE: If INVALID_REQ_ERROR is flagged, the source of the request is indicated by these bits. Bits 58:60 = {PC_REQ, RC_REQ, WC_REQ}.
61:63	RWX	EARLY_REQ_SOURCE: If EARLY_REQ_ERROR is flagged, the source of the request is indicated by these bits. Bits 61:63 = {PC_REQ, RC_REQ, WC_REQ}.

Register Name	SEQ Error Status 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ERROR_STATUS0_P3
Address	8000C40807011C3F (SCOM)
Description	This register contains error and status information about the sequencer logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RWX	MULTIPLE_REQ_ERROR: 1 = Error: Multiple requests received at the same time.
49	RWX	INVALID_REQTYPE_ERROR: 1 = Error: In the current state, this request is not expected.
50	RWX	EARLY_REQ_ERROR: 1 = Error: A new request arrived before acknowledgment of the previous request.
51:53	RWX	MULTIPLE_REQ_SOURCE: If MULTIPLE_REQ_ERROR is flagged, the source of the request is indicated by these bits. Bits 51:53 = {PC_REQ, RC_REQ, WC_REQ}.
54:57	RWX	INVALID_REQTYPE: If INVALID_REQTYPE_ERROR is flagged, the type of request is indicated by this register.
58:60	RWX	INVALID_REQ_SOURCE: If INVALID_REQ_ERROR is flagged, the source of the request is indicated by these bits. Bits 58:60 = {PC_REQ, RC_REQ, WC_REQ}.

Bits	SCOM	Field Mnemonic: Description
61:63	RWX	EARLY_REQ_SOURCE: If EARLY_REQ_ERROR is flagged, the source of the request is indicated by these bits. Bits 61:63 = {PC_REQ, RC_REQ, WC_REQ}.

Register Name	SEQ Error Mask 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ERROR_MASK0_P0
Address	8000C4090701103F (SCOM)
Description	This register masks errors in the SEQ Error Status 0 Register. It also prevents the SEQ_ERROR bit from being set in the PC Error Status 0 Register and the appropriate bit from being set in the PC Initial Calibration Error Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	MULT_REQ_ERR_MASK: 1 = Prevent the MULTIPLE_REQ_ERROR bit from being set in the SEQ Error Status 0 Register. 0 = Allow the MULTIPLE_REQ_ERROR bit to be set.
49	RW	INVALID_REQTYPE_ERR_MASK: 1 = Prevent the INVALID_REQTYPE_ERROR bit from being set in the SEQ Error Status 0 Register. 0 = Allow the INVALID_REQTYPE_ERROR bit to be set.
50	RW	EARLY_REQ_ERR_MASK: 1 = Prevent the EARLY_REQ_ERROR bit from being set in the SEQ Error Status 0 Register. 0 = Allow the EARLY_REQ_ERROR bit to be set.
51:63	RW	Reserved.

Register Name	SEQ Error Mask 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ERROR_MASK0_P1
Address	8000C4090701143F (SCOM)
Description	This register masks errors in the SEQ Error Status 0 Register. It also prevents the SEQ_ERROR bit from being set in the PC Error Status 0 Register and the appropriate bit from being set in the PC Initial Calibration Error Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	MULT_REQ_ERR_MASK: 1 = Prevent the MULTIPLE_REQ_ERROR bit from being set in the SEQ Error Status 0 Register. 0 = Allow the MULTIPLE_REQ_ERROR bit to be set.
49	RW	INVALID_REQTYPE_ERR_MASK: 1 = Prevent the INVALID_REQTYPE_ERROR bit from being set in the SEQ Error Status 0 Register. 0 = Allow the INVALID_REQTYPE_ERROR bit to be set.
50	RW	EARLY_REQ_ERR_MASK: 1 = Prevent the EARLY_REQ_ERROR bit from being set in the SEQ Error Status 0 Register. 0 = Allow the EARLY_REQ_ERROR bit to be set.
51:63	RW	Reserved.

Register Name	SEQ Error Mask 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ERROR_MASK0_P2
Address	8000C4090701183F (SCOM)
Description	This register masks errors in the SEQ Error Status 0 Register. It also prevents the SEQ_ERROR bit from being set in the PC Error Status 0 Register and the appropriate bit from being set in the PC Initial Calibration Error Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	MULT_REQ_ERR_MASK: 1 = Prevent the MULTIPLE_REQ_ERROR bit from being set in the SEQ Error Status 0 Register. 0 = Allow the MULTIPLE_REQ_ERROR bit to be set.
49	RW	INVALID_REQTYPE_ERR_MASK: 1 = Prevent the INVALID_REQTYPE_ERROR bit from being set in the SEQ Error Status 0 Register. 0 = Allow the INVALID_REQTYPE_ERROR bit to be set.
50	RW	EARLY_REQ_ERR_MASK: 1 = Prevent the EARLY_REQ_ERROR bit from being set in the SEQ Error Status 0 Register. 0 = Allow the EARLY_REQ_ERROR bit to be set.
51:63	RW	Reserved.

Register Name	SEQ Error Mask 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ERROR_MASK0_P3
Address	8000C40907011C3F (SCOM)
Description	This register masks errors in the SEQ Error Status 0 Register. It also prevents the SEQ_ERROR bit from being set in the PC Error Status 0 Register and the appropriate bit from being set in the PC Initial Calibration Error Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	MULT_REQ_ERR_MASK: 1 = Prevent the MULTIPLE_REQ_ERROR bit from being set in the SEQ Error Status 0 Register. 0 = Allow the MULTIPLE_REQ_ERROR bit to be set.
49	RW	INVALID_REQTYPE_ERR_MASK: 1 = Prevent the INVALID_REQTYPE_ERROR bit from being set in the SEQ Error Status 0 Register. 0 = Allow the INVALID_REQTYPE_ERROR bit to be set.
50	RW	EARLY_REQ_ERR_MASK: 1 = Prevent the EARLY_REQ_ERROR bit from being set in the SEQ Error Status 0 Register. 0 = Allow the EARLY_REQ_ERROR bit to be set.
51:63	RW	Reserved.

Register Name	SEQ ODT Write Configuration 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_WR_CONFIG0_P0
Address	8000C40A0701103F (SCOM)
Description	This register determines the on-die termination (ODT) values that are sent to all ranks when the given rank is written during calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:51	RW	ODT_WR_VALUES0: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 is written. This field corresponds to the even rank.
52:55	RW	Reserved.
56:59	RW	ODT_WR_VALUES1: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is written. This field corresponds to the odd rank.
60:63	RW	Reserved.

Register Name	SEQ ODT Write Configuration 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_WR_CONFIG0_P1
Address	8000C40A0701143F (SCOM)
Description	This register determines the ODT values that are sent to all ranks when the given rank is written during calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:51	RW	ODT_WR_VALUES0: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 is written. This field corresponds to the even rank.
52:55	RW	Reserved.
56:59	RW	ODT_WR_VALUES1: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is written. This field corresponds to the odd rank.
60:63	RW	Reserved.

Register Name	SEQ ODT Write Configuration 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_WR_CONFIG0_P2
Address	8000C40A0701183F (SCOM)
Description	This register determines the ODT values that are sent to all ranks when the given rank is written during calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:51	RW	ODT_WR_VALUES0: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 is written. This field corresponds to the even rank.
52:55	RW	Reserved.
56:59	RW	ODT_WR_VALUES1: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is written. This field corresponds to the odd rank.
60:63	RW	Reserved.

Register Name	SEQ ODT Write Configuration 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_WR_CONFIG0_P3
Address	8000C40A07011C3F (SCOM)
Description	This register determines the ODT values that are sent to all ranks when the given rank is written during calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	ODT_WR_VALUES0: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 is written. This field corresponds to the even rank.
52:55	RW	Reserved.
56:59	RW	ODT_WR_VALUES1: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is written. This field corresponds to the odd rank.
60:63	RW	Reserved.

Register Name	SEQ ODT Write Configuration 1 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_WR_CONFIG1_P0
Address	8000C40B0701103F (SCOM)
Description	This register determines the ODT values that are sent to all ranks when the given rank is written during calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	ODT_WR_VALUES2: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 is written. This field corresponds to the even rank.
52:55	RW	Reserved.
56:59	RW	ODT_WR_VALUES3: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is written. This field corresponds to the odd rank.
60:63	RW	Reserved.

Register Name	SEQ ODT Write Configuration 1 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_WR_CONFIG1_P1
Address	8000C40B0701143F (SCOM)
Description	This register determines the ODT values that are sent to all ranks when the given rank is written during calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	ODT_WR_VALUES2: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 is written. This field corresponds to the even rank.
52:55	RW	Reserved.
56:59	RW	ODT_WR_VALUES3: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is written. This field corresponds to the odd rank.

Bits	SCOM	Field Mnemonic: Description
60:63	RW	Reserved.

Register Name	SEQ ODT Write Configuration 1 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_WR_CONFIG1_P2
Address	8000C40B0701183F (SCOM)
Description	This register determines the ODT values that are sent to all ranks when the given rank is written during calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	ODT_WR_VALUES2: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 is written. This field corresponds to the even rank.
52:55	RW	Reserved.
56:59	RW	ODT_WR_VALUES3: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is written. This field corresponds to the odd rank.
60:63	RW	Reserved.

Register Name	SEQ ODT Write Configuration 1 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_WR_CONFIG1_P3
Address	8000C40B07011C3F (SCOM)
Description	This register determines the ODT values that are sent to all ranks when the given rank is written during calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	ODT_WR_VALUES2: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 is written. This field corresponds to the even rank.
52:55	RW	Reserved.
56:59	RW	ODT_WR_VALUES3: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is written. This field corresponds to the odd rank.
60:63	RW	Reserved.

Register Name	SEQ ODT Read Configuration 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_RD_CONFIG0_P0
Address	8000C40E0701103F (SCOM)
Description	This register determines the ODT values that are sent to all ranks when the given rank is read during calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	ODT_RD_VALUES0: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 is read. This field corresponds to the even rank.

Bits	SCOM	Field Mnemonic: Description
52:55	RW	Reserved.
56:59	RW	ODT_RD_VALUES1: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is read. This field corresponds to the odd rank.
60:63	RW	Reserved.

Register Name	SEQ ODT Read Configuration 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_RD_CONFIG0_P1
Address	8000C40E0701143F (SCOM)
Description	This register determines the ODT values that are sent to all ranks when the given rank is read during calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	ODT_RD_VALUES0: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 is read. This field corresponds to the even rank.
52:55	RW	Reserved.
56:59	RW	ODT_RD_VALUES1: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is read. This field corresponds to the odd rank.
60:63	RW	Reserved.

Register Name	SEQ ODT Read Configuration 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_RD_CONFIG0_P2
Address	8000C40E0701183F (SCOM)
Description	This register determines the ODT values that are sent to all ranks when the given rank is read during calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	ODT_RD_VALUES0: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 is read. This field corresponds to the even rank.
52:55	RW	Reserved.
56:59	RW	ODT_RD_VALUES1: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is read. This field corresponds to the odd rank.
60:63	RW	Reserved.

Register Name	SEQ ODT Read Configuration 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_RD_CONFIG0_P3
Address	8000C40E07011C3F (SCOM)
Description	This register determines the ODT values that are sent to all ranks when the given rank is read during calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:51	RW	ODT_RD_VALUES0: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 is read. This field corresponds to the even rank.
52:55	RW	Reserved.
56:59	RW	ODT_RD_VALUES1: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is read. This field corresponds to the odd rank.
60:63	RW	Reserved.

Register Name	SEQ ODT Read Configuration 1 Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_RD_CONFIG1_P0
Address	8000C40F0701103F (SCOM)
Description	This register determines the ODT values that are sent to all ranks when the given rank is read during calibration.

56:59	RW	ODT_RD_VALUES3: This 4-bit value is driven on ODT pins 0:3 when rank {0-1} × 2 + 1 is read. This field corresponds to the odd rank.
60:63	RW	Reserved.

Register Name	SEQ Memory Timing Parameter 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_MEM_TIMING_PARAM0_P0
Address	8000C4120701103F (SCOM)
Description	This register determines the memory timing parameters to be used during calibration. Each nibble is used as an exponent of 2, to calculate the number of MEMINTCLKO clock cycles. For example, if TMOD_CYCLES[0:3] = 5, the internal timers use the value 25 = 32 MEMINTCLKO clock cycles. The maximum value per nibble is Ah.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	TMOD_CYCLES: max(tMRD, tMOD).
52:55	RW	TRCD_CYCLES: tRCD.
56:59	RW	TRP_CYCLES: tRP.

Bits	SCOM	Field Mnemonic: Description
60:63	RW	TRFC_CYCLES: tRFC.

Register Name	SEQ Memory Timing Parameter 0 Register
Mnemonic	IOM0.DDRPHY_SEQ_MEM_TIMING_PARAM0_P1
Address	8000C4120701143F (SCOM)
Description	This register determines the memory timing parameters to be used during calibration. Each nibble is used as an exponent of 2, to calculate the number of MEMINTCLKO clock cycles. For example, if TMOD_CYCLES[0:3] = 5, the internal timers use the value 25 = 32 MEMINTCLKO clock cycles. The maximum value per nibble is Ah.

Bits	SCOM	Field Mnemonic: Description

Register Name	SEQ Memory Timing Parameter 2 Register
Mnemonic	IOM0.DDRPHY_SEQ_MEM_TIMING_PARAM2_P0
Address	8000C4140701103F (SCOM)
Description	This register determines the memory timing parameters to be used during calibration. Each nibble is used as an exponent of 2, to calculate the number of MEMINTCLKO clock cycles. That is, if TMOD_CYCLES[0:3] = 5, the internal timers use the value 25 = 32 MEMINTCLKO clock cycles. The maximum allowed value per nibble is Ah.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:51	RW	TODTLON_OFF_CYCLES: max(ODTLon, ODTLoff). When the ODT values change during a calibration algorithm, the PHY waits TODTLON_OFF_CYCLES 2 memory clock cycles before changing the ODT values. The ODT values might change because of a rank change, or a change from read ODT values to write ODT values, or because a mode register set (MRS) command is issued. For more information, see SEQ ODT Write Configuration {0-3} Registers and SEQ ODT Read Configuration {0-3} Registers. The ODT pins must be forced to zero during MRS commands when RTT_Nom is enabled via MR1. This is independent of the values stored in the SEQ ODT Write/Read Configuration {0-3} Registers. Before issuing the MRS command, the DDR PHY checks if the ODT pin was recently changed within the window. It waits for the tODTLOFF cycles to expire. When tODTLOFF expires, the ODT value is forced to zero, and the DDR PHY again waits for tODTLOFF cycles. After this, the MRS command is issued. The DDR PHY waits for tMOD cycles, and then restores the ODT pins to their prior state.
52:63	RW	Reserved.

Register Name	SEQ Memory Timing Parameter 2 Register
Mnemonic	IOM0.DDRPHY_SEQ_MEM_TIMING_PARAM2_P1

Address	8000C41E0701143F (SCOM)
Description	This register contains the conversion from RTT_WR settings to RTT_NOM settings corresponding to JEDEC Mode Register settings.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:50	RW	RTT_WR5_NOM_VALUE: Value for RTT_NOM if RTT_WR contains a 5 value: bit 48 → A10. bit 49 → A9. bit 50 → A8.
51:53	RW	RTT_WR6_NOM_VALUE: Value for RTT_NOM if RTT_WR contains a 6 value: bit 51 → A10. bit 52 → A9. bit 52 → A8.
54:56	RW	RTT_WR7_NOM_VALUE: Value for RTT_NOM if RTT_WR contains a 7 value: bit 54 → A10. bit 55 → A9. bit 56 → A8.
57:63	RW	Reserved.

Register Name	SEQ RTT Write Term Swap 1 Register
Mnemonic	IOM0.DDRPHY_SEQ_WR_TERM_SWAP1_P2
Address	8000C41E0701183F (SCOM)
Description	This register contains the conversion from RTT_WR settings to RTT_NOM settings corresponding to JEDEC Mode Register settings.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:50	RW	RTT_WR5_NOM_VALUE: Value for RTT_NOM if RTT_WR contains a 5 value: bit 48 → A10. bit 49 → A9. bit 50 → A8.
51:53	RW	RTT_WR6_NOM_VALUE: Value for RTT_NOM if RTT_WR contains a 6 value: bit 51 → A10. bit 52 → A9. bit 52 → A8.
54:56	RW	RTT_WR7_NOM_VALUE: Value for RTT_NOM if RTT_WR contains a 7 value: bit 54 → A10. bit 55 → A9. bit 56 → A8.
57:63	RW	Reserved.

Register Name	SEQ RTT Write Term Swap 1 Register
Mnemonic	IOM0.DDRPHY_SEQ_WR_TERM_SWAP1_P3
Address	8000C41E07011C3F (SCOM)
Description	This register contains the conversion from RTT_WR settings to RTT_NOM settings corresponding to JEDEC Mode Register settings.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:50	RW	RTT_WR5_NOM_VALUE: Value for RTT_NOM if RTT_WR contains a 5 value: bit 48 → A10. bit 49 → A9. bit 50 → A8.
51:53	RW	RTT_WR6_NOM_VALUE: Value for RTT_NOM if RTT_WR contains a 6 value: bit 51 → A10. bit 52 → A9. bit 52 → A8.
54:56	RW	RTT_WR7_NOM_VALUE: Value for RTT_NOM if RTT_WR contains a 7 value: bit 54 → A10. bit 55 → A9. bit 56 → A8.
57:63	RW	Reserved.

Register Name	SEQ ODT Default Configuration Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_DEFAULT_CONFIG_P0
Address	8000C4240701103F (SCOM)
Description	This register determines the ODT values sent to all ranks during MRS commands.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:51	RW	ODT_DEF_VALUES: The four ODT values in this register are driven to the ODT pins during MRS commands. Typically, the ODT value must be set to all zeros during MRS commands. Where: bit 0 = ODT value for ODT pin 0 during MRS command. bit 1 = ODT value for ODT pin 1 during MRS command. bit 2 = ODT value for ODT pin 2 during MRS command. bit 3 = ODT value for ODT pin 3 during MRS command.
52:63	RW	Reserved.

Register Name	SEQ ODT Default Configuration Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_DEFAULT_CONFIG_P1
Address	8000C4240701143F (SCOM)
Description	This register determines the ODT values sent to all ranks during MRS commands.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:51	RW	ODT_DEF_VALUES: The four ODT values in this register are driven to the ODT pins during MRS commands. Typically, the ODT value must be set to all zeros during MRS commands. Where: bit 0 = ODT value for ODT pin 0 during MRS command. bit 1 = ODT value for ODT pin 1 during MRS command. bit 2 = ODT value for ODT pin 2 during MRS command. bit 3 = ODT value for ODT pin 3 during MRS command.
52:63	RW	Reserved.

Register Name	SEQ ODT Default Configuration Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_DEFAULT_CONFIG_P2
Address	8000C4240701183F (SCOM)
Description	This register determines the ODT values sent to all ranks during MRS commands.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:51	RW	ODT_DEF_VALUES: The four ODT values in this register are driven to the ODT pins during MRS commands. Typically, the ODT value must be set to all zeros during MRS commands. Where: bit 0 = ODT value for ODT pin 0 during MRS command. bit 1 = ODT value for ODT pin 1 during MRS command. bit 2 = ODT value for ODT pin 2 during MRS command. bit 3 = ODT value for ODT pin 3 during MRS command.
52:63	RW	Reserved.

Register Name	SEQ ODT Default Configuration Register
Mnemonic	IOM0.DDRPHY_SEQ_ODT_DEFAULT_CONFIG_P3
Address	8000C42407011C3F (SCOM)
Description	This register determines the ODT values sent to all ranks during MRS commands.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:51	RW	ODT_DEF_VALUES: The four ODT values in this register are driven to the ODT pins during MRS commands. Typically, the ODT value must be set to all zeros during MRS commands. Where: bit 0 = ODT value for ODT pin 0 during MRS command. bit 1 = ODT value for ODT pin 1 during MRS command. bit 2 = ODT value for ODT pin 2 during MRS command. bit 3 = ODT value for ODT pin 3 during MRS command.
52:63	RW	Reserved.

10. DDRPHY: WC Registers

This section contains the registers located in the write control (WC) logic. The WC registers are listed alphabetically by mnemonic in the following address table.

The WC registers are listed in the following tables.

Register Name	WC Configuration 0 Register
Mnemonic	IOM0.DDRPHY_WC_CONFIG0_P0
Address	8000CC000701103F (SCOM)
Description	This register contains global configuration information to control the write control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:55	RW	TWLO_TWLOE: This field contains the number of memory clock cycles that equal: 12 + {The greater of (tWLDQSEN - tMOD) converted to and rounded up to the nearest integer number of memory clock cycles or (tWLO + tWLOE) converted to and rounded up to the nearest integer number of memory clock cycles.} + {The longest DQS wire delay converted to and rounded up to the nearest integer number of memory clock cycles.} + {The longest DQ wire delay converted to and rounded up to the nearest integer number of memory clock cycles.}. This field is used during write leveling.
56	RW	WL_ONE_DQS_PULSE: 0 = Continuous data strobe (DQS) pulses during write leveling. Thirty-two continuous pulses are sent. 1 = One DQS pulse during each write-leveling adjustment.
57:62	RW	FW_WR_RD: This field contains the number of memory clock cycles to wait between the write and read command pairs during write centering.
63	RW	CUSTOM_INIT_WRITE: 1 = Write the data pattern in the SEQ Read/Write Data {0-1} Registers during the initial-pattern-write algorithm. 0 = Write the MPR-like pattern defined by the MPR_PATTERN_BIT field in the SEQ Configuration 0 Register during the initial-pattern-write algorithm.

Register Name	WC Configuration 0 Register
Mnemonic	IOM0.DDRPHY_WC_CONFIG0_P1
Address	8000CC000701143F (SCOM)
Description	This register contains global configuration information to control the write control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:55	RW	TWLO_TWLOE: This field contains the number of memory clock cycles that equal: 12 + {The greater of (tWLDQSEN - tMOD) converted to and rounded up to the nearest integer number of memory clock cycles or (tWLO + tWLOE) converted to and rounded up to the nearest integer number of memory clock cycles.} + {The longest DQS wire delay converted to and rounded up to the nearest integer number of memory clock cycles.} + {The longest DQ wire delay converted to and rounded up to the nearest integer number of memory clock cycles.}. This field is used during write leveling.
56	RW	WL_ONE_DQS_PULSE: 0 = Continuous DQS pulses during write leveling. Thirty-two continuous pulses are sent. 1 = One DQS pulse during each write-leveling adjustment.
57:62	RW	FW_WR_RD: This field contains the number of memory clock cycles to wait between the write and read command pairs during write centering.

Bits	SCOM	Field Mnemonic: Description
63	RW	CUSTOM_INIT_WRITE: 1 = Write the data pattern in the SEQ Read/Write Data {0-1} Registers during the initial-pattern-write algorithm. 0 = Write the MPR-like pattern defined by the MPR_PATTERN_BIT field in the SEQ Configuration 0 Register during the initial-pattern-write algorithm.

Register Name	WC Configuration 0 Register
Mnemonic	IOM0.DDRPHY_WC_CONFIG0_P2
Address	8000CC000701183F (SCOM)
Description	This register contains global configuration information to control the write control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:55	RW	TWLO_TWLOE: This field contains the number of memory clock cycles that equal: 12 + {The greater of (tWLDQSEN - tMOD) converted to and rounded up to the nearest integer number of memory clock cycles or (tWLO + tWLOE) converted to and rounded up to the nearest integer number of memory clock cycles.} + {The longest DQS wire delay converted to and rounded up to the nearest integer number of memory clock cycles.} + {The longest DQ wire delay converted to and rounded up to the nearest integer number of memory clock cycles.}. This field is used during write leveling.
56	RW	WL_ONE_DQS_PULSE: 0 = Continuous DQS pulses during write leveling. Thirty-two continuous pulses are sent. 1 = One DQS pulse during each write-leveling adjustment.
57:62	RW	FW_WR_RD: This field contains the number of memory clock cycles to wait between the write and read command pairs during write centering.
63	RW	CUSTOM_INIT_WRITE: 1 = Write the data pattern in the SEQ Read/Write Data {0-1} Registers during the initial-pattern-write algorithm. 0 = Write the MPR-like pattern defined by the MPR_PATTERN_BIT field in the SEQ Configuration 0 Register during the initial-pattern-write algorithm.

Register Name	WC Configuration 0 Register
Mnemonic	IOM0.DDRPHY_WC_CONFIG0_P3
Address	8000CC0007011C3F (SCOM)
Description	This register contains global configuration information to control the write control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:55	RW	TWLO_TWLOE: This field contains the number of memory clock cycles that equal: 12 + {The greater of (tWLDQSEN - tMOD) converted to and rounded up to the nearest integer number of memory clock cycles or (tWLO + tWLOE) converted to and rounded up to the nearest integer number of memory clock cycles.} + {The longest DQS wire delay converted to and rounded up to the nearest integer number of memory clock cycles.} + {The longest DQ wire delay converted to and rounded up to the nearest integer number of memory clock cycles.}. This field is used during write leveling.
56	RW	WL_ONE_DQS_PULSE: 0 = Continuous DQS pulses during write leveling. Thirty-two continuous pulses are sent. 1 = One DQS pulse during each write-leveling adjustment.
57:62	RW	FW_WR_RD: This field contains the number of memory clock cycles to wait between the write and read command pairs during write centering.
63	RW	CUSTOM_INIT_WRITE: 1 = Write the data pattern in the SEQ Read/Write Data {0-1} Registers during the initial-pattern-write algorithm. 0 = Write the MPR-like pattern defined by the MPR_PATTERN_BIT field in the SEQ Configuration 0 Register during the initial-pattern-write algorithm.

Register Name	**WC Configuration 1 Register**
Mnemonic	IOM0.DDRPHY_WC_CONFIG1_P0
Address	8000CC010701103F (SCOM)
Description	This register contains global configuration information to control the write control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48:51	RW	BIG_STEP: This field indicates the amount the phase rotator value is adjusted during a big step in the write-leveling and write-centering algorithms. The amount of the adjustment is (BIG_STEP + 1) / 128th of a memory clock.
52:54	RW	SMALL_STEP: This field indicates the amount the phase rotator value is adjusted during a small step in the write-leveling and write-centering algorithms. The amount of the adjustment is (SMALL_STEP + 1) / 128th of a memory clock. **Note:** The write-leveling and write-centering algorithms achieve the most accurate results when this field is set to zero.
55:60	RW	WR_PRE_DLY: This field indicates the number of dphy_gckn cycles between a write command and a precharge command in the coarse initial-pattern-write, initial-write, and write-centering calibration algorithms. This value has a range limitation of 0:63. For 2666 Mbps speeds and beyond, 63 might not be a sufficient delay. The range of the delay can be extended by using the DD2_WR_PRE_DLY_EXT bit in the PC Resets Register.
61:63	RO	Constant = 0b000

Register Name	**WC Configuration 1 Register**
Mnemonic	IOM0.DDRPHY_WC_CONFIG1_P1
Address	8000CC010701143F (SCOM)
Description	This register contains global configuration information to control the write control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	BIG_STEP: This field indicates the amount the phase rotator value is adjusted during a big step in the write-leveling and write-centering algorithms. The amount of the adjustment is (BIG_STEP + 1) / 128th of a memory clock.
52:54	RW	SMALL_STEP: This field indicates the amount the phase rotator value is adjusted during a small step in the write-leveling and write-centering algorithms. The amount of the adjustment is (SMALL_STEP + 1) / 128th of a memory clock. **Note:** The write-leveling and write-centering algorithms achieve the most accurate results when this field is set to zero.
55:60	RW	WR_PRE_DLY: This field indicates the number of dphy_gckn cycles between a write command and a precharge command in the coarse initial-pattern-write, initial-write, and write-centering calibration algorithms. This value has a range limitation of 0:63. For 2666 Mbps speeds and beyond, 63 might not be a sufficient delay. The range of the delay can be extended by using the DD2_WR_PRE_DLY_EXT bit in the PC Resets Register.
61:63	RO	Constant = 0b000

Register Name	WC Configuration 1 Register
Mnemonic	IOM0.DDRPHY_WC_CONFIG1_P2
Address	8000CC010701183F (SCOM)
Description	This register contains global configuration information to control the write control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	BIG_STEP: This field indicates the amount the phase rotator value is adjusted during a big step in the write-leveling and write-centering algorithms. The amount of the adjustment is (BIG_STEP + 1) / 128th of a memory clock.
52:54	RW	SMALL_STEP: This field indicates the amount the phase rotator value is adjusted during a small step in the write-leveling and write-centering algorithms. The amount of the adjustment is (SMALL_STEP + 1) / 128th of a memory clock. **Note:** The write-leveling and write-centering algorithms achieve the most accurate results when this field is set to zero.
55:60	RW	WR_PRE_DLY: This field indicates the number of dphy_gckn cycles between a write command and a precharge command in the coarse initial-pattern-write, initial-write, and write-centering calibration algorithms. This value has a range limitation of 0:63. For 2666 Mbps speeds and beyond, 63 might not be a sufficient delay. The range of the delay can be extended by using the DD2_WR_PRE_DLY_EXT bit in the PC Resets Register.
61:63	RO	Constant = 0b000

Register Name	WC Configuration 1 Register
Mnemonic	IOM0.DDRPHY_WC_CONFIG1_P3
Address	8000CC0107011C3F (SCOM)
Description	This register contains global configuration information to control the write control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:51	RW	BIG_STEP: This field indicates the amount the phase rotator value is adjusted during a big step in the write-leveling and write-centering algorithms. The amount of the adjustment is (BIG_STEP + 1) / 128th of a memory clock.
52:54	RW	SMALL_STEP: This field indicates the amount the phase rotator value is adjusted during a small step in the write-leveling and write-centering algorithms. The amount of the adjustment is (SMALL_STEP + 1) / 128th of a memory clock. **Note:** The write-leveling and write-centering algorithms achieve the most accurate results when this field is set to zero.
55:60	RW	WR_PRE_DLY: This field indicates the number of dphy_gckn cycles between a write command and a precharge command in the coarse initial-pattern-write, initial-write, and write-centering calibration algorithms. This value has a range limitation of 0:63. For 2666 Mbps speeds and beyond, 63 might not be a sufficient delay. The range of the delay can be extended by using the DD2_WR_PRE_DLY_EXT bit in the PC Resets Register.
61:63	RO	Constant = 0b000

Register Name	**WC Configuration 2 Register**
Mnemonic	IOM0.DDRPHY_WC_CONFIG2_P0
Address	8000CC020701103F (SCOM)
Description	This register contains global configuration information to control the write control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	NUM_VALID_SAMPLES: The write-leveling and write-centering algorithms require NUM_VALID_SAMPLES + 1 samples at one delay to determine that the delay setting returns valid data. One invalid sample at any time causes an invalid sample. The write-leveling algorithm performs the second-to-last sample at the current sample point plus 1/2 unit interval (UI) to ensure that the current sample point is at the 0b-to-1b transition. **Caution:** The minimum value for this field is 2.
52:57	RW	FW_RD_WR: This delay value is used in two places in the write-centering algorithm. This value sets the delay between a read and write command in memory clock cycles. This value must be a minimum of 11 plus the spacing required by DDR4. For example, DDR4 specifies this spacing as tWTR. The second place this delay value is used is to set the delay between the read and the precharge command in memory clock cycles. This value must be a minimum of 3 plus the spacing required by DDR4. For example, DDR4 specifies this spacing as additive latency (AL) + tRTP. This field must be set to the larger of the two values in number of memory clock cycles. FW_RD_WR = max(tWTR + 11, AL + tRTP + 3).
58:61	RW	IPW_WR_WR: This delay value is used to separate write commands during an initial pattern write. When writing a pattern to DDR4 MPRs, this must be set to meet tWR_MPR. Otherwise, this should be set to 0h. The number of clock cycles between write commands is (IPW_WR_WR + 1) x 4.
62	RW	CDD2_FIX_DIS: 0 = Enable the POWER8 DD2 function. 1 = Enable the POWER8 DD1 function.
63	RW	EN_RESET_WR_DELAY_WL: 1 = The DP16 Write Delay Value {0-23} Registers are reset at the start of the write-leveling calibration algorithm for rank pair 0. 0 = The DP16 Write Delay Value {0-23} Registers are not reset at the start of the write-leveling calibration algorithm.

Register Name	WC Configuration 2 Register
Mnemonic	IOM0.DDRPHY_WC_CONFIG2_P1
Address	8000CC020701143F (SCOM)
Description	This register contains global configuration information to control the write control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	NUM_VALID_SAMPLES: The write-leveling and write-centering algorithms require NUM_VALID_SAMPLES + 1 samples at one delay to determine that the delay setting returns valid data. Register Name	**WC Configuration 2 Register**
Mnemonic	IOM0.DDRPHY_WC_CONFIG2_P3
Address	8000CC0207011C3F (SCOM)
Description	This register contains global configuration information to control the write control logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	NUM_VALID_SAMPLES: The write-leveling and write-centering algorithms require NUM_VALID_SAMPLES + 1 samples at one delay to determine that the delay setting returns valid data. One invalid sample at any time causes an invalid sample. The write-leveling algorithm performs the second-to-last sample at the current sample point plus 1/2 UI to ensure that the current sample point is at the 0b-to-1b transition. **Caution:** The minimum value for this field is 2.
52:57	RW	FW_RD_WR: This delay value is used in two places in the write-centering algorithm. This value sets the delay between a read and write command in memory clock cycles. This value must be a minimum of 11 plus the spacing required by DDR4. For example, DDR4 specifies this spacing as tWTR. The second place this delay value is used is to set the delay between the read and the precharge command in memory clock cycles. This value must be a minimum of 3 plus the spacing required by DDR4. For example, DDR4 specifies this spacing as additive latency (AL) + tRTP. This field must be set to the larger of the two values in number of memory clock cycles. FW_RD_WR = max(tWTR + 11, AL + tRTP + 3).
58:61	RW	IPW_WR_WR: This delay value is used to separate write commands during an initial pattern write. When writing a pattern to DDR4 MPRs, this must be set to meet tWR_MPR. Otherwise, this should be set to 0h. The number of clock cycles between write commands is (IPW_WR_WR + 1) x 4.
62	RW	CDD2_FIX_DIS: 0 = Enable the POWER8 DD2 function. 1 = Enable the POWER8 DD1 function.

Bits	SCOM	Field Mnemonic: Description
63	RW	EN_RESET_WR_DELAY_WL: 1 = The DP16 Write Delay Value {0-23} Registers are reset at the start of the write-leveling calibration algorithm for rank pair 0. 0 = The DP16 Write Delay Value {0-23} Registers are not reset at the start of the write-leveling calibration algorithm.

Register Name	**WC Error Status 0 Register**
Mnemonic	IOM0.DDRPHY_WC_ERROR_STATUS0_P0
Address	8000CC030701103F (SCOM)
Description	This register contains error information about the write control logic. It contains composite error information from the DP16 logic block that is about write calibration algorithms. Before writing this register to ‘0’b, DDRPHY_DP16_WR_ERROR0, if set, must be written to ‘0’b.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WR_CNTL_ERROR: 1 = Write control error. See the DP16 Write Error 0 Register for more information.
49:63	RO	Constant = 0b000000000000000

Register Name	**WC Error Status 0 Register**
Mnemonic	IOM0.DDRPHY_WC_ERROR_STATUS0_P1
Address	8000CC030701143F (SCOM)
Description	This register contains error information about the write control logic. It contains composite error information from the DP16 logic block that is about write calibration algorithms. Before writing this register to ‘0’b, DDRPHY_DP16_WR_ERROR0, if set, must be written to ‘0’b.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WR_CNTL_ERROR: 1 = Write control error. See the DP16 Write Error 0 Register for more information.
49:63	RO	Constant = 0b000000000000000

Register Name	**WC Error Status 0 Register**
Mnemonic	IOM0.DDRPHY_WC_ERROR_STATUS0_P2
Address	8000CC030701183F (SCOM)
Description	This register contains error information about the write control logic. It contains composite error information from the DP16 logic block that is about write calibration algorithms. Before writing this register to ‘0’b, DDRPHY_DP16_WR_ERROR0, if set, must be written to ‘0’b.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WR_CNTL_ERROR: 1 = Write control error. See the DP16 Write Error 0 Register for more information.
49:63	RO	Constant = 0b000000000000000

Register Name	WC Error Status 0 Register
Mnemonic	IOM0.DDRPHY_WC_ERROR_STATUS0_P3
Address	8000CC0307011C3F (SCOM)
Description	This register contains error information about the write control logic. It contains composite error information from the DP16 logic block that is about write calibration algorithms. Before writing this register to ‘0’b, DDRPHY_DP16_WR_ERROR0, if set, must be written to ‘0’b.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	WR_CNTL_ERROR: 1 = Write control error. See the DP16 Write Error 0 Register for more information.
49:63	RO	Constant = 0b000000000000000

Register Name	WC Error Mask 0 Register
Mnemonic	IOM0.DDRPHY_WC_ERROR_MASK0_P0
Address	8000CC040701103F (SCOM)
Description	This register masks errors in the WC Error Status 0 Register. It prevents the WC_ERROR bit from being set in the PC Error Status 0 Register and the appropriate bit from being set in PC Initial Calibration Error Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	WR_CNTL_ERROR_MASK: 1 = Mask WR_CNTL_ERROR.
49:63	RO	Constant = 0b000000000000000

Register Name	WC Error Mask 0 Register
Mnemonic	IOM0.DDRPHY_WC_ERROR_MASK0_P1
Address	8000CC040701143F (SCOM)
Description	This register masks errors in the WC Error Status 0 Register. It prevents the WC_ERROR bit from being set in the PC Error Status 0 Register and the appropriate bit from being set in PC Initial Calibration Error Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	WR_CNTL_ERROR_MASK: 1 = Mask WR_CNTL_ERROR.
49:63	RO	Constant = 0b000000000000000

Register Name	WC Error Mask 0 Register
Mnemonic	IOM0.DDRPHY_WC_ERROR_MASK0_P2
Address	8000CC040701183F (SCOM)
Description	This register masks errors in the WC Error Status 0 Register. It prevents the WC_ERROR bit from being set in the PC Error Status 0 Register and the appropriate bit from being set in PC Initial Calibration Error Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WR_CNTL_ERROR_MASK: 1 = Mask WR_CNTL_ERROR.
49:63	RO	Constant = 0b000000000000000

Register Name	WC Error Mask 0 Register
Mnemonic	IOM0.DDRPHY_WC_ERROR_MASK0_P3
Address	8000CC0407011C3F (SCOM)
Description	This register masks errors in the WC Error Status 0 Register. It prevents the WC_ERROR bit from being set in the PC Error Status 0 Register and the appropriate bit from being set in PC Initial Calibration Error Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WR_CNTL_ERROR_MASK: 1 = Mask WR_CNTL_ERROR.
49:63	RO	Constant = 0b000000000000000

Register Name	WC Configuration 3 Register
Mnemonic	IOM0.DDRPHY_WC_CONFIG3_P0
Address	8000CC050701103F (SCOM)
Description	This register contains global configuration information to control per DRAM address (PDA) mode MRS commands. The DQ and DQS are required to be driven in PDA mode. This register must be set to enable driving DQ/DQS (for DDR4), and to start and stop driving DQ/DQS such that timing expectations of the JEDEC standard are met at the DRAM. **Note:** PHY logic can only track one MRS PDA command at a time. The minimum spacing between MRS commands is MRS_CMD_DQ_ON + MRS_CMD_DQ_OFF + 8 when this mode is used.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	PDA_RANKDELAY_ENABLE: This bit enables the use of rank-pair-specific calibrated delays. It must be set to 1 when using PDA.
49:54	RW	MRS_CMD_DQ_ON: MRS_CMD_DQ_ON determines the WL_per_DRAM_addr time. It is used for both PDA and PBA modes. WL_per_DRAM_addr = 8 + MRS_CMD_DQ_ON memory clock cycles in 2:1 mode. The PHY starts to drive I/O after WL_per_DRAM_addr cycles, as measured from the MRS command. The value that must be programmed for MRS_CMD_DQ_ON is determined by the latencies programmed in the DRAM Mode Registers as well as the Write Latency Offset in the PC Configuration 1 Register. The cycle on which I/O is driven is independent of the DP16 Write Delay Value {0-23} Registers. Therefore, it might be necessary to pad when the I/O turns on/off to account for wire delays.

Bits	SCOM	Field Mnemonic: Description
55:60	RW	MRS_CMD_DQ_OFF is the number of memory clock cycles that the write DQ/DQS are driven after MRS_CMD_DQ_ON before returning to high impedance. It is used for both PDA and PBA modes.
61:63	RO	Constant = 0b000

Register Name	WC Configuration 3 Register
Mnemonic	IOM0.DDRPHY_WC_CONFIG3_P1
Address	8000CC050701143F (SCOM)
Description	This register contains global configuration information to control per DRAM address (PDA) mode MRS commands. The DQ and DQS are required to be driven in PDA mode. This register must be set to enable driving DQ/DQS (for DDR4), and to start and stop driving DQ/DQS such that timing expectations of the JEDEC standard are met at the DRAM. **Note:** PHY logic can only track one MRS PDA command at a time. The minimum spacing between MRS commands is MRS_CMD_DQ_ON + MRS_CMD_DQ_OFF + 8 when this mode is used.

Bits	SCOM	Field Mnemonic: Description

55:60	RW	MRS_CMD_DQ_OFF is the number of memory clock cycles that the write DQ/DQS are driven after MRS_CMD_DQ_ON before returning to high impedance. It is used for both PDA and PBA modes.
61:63	RO	Constant = 0b000

Register Name	WC RTT Write Swap Enable Register
Mnemonic	IOM0.DDRPHY_WC_RTT_WR_SWAP_ENABLE_P0
Address	8000CC060701103F (SCOM)
Description	This register enables hardware mode switches, allowing for RTT_WR to be swapped into RTT_NOM for PDA in write centering or for write leveling.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RW	WL_ENABLE_RTT_SWAP: This bit enables the swapping of RTT_WR values into RTT_NOM for the write-leveling calibration step.
49	RW	WR_CTR_ENABLE_RTT_SWAP: This bit enables the swapping of RTT_WR values into RTT_NOM for the write-centering VREF calibration step before and after VREF changes.
50:59	RW	WR_CTR_VREF_COUNTER_RESET_VAL: This field resets the VREF wait state counter to a predefined user value. This must be computed according to the JEDEC time of the VREF wait divided by the command clock time.
60:63	RO	Constant = 0b0000

Register Name	**WC RTT Write Swap Enable Register**
Mnemonic	IOM0.DDRPHY_WC_RTT_WR_SWAP_ENABLE_P1
Address	8000CC060701143F (SCOM)
Description	This register enables hardware mode switches, allowing for RTT_WR to be swapped into RTT_NOM for PDA in write centering or for write leveling.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WL_ENABLE_RTT_SWAP: This bit enables the swapping of RTT_WR values into RTT_NOM for the write-leveling calibration step.
49	RW	WR_CTR_ENABLE_RTT_SWAP: This bit enables the swapping of RTT_WR values into RTT_NOM for the write-centering VREF calibration step before and after VREF changes.
50:59	RW	WR_CTR_VREF_COUNTER_RESET_VAL: This field resets the VREF wait state counter to a predefined user value. This must be computed according to the JEDEC time of the VREF wait divided by the command clock time.
60:63	RO	Constant = 0b0000

Register Name	**WC RTT Write Swap Enable Register**
Mnemonic	IOM0.DDRPHY_WC_RTT_WR_SWAP_ENABLE_P2
Address	8000CC060701183F (SCOM)
Description	This register enables hardware mode switches, allowing for RTT_WR to be swapped into RTT_NOM for PDA in write centering or for write leveling.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WL_ENABLE_RTT_SWAP: This bit enables the swapping of RTT_WR values into RTT_NOM for the write-leveling calibration step.
49	RW	WR_CTR_ENABLE_RTT_SWAP: This bit enables the swapping of RTT_WR values into RTT_NOM for the write-centering VREF calibration step before and after VREF changes.
50:59	RW	WR_CTR_VREF_COUNTER_RESET_VAL: This field resets the VREF wait state counter to a predefined user value. This must be computed according to the JEDEC time of the VREF wait divided by the command clock time.
60:63	RO	Constant = 0b0000

Register Name	WC RTT Write Swap Enable Register
Mnemonic	IOM0.DDRPHY_WC_RTT_WR_SWAP_ENABLE_P3
Address	8000CC0607011C3F (SCOM)
Description	This register enables hardware mode switches, allowing for RTT_WR to be swapped into RTT_NOM for PDA in write centering or for write leveling.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	WL_ENABLE_RTT_SWAP: This bit enables the swapping of RTT_WR values into RTT_NOM for the write-leveling calibration step.
49	RW	WR_CTR_ENABLE_RTT_SWAP: This bit enables the swapping of RTT_WR values into RTT_NOM for the write-centering VREF calibration step before and after VREF changes.
50:59	RW	WR_CTR_VREF_COUNTER_RESET_VAL: This field resets the VREF wait state counter to a predefined user value. This must be computed according to the JEDEC time of the VREF wait divided by the command clock time.
60:63	RO	Constant = 0b0000

11. DDRPHY: DP16 Registers

This section contains the addressable registers in data path 16 (DP16). The DP16 registers are listed alphabetically by mnemonic in the following address table.

Mnemonic	Address	Page
IOM0.DDRPHY_DP16_DELAY_LINE_PWR_CTL_P1_[n]	0x8000006F0701143F	1217
IOM0.DDRPHY_DP16_DELAY_LINE_PWR_CTL_P2_[n]	0x8000006F0701183F	1217
IOM0.DDRPHY_DP16_DELAY_LINE_PWR_CTL_P3_[n]	0x8000006F07011C3F	1217
IOM0.DDRPHY_DP16_DFT_DIG_EYE_P0_[n]	0x800000080701103F	1025
IOM0.DDRPHY_DP16_DFT_DIG_EYE_P1_[n]	0x800000080701143F	1026

The DP16 registers are listed in the following tables.

Register Name	**DP16 DQ Bit Enable 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQ_BIT_ENABLE0_P0_[n]
Address	800000000701103F (SCOM), +0x0400_0000_0000
Description	A DP16 has 16 possible single-ended data pins that can send or receive data. This register is used to enable and disable each of the 16 pins for data sending or receiving. Any pins on the DP16 that are used as strobes or clocks to capture the data must not be marked as enabled in this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RW	DATA_BIT_ENABLE_0_15: 1 = Indicates that the DP16 bit is enabled, and is used for sending or receiving data to or from the memory device. This bit is calibrated as a data bit. 0 = Indicates that the DP16 bit is not used to send or receive data. Bit 48 controls MEMINTD00B(n). Bit 49 controls MEMINTD01B(n). Bit 50 controls MEMINTD02B(n). ... Bit 63 controls MEMINTD15B(n). where n is the DP16 instance number. Note: For correct operation of the coarse read alignment algorithm, a minimum of 3 bidirectional data bits must be enabled (and not disabled) in each nibble (0 - 3, 4 - 7, 8 - 11, and 12 - 15) to be calibrated.

Register Name	DP16 DQ Bit Enable 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQ_BIT_ENABLE0_P1_[n]
Address	800000000701143F (SCOM), +0x0400_0000_0000
Description	A DP16 has 16 possible single-ended data pins that can send or receive data. This register is used to enable and disable each of the 16 pins for data sending or receiving. Any pins on the DP16 that are used as strobes or clocks to capture the data must not be marked as enabled in this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RW	DATA_BIT_ENABLE_0_15: 1 = Indicates that the DP16 bit is enabled, and is used for sending or receiving data to or from the memory device. This bit is calibrated as a data bit. 0 = Indicates that the DP16 bit is not used to send or receive data. Bit 48 controls MEMINTD00B(n). Bit 49 controls MEMINTD01B(n). Bit 50 controls MEMINTD02B(n). ... Bit 63 controls MEMINTD15B(n). where n is the DP16 instance number. Note: For correct operation of the coarse read alignment algorithm, a minimum of 3 bidirectional data bits must be enabled (and not disabled) in each nibble (0 - 3, 4 - 7, 8 - 11, and 12 - 15) to be calibrated.

Register Name	DP16 DQ Bit Enable 0 Register [n] (n=0:4)
Mnemonic	IOM0. DDRPHY_DP16_DQ_BIT_ENABLE0_P2_[n]
Address	800000000701183F (SCOM), +0x0400_0000_0000
Description	A DP16 has 16 possible single-ended data pins that can send or receive data. This register is used to enable and disable each of the 16 pins for data sending or receiving. Any pins on the DP16 that are used as strobes or clocks to capture the data must not be marked as enabled in this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RW	DATA_BIT_ENABLE_0_15: 1 = Indicates that the DP16 bit is enabled, and is used for sending or receiving data to or from the memory device. This bit is calibrated as a data bit. 0 = Indicates that the DP16 bit is not used to send or receive data. Bit 48 controls MEMINTD00B(n). Bit 49 controls MEMINTD01B(n). Bit 50 controls MEMINTD02B(n). ... Bit 63 controls MEMINTD15B(n). where n is the DP16 instance number. Note: For correct operation of the coarse read alignment algorithm, a minimum of 3 bidirectional data bits must be enabled (and not disabled) in each nibble (0 - 3, 4 - 7, 8 - 11, and 12 - 15) to be calibrated.

Register Name	**DP16 DQ Bit Enable 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQ_BIT_ENABLE0_P3_[n]
Address	8000000007011C3F (SCOM), +0x0400_0000_0000
Description	A DP16 has 16 possible single-ended data pins that can send or receive data. This register is used to enable and disable each of the 16 pins for data sending or receiving. Any pins on the DP16 that are used as strobes or clocks to capture the data must not be marked as enabled in this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	DATA_BIT_ENABLE_0_15: 1 = Indicates that the DP16 bit is enabled, and is used for sending or receiving data to or from the memory device. This bit is calibrated as a data bit. 0 = Indicates that the DP16 bit is not used to send or receive data. Bit 48 controls MEMINTD00B(n). Bit 49 controls MEMINTD01B(n). Bit 50 controls MEMINTD02B(n). ... Bit 63 controls MEMINTD15B(n). where n is the DP16 instance number. Note: For correct operation of the coarse read alignment algorithm, a minimum of 3 bidirectional data bits must be enabled (and not disabled) in each nibble (0 - 3, 4 - 7, 8 - 11, and 12 - 15) to be calibrated.

Register Name	**DP16 DFT/PDA Control Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DFT_PDA_CONTROL_P0_[n]
Address	800000010701103F (SCOM), +0x0400_0000_0000
Description	This register provides design for test (DFT) and per DRAM addressability (PDA) controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:55	RW	Reserved. This field must remain at the reset value.
56	RW	DFT_FORCE_OUTPUTS: 1 = The 24 outputs of the DP16 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is 1b. They are forced to a high-impedance state when the corresponding DATA_BIT_ENABLE bit is 0b. When a DP16 output is forced to a low-impedance state, the value driven out, 1b or 0b, is determined by the corresponding bit value in the DP16 DQ Force Outputs and DP16 Configuration 0 Registers. 0 = The 24 outputs of the DP16 are not forced.
57	RW	DFT_PRBS7_GEN_EN: 1 = The 24 outputs of the DP16 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is 1b or when enabled as a write clock in the DP16 Write Clock Enable and Clock Selection Register. An output is forced to a high-impedance state when the corresponding DATA_BIT_ENABLE bit is 0b and not enabled as a write clock. When a pin is enabled via the corresponding DATA_BIT_ENABLE bit, the PRBS7 pattern is driven out. When a pin is enabled as a clock, a free running clock is driven out. Note: When a clock is enabled as differential, both outputs drive out the same free running clock. The two clocks are in-phase, synchronous clocks; they are edge-aligned clocks, and are not differential. 0 = The 24 outputs of the DP16 are not forced.
58	RW	WRAPSEL: This bit is connected directly to the S0WRAPSEL and S1WRAPSEL input pins of the analog core. This bit is used during wrap tests of the analog core. This bit must be 0b for proper functional operation.
59	RW	Reserved.

Bits	SCOM	Field Mnemonic: Description
60	RW	MRS_CMD_DATA_N0: This is the value that is driven by MEMINT_D00_B - MEMINT_D03_B when a double data rate 4 (DDR4) mode register set (MRS) command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.
61	RW	MRS_CMD_DATA_N1: This is the value that is driven by MEMINT_D04_B - MEMINT_D07_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.
62	RW	MRS_CMD_DATA_N2: This is the value that is driven by MEMINT_D08_B - MEMINT_D11_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.
63	RW	MRS_CMD_DATA_N3: This is the value that is driven by MEMINT_D12_B - MEMINT_D15_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.

Register Name	DP16 DFT/PDA Control Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DFT_PDA_CONTROL_P1_[n]
Address	800000010701143F (SCOM), +0x0400_0000_0000
Description	This register provides DFT and PDA controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:55	RW	Reserved. This field must remain at the reset value.
56	RW	DFT_FORCE_OUTPUTS: 1 = The 24 outputs of the DP16 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is 1b. They are forced to a high-impedance state when the corresponding DATA_BIT_ENABLE bit is 0b. When a DP16 output is forced to a low-impedance state, the value driven out, 1b or 0b, is determined by the corresponding bit value in the DP16 DQ Force Outputs and DP16 Config0 Registers. 0 = The 24 outputs of the DP16 are not forced.
57	RW	DFT_PRBS7_GEN_EN: 1 = The 24 outputs of the DP16 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is 1b or when enabled as a write clock in the DP16 Write Clock Enable and Clock Selection Register. An output is forced to a high-impedance state when the corresponding DATA_BIT_ENABLE bit is 0b and not enabled as a write clock. When a pin is enabled via the corresponding DATA_BIT_ENABLE bit, the PRBS7 pattern is driven out. When a pin is enabled as a clock, a free running clock is driven out. Note: When a clock is enabled as differential, both outputs drive out the same free running clock. The two clocks are in-phase, synchronous clocks; they are edge-aligned clocks, and are not differential. 0 = The 24 outputs of the DP16 are not forced.
58	RW	WRAPSEL: This bit is connected directly to the S0WRAPSEL and S1WRAPSEL input pins of the analog core. This bit is used during wrap tests of the analog core. This bit must be 0b for proper functional operation.
59	RW	Reserved.
60	RW	MRS_CMD_DATA_N0: This is the value that is driven by MEMINT_D00_B - MEMINT_D03_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.

Bits	SCOM	Field Mnemonic: Description
61	RW	MRS_CMD_DATA_N1: This is the value that is driven by MEMINT_D04_B - MEMINT_D07_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.
62	RW	MRS_CMD_DATA_N2: This is the value that is driven by MEMINT_D08_B - MEMINT_D11_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.
63	RW	MRS_CMD_DATA_N3: This is the value that is driven by MEMINT_D12_B - MEMINT_D15_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.

Register Name	**DP16 DFT/PDA Control Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DFT_PDA_CONTROL_P2_[n]
Address	800000010701183F (SCOM), +0x0400_0000_0000
Description	This register provides DFT and PDA controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:55	RW	Reserved. This field must remain at the reset value.
56	RW	DFT_FORCE_OUTPUTS: 1 = The 24 outputs of the DP16 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is 1b. They are forced to a high-impedance state when the corresponding DATA_BIT_ENABLE bit is 0b. When a DP16 output is forced to a low-impedance state, the value driven out, 1b or 0b, is determined by the corresponding bit value in the DP16 DQ Force Outputs and DP16 Configuration 0 Registers. 0 = The 24 outputs of the DP16 are not forced.
57	RW	DFT_PRBS7_GEN_EN: 1 = The 24 outputs of the DP16 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is 1b or when enabled as a write clock in the DP16 Write Clock Enable and Clock Selection Register. An output is forced to a high-impedance state when the corresponding DATA_BIT_ENABLE bit is 0b and not enabled as a write clock. When a pin is enabled via the corresponding DATA_BIT_ENABLE bit, the PRBS7 pattern is driven out. When a pin is enabled as a clock, a free running clock is driven out. Note: When a clock is enabled as differential, both outputs drive out the same free running clock. The two clocks are in-phase, synchronous clocks; they are edge-aligned clocks, and are not differential. 0 = The 24 outputs of the DP16 are not forced.
58	RW	WRAPSEL: This bit is connected directly to the S0WRAPSEL and S1WRAPSEL input pins of the analog core. This bit is used during wrap tests of the analog core. This bit must be 0b for proper functional operation.
59	RW	Reserved.
60	RW	MRS_CMD_DATA_N0: This is the value that is driven by MEMINT_D00_B - MEMINT_D03_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.
61	RW	MRS_CMD_DATA_N1: This is the value that is driven by MEMINT_D04_B - MEMINT_D07_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.

Bits	SCOM	Field Mnemonic: Description
62	RW	MRS_CMD_DATA_N2: This is the value that is driven by MEMINT_D08_B - MEMINT_D11_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.
63	RW	MRS_CMD_DATA_N3: This is the value that is driven by MEMINT_D12_B - MEMINT_D15_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.

Register Name	**DP16 DFT/PDA Control Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DFT_PDA_CONTROL_P3_[n]
Address	8000000107011C3F (SCOM), +0x0400_0000_0000
Description	This register provides DFT and PDA controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48:55	RW	Reserved. This field must remain at the reset value.
56	RW	DFT_FORCE_OUTPUTS: 1 = The 24 outputs of the DP16 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is 1b. They are forced to a high-impedance state when the corresponding DATA_BIT_ENABLE bit is 0b. When a DP16 output is forced to a low-impedance state, the value driven out, 1b or 0b, is determined by the corresponding bit value in the DP16 DQ Force Outputs and DP16 Configuration 0 Registers. 0 = The 24 outputs of the DP16 are not forced.
57	RW	DFT_PRBS7_GEN_EN: 1 = The 24 outputs of the DP16 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is 1b or when enabled as a write clock in the DP16 Write Clock Enable and Clock Selection Register. An output is forced to a high-impedance state when the corresponding DATA_BIT_ENABLE bit is 0b and not enabled as a write clock. When a pin is enabled via the corresponding DATA_BIT_ENABLE bit, the PRBS7 pattern is driven out. When a pin is enabled as a clock, a free running clock is driven out. Note: When a clock is enabled as differential, both outputs drive out the same free running clock. The two clocks are in-phase, synchronous clocks; they are edge-aligned clocks, and are not differential. 0 = The 24 outputs of the DP16 are not forced.
58	RW	WRAPSEL: This bit is connected directly to the S0WRAPSEL and S1WRAPSEL input pins of the analog core. This bit is used during wrap tests of the analog core. This bit must be 0b for proper functional operation.
59	RW	Reserved.
60	RW	MRS_CMD_DATA_N0: This is the value that is driven by MEMINT_D00_B - MEMINT_D03_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.
61	RW	MRS_CMD_DATA_N1: This is the value that is driven by MEMINT_D04_B - MEMINT_D07_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.
62	RW	MRS_CMD_DATA_N2: This is the value that is driven by MEMINT_D08_B - MEMINT_D11_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.

Bits	SCOM	Field Mnemonic: Description
63	RW	MRS_CMD_DATA_N3: This is the value that is driven by MEMINT_D12_B - MEMINT_D15_B when a DDR4 MRS command is detected, and PDA mode is enabled, in the PC Mode 3 Register bit A4. This represents an MR3 register of the primary rank within a rank group that has been programmed to enable PDA mode. It is also used in PBA mode.

Register Name	DP16 DQ Force Outputs Register [n] (n=0:4)
Mnemonic	DDRPHY_DP16_DQ_FORCE_OUTPUTS_P0_[n]
Address	800000020701103F (SCOM), +0x0400_0000_0000
Description	This register is used for diagnostic purposes only. It defines the voltage levels to be driven out of the data (DQ) bits when DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4).

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	DQ_FORCE_VALUE_0_15: When set to '0', a low voltage is driven out of the associated DQ pin if DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4). When set to '1', a high voltage is driven out of the associated DQ pin if DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4).

Register Name	DP16 DQ Force Outputs Register [n] (n=0:4)
Mnemonic	DDRPHY_DP16_DQ_FORCE_OUTPUTS_P1_[n]
Address	800000020701143F (SCOM), +0x0400_0000_0000
Description	It defines the voltage levels to be driven out of the DQ bits when DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4).

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	DQ_FORCE_VALUE_0_15: When set to '0', a low voltage is driven out of the associated DQ pin if DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4). When set to '1', a high voltage is driven out of the associated DQ pin if DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4).

Register Name	DP16 DQ Force Outputs Register [n] (n=0:4)
Mnemonic	DDRPHY_DP16_DQ_FORCE_OUTPUTS_P2_[n]
Address	800000020701183F (SCOM), +0x0400_0000_0000
Description	It defines the voltage levels to be driven out of the DQ bits when DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4).

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:63	RW	DQ_FORCE_VALUE_0_15: When set to ‘0’, a low voltage is driven out of the associated DQ pin if DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4). When set to ‘1’, a high voltage is driven out of the associated DQ pin if DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4).

Register Name	**DP16 DQ Force Outputs Register [n] (n=0:4)**
Mnemonic	DDRPHY_DP16_DQ_FORCE_OUTPUTS_P3_[n]
Address	8000000207011C3F (SCOM), +0x0400_0000_0000
Description	It defines the voltage levels to be driven out of the DQ bits when DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4).

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	DQ_FORCE_VALUE_0_15: When set to ‘0’, a low voltage is driven out of the associated DQ pin if DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4). When set to ‘1’, a high voltage is driven out of the associated DQ pin if DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4).

Register Name	**DP16 Configuration 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_CONFIG0_P0_[n]
Address	800000030701103F (SCOM), +0x0400_0000_0000
Description	This is the DP16 configuration register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	DD2_COARSE_OF_DISABLE: 0 = Enable the DD2 function for reporting of write delay overflow errors in coarse alignment. 1 = Enable the DD1 function.
49	RW	DD2_DBDIS_DQS_DISABLE: 0 = Enable the DD2 function to allow setting data strobe (DQS) disable bits when DQS calibration is detected. 1 = Enable the DD1 function.
50	RW	DD2_SPARE_L2SFF_CG_DISABLE: 0 = Enable the DD2 function of clock gating on spare L2 flip flop (L2SFF) latches. 1 = Enable the DD1 function.
51	RW	FLUSH: Manufacturing macro test control for ANALOG. This bit controls whether the transmit FIFO is flushed or not. When flushed, half-rate data is no longer valid.
52	RW	DQS_FORCE_VALUE: This bit is relevant only when DFT_FORCE_OUTPUTS = 1 in the DP16 DFT/PDA Control Register [n] (n=0:4). 0 = A low voltage is driven on all eight DQS pins. 1 = A high voltage is driven on all eight DQS pins.
53	RW	P8_DD2_FIX_DIS: 0 = Enable POWER8 DD2 function. 1 = Enable POWER8 DD1 function.

Bits	SCOM	Field Mnemonic: Description
54	RW	INIT_IO: Enables the DC level translator in front of the TX output stages, which initialize the top-plate voltage of the fly cap in the AC level translator at start up. This must be applied for a minimum of five clock cycles after startup, and before the I/Os can be used. This requirement also applies to all manufacturing test modes.
55	RW	ADVANCE_PING_PONG: This bit must be set to 1b due to the timing requirements of the analog core. 0 = The DQS (write strobe) phase rotator multiplex select is not advanced. 1 = The DQS (write strobe) phase rotator multiplex select switches one system clock (SysClk) clock cycle early.
56	RW	WL_ADVANCE_DISABLE: 0 = Enable the 1/2 unit interval (UI) advance of the second-to-last sample in the write-leveling calibration algorithm. 1 = Disable the 1/2 UI advance of the second-to-last sample in the write-leveling calibration algorithm.
57	RW	DISABLE_PING_PONG: Reserved. This bit must always be written to zero. 0 = The DQS (write strobe) write phase rotator values toggle between the two possible phase rotator values when the rank pair written is not the same as the last rank pair that was written. 1 = The DQS (write strobe) write phase rotator values do not toggle. Each DQS (write strobe) output uses the corresponding phase rotator.
58	RW	DELAY_PING_PONG_HALF: This bit must be set to 1b due to the timing requirements of the analog core. 0 = The DQS (write strobe) phase rotator multiplex select is not delayed. 1 = The DQS (write strobe) phase rotator multiplex select is not 1/2 SysClk clock cycle later. When this bit is set to 1b, and the ADVANCE_PING_PONG bit is set to 1b, the phase rotator multiplex select switches 1/2 a SysClk clock cycle early.
59:63	RW	ATESTSEL_0_4: Lowest level of analog test pin (ATEST) multiplex selection.

Register Name	DP16 Configuration 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_CONFIG0_P1_[n]
Address	800000030701143F (SCOM), +0x0400_0000_0000
Description	This is the DP16 configuration register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Register Name	**DP16 Read Clock Enable and Selection RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_CLOCK_RANK_PAIR0_P2_[n]
Address	800000040701183F (SCOM), +0x0400_0000_0000
Description	This register configures which input pins on the DP16 are used as strobes to capture incoming data on which data pins. This register must be configured the same as the DP16 Write Clock Enable and Selection Register. The following are legal configurations on POWER9 for bits 48:53: 110000 = By-8 memory using CLK16. 000011 = By-8 memory using CLK18. 100001 = By-4 memory, not cross-coupled. 010010 = By-4 memory, cross-coupled. 000000 = Byte is not used. Other values are reserved. The following are legal configurations on POWER9 for bits 54:57: 1100 = By-8 memory using CLK20. 0011 = By-8 memory using CLK22. 1001 = By-4 memory, not cross-coupled. 0110 = By-4 memory, cross-coupled. 0000 = Byte is not used. Other values are reserved.

48	RW	NIB0TCFLIP_DC: Reverse the polarity of the differential pair on DQS0 (lane 16/17). 0 = Normal wiring of true and complement. 1 = Reverse usage of true and complement.

Bits	SCOM	Field Mnemonic: Description
49	RW	NIB1TCFLIP_DC: Reverse the polarity of the differential pair on DQS1 (lane 18/19). 0 = Normal wiring of true and complement. 1 = Reverse usage of true and complement.
50	RW	NIB2TCFLIP_DC: Reverse the polarity of the differential pair on DQS2 (lane 20/21). 0 = Normal wiring of true and complement. 1 = Reverse usage of true and complement.
51	RW	NIB3TCFLIP_DC: Reverse the polarity of the differential pair on DQS3 (lane 22/23). 0 = Normal wiring of true and complement. 1 = Reverse usage of true and complement.
52	RW	DD2_MCTERM_FIX_DISABLE: 0 = Enable the DD2 function for suppressing an extraneous pulse on MCTERM. 1 = Enable the DD1 function.
53	RW	DD2_COARSE_ALN_FIX_DISABLE: 0 = Enable the DD2 function for coarse alignment not recognizing out-of-range latency adjustments. 1 = Enable the DD1 function.
54	RW	DD2_RESET_READ_FIX_DISABLE: 0 = Enable the DD2 function to remove the register reset on read feature on status registers. 1 = Enable the DD1 function.
55	RW	DD2_RDFIFO_CG_DISABLE: 0 = Enable DD2 enhanced clock gating on read FIFO registers. 1 = Enable the DD1 function.
56	RW	DD2_RDCNTL_CG_DISABLE: 0 = Enable DD2 enhanced clock gating on read control registers. 1 = Enable the DD1 function.
57	RW	DD2_WRCNTL_CG_DISABLE 0 = Enable DD2 enhanced clock gating on write control registers. 1 = Enable the DD1 function.
58	RW	DD2_PARERROR_FIX_DISABLE: 0 = Enable the DD2 fix for parity errors on the VREF Calibration Error Registers. 1 = Enable the DD1 function.
59:60	RW	Reserved.
61	RW	DISABLE_TERMINATION: 0 = The termination resistors for data and strobe pins are turned on during read data transfer. 1 = The termination resistors for data and strobe pins are always off.
62:63	RW	READ_CENTERING_MODE: 00 = Data read from memory is compared to the value of the SEQ Read/Write Data 0 - 1 Registers. The specific bits used by each lane are determined by the DP16 Pattern Position 0 - 2 Registers. This mode is used for custom read centering. 01 = Read back the read FIFO for DDR4 load-reduced dual in-line memory module (LRDIMM) calibration. Do not use for custom calibration. 10 = Reserved. Do not execute custom read centering with this value. 11 = Data read from memory is compared to the value of the SEQ Read/Write Data 0 - 1 Registers. The specific bits used by each lane are determined dynamically based on traffic. This mode is used for DDR4 custom read centering for either the Multipurpose Register (MPR) serial or MPR staggered mode. (MPR parallel mode is supported with a firmware assist, but must not be used for calibration.) These bits are used if custom read centering is enabled. These bits are not used during periodic read centering. The expected read data is always an alternating 01010101 pattern during periodic read centering. The value of the reserved location in DDR4 devices, and the value of the MPR registers in DDR4 memories, is written during initial pattern write. See the CUSTOM_INIT_WRITE field in the WC Configuration 0 Register. For reference, the alternating 01010101 pattern used during initial read centering and periodic read centering is typically read from the MPR0 register of DDR4 devices. The first bit of the expected 01010101 data pattern is controlled by the MPR_PATTERN_BIT of the SEQ Configuration 0 Register.

Register Name	DP16 IO RX Configuration 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RX_CONFIG0_P1_[n]
Address	800000060701143F (SCOM), +0x0400_0000_0000
Description	This register contains the receiver configuration for the DP16.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	NIB0TCFLIP_DC: Reverse the polarity of the differential pair on DQS0 (lane 16/17). 0 = Normal wiring of true and complement. 1 = Reverse usage of true and complement.
49	RW	NIB1TCFLIP_DC: Reverse the polarity of the differential pair on DQS1 (lane 18/19). 0 = Normal wiring of true and complement. 1 = Reverse usage of true and complement.
50	RW	NIB2TCFLIP_DC: Reverse the polarity of the differential pair on DQS2 (lane 20/21). 0 = Normal wiring of true and complement. 1 = Reverse usage of true and complement.
51	RW	NIB3TCFLIP_DC: Reverse the polarity of the differential pair on DQS3 (lane 22/23). 0 = Normal wiring of true and complement. 1 = Reverse usage of true and complement.
52	RW	DD2_MCTERM_FIX_DISABLE: 0 = Enable the DD2 function for suppressing an extraneous pulse on MCTERM. 1 = Enable the DD1 function.
53	RW	DD2_COARSE_ALN_FIX_DISABLE: 0 = Enable the DD2 function for coarse alignment not recognizing out-of-range latency adjustments. 1 = Enable the DD1 function.
54	RW	DD2_RESET_READ_FIX_DISABLE: 0 = Enable the DD2 function to remove the register reset on read feature on status registers. 1 = Enable the DD1 function.
55	RW	DD2_RDFIFO_CG_DISABLE: 0 = Enable DD2 enhanced clock gating on read FIFO registers. 1 = Enable the DD1 function.
56	RW	DD2_RDCNTL_CG_DISABLE: 0 = Enable DD2 enhanced clock gating on read control registers. 1 = Enable the DD1 function.
57	RW	DD2_WRCNTL_CG_DISABLE 0 = Enable DD2 enhanced clock gating on write control registers. 1 = Enable the DD1 function.
58	RW	DD2_PARERROR_FIX_DISABLE: 0 = Enable the DD2 fix for parity errors on the VREF Calibration Error Registers. 1 = Enable the DD1 function.
59:60	RW	Reserved.
61	RW	DISABLE_TERMINATION: 0 = The termination resistors for data and strobe pins are turned on during read data transfer. 1 = The termination resistors for data and strobe pins are always off.

Bits	SCOM	Field Mnemonic: Description
62:63	RW	READ_CENTERING_MODE: 00 = Data read from memory is compared to the value of the SEQ Read/Write Data 0 - 1 Registers. The specific bits used by each lane are determined by the DP16 Pattern Position 0 - 2 Registers. This mode is used for custom read centering. 01 = Read back the read FIFO for DDR4 LRDIMM calibration. Do not use for custom calibration. 10 = Reserved. Do not execute custom read centering with this value. 11 = Data read from memory is compared to the value of the SEQ Read/Write Data 0 - 1 Registers. The specific bits used by each lane are determined dynamically based on traffic. This mode is used for DDR4 custom read centering for either the MPR serial or MPR staggered mode. (MPR parallel mode is supported with a firmware assist, but must not be used for calibration.) These bits are used if custom read centering is enabled. These bits are not used during periodic read centering. The expected read data is always an alternating 01010101 pattern during periodic read centering. The value of the reserved location in DDR4 devices, and the value of the MPR registers in DDR4 memories, is written during initial pattern write. See the CUSTOM_INIT_WRITE field in the WC Configuration 0 Register. For reference, the alternating 01010101 pattern used during initial read centering and periodic read centering is typically read from the MPR0 register of DDR4 devices. The first bit of the expected 01010101 data pattern is controlled by the MPR_PATTERN_BIT of the SEQ Configuration 0 Register.

Register Name	DP16 IO RX Configuration 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RX_CONFIG0_P2_[n]
Address	800000060701183F (SCOM), +0x0400_0000_0000
Description	This register contains the receiver configuration for the DP16.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

See the CUSTOM_INIT_WRITE field in the WC Configuration 0 Register. For reference, the alternating 01010101 pattern used during initial read centering and periodic read centering is typically read from the MPR0 register of DDR4 devices. The first bit of the expected 01010101 data pattern is controlled by the MPR_PATTERN_BIT of the SEQ Configuration 0 Register.

Register Name	**DP16 SysClk 0 Phase Rotator Control Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_SYSCLK_PR0_P0_[n]
Address	800000070701103F (SCOM), +0x0400_0000_0000
Description	This register controls the circuit that aligns the internal SysClk 0 to the incoming dphy_gckn clock clock.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RW	Reserved.
49:55	RW	SYSCLK_ROT_OVERRIDE: System clock (SysClk) phase rotator override value. This field has a dual purpose: override control and lock control. When SYSCLK_ROT_OVERRIDE_EN = 1b, this field is in override control mode. When SYSCLK_ROT_OVERRIDE_EN = 0b, this field is in lock control mode. For override control: The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by four dphy_gckn clock cycles. Back-to-back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register is reserved. For lock control: Write this field to all zeros unless instructed otherwise by your IBM representative. Bit 50: Lock select: Selects between lock status and sticky lock. 0 = Selects the status of the lock. When the dphy_gckn detects that it has reached alignment between the dphy_gckn and SysClk, the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register is asserted. 1 = Selects the sticky lock to the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register. The sticky lock is controlled by bit 52, sticky lock enable. After the sticky lock is set, it remains set. Bit 52: Sticky lock enable. Bits 53:55 000 = At most, a 1-count increment or decrement occurs to indicate a lock. 001 = At most, a 2-count increment or decrement occurs to indicate a lock. 010 = At most, a 3-count increment or decrement occurs to indicate a lock. 011 = At most, a 4-count increment or decrement occurs to indicate a lock. 100 = At most, a 5-count increment or decrement occurs to indicate a lock.
56	RW	SYSCLK_ROT_OVERRIDE_EN: This field enables the use of the SYSCLK_ROT_OVERRIDE field rather than the internally calculated SYSCLK_ROT value when set to 1b. The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by four dphy_gckn clock cycles. Back-to-back APB write operations to this register provide the required separation. When this bit is written to 0b and was 1b, the SYSCLK_ROT value in the DP16 SysClk 1 Phase Rotator Control Register resets to zero.
57	RW	SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_gckn, the SysClk phase alignment controller. Must be asserted after the phase-locked loop (PLL) locks, and must be active for at least five SysClk cycles.
58	RW	SYSCLK_PHASE_CNTL_EN: Alignment enable to dphy_gckn, the SysClk phase alignment controller Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	SYSCLK_PHASE_DEFAULT_EN: This field enables default startup values to be output by dphy_gckn, the SysClk phase alignment controller. This bit must be asserted during system reset and de-asserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	SYSCLK_POS_EDGE_ALIGN: This field must be 0b for proper functional operation. It is an edge-alignment strap to dphy_gckn, the SysClk phase alignment controller. 0 = Negative edge alignment of the SysClk to the positive edge of dphy_gckn. 1 = Positive edge alignment of the SysClk to the positive edge of dphy_gckn.
61	RW	CONTINUOUS_UPDATE: 0 = The dphy_gckn, the SysClk phase alignment controller, is only updated periodically under hardware control when an update does not interfere with the physical layer (PHY) functional operations. 1 = The dphy_gckn, the SysClk phase alignment controller, runs continuously. Thus, it continuously aligns the dphy_gckn clock to the internal SysClk clock.
62:63	RO	Constant = 0b00

Register Name	DP16 SysClk 0 Phase Rotator Control Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_SYSCLK_PR0_P1_[n]
Address	800000070701143F (SCOM), +0x0400_0000_0000
Description	This register controls the circuit that aligns the internal SysClk 0 to the incoming dphy_gckn clock clock.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	SYSCLK_ROT_OVERRIDE: System clock (SysClk) phase rotator override value. This field has a dual purpose: override control and lock control. When SYSCLK_ROT_OVERRIDE_EN = 1b, this field is in override control mode. When SYSCLK_ROT_OVERRIDE_EN = 0b, this field is in lock control mode. For override control: The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by four dphy_gckn clock cycles. Back-to-back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register is reserved. For lock control: Write this field to all zeros unless instructed otherwise by your IBM representative. Bit 50: Lock select: Selects between lock status and sticky lock. 0 = Selects the status of the lock. When the dphy_gckn detects that it has reached alignment between the dphy_gckn and SysClk, the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register is asserted. 1 = Selects the sticky lock to the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register. The sticky lock is controlled by bit 52, sticky lock enable. After the sticky lock is set, it remains set. Bit 52: Sticky lock enable. Bits 53:55 000 = At most, a 1-count increment or decrement occurs to indicate a lock. 001 = At most, a 2-count increment or decrement occurs to indicate a lock. 010 = At most, a 3-count increment or decrement occurs to indicate a lock. 011 = At most, a 4-count increment or decrement occurs to indicate a lock. 100 = At most, a 5-count increment or decrement occurs to indicate a lock.
56	RW	SYSCLK_ROT_OVERRIDE_EN: This field enables the use of the SYSCLK_ROT_OVERRIDE field rather than the internally calculated SYSCLK_ROT value when set to 1b. The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by four dphy_gckn clock cycles. Back-to-back APB write operations to this register provide the required separation. When this bit is written to 0b and was 1b, the SYSCLK_ROT value in the DP16 SysClk 1 Phase Rotator Control Register resets to zero.
57	RW	SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_gckn, the SysClk phase alignment controller. Must be asserted after the PLL locks, and must be active for at least five SysClk cycles.
58	RW	SYSCLK_PHASE_CNTL_EN: Alignment enable to dphy_gckn, the SysClk phase alignment controller. Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	SYSCLK_PHASE_DEFAULT_EN: This field enables default startup values to be output by dphy_gckn, the SysClk phase alignment controller. This bit must be asserted during system reset and de-asserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	SYSCLK_POS_EDGE_ALIGN: This field must be 0b for proper functional operation. It is an edge-alignment strap to dphy_gckn, the SysClk phase alignment controller. 0 = Negative edge alignment of the SysClk to the positive edge of dphy_gckn. 1 = Positive edge alignment of the SysClk to the positive edge of dphy_gckn.

Bits	SCOM	Field Mnemonic: Description
61	RW	CONTINUOUS_UPDATE: 0 = The dphy_gckn, the SysClk phase alignment controller, is only updated periodically under hardware control when an update does not interfere with the PHY functional operations. 1 = The dphy_gckn, the SysClk phase alignment controller, runs continuously. Thus, it continuously aligns the dphy_gckn clock to the internal SysClk clock.
62:63	RO	Constant = 0b00

Register Name	DP16 SysClk 0 Phase Rotator Control Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_SYSCLK_PR0_P2_[n]
Address	800000070701183F (SCOM), +0x0400_0000_0000
Description	This register controls the circuit that aligns the internal SysClk 0 to the incoming dphy_gckn clock clock.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	SYSCLK_ROT_OVERRIDE: System clock (SysClk) phase rotator override value. This field has a dual purpose: override control and lock control. When SYSCLK_ROT_OVERRIDE_EN = 1b, this field is in override control mode. When SYSCLK_ROT_OVERRIDE_EN = 0b, this field is in lock control mode. For override control: The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by four dphy_gckn clock cycles. Back-to-back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register is reserved. For lock control: Write this field to all zeros unless instructed otherwise by your IBM representative. Bit 50: Lock select: Selects between lock status and sticky lock. 0 = Selects the status of the lock. When the dphy_gckn detects that it has reached alignment between the dphy_gckn and SysClk, the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register is asserted. 1 = Selects the sticky lock to the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register. The sticky lock is controlled by bit 52, sticky lock enable. After the sticky lock is set, it remains set. Bit 52: Sticky lock enable. Bits 53:55 000 = At most, a 1-count increment or decrement occurs to indicate a lock. 001 = At most, a 2-count increment or decrement occurs to indicate a lock. 010 = At most, a 3-count increment or decrement occurs to indicate a lock. 011 = At most, a 4-count increment or decrement occurs to indicate a lock. 100 = At most, a 5-count increment or decrement occurs to indicate a lock.
56	RW	SYSCLK_ROT_OVERRIDE_EN: This field enables the use of the SYSCLK_ROT_OVERRIDE field, rather than the internally calculated SYSCLK_ROT value, when set to 1b. The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by four dphy_gckn clock cycles. Back-to-back APB write operations to this register provide the required separation. When this bit is written to 0b and was 1b, the SYSCLK_ROT value in the DP16 SysClk 1 Phase Rotator Control Register resets to zero.
57	RW	SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_gckn, the SysClk phase alignment controller. Must be asserted after the PLL locks, and must be active for at least five SysClk cycles.
58	RW	SYSCLK_PHASE_CNTL_EN: Alignment enable to dphy_gckn, the SysClk phase alignment controller. Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.

Bits	SCOM	Field Mnemonic: Description
59	RW	SYSCLK_PHASE_DEFAULT_EN: This field enables default startup values to be output by dphy_gckn, the SysClk phase alignment controller. This bit must be asserted during system reset and de-asserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	SYSCLK_POS_EDGE_ALIGN: This field must be 0b for proper functional operation. It is an edge-alignment strap to dphy_gckn, the SysClk phase alignment controller. 0 = Negative edge alignment of the SysClk to the positive edge of dphy_gckn. 1 = Positive edge alignment of the SysClk to the positive edge of dphy_gckn.
61	RW	CONTINUOUS_UPDATE: 0 = The dphy_gckn, the SysClk phase alignment controller, is only updated periodically under hardware control when an update does not interfere with the PHY functional operations. 1 = The dphy_gckn, the SysClk phase alignment controller, runs continuously. Thus, it continuously aligns the dphy_gckn clock to the internal SysClk clock.
62:63	RO	Constant = 0b00

Register Name	DP16 SysClk 0 Phase Rotator Control Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_SYSCLK_PR0_P3_[n]
Address	8000000707011C3F (SCOM), +0x0400_0000_0000
Description	This register controls the circuit that aligns the internal SysClk 0 to the incoming dphy_gckn clock clock.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	SYSCLK_ROT_OVERRIDE: System clock (SysClk) phase rotator override value. This field has a dual purpose: override control and lock control. When SYSCLK_ROT_OVERRIDE_EN = 1b, this field is in override control mode. When SYSCLK_ROT_OVERRIDE_EN = 0b, this field is in lock control mode. For override control: The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by four dphy_gckn clock cycles. Back-to-back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register is reserved. For lock control: Write this field to all zeros unless instructed otherwise by your IBM representative. Bit 50: Lock select: Selects between lock status and sticky lock. 0 = Selects the status of the lock. When the dphy_gckn detects that it has reached alignment between the dphy_gckn and SysClk, the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register is asserted. 1 = Selects the sticky lock to the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register. The sticky lock is controlled by bit 52, sticky lock enable. After the sticky lock is set, it remains set. Bit 52: Sticky lock enable. Bits 53:55 000 = At most, a 1-count increment or decrement occurs to indicate a lock. 001 = At most, a 2-count increment or decrement occurs to indicate a lock. 010 = At most, a 3-count increment or decrement occurs to indicate a lock. 011 = At most, a 4-count increment or decrement occurs to indicate a lock. 100 = At most, a 5-count increment or decrement occurs to indicate a lock.

Bits	SCOM	Field Mnemonic: Description
56	RW	SYSCLK_ROT_OVERRIDE_EN: This field enables the use of the SYSCLK_ROT_OVERRIDE field rather than the internally calculated SYSCLK_ROT value when set to 1b. The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by four dphy_gckn clock cycles. Back-to-back APB write operations to this register provide the required separation. When this bit is written to 0b and was 1b, the SYSCLK_ROT value in the DP16 SysClk 1 Phase Rotator Control Register resets to zero.
57	RW	SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_gckn, the SysClk phase alignment controller. Must be asserted after the PLL locks, and must be active for at least five SysClk cycles.
58	RW	SYSCLK_PHASE_CNTL_EN: Alignment enable to dphy_gckn, the SysClk phase alignment controller Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	SYSCLK_PHASE_DEFAULT_EN: This field enables default startup values to be output by dphy_gckn, the SysClk phase alignment controller. This bit must be asserted during system reset and de-asserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	SYSCLK_POS_EDGE_ALIGN: This field must be 0b for proper functional operation. It is an edge-alignment strap to dphy_gckn, the SysClk phase alignment controller. 0 = Negative edge alignment of the SysClk to the positive edge of dphy_gckn. 1 = Positive edge alignment of the SysClk to the positive edge of dphy_gckn.
61	RW	CONTINUOUS_UPDATE: 0 = The dphy_gckn, the SysClk phase alignment controller, is only updated periodically under hardware control when an update does not interfere with the PHY functional operations. 1 = The dphy_gckn, the SysClk phase alignment controller, runs continuously. Thus, it continuously aligns the dphy_gckn clock to the internal SysClk clock.

Register Name	**DP16 Debug Bus Select Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DEBUG_SEL_P0_[n]
Address	8000000B0701103F (SCOM), +0x0400_0000_0000
Description	This register is used for the diagnosis and characterization of the DP16 core. For correct functional mainline operation, this register must not be written. Contact your IBM representative before changing the value of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:53	RW	HS_PROBE_A_SEL: High-speed probe A select.
54:59	RW	HS_PROBE_B_SEL: High-speed probe B select.
60:63	RW	RD_DEBUG_SEL: Selects signals that drive the 44-bit debug bus output of DP16.

Register Name	**DP16 Debug Bus Select Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DEBUG_SEL_P1_[n]
Address	8000000B0701143F (SCOM), +0x0400_0000_0000
Description	This register is used for the diagnosis and characterization of the DP16 core. For correct functional mainline operation, this register must not be written. Contact your IBM representative before changing the value of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:53	RW	HS_PROBE_A_SEL: High-speed probe A select.
54:59	RW	HS_PROBE_B_SEL: High-speed probe B select.
60:63	RW	RD_DEBUG_SEL: Selects signals that drive the 44-bit debug bus output of DP16.

Register Name	DP16 Debug Bus Select Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DEBUG_SEL_P2_[n]
Address	8000000B0701183F (SCOM), +0x0400_0000_0000
Description	This register is used for the diagnosis and characterization of the DP16 core. For correct functional mainline operation, this register must not be written. Contact your IBM representative before changing the value of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:53	RW	HS_PROBE_A_SEL: High-speed probe A select.
54:59	RW	HS_PROBE_B_SEL: High-speed probe B select.
60:63	RW	RD_DEBUG_SEL: Selects signals that drive the 44-bit debug bus output of DP16.

Register Name	DP16 Debug Bus Select Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DEBUG_SEL_P3_[n]
Address	8000000B07011C3F (SCOM), +0x0400_0000_0000
Description	This register is used for the diagnosis and characterization of the DP16 core. For correct functional mainline operation, this register must not be written. Contact your IBM representative before changing the value of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:53	RW	HS_PROBE_A_SEL: High-speed probe A select.
54:59	RW	HS_PROBE_B_SEL: High-speed probe B select.
60:63	RW	RD_DEBUG_SEL: Selects signals that drive the 44-bit debug bus output of DP16.

Register Name	DP16 Read Delay Offset 0 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY_OFFSET0_RANK_PAIR0_P0_[n]
Address	8000000C0701103F (SCOM), +0x0400_0000_0000
Description	Each register field holds the read delay offsets for four of the MEMINTDnnB pins for one rank pair in the DP16.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000000000000
49:55	RW	OFFSET0: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.
56	RO	Constant = 0b0

Bits	SCOM	Field Mnemonic: Description
57:63	RW	OFFSET1: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.

Register Name	**DP16 Read Delay Offset 0 RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY_OFFSET0_RANK_PAIR0_P1_[n]
Address	8000000C0701143F (SCOM), +0x0400_0000_0000
Description	Each register field holds the read delay offsets for four of the MEMINTDnnB pins for one rank pair in the DP16.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	OFFSET0: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.
56	RO	Constant = 0b0
57:63	RW	OFFSET1: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.

Register Name	**DP16 Read Delay Offset 0 RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY_OFFSET0_RANK_PAIR0_P2_[n]
Address	8000000C0701183F (SCOM), +0x0400_0000_0000
Description	Each register field holds the read delay offsets for four of the MEMINTDnnB pins for one rank pair in the DP16.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	OFFSET0: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.
56	RO	Constant = 0b0

Bits	SCOM	Field Mnemonic: Description
57:63	RW	OFFSET1: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.

Register Name	**DP16 Read Delay Offset 0 RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY_OFFSET0_RANK_PAIR0_P3_[n]
Address	8000000C07011C3F (SCOM), +0x0400_0000_0000
Description	Each register field holds the read delay offsets for four of the MEMINTDnnB pins for one rank pair in the DP16.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	OFFSET0: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.
56	RO	Constant = 0b0
57:63	RW	OFFSET1: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.

Register Name	**DP16 Read Delay Offset 1 RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY_OFFSET1_RANK_PAIR0_P0_[n]
Address	8000000D0701103F (SCOM), +0x0400_0000_0000
Description	Each register field holds the read delay offsets for four of the MEMINTDnnB pins for one rank pair in the DP16.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	OFFSET2: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.
56	RO	Constant = 0b0

Bits	SCOM	Field Mnemonic: Description
57:63	RW	OFFSET3: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.

Register Name	**DP16 Read Delay Offset 1 RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY_OFFSET1_RANK_PAIR0_P1_[n]
Address	8000000D0701143F (SCOM), +0x0400_0000_0000
Description	Each register field holds the read delay offsets for four of the MEMINTDnnB pins for one rank pair in the DP16.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	OFFSET2: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.
56	RO	Constant = 0b0
57:63	RW	OFFSET3: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.

Register Name	**DP16 Read Delay Offset 1 RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY_OFFSET1_RANK_PAIR0_P2_[n]
Address	8000000D0701183F (SCOM), +0x0400_0000_0000
Description	Each register field holds the read delay offsets for four of the MEMINTDnnB pins for one rank pair in the DP16.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	OFFSET2: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.
56	RO	Constant = 0b0

Bits	SCOM	Field Mnemonic: Description
57:63	RW	OFFSET3: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.

Register Name	DP16 Read Delay Offset 1 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY_OFFSET1_RANK_PAIR0_P3_[n]
Address	8000000D07011C3F (SCOM), +0x0400_0000_0000
Description	Each register field holds the read delay offsets for four of the MEMINTDnnB pins for one rank pair in the DP16.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	OFFSET2: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.
56	RO	Constant = 0b0
57:63	RW	OFFSET3: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.

Register Name	DP16 Read Centering Status 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_LVL_STATUS0_P0_[n]
Address	8000000E0701103F (SCOM), +0x0400_0000_0000
Description	This register contains status information about read calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RO	LEADING_EDGE_NOT_FOUND_0_15: The leading-edge (left side) transition of the data eye was not found during read centering of the data bits on the MEMINTD{0-15}B pin when enabled as receiving data bits.

Register Name	DP16 Read Centering Status 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_LVL_STATUS0_P1_[n]
Address	8000000E0701143F (SCOM), +0x0400_0000_0000
Description	This register contains status information about read calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RO	LEADING_EDGE_NOT_FOUND_0_15: The leading-edge (left side) transition of the data eye was not found during read centering of the data bits on the MEMINTD{0-15}B pin when enabled as receiving data bits.

Register Name	DP16 Read Centering Status 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_LVL_STATUS0_P2_[n]
Address	8000000E0701183F (SCOM), +0x0400_0000_0000
Description	This register contains status information about read calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RO	LEADING_EDGE_NOT_FOUND_0_15: The leading-edge (left side) transition of the data eye was not found during read centering of the data bits on the MEMINTD{0-15}B pin when enabled as receiving data bits.

Register Name	DP16 Read Centering Status 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_LVL_STATUS0_P3_[n]
Address	8000000E07011C3F (SCOM), +0x0400_0000_0000
Description	This register contains status information about read calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RO	LEADING_EDGE_NOT_FOUND_0_15: The leading-edge (left side) transition of the data eye was not found during read centering of the data bits on the MEMINTD{0-15}B pin when enabled as receiving data bits.

Register Name	DP16 Read Centering Status 2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_LVL_STATUS2_P0_[n]
Address	800000100701103F (SCOM), +0x0400_0000_0000
Description	This register contains status information about read calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RO	TRAILING_EDGE_NOT_FOUND_0_15: The trailing-edge (right side) transition of the data eye was not found during read centering of the data bits on the MEMINTD{0-15}B pin when enabled as receiving data bits.

Register Name	DP16 Read Centering Status 2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_LVL_STATUS2_P1_[n]
Address	800000100701143F (SCOM), +0x0400_0000_0000
Description	This register contains status information about read calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RO	TRAILING_EDGE_NOT_FOUND_0_15: The trailing-edge (right side) transition of the data eye was not found during read centering of the data bits on the MEMINTD{0-15}B pin when enabled as receiving data bits.

Register Name	DP16 Read Centering Status 2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_LVL_STATUS2_P2_[n]
Address	800000100701183F (SCOM), +0x0400_0000_0000
Description	This register contains status information about read calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RO	TRAILING_EDGE_NOT_FOUND_0_15: The trailing-edge (right side) transition of the data eye was not found during read centering of the data bits on the MEMINTD{0-15}B pin when enabled as receiving data bits.

Register Name	DP16 Read Centering Status 2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_LVL_STATUS2_P3_[n]
Address	8000001007011C3F (SCOM), +0x0400_0000_0000
Description	This register contains status information about read calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RO	TRAILING_EDGE_NOT_FOUND_0_15: The trailing-edge (right side) transition of the data eye was not found during read centering of the data bits on the MEMINTD{0-15}B pin when enabled as receiving data bits.

Register Name	DP16 Read Diagnostic Configuration 5 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_DIA_CONFIG5_P0_[n]
Address	800000120701103F (SCOM), +0x0400_0000_0000
Description	This register is used for the diagnosis and characterization of the read function within the DP16. For correct functional mainline operation, this register must not be written. Contact your IBM representative before changing the value of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	DYN_POWER_CNTL_EN: Dynamic power control enable: 0 = Normal operation with mode disabled. Seven delay stages are powered on per quad. 1 = Mode enabled. The number of delay stages powered on is based on the read delay values determined by initial read centering. If this mode is enabled, initial read centering must be run on rank group 0 and all other rank groups that are populated.
49	RW	DYN_MCTERM_CNTL_EN: Dynamic termination control enable. This bit must be set to 1 for normal operation.
50	RW	DYN_RX_GATE_CNTL_EN: Reserved. This bit must be set to 0 for normal operation.
51	RW	CALGATE_ON: Reserved. This bit must be set to 0 for normal operation.

Bits	SCOM	Field Mnemonic: Description
52	RW	PER_CAL_UPDATE_DISABLE: Reserved. This bit must be set to 0 for normal operation.
53:54	RW	DQS_PIPE_FIX_DIS: Reserved. These bits must be set to 00 for normal operation.
55	RW	CDD2_DQS_FIX_DIS: Reserved. This bit must be set to 0 for normal operation.
56	RW	DL_FORCE_ON: Reserved. This bit must be set to 0 for normal operation.
57	RW	BLFIFO_DIS: Reserved. This bit must be set to 0 for normal operation.
58	RW	WTRFL_AVE_DIS: Reserved. This bit must be set to 0 for normal operation.
59	RW	PERCAL_PWR_DIS: 0 = Run DQS alignment when doing periodic calibration for each bit. 1 = Run DQS alignment when doing periodic calibration for bit 0 only.
60	RW	LOOPBACK_FIX_EN: Set this bit to 1 for improved loopback reliability.
61	RW	LOOPBACK_DLY12: If LOOPBACK_FIX_EN = 1, this bit controls the loopback start delay.
62	RW	CDD2_WTRFL_SYNC_DIS: Reserved. This bit must be set to 0 for normal operation.
63	RW	FORCE_FIFO_CAPTURE: 0 = Normal operation. 1 = Force DQ capture in the read FIFO to support DDR4 LRDIMM calibration.

Register Name	**DP16 Read Diagnostic Configuration 5 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_DIA_CONFIG5_P1_[n]
Address	800000120701143F (SCOM), +0x0400_0000_0000
Description	This register is used for the diagnosis and characterization of the read function within the DP16. For correct functional mainline operation, this register must not be written. Contact your IBM representative before changing the value of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	DYN_POWER_CNTL_EN: Dynamic power control enable: 0 = Normal operation with mode disabled. Seven delay stages are powered on per quad. 1 = Mode enabled. The number of delay stages powered on is based on the read delay values determined by initial read centering. If this mode is enabled, initial read centering must be run on rank group 0 and all other rank groups that are populated.
49	RW	DYN_MCTERM_CNTL_EN: Dynamic termination control enable. This bit must be set to 1 for normal operation.
50	RW	DYN_RX_GATE_CNTL_EN: Reserved. This bit must be set to 0 for normal operation.
51	RW	CALGATE_ON: Reserved. This bit must be set to 0 for normal operation.
52	RW	PER_CAL_UPDATE_DISABLE: Reserved. This bit must be set to 0 for normal operation.
53:54	RW	DQS_PIPE_FIX_DIS: Reserved. These bits must be set to 00 for normal operation.
55	RW	CDD2_DQS_FIX_DIS: Reserved. This bit must be set to 0 for normal operation.
56	RW	DL_FORCE_ON: Reserved. This bit must be set to 0 for normal operation.
57	RW	BLFIFO_DIS: Reserved. This bit must be set to 0 for normal operation.
58	RW	WTRFL_AVE_DIS: Reserved. This bit must be set to 0 for normal operation.
59	RW	PERCAL_PWR_DIS: 0 = Run DQS alignment when doing periodic calibration for each bit. 1 = Run DQS alignment when doing periodic calibration for bit 0 only.

Bits	SCOM	Field Mnemonic: Description
60	RW	LOOPBACK_FIX_EN: Set this bit to 1 for improved loopback reliability.
61	RW	LOOPBACK_DLY12: If LOOPBACK_FIX_EN = 1, this bit controls the loopback start delay.
62	RW	CDD2_WTRFL_SYNC_DIS: Reserved. This bit must be set to 0 for normal operation.
63	RW	FORCE_FIFO_CAPTURE: 0 = Normal operation. 1 = Force DQ capture in the read FIFO to support DDR4 LRDIMM calibration.

Register Name	**DP16 Read Status 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_STATUS0_P0_[n]
Address	800000140701103F (SCOM), +0x0400_0000_0000
Description	This register contains status information about read calibrations. The bits in this register can only be set by hardware when the corresponding mask bit is not set in the DP16 Read Error Mask 0 Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RWX	NO_EYE_DETECTED: Read centering error. No eye was detected on at least one of the data pins by one of the DP16 logic blocks.
49	RWX	LEADING_EDGE_NOT_FOUND: Read centering error. This bit is set when at least one of the leading edges of the data eyes of the data bits are not found during a calibration.
50	RWX	TRAILING_EDGE_NOT_FOUND: Read centering error. This bit is set when at least one of the trailing edges of the data eyes of the data bits are not found during a calibration.
51	RWX	INCOMPLETE_RD_CAL_N0: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD00B - MEMINTD03B.
52	RWX	INCOMPLETE_RD_CAL_N1: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD04B - MEMINTD07B.
53	RWX	INCOMPLETE_RD_CAL_N2: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a a read calibration operation on pins MEMINTD08B - MEMINTD11B.

Bits	SCOM	Field Mnemonic: Description
54	RWX	INCOMPLETE_RD_CAL_N3: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD12B - MEMINTD15B.
55	RWX	COARSE_PATTERN_ERR_N0: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD00B - MEMINTD03B.
56	RWX	COARSE_PATTERN_ERR_N1: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD04B - MEMINTD07B.
57	RWX	COARSE_PATTERN_ERR_N2: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD08B - MEMINTD11B.
58	RWX	COARSE_PATTERN_ERR_N3: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD12B - MEMINTD15B.
59	RWX	EYE_CLIPPING: Read centering error/status. This bit activates whenever the eye center is out of the range of the strobe delay line. This is an expected condition for negative values of Trdqsdq (DQ arrives before DQS). The DDR PHY is usually capable of compensating for this. In a typical configuration, the EYE_CLIPPLING_MASK bit must be set to 1b so that this condition is not reported as an error. When EYE_CLIPPING_MASK is 1b, the read centering algorithm continues calibration by using an adjacent DQS edge to perform centering. This configures normal operation of the DDR PHY in most cases, with the margin for inter-symbol interference, and random noise is reduced. The extent of margin reduction is dependent on jitter and the duty cycle distortion (DCD) characteristics of the DRAM.
60	RWX	NO_DQS: DQS alignment error/status. This bit is set when a strobe edge was not detected during DQS alignment calibration. If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to-rank switching delays differ by no more than 1/2 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. You can use the firmware to recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings that are associated with stuck or broken strobes to maintain the 1/2 UI rank-to-rank compression rule.
61	RWX	NO_LOCK: DQS alignment error and status. This bit is set when a phase rotator lock could not be attained on a strobe during DQS alignment calibration. The No Lock error detect circuit detects a DQS strobe that is always 1b or always 0b. When a DQS strobe is always 1b or 0b, it is considered missing or stuck. The No Lock circuit sets this bit when: It does not have a valid strobe for more than 30 samples (that is, 30 samples x 27 tCK per sample = 810 tCK) and The strobe then goes missing or stuck for at least 13 samples (that is, 13 samples x 27 tCK per sample = 351 tCK). If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to-rank switching delays differ by no more than 1/2 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. Firmware can optionally recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings associated with stuck/broken strobes in a way that maintains the 1/2 UI rank-to-rank compression rule.
62	RWX	DRIFT_ERROR: Periodic read calibration error/status: This bit is set when a DQS signal has drifted further than the limit set in the MAX_DQS_DRIFT field of the DP16 Drift Limits Register. The drift limit can be configured very tightly, in which case the activation of this bit is typically informational. Alternatively, it can be configured to a larger value that might indicate rank-to-rank switching is unreliable. Even in such a case, it can be ignored if the application uses a parity of error correction code (ECC) as the final arbiter.

Bits	SCOM	Field Mnemonic: Description
63	RWX	MIN_EYE: Periodic read calibration error/status: This bit is set when a data eye has closed to a value less than the value set in the MIN_RD_EYE_SIZE field of the DP16 Drift Limits Register. The minimum eye size can be configured to a value that is informational, or it can be configured to a limit that reflects a customer's maximum tolerance for errors. In that case, it can be considered to be an error.

Register Name	**DP16 Read Status 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_STATUS0_P1_[n]
Address	800000140701143F (SCOM), +0x0400_0000_0000
Description	This register contains status information about read calibrations. The bits in this register can only be set by hardware when the corresponding mask bit is not set in the DP16 Read Error Mask 0 Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RWX	NO_EYE_DETECTED: Read centering error. No eye was detected on at least one of the data pins by one of the DP16 logic blocks.
49	RWX	LEADING_EDGE_NOT_FOUND: Read centering error. This bit is set when at least one of the leading edges of the data eyes of the data bits are not found during a calibration.
50	RWX	TRAILING_EDGE_NOT_FOUND: Read centering error. This bit is set when at least one of the trailing edges of the data eyes of the data bits are not found during a calibration.
51	RWX	INCOMPLETE_RD_CAL_N0: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD00B - MEMINTD03B.
52	RWX	INCOMPLETE_RD_CAL_N1: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD04B - MEMINTD07B.
53	RWX	INCOMPLETE_RD_CAL_N2: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a a read calibration operation on pins MEMINTD08B - MEMINTD11B.
54	RWX	INCOMPLETE_RD_CAL_N3: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD12B - MEMINTD15B.
55	RWX	COARSE_PATTERN_ERR_N0: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD00B - MEMINTD03B.
56	RWX	COARSE_PATTERN_ERR_N1: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD04B - MEMINTD07B.
57	RWX	COARSE_PATTERN_ERR_N2: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD08B - MEMINTD11B.
58	RWX	COARSE_PATTERN_ERR_N3: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD12B - MEMINTD15B.

Bits	SCOM	Field Mnemonic: Description
59	RWX	EYE_CLIPPING: Read centering error/status. This bit activates whenever the eye center is out of the range of the strobe delay line. This is an expected condition for negative values of Trdqsdq (DQ arrives before DQS). The DDR PHY is usually capable of compensating for this. In a typical configuration, the EYE_CLIPPLING_MASK bit must be set to 1b so that this condition is not reported as an error. When EYE_CLIPPING_MASK is 1b, the read centering algorithm continues calibration by using an adjacent DQS edge to perform centering. This configures normal operation of the DDR PHY in most cases, with the margin for inter-symbol interference, and random noise is reduced. The extent of margin reduction is dependent on jitter and the DCD characteristics of the DRAM.
60	RWX	NO_DQS: DQS alignment error/status. This bit is set when a strobe edge was not detected during DQS alignment calibration. If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to-rank switching delays differ by no more than 1/2 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. You can use the firmware to recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings that are associated with stuck or broken strobes to maintain the 1/2 UI rank-to-rank compression rule.
61	RWX	NO_LOCK: DQS alignment error and status. This bit is set when a phase rotator lock could not be attained on a strobe during DQS alignment calibration. The No Lock error detect circuit detects a DQS strobe that is always 1b or always 0b. When a DQS strobe is always 1b or 0b, it is considered missing or stuck. The No Lock circuit sets this bit when: It does not have a valid strobe for more than 30 samples (that is, 30 samples x 27 tCK per sample = 810 tCK) and The strobe then goes missing or stuck for at least 13 samples (that is, 13 samples x 27 tCK per sample = 351 tCK). If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to-rank switching delays differ by no more than 1/2 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. Firmware can optionally recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings associated with stuck/broken strobes in a way that maintains the 1/2 UI rank-to-rank compression rule.
62	RWX	DRIFT_ERROR: Periodic read calibration error/status: This bit is set when a DQS signal has drifted further than the limit set in the MAX_DQS_DRIFT field of the DP16 Drift Limits Register. The drift limit can be configured very tightly, in which case the activation of this bit is typically informational. Alternatively, it can be configured to a larger value that might indicate rank-to-rank switching is unreliable. Even in such a case, it can be ignored if the application uses a parity of ECC code as the final arbiter.
63	RWX	MIN_EYE: Periodic read calibration error/status: This bit is set when a data eye has closed to a value less than the value set in the MIN_RD_EYE_SIZE field of the DP16 Drift Limits Register. The minimum eye size can be configured to a value that is informational, or it can be configured to a limit that reflects a customer's maximum tolerance for errors. In that case, it can be considered to be an error.

Register Name	**DP16 Read Status 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_STATUS0_P2_[n]
Address	800000140701183F (SCOM), +0x0400_0000_0000
Description	This register contains status information about read calibrations. The bits in this register can only be set by hardware when the corresponding mask bit is not set in the DP16 Read Error Mask 0 Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RWX	NO_EYE_DETECTED: Read centering error. No eye was detected on at least one of the data pins by one of the DP16 logic blocks.

Bits	SCOM	Field Mnemonic: Description
49	RWX	LEADING_EDGE_NOT_FOUND: Read centering error. This bit is set when at least one of the leading edges of the data eyes of the data bits are not found during a calibration.
50	RWX	TRAILING_EDGE_NOT_FOUND: Read centering error. This bit is set when at least one of the trailing edges of the data eyes of the data bits are not found during a calibration.
51	RWX	INCOMPLETE_RD_CAL_N0: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD00B - MEMINTD03B.
52	RWX	INCOMPLETE_RD_CAL_N1: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD04B - MEMINTD07B.
53	RWX	INCOMPLETE_RD_CAL_N2: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a a read calibration operation on pins MEMINTD08B - MEMINTD11B.
54	RWX	INCOMPLETE_RD_CAL_N3: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD12B - MEMINTD15B.
55	RWX	COARSE_PATTERN_ERR_N0: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD00B - MEMINTD03B.
56	RWX	COARSE_PATTERN_ERR_N1: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD04B - MEMINTD07B.
57	RWX	COARSE_PATTERN_ERR_N2: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD08B - MEMINTD11B.
58	RWX	COARSE_PATTERN_ERR_N3: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD12B - MEMINTD15B.
59	RWX	EYE_CLIPPING: Read centering error/status. This bit activates whenever the eye center is out of the range of the strobe delay line. This is an expected condition for negative values of Trdqsdq (DQ arrives before DQS). The DDR PHY is usually capable of compensating for this. In a typical configuration, the EYE_CLIPPLING_MASK bit must be set to 1b so that this condition is not reported as an error. When EYE_CLIPPING_MASK is 1b, the read centering algorithm continues calibration by using an adjacent DQS edge to perform centering. This configures normal operation of the DDR PHY in most cases, with the margin for inter-symbol interference, and random noise is reduced. The extent of margin reduction is dependent on jitter and the DCD characteristics of the DRAM.
60	RWX	NO_DQS: DQS alignment error/status. This bit is set when a strobe edge was not detected during DQS alignment calibration. If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to-rank switching delays differ by no more than 1/2 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. You can use the firmware to recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings that are associated with stuck or broken strobes to maintain the 1/2 UI rank-to-rank compression rule.

Bits	SCOM	Field Mnemonic: Description
61	RWX	NO_LOCK: DQS alignment error and status. This bit is set when a phase rotator lock could not be attained on a strobe during DQS alignment calibration. The No Lock error detect circuit detects a DQS strobe that is always 1b or always 0b. When a DQS strobe is always 1b or 0b, it is considered missing or stuck. The No Lock circuit sets this bit when: It does not have a valid strobe for more than 30 samples (that is, 30 samples x 27 tCK per sample = 810 tCK) and The strobe then goes missing or stuck for at least 13 samples (that is, 13 samples x 27 tCK per sample = 351 tCK). If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to-rank switching delays differ by no more than 1/2 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. Firmware can optionally recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings associated with stuck/broken strobes in a way that maintains the 1/2 UI rank-to-rank compression rule.
62	RWX	DRIFT_ERROR: Periodic read calibration error/status: This bit is set when a DQS signal has drifted further than the limit set in the MAX_DQS_DRIFT field of the DP16 Drift Limits Register. The drift limit can be configured very tightly, in which case the activation of this bit is typically informational. Alternatively, it can be configured to a larger value that might indicate rank-to-rank switching is unreliable. Even in such a case, it can be ignored if the application uses a parity of ECC code as the final arbiter.
63	RWX	MIN_EYE: Periodic read calibration error/status: This bit is set when a data eye has closed to a value less than the value set in the MIN_RD_EYE_SIZE field of the DP16 Drift Limits Register. The minimum eye size can be configured to a value that is informational, or it can be configured to a limit that reflects a customer's maximum tolerance for errors. In that case, it can be considered to be an error.

Register Name	**DP16 Read Status 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_STATUS0_P3_[n]
Address	8000001407011C3F (SCOM), +0x0400_0000_0000
Description	This register contains status information about read calibrations. The bits in this register can only be set by hardware when the corresponding mask bit is not set in the DP16 Read Error Mask 0 Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RWX	NO_EYE_DETECTED: Read centering error. No eye was detected on at least one of the data pins by one of the DP16 logic blocks.
49	RWX	LEADING_EDGE_NOT_FOUND: Read centering error. This bit is set when at least one of the leading edges of the data eyes of the data bits are not found during a calibration.
50	RWX	TRAILING_EDGE_NOT_FOUND: Read centering error. This bit is set when at least one of the trailing edges of the data eyes of the data bits are not found during a calibration.
51	RWX	INCOMPLETE_RD_CAL_N0: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD00B - MEMINTD03B.
52	RWX	INCOMPLETE_RD_CAL_N1: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD04B - MEMINTD07B.
53	RWX	INCOMPLETE_RD_CAL_N2: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a a read calibration operation on pins MEMINTD08B - MEMINTD11B.

Bits	SCOM	Field Mnemonic: Description
54	RWX	INCOMPLETE_RD_CAL_N3: Read centering/DQS alignment/coarse read alignment error. This bit is set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD12B - MEMINTD15B.
55	RWX	COARSE_PATTERN_ERR_N0: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD00B - MEMINTD03B.
56	RWX	COARSE_PATTERN_ERR_N1: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD04B - MEMINTD07B.
57	RWX	COARSE_PATTERN_ERR_N2: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD08B - MEMINTD11B.
58	RWX	COARSE_PATTERN_ERR_N3: Coarse read alignment error. This bit is set when the coarse read alignment algorithm does not receive a valid pattern fragment on pins MEMINTD12B - MEMINTD15B.
59	RWX	EYE_CLIPPING: Read centering error/status. This bit activates whenever the eye center is out of the range of the strobe delay line. This is an expected condition for negative values of Trdqsdq (DQ arrives before DQS). The DDR PHY is usually capable of compensating for this. In a typical configuration, the EYE_CLIPPLING_MASK bit must be set to 1b so that this condition is not reported as an error. When EYE_CLIPPING_MASK is 1b, the read centering algorithm continues calibration by using an adjacent DQS edge to perform centering. This configures normal operation of the DDR PHY in most cases, with the margin for inter-symbol interference, and random noise is reduced. The extent of margin reduction is dependent on jitter and the DCD characteristics of the DRAM.
60	RWX	NO_DQS: DQS alignment error/status. This bit is set when a strobe edge was not detected during DQS alignment calibration. If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to-rank switching delays differ by no more than 1/2 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. You can use the firmware to recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings that are associated with stuck or broken strobes to maintain the 1/2 UI rank-to-rank compression rule.
61	RWX	NO_LOCK: DQS alignment error and status. This bit is set when a phase rotator lock could not be attained on a strobe during DQS alignment calibration. The No Lock error detect circuit detects a DQS strobe that is always 1b or always 0b. When a DQS strobe is always 1b or 0b, it is considered missing or stuck. The No Lock circuit sets this bit when: It does not have a valid strobe for more than 30 samples (that is, 30 samples x 27 tCK per sample = 810 tCK) and The strobe then goes missing or stuck for at least 13 samples (that is, 13 samples x 27 tCK per sample = 351 tCK). If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to-rank switching delays differ by no more than 1/2 UI. Register Name	**DP16 Read VREF DAC 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_0_P0_[n]
Address	800000160701103F (SCOM), +0x0400_0000_0000
Description	This register controls the digital-to-analog converter (DAC) settings of the read reference voltage (VREF) in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RWX	NIB0_EN_FORCE: This bit overrides the logic enabling the comparator in the analog DACs for nibble 0 (bits 0:3 of 0:15) to set them to the value specified in the DP16 Read VREF DAC Comparator Ouptut Register. The binary string sent to the DAC is the value in BIT0_VREF_DAC. This allows the user to manually set the enable bits and DAC value for each nibble. The output of the comparator is captured in the DP16 Read VREF DAC Comparator Output Register. While read VREF calibration is running, this bit has no effect.

Bits	SCOM	Field Mnemonic: Description
49:55	RWX	BIT0_VREF_DAC: DAC settings to control VREF on bit0 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE =1, this field reverts to the average of nibble 0.
56	RWX	NIB1_EN_FORCE: This bit overrides the logic enabling the comparator in the analog DACs for nibble 1 (bits 4:7 of 0:15) to set them to the value specified in the DP16 Read VREF DAC Comparator Ouptut Register. The binary string sent to the DAC is the value in BIT1_VREF_DAC. This allows the user to manually set the enable bits and DAC value for each nibble. The output of the comparator is captured in the DP16 Read VREF DAC Comparator Output Register. While read VREF calibration is running, this bit has no effect.
57:63	RWX	BIT1_VREF_DAC: DAC settings to control VREF on bit 1 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field reverts to the average of nibble 1.

Register Name	**DP16 Read VREF DAC 0 Register[n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_0_P1_[n]
Address	800000160701143F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

57:63	RO	Constant = 0b0000000

Register Name	DP16 Write Centering Status 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_CNTR_STATUS0_P0_[n]
Address	800000180701103F (SCOM), +0x0400_0000_0000
Description	This register contains status information about write-centering calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48:52	RW	BIT_CENTERED: When the DONE bit is set, this field contains the bit number (0 - 23) on which the write-centering algorithm has been applied.
53	RW	SMALL_STEP_LEFT: This bit is set when valid data is sampled when the write-centering algorithm is big stepping to the right to find the first valid data sample. When this bit is set, the write-centering algorithm begins to small step to the left to find the left edge of the eye, the first invalid data sample. This bit is reset when write-centering starts on a new bit (DONE = 0b or BIT_CENTERED does not equal the bit being write centered).

Bits	SCOM	Field Mnemonic: Description
54	RW	BIG_STEP_RIGHT: This bit is set when invalid data is sampled when the write-centering algorithm is small stepping to the left and finds the left edge of the eye. When this bit is set, the write-centering algorithm begins to big step to the right to find valid data again. This bit is reset when write-centering starts on a new bit (DONE = 0b or BIT_CENTERED does not equal the bit being write centered).
55	RW	MATCH_STEP_RIGHT: This bit is set when valid data is sampled when the write-centering algorithm is big stepping to the right after finding the left edge of the eye. When this bit is set, the write-centering algorithm continues to big step to the right to find the right edge of the eye. This bit is reset when write centering starts on a new bit (DONE = 0b or BIT_CENTERED does not equal the bit being write centered).
56	RW	JUMP_BACK_RIGHT: This bit is set when invalid data is sampled when the write-centering algorithm is big stepping to the right to find the right side of the eye. When this bit is set, the write-centering algorithm big steps to the left to find valid data. This bit is reset when write centering starts on a new bit (DONE = 0b or BIT_CENTERED does not equal the bit being write centered).
57	RW	SMALL_STEP_RIGHT: This bit is set when valid data is sampled when the write-centering algorithm is big stepping to the left to find valid data. When this bit is set, the write-centering algorithm small steps to the right to find the right side of the eye, the first invalid data sample. This bit is reset when write centering starts on a new bit (DONE = 0b or BIT_CENTERED does not equal the bit being write centered).
58	RW	DONE: This bit is set when invalid data is sampled when the write-centering algorithm is small stepping to the right to find the right side of the eye. When the write-centering algorithm completes successfully, this bit is set and the average of the left side and right side delay values is loaded into the DP16 Write Delay Value Register {0-23}, which corresponds to the bit being write centered. When the write-centering algorithm finds an error, this bit is set and the current delay value being used by the algorithm is loaded into the DP16 Write Delay Value Register {0-23}. The bit number being write centered is loaded into the BIT_CENTERED field when this bit is set. This bit is reset when write centering starts on a new bit (DONE = 0b or BIT_CENTERED does not equal the bit being write centered).
59:63	RO	Constant = 0b00000

Description	This register contains status information about write-centering calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48:52	RW	BIT_CENTERED: When the DONE bit is set, this field contains the bit number (0 - 23) on which the write-centering algorithm has been applied.
53	RW	SMALL_STEP_LEFT: This bit is set when valid data is sampled when the write-centering algorithm is big stepping to the right to find the first valid data sample. When this bit is set, the write-centering algorithm begins to small step to the left to find the left edge of the eye, the first invalid data sample. This bit is reset when write centering starts on a new bit (DONE = 0b or BIT_CENTERED does not equal the bit being write centered).
54	RW	BIG_STEP_RIGHT: This bit is set when invalid data is sampled when the write-centering algorithm is small stepping to the left and finds the left edge of the eye. When this bit is set, the write-centering algorithm begins to big step to the right to find valid data again. This bit is reset when write centering starts on a new bit (DONE = 0b or BIT_CENTERED does not equal the bit being write centered).
55	RW	MATCH_STEP_RIGHT: This bit is set when valid data is sampled when the write-centering algorithm is big stepping to the right after finding the left edge of the eye. When this bit is set, the write-centering algorithm continues to big step to the right to find the right edge of the eye. This bit is reset when write centering starts on a new bit (DONE = 0b or BIT_CENTERED does not equal the bit being write centered).
56	RW	JUMP_BACK_RIGHT: This bit is set when invalid data is sampled when the write-centering algorithm is big stepping to the right to find the right side of the eye. When this bit is set, the write-centering algorithm big steps to the left to find valid data. This bit is reset when write centering starts on a new bit (DONE = 0b or BIT_CENTERED does not equal the bit being write centered).

Bits	SCOM	Field Mnemonic: Description
57	RW	SMALL_STEP_RIGHT: This bit is set when valid data is sampled when the write-centering algorithm is big stepping to the left to find valid data. When this bit is set, the write-centering algorithm small steps to the right to find the right side of the eye, the first invalid data sample. This bit is reset when write centering starts on a new bit (DONE = 0b or BIT_CENTERED does not equal the bit being write centered).
58	RW	DONE: This bit is set when invalid data is sampled when the write-centering algorithm is small stepping to the right to find the right side of the eye. When the write-centering algorithm completes successfully, this bit is set and the average of the left side and right side delay values is loaded into the DP16 Write Delay Value Register {0-23}, which corresponds to the bit being write centered. When the write-centering algorithm finds an error, this bit is set and the current delay value being used by the algorithm is loaded into the DP16 Write Delay Value Register {0-23}. The bit number being write centered is loaded into the BIT_CENTERED field when this bit is set. This bit is reset when write centering starts on a new bit (DONE = 0b or BIT_CENTERED does not equal the bit being write centered).
59:63	RO	Constant = 0b00000

Register Name	DP16 Write Centering Status 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_CNTR_STATUS1_P0_[n]
Address	800000190701103F (SCOM), +0x0400_0000_0000
Description	This register contains status information about write-centering calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:58	RO	FW_LEFT_SIDE: This field contains the delay value of the left edge of the write data eye found by the write-centering algorithm.
59:63	RO	Constant = 0b00000

Register Name	DP16 Write Centering Status 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_CNTR_STATUS1_P1_[n]
Address	800000190701143F (SCOM), +0x0400_0000_0000
Description	This register contains status information about write-centering calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:58	RO	FW_LEFT_SIDE: This field contains the delay value of the left edge of the write data eye found by the write-centering algorithm.
59:63	RO	Constant = 0b00000

Register Name	DP16 Write Centering Status 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_CNTR_STATUS1_P2_[n]
Address	800000190701183F (SCOM), +0x0400_0000_0000
Description	This register contains status information about write-centering calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:58	RO	FW_LEFT_SIDE: This field contains the delay value of the left edge of the write data eye found by the write-centering algorithm.
59:63	RO	Constant = 0b00000

Register Name	DP16 Write Centering Status 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_CNTR_STATUS1_P3_[n]
Address	8000001907011C3F (SCOM), +0x0400_0000_0000
Description	This register contains status information about write-centering calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:58	RO	FW_LEFT_SIDE: This field contains the delay value of the left edge of the write data eye found by the write-centering algorithm.
59:63	RO	Constant = 0b00000

Register Name	DP16 Write Centering Status 2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_CNTR_STATUS2_P0_[n]
Address	8000001A0701103F (SCOM), +0x0400_0000_0000
Description	This register contains status information about write-centering calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:58	RO	FW_RIGHT_SIDE: This field contains the delay value of the right edge of the write data eye found by the write-centering algorithm.
59:63	RO	Constant = 0b00000

Register Name	DP16 Write Centering Status 2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_CNTR_STATUS2_P1_[n]
Address	8000001A0701143F (SCOM), +0x0400_0000_0000
Description	This register contains status information about write-centering calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:58	RO	FW_RIGHT_SIDE: This field contains the delay value of the right edge of the write data eye found by the write-centering algorithm.
59:63	RO	Constant = 0b00000

Register Name	DP16 Write Centering Status 2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_CNTR_STATUS2_P2_[n]
Address	8000001A0701183F (SCOM), +0x0400_0000_0000
Description	This register contains status information about write-centering calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:58	RO	FW_RIGHT_SIDE: This field contains the delay value of the right edge of the write data eye found by the write-centering algorithm.
59:63	RO	Constant = 0b00000

Register Name	DP16 Write Centering Status 2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_CNTR_STATUS2_P3_[n]
Address	8000001A07011C3F (SCOM), +0x0400_0000_0000
Description	This register contains status information about write-centering calibrations.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:58	RO	FW_RIGHT_SIDE: This field contains the delay value of the right edge of the write data eye found by the write-centering algorithm.
59:63	RO	Constant = 0b00000

Register Name	DP16 Write Error 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_ERROR0_P0_[n]
Address	8000001B0701103F (SCOM), +0x0400_0000_0000
Description	This register contains the errors detected during write-calibration algorithms.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RWX_RCLRPART	WL_ERR_CLK16: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 16.
49	RWX_RCLRPART	WL_ERR_CLK18: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 18.
50	RWX_RCLRPART	WL_ERR_CLK20: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 20.
51	RWX_RCLRPART	WL_ERR_CLK22: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 22.
52	RW	COARSE_ERR_CLK16: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.
53	RW	COARSE_ERR_CLK18: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.
54	RW	COARSE_ERR_CLK20: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.
55	RW	COARSE_ERR_CLK22: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.

Bits	SCOM	Field Mnemonic: Description
56	RWX_RCLRPART	VALID_NS_BIG_L: Write-centering error. This bit is set when the write-centering algorithm did not sample valid data during big steps to the right to find the left edge of the eye.
57	RWX_RCLRPART	INVALID_NS_SMALL_L: Write-centering error/status. This bit is set when the write-centering algorithm did not sample invalid data during small steps to the left to find the left edge of the eye. This status bit does not cause the write-centering algorithm to stop. It uses the starting delay point as the left edge of the eye. This bit lane might be functional, but it might not be an optimal centering solution.
58	RWX_RCLRPART	VALID_NS_BIG_R: Write-centering error. This bit is set when the write-centering algorithm did not sample valid data during big steps to the right to find the right side of the eye.
59	RWX_RCLRPART	INVALID_NS_BIG_R: Write-centering error. This bit is set when the write-centering algorithm did not sample invalid data during big steps to the right to find the right side of the eye.
60	RWX_RCLRPART	VALID_NS_JUMP_BACK: Write-centering error. This bit is set when the write-centering algorithm did not sample valid data during big steps to the left to find the right side of the eye.
61	RWX_RCLRPART	INVALID_NS_SMALL_R: Write-centering error. This bit is set when the write-centering algorithm did not sample invalid data during small steps to the right to find the right side of the eye.
62	RWX_RCLRPART	OFFSET_ERR: Write-centering error. This bit is set when the sum of the DQ_WR_OFFSET_N* value in the DP16 Write DQ Offset Value Register and the center value determined by the write-centering algorithm is a negative number.
63	RW	Reserved.

Register Name	**DP16 Write Error 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_ERROR0_P1_[n]
Address	8000001B0701143F (SCOM), +0x0400_0000_0000
Description	This register contains the errors detected during write-calibration algorithms.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RWX_RCLRPART	WL_ERR_CLK16: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 16.
49	RWX_RCLRPART	WL_ERR_CLK18: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 18.
50	RWX_RCLRPART	WL_ERR_CLK20: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 20.
51	RWX_RCLRPART	WL_ERR_CLK22: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 22.
52	RW	COARSE_ERR_CLK16: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.
53	RW	COARSE_ERR_CLK18: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.
54	RW	COARSE_ERR_CLK20: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.
55	RW	COARSE_ERR_CLK22: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.

Bits	SCOM	Field Mnemonic: Description
56	RWX_RCLRPART	VALID_NS_BIG_L: Write-centering error. This bit is set when the write-centering algorithm did not sample valid data during big steps to the right to find the left edge of the eye.
57	RWX_RCLRPART	INVALID_NS_SMALL_L: Write-centering error/status. This bit is set when the write-centering algorithm did not sample invalid data during small steps to the left to find the left edge of the eye. This status bit does not cause the write-centering algorithm to stop. It uses the starting delay point as the left edge of the eye. This bit lane might be functional, but it might not be an optimal centering solution.
58	RWX_RCLRPART	VALID_NS_BIG_R: Write-centering error. This bit is set when the write-centering algorithm did not sample valid data during big steps to the right to find the right side of the eye.
59	RWX_RCLRPART	INVALID_NS_BIG_R: Write-centering error. This bit is set when the write-centering algorithm did not sample invalid data during big steps to the right to find the right side of the eye.
60	RWX_RCLRPART	VALID_NS_JUMP_BACK: Write-centering error. This bit is set when the write-centering algorithm did not sample valid data during big steps to the left to find the right side of the eye.
61	RWX_RCLRPART	INVALID_NS_SMALL_R: Write-centering error. This bit is set when the write-centering algorithm did not sample invalid data during small steps to the right to find the right side of the eye.
62	RWX_RCLRPART	OFFSET_ERR: Write-centering error. This bit is set when the sum of the DQ_WR_OFFSET_N* value in the DP16 Write DQ Offset Value Register and the center value determined by the write-centering algorithm is a negative number.
63	RW	Reserved.

Register Name	**DP16 Write Error 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_ERROR0_P2_[n]
Address	8000001B0701183F (SCOM), +0x0400_0000_0000
Description	This register contains the errors detected during write-calibration algorithms.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RWX_RCLRPART	WL_ERR_CLK16: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 16.
49	RWX_RCLRPART	WL_ERR_CLK18: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 18.
50	RWX_RCLRPART	WL_ERR_CLK20: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 20.
51	RWX_RCLRPART	WL_ERR_CLK22: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 22.
52	RW	COARSE_ERR_CLK16: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.
53	RW	COARSE_ERR_CLK18: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.
54	RW	COARSE_ERR_CLK20: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.
55	RW	COARSE_ERR_CLK22: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.

Bits	SCOM	Field Mnemonic: Description
56	RWX_RCLRPART	VALID_NS_BIG_L: Write-centering error. This bit is set when the write-centering algorithm did not sample valid data during big steps to the right to find the left edge of the eye.
57	RWX_RCLRPART	INVALID_NS_SMALL_L: Write-centering error/status. This bit is set when the write-centering algorithm did not sample invalid data during small steps to the left to find the left edge of the eye. This status bit does not cause the write-centering algorithm to stop. It uses the starting delay point as the left edge of the eye. This bit lane might be functional, but it might not be an optimal centering solution.
58	RWX_RCLRPART	VALID_NS_BIG_R: Write-centering error. This bit is set when the write-centering algorithm did not sample valid data during big steps to the right to find the right side of the eye.
59	RWX_RCLRPART	INVALID_NS_BIG_R: Write-centering error. This bit is set when the write-centering algorithm did not sample invalid data during big steps to the right to find the right side of the eye.
60	RWX_RCLRPART	VALID_NS_JUMP_BACK: Write-centering error. This bit is set when the write-centering Algorithm did not sample valid data during big steps to the left to find the right side of the eye.
61	RWX_RCLRPART	INVALID_NS_SMALL_R: Write-centering error. This bit is set when the write-centering algorithm did not sample invalid data during small steps to the right to find the right side of the eye.
62	RWX_RCLRPART	OFFSET_ERR: Write-centering error. This bit is set when the sum of the DQ_WR_OFFSET_N* value in the DP16 Write DQ Offset Value Register and the center value determined by the write-centering algorithm is a negative number.
63	RW	Reserved.

Register Name	**DP16 Write Error 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_ERROR0_P3_[n]
Address	8000001B07011C3F (SCOM), +0x0400_0000_0000
Description	This register contains the errors detected during write-calibration algorithms.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RWX_RCLRPART	WL_ERR_CLK16: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 16.
49	RWX_RCLRPART	WL_ERR_CLK18: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 18.
50	RWX_RCLRPART	WL_ERR_CLK20: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 20.
51	RWX_RCLRPART	WL_ERR_CLK22: Write-leveling error. This bit is set when the write-leveling algorithm cannot find a write-leveling solution for CLK 22.
52	RW	COARSE_ERR_CLK16: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.
53	RW	COARSE_ERR_CLK18: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.
54	RW	COARSE_ERR_CLK20: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.
55	RW	COARSE_ERR_CLK22: The DQS write delay exceeded the allowable delay range maximum of 0x1FF.

Bits	SCOM	Field Mnemonic: Description
56	RWX_RCLRPART	VALID_NS_BIG_L: Write-centering error. This bit is set when the write-centering algorithm did not sample valid data during big steps to the right to find the left edge of the eye.
57	RWX_RCLRPART	INVALID_NS_SMALL_L: Write-centering error/status. This bit is set when the write-centering algorithm did not sample invalid data during small steps to the left to find the left edge of the eye. This status bit does not cause the write-centering algorithm to stop. It uses the starting delay point as the left edge of the eye. This bit lane might be functional, but it might not be an optimal centering solution.
58	RWX_RCLRPART	VALID_NS_BIG_R: Write-centering error. This bit is set when the write-centering algorithm did not sample valid data during big steps to the right to find the right side of the eye.
59	RWX_RCLRPART	INVALID_NS_BIG_R: Write-centering error. This bit is set when the write-centering algorithm did not sample invalid data during big steps to the right to find the right side of the eye.
60	RWX_RCLRPART	VALID_NS_JUMP_BACK: Write-centering error. This bit is set when the write-centering algorithm did not sample valid data during big steps to the left to find the right side of the eye.
61	RWX_RCLRPART	INVALID_NS_SMALL_R: Write-centering error. This bit is set when the write-centering algorithm did not sample invalid data during small steps to the right to find the right side of the eye.
62	RWX_RCLRPART	OFFSET_ERR: Write-centering error. This bit is set when the sum of the DQ_WR_OFFSET_N* value in the DP16 Write DQ Offset Value Register and the center value determined by the write-centering algorithm is a negative number.
63	RW	Reserved.

Register Name	**DP16 Write Error Mask 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_ERROR_MASK0_P0_[n]
Address	8000001C0701103F (SCOM), +0x0400_0000_0000
Description	This register masks errors in the DP16 Write Error 0 Register. Thus, it prevents the WR_CNTL_ERROR bit from being set in the WC Error Status 0 Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	WL_ERR_CLK16_MASK: 1 = Mask the WL_ERR_CLK16 error.
49	RW	WL_ERR_CLK18_MASK: 1 = Mask the WL_ERR_CLK18 error.
50	RW	WL_ERR_CLK20_MASK: 1 = Mask the WL_ERR_CLK20 error.
51	RW	WR_ERR_CLK22_MASK: 1 = Mask the WL_ERR_CLK22 error.
52:55	RW	Reserved.
56	RW	VALID_NS_BIG_L_MASK: 1 = Mask the VALID_NS_BIG_L error.
57	RW	INVALID_NS_SMALL_L_MASK: 1 = Mask the INVALID_NS_SMALL_L error.

Bits	SCOM	Field Mnemonic: Description
58	RW	VALID_NS_BIG_R_MASK: 1 = Mask the VALID_NS_BIG_R error.
59	RW	INVALID_NS_BIG_R_MASK: 1 = Mask the INVALID_NS_BIG_R error.
60	RW	VALID_NS_JUMP_BACK_MASK: 1 = Mask the VALID_NS_JUMP_BACK error.
61	RW	INVALID_NS_SMALL_R_MASK: 1 = Mask the INVALID_NS_SMALL_R error.
62	RW	OFFSET_ERR_MASK: 1 = Mask the OFFSET_ERR error.
63	RW	ADVANCE_PR_VALUE: Advance phase-rotator value control switch. 0 = Normal operation. 1 = Change the phase-rotator values going to the analog core 1 SysClk clock cycle earlier on pins 0 – 15, inclusive. This provides more settling and propagation time of the phase rotator values before output enable (OE), even data (EDAT), and odd data (ODAT) values are driven to the analog core.

Register Name	DP16 Write Error Mask 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_ERROR_MASK0_P1_[n]
Address	8000001C0701143F (SCOM), +0x0400_0000_0000
Description	This register masks errors in the DP16 Write Error 0 Register. Thus, it prevents the WR_CNTL_ERROR bit from being set in the WC Error Status 0 Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WL_ERR_CLK16_MASK: 1 = Mask the WL_ERR_CLK16 error.
49	RW	WL_ERR_CLK18_MASK: 1 = Mask the WL_ERR_CLK18 error.
50	RW	WL_ERR_CLK20_MASK: 1 = Mask the WL_ERR_CLK20 error.
51	RW	WR_ERR_CLK22_MASK: 1 = Mask the WL_ERR_CLK22 error.
52:55	RW	Reserved.
56	RW	VALID_NS_BIG_L_MASK: 1 = Mask the VALID_NS_BIG_L error.
57	RW	INVALID_NS_SMALL_L_MASK: 1 = Mask the INVALID_NS_SMALL_L error.
58	RW	VALID_NS_BIG_R_MASK: 1 = Mask the VALID_NS_BIG_R error.
59	RW	INVALID_NS_BIG_R_MASK: 1 = Mask the INVALID_NS_BIG_R error.
60	RW	VALID_NS_JUMP_BACK_MASK: 1 = Mask the VALID_NS_JUMP_BACK error.
61	RW	INVALID_NS_SMALL_R_MASK: 1 = Mask the INVALID_NS_SMALL_R error.

Bits	SCOM	Field Mnemonic: Description
62	RW	OFFSET_ERR_MASK: 1 = Mask the OFFSET_ERR error.
63	RW	ADVANCE_PR_VALUE: Advance phase-rotator value control switch. 0 = Normal operation. 1 = Change the phase-rotator values going to the analog core 1 SysClk clock cycle earlier on pins 0 – 15, inclusive. This provides more settling and propagation time of the phase rotator values before OE, EDAT, and ODAT values are driven to the analog core.

Register Name	**DP16 Write Error Mask 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_ERROR_MASK0_P2_[n]
Address	8000001C0701183F (SCOM), +0x0400_0000_0000
Description	This register masks errors in the DP16 Write Error 0 Register. Thus, it prevents the WR_CNTL_ERROR bit from being set in the WC Error Status 0 Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	WL_ERR_CLK16_MASK: 1 = Mask the WL_ERR_CLK16 error.
49	RW	WL_ERR_CLK18_MASK: 1 = Mask the WL_ERR_CLK18 error.
50	RW	WL_ERR_CLK20_MASK: 1 = Mask the WL_ERR_CLK20 error.
51	RW	WR_ERR_CLK22_MASK: 1 = Mask the WL_ERR_CLK22 error.
52:55	RW	Reserved.
56	RW	VALID_NS_BIG_L_MASK: 1 = Mask the VALID_NS_BIG_L error.
57	RW	INVALID_NS_SMALL_L_MASK: 1 = Mask the INVALID_NS_SMALL_L error.
58	RW	VALID_NS_BIG_R_MASK: 1 = Mask the VALID_NS_BIG_R error.
59	RW	INVALID_NS_BIG_R_MASK: 1 = Mask the INVALID_NS_BIG_R error.
60	RW	VALID_NS_JUMP_BACK_MASK: 1 = Mask the VALID_NS_JUMP_BACK error.
61	RW	INVALID_NS_SMALL_R_MASK: 1 = Mask the INVALID_NS_SMALL_R error.
62	RW	OFFSET_ERR_MASK: 1 = Mask the OFFSET_ERR error.
63	RW	ADVANCE_PR_VALUE: Advance phase-rotator value control switch. 0 = Normal operation. 1 = Change the phase-rotator values going to the analog core 1 SysClk clock cycle earlier on pins 0 – 15, inclusive. This provides more settling and propagation time of the phase rotator values before OE, EDAT, and ODAT values are driven to the analog core.

Register Name	DP16 Write Error Mask 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_ERROR_MASK0_P3_[n]
Address	8000001C07011C3F (SCOM), +0x0400_0000_0000
Description	This register masks errors in the DP16 Write Error 0 Register. Thus, it prevents the WR_CNTL_ERROR bit from being set in the WC Error Status 0 Register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	WL_ERR_CLK16_MASK: 1 = Mask the WL_ERR_CLK16 error.
49	RW	WL_ERR_CLK18_MASK: 1 = Mask the WL_ERR_CLK18 error.
50	RW	WL_ERR_CLK20_MASK: 1 = Mask the WL_ERR_CLK20 error.
51	RW	WR_ERR_CLK22_MASK: 1 = Mask the WL_ERR_CLK22 error.
52:55	RW	Reserved.
56	RW	VALID_NS_BIG_L_MASK: 1 = Mask the VALID_NS_BIG_L error.
57	RW	INVALID_NS_SMALL_L_MASK: 1 = Mask the INVALID_NS_SMALL_L error.
58	RW	VALID_NS_BIG_R_MASK: 1 = Mask the VALID_NS_BIG_R error.
59	RW	INVALID_NS_BIG_R_MASK: 1 = Mask the INVALID_NS_BIG_R error.
60	RW	VALID_NS_JUMP_BACK_MASK: 1 = Mask the VALID_NS_JUMP_BACK error.
61	RW	INVALID_NS_SMALL_R_MASK: 1 = Mask the INVALID_NS_SMALL_R error.
62	RW	OFFSET_ERR_MASK: 1 = Mask the OFFSET_ERR error.
63	RW	ADVANCE_PR_VALUE: Advance phase-rotator value control switch. 0 = Normal operation. 1 = Change the phase-rotator values going to the analog core 1 SysClk clock cycle earlier on pins 0 – 15, inclusive. This provides more settling and propagation time of the phase rotator values before OE, EDAT, and ODAT values are driven to the analog core.

Register Name	DP16 DFT Wrap Status Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DFT_WRAP_STATUS_P0_[n]
Address	8000001D0701103F (SCOM), +0x0400_0000_0000
Description	This register provides the status of the DP16 wrap test. This register must be used only to perform diagnostic, manufacturing, or characterization testing. Contact your IBM representative before modifying this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RWX	CHECKER_ENABLE: Writing this bit to a 1 enables the pseudo-random binary sequence (PRBS) checker function.
49	RWX	CHECKER_RESET: Writing this bit to a 1 causes the SYNC and ERROR fields to clear to zero, and this field self clears.
50:51	RO	Constant = 0b00
52:55	ROX	SYNC: Each bit of this field is set during wrap testing when the PRBS7 pattern is detected on the corresponding receive bit. The bits are tested in the following groups: Bit 52 = MEMINTD00B MEMINTD04B MEMINTD08B MEMINTD12B. Bit 53 = MEMINTD01B MEMINTD05B MEMINTD09B MEMINTD13B. Bit 54 = MEMINTD02B MEMINTD06B MEMINTD10B MEMINTD14B. Bit 55 = MEMINTD03B MEMINTD07B MEMINTD11B MEMINTD15B.
56:57	RO	Reserved.
58:61	ROX	ERROR: Each bit of this field is set during wrap testing when the corresponding SYNC bit has been set, but a subsequent received data bit does not match the PRBS7 pattern.
62:63	RO	Reserved.

Register Name	DP16 DFT Wrap Status Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DFT_WRAP_STATUS_P1_[n]
Address	8000001D0701143F (SCOM), +0x0400_0000_0000
Description	This register provides the status of the DP16 wrap test. This register must be used only to perform diagnostic, manufacturing, or characterization testing. Contact your IBM representative before modifying this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RWX	CHECKER_ENABLE: Writing this bit to a 1 enables the PRBS checker function.
49	RWX	CHECKER_RESET: Writing this bit to a 1 causes the SYNC and ERROR fields to clear to zero, and this field self clears.
50:51	RO	Constant = 0b00

Register Name	DP16 Read VREF DAC 1 Register[n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_1_P0_[n]
Address	8000001F0701103F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RWX	NIB2_EN_FORCE: This bit overrides the logic enabling the comparator in the analog DACs for nibble 2 (bits 8:11 of 0:15) to set them to the value specified in the DP16 Read VREF DAC Comparator Ouptut Register. The binary string sent to the DAC is the value in BIT2_VREF_DAC. This allows the user to manually set the enable bits and DAC value for each nibble. The output of the comparator is captured in the DP16 Read VREF DAC Comparator Output Register. While read VREF calibration is running, this bit has no effect.
49:55	RWX	BIT2_VREF_DAC: DAC setting to control VREF on bit 2 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field reverts to the average of nibble 2.
56	RWX	NIB3_EN_FORCE: This bit overrides the logic enabling the comparator in the analog DACs for nibble 3 (bits 12:15 of 0:15) to set them to the value specified in the DP16 Read VREF DAC Comparator Ouptut Register. The binary string sent to the DAC is the value in BIT3_VREF_DAC. This allows the user to manually set the enable bits and DAC value for each nibble. The output of the comparator is captured in the DP16 Read VREF DAC Comparator Output Register. While read VREF calibration is running, this bit has no effect.
57:63	RWX	BIT3_VREF_DAC: DAC setting to control VREF on bit 3 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field reverts to the average of nibble 3.

Register Name	DP16 Read VREF DAC 1 Register[n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_1_P1_[n]
Address	8000001F0701143F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RWX	NIB2_EN_FORCE: This bit overrides the logic enabling the comparator in the analog DACs for nibble 2 (bits 8:11 of 0:15) to set them to the value specified in the DP16 Read VREF DAC Comparator Ouptut Register. The binary string sent to the DAC is the value in BIT2_VREF_DAC. This allows the user to manually set the enable bits and DAC value for each nibble. The output of the comparator is captured in the DP16 Read VREF DAC Comparator Output Register. While read VREF calibration is running, this bit has no effect.
49:55	RWX	BIT2_VREF_DAC: DAC setting to control VREF on bit 2 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field reverts to the average of nibble 2.
56	RWX	NIB3_EN_FORCE: This bit overrides the logic enabling the comparator in the analog DACs for nibble 3 (bits 12:15 of 0:15) to set them to the value specified in the DP16 Read VREF DAC Comparator Ouptut Register. The binary string sent to the DAC is the value in BIT3_VREF_DAC. This allows the user to manually set the enable bits and DAC value for each nibble. The output of the comparator is captured in the DP16 Read VREF DAC Comparator Output Register. While read VREF calibration is running, this bit has no effect.
57:63	RWX	BIT3_VREF_DAC: DAC setting to control VREF on bit 3 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field reverts to the average of nibble 3.

Register Name	**DP16 Read VREF DAC 1 Register[n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_1_P2_[n]
Address	8000001F0701183F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RWX	NIB2_EN_FORCE: This bit overrides the logic enabling the comparator in the analog DACs for nibble 2 (bits 8:11 of 0:15) to set them to the value specified in the DP16 Read VREF DAC Comparator Ouptut Register. The binary string sent to the DAC is the value in BIT2_VREF_DAC. This allows the user to manually set the enable bits and DAC value for each nibble. The output of the comparator is captured in the DP16 Read VREF DAC Comparator Output Register. While read VREF calibration is running, this bit has no effect.
49:55	RWX	BIT2_VREF_DAC: DAC setting to control VREF on bit 2 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field reverts to the average of nibble 2.
56	RWX	NIB3_EN_FORCE: This bit overrides the logic enabling the comparator in the analog DACs for nibble 3 (bits 12:15 of 0:15) to set them to the value specified in the DP16 Read VREF DAC Comparator Ouptut Register. The binary string sent to the DAC is the value in BIT3_VREF_DAC. This allows the user to manually set the enable bits and DAC value for each nibble. The output of the comparator is captured in the DP16 Read VREF DAC Comparator Output Register. While read VREF calibration is running, this bit has no effect.
57:63	RWX	BIT3_VREF_DAC: DAC setting to control VREF on bit 3 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field reverts to the average of nibble 3.

Register Name	DP16 Read VREF DAC 1 Register[n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_1_P3_[n]
Address	8000001F07011C3F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RWX	NIB2_EN_FORCE: This bit overrides the logic enabling the comparator in the analog DACs for nibble 2 (bits 8:11 of 0:15) to set them to the value specified in the DP16 Read VREF DAC Comparator Ouptut Register. The binary string sent to the DAC is the value in BIT2_VREF_DAC. This allows the user to manually set the enable bits and DAC value for each nibble. The output of the comparator is captured in the DP16 Read VREF DAC Comparator Output Register. While read VREF calibration is running, this bit has no effect.
49:55	RWX	BIT2_VREF_DAC: DAC setting to control VREF on bit 2 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field reverts to the average of nibble 2.
56	RWX	NIB3_EN_FORCE: This bit overrides the logic enabling the comparator in the analog DACs for nibble 3 (bits 12:15 of 0:15) to set them to the value specified in the DP16 Read VREF DAC Comparator Ouptut Register. The binary string sent to the DAC is the value in BIT3_VREF_DAC. This allows the user to manually set the enable bits and DAC value for each nibble. The output of the comparator is captured in the DP16 Read VREF DAC Comparator Output Register. While read VREF calibration is running, this bit has no effect.
57:63	RWX	BIT3_VREF_DAC: DAC setting to control VREF on bit 3 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field reverts to the average of nibble 3.

Register Name	DP16 CTLE Control Byte 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_CTLE_CTL_BYTE0_P0_[n]
Address	800000200701103F (SCOM), +0x0400_0000_0000
Description	These registers are used to control continuous time linear equalization (CTLE) on the DQ data bits. This is a new function for POWER9.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:49	RW	NIB_0_DQSEL_CAP: This field sets the capacitance value in the read control (RC) source degeneration, which defines the zero in the CTLEs transfer characteristic together with *_DQSEL_RES. The value is binary encoded. Higher values add more capacitance. 00 = No capacitor is selected. 01 to 10 = An increasing number of capacitors are selected. 11 = The maximum number of capacitors is selected.
50:52	RW	NIB{0,2}_BIAS_TRIM: This field sets the bias current in the CTLE circuit. 000 = Nominal current.
53:55	RW	NIB_0_DQSEL_RES: This field sets the resistance value in the RC source degeneration, which defines the zero in the CTLEs transfer characteristic together with *_DQSEL_CAP. In addition to setting the zero in the transfer characteristic, this also defines the CTLEs DC gain. The value is binary coded. Higher values decrease resistance. 000 = Maximum resistance; only a fixed resistor is used. 001 to 110 = Decreasing resistance. 111 = Minimum resistance.

Bits	SCOM	Field Mnemonic: Description
56:57	RW	NIB_1_DQSEL_CAP: This field sets the capacitance value in the RC source degeneration, which defines the zero in the CTLEs transfer characteristic together with *_DQSEL_RES. The value is binary encoded. Higher values add more capacitance. 00 = No capacitor is selected. 01 to 10 = An increasing number of capacitors are selected. 11 = The maximum number of capacitors is selected.
58:60	RW	NIB{1,3}_BIAS_TRIM: This field sets the bias current in the CTLE circuit. 000 = Nominal current.
61:63	RW	NIB_1_DQSEL_RES: This field sets the resistance value in the RC source degeneration, which defines the zero in the CTLEs transfer characteristic together with *_DQSEL_CAP. In addition to setting the zero in the transfer characteristic, this also defines the CTLEs DC gain. The value is binary coded. Higher values decrease resistance. 000 = Maximum resistance; only a fixed resistor is used. 001 to 110 = Decreasing resistance. 111 = Minimum resistance.

Register Name	DP16 CTLE Control Byte 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_CTLE_CTL_BYTE0_P1_[n]
Address	800000200701143F (SCOM), +0x0400_0000_0000
Description	These registers are used to control continuous time linear equalization (CTLE) on the DQ data bits. This is a new function for POWER9.

Bits	SCOM	Field Mnemonic: Description

57:63	RO	Constant = 0b0000000

Register Name	**DP16 DLL Control 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DLL_CNTL0_P0_[n]
Address	800000240701103F (SCOM), +0x0400_0000_0000
Description	This register controls the delay locked loop (DLL) calibration logic. CAUTION: This register must not be written while hardware calibration is active. Note: When writing the register, software must write bits (61:63) to 0b000 to avoid a parity error.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	INIT_RXDLL_CAL_RESET: When 1, DLL calibration controls are set to default values and the DLL output clocks are not correct. Write to 0 to initiate full calibration. Leave at 0 after calibration. Note: Power must be on and stable to the analog DLL logic a minimum of 100 ns before deactivating reset.
49	RW	INIT_RXDLL_CAL_UPDATE: When 1, this bit requests DLL calibration to update/adjust fine delays only. Voltage regulation (VREG) and coarse calibration are skipped, although they must have completed successfully before writing this bit to 1. Note: This bit starts at 0, but hardware automatically sets it to 1 on the rising edge of "cal_good," which should occur after full calibration. This enables fine calibration to run continuously after full calibration. When software writes this bit to 0, reads of the bit might still show 1 until the current fine calibration sequence finishes. Note: Power must be on and stable to the analog DLL logic a minimum of 100 ns before activating CAL_UPDATE.
50:51	RW	REGS_RXDLL_CAL_SKIP: Skip calibration steps (requires manual presets too). Bit 0: When 1, skip VREG calibration. Bit 1: When 1, skip coarse delay calibration.
52	RW	REGS_RXDLL_COARSE_ADJ_BY2: At the end of coarse calibration, the DAC code is reduced to set the total delay under one period before entering fine calibration. This bit controls whether the reduction is one or two code increments. When 0, change the final coarse delay setting by 1 (default). When 1, change the final coarse delay setting by 2. Note: This bit has lower priority than REGS_RXDLL_COARSE_ADJ_BY0 if both are set.
53:55	RW	RXREG_DLL_FILTER_LENGTH_DC: This field adjusts the number of lead/lag samples to filter out. A smaller binary code gives a smaller number of samples.
56:58	RW	RXREG_DLL_LEAD_LAG_SEPARATION_DC: This field adjusts the number of lead-more-than-lag or lag-more than-lead to get a positive phase adjustment or a negative phase adjustment.
59	RW	DLL_EN_DRIVER_INVFB_DC: Enable driver inverter feedback. This bit controls when cross-coupled inverters are included across DLL output drivers. Adding the inverters can improve driver performance, but might introduce excessive current if the DLL outputs are not close to their final values. The intent is to exclude the cross-coupled inverters during initial calibration, but possibly include them, when repeating fine calibration only, because DLL outputs are close to their optimal values during fine calibration. 0 = Disable use of cross-coupled inverters on DLL output drivers. 1 = Enable use of cross-coupled inverters on DLL output drivers.
60	RW	Reserved.
61	ROX	CAL_GOOD: (Read only.) When 1, calibration finished successfully. When 0, calibration is on-going or resulted in an error if either CAL_ERROR or CAL_ERROR_FINE is set. Note: This is the local copy of CAL_GOOD directly from the DLL calibration logic. Thus, it alternates between 0 and 1 when fine calibration runs continuously.
62	ROX	CAL_ERROR: (Read only.) When 1, VREG or coarse calibration finished with an error.
63	ROX	CAL_ERROR_FINE: (Read only.) When 1, fine calibration finished with an error.

Register Name	DP16 DLL Control 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DLL_CNTL0_P1_[n]
Address	800000240701143F (SCOM), +0x0400_0000_0000
Description	This register controls the DLL calibration logic. CAUTION: This register must not be written while hardware calibration is active. Note: When writing the register, software must write bits (61:63) to 0b000 to avoid a parity error.

Bits	SCOM	Field Mnemonic: Description

59	RW	DLL_EN_DRIVER_INVFB_DC: Enable driver inverter feedback. This bit controls when cross-coupled inverters are included across DLL output drivers. Adding the inverters can improve driver performance, but might introduce excessive current if the DLL outputs are not close to their final values. The intent is to exclude the cross-coupled inverters during initial calibration, but possibly include them, when repeating fine calibration only, because DLL outputs are close to their optimal values during fine calibration 0 = Disable use of cross-coupled inverters on DLL output drivers. 1 = Enable use of cross-coupled inverters on DLL output drivers.
60	RW	Reserved.
61	ROX	CAL_GOOD: (Read only.) When 1, calibration finished successfully. When 0, calibration is on-going or resulted in an error if either CAL_ERROR or CAL_ERROR_FINE is set. Note: This is the local copy of CAL_GOOD directly from the DLL calibration logic. Thus, it alternates between 0 and 1 when fine calibration runs continuously.
62	ROX	CAL_ERROR: (Read only.) When 1, VREG or coarse calibration finished with an error.
63	ROX	CAL_ERROR_FINE: (Read only.) When 1, fine calibration finished with an error.

Register Name	DP16 DLL Control 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DLL_CNTL1_P2_[n]
Address	800000250701183F (SCOM), +0x0400_0000_0000
Description	This register controls the DLL calibration logic. CAUTION: This register must not be written while hardware calibration is active. Note: When writing the register, software must write bits (61:63) to 0b000 to avoid a parity error.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	INIT_RXDLL_CAL_RESET: When 1, DLL calibration controls are set to default values and the DLL output clocks are not correct. Write to 0 to initiate full calibration. Leave at 0 after calibration. Note: Power must be on and stable to the analog DLL logic a minimum of 100 ns before deactivating reset.
49	RW	INIT_RXDLL_CAL_UPDATE: When 1, this bit requests DLL calibration to update/adjust fine delays only. VREG and coarse calibration are skipped, although they must have completed successfully before writing this bit to 1. Note: This bit starts at 0, but hardware automatically sets it to 1 on the rising edge of "cal_good," which should occur after full calibration. This enables fine calibration to run continuously after full calibration. When software writes this bit to 0, reads of the bit might still show 1 until the current fine calibration sequence finishes. Note: Power must be on and stable to the analog DLL logic a minimum of 100 ns before activating CAL_UPDATE.
50:51	RW	REGS_RXDLL_CAL_SKIP: Skip calibration steps (requires manual presets too). Bit 0: When 1, skip VREG calibration. Bit 1: When 1, skip coarse delay calibration.
52	RW	REGS_RXDLL_COARSE_ADJ_BY2: At the end of coarse calibration, the DAC code is reduced to set the total delay under one period before entering fine calibration. This bit controls whether the reduction is one or two code increments. When 0, change the final coarse delay setting by 1 (default). When 1, change the final coarse delay setting by 2. Note: This bit has lower priority than REGS_RXDLL_COARSE_ADJ_BY0 if both are set.
53:55	RW	RXREG_DLL_FILTER_LENGTH_DC: This field adjusts the number of lead/lag samples to filter out. A smaller binary code gives a smaller number of samples.
56:58	RW	RXREG_DLL_LEAD_LAG_SEPARATION_DC: This field adjusts the number of lead-more-than-lag or lag-more than-lead to get a positive phase adjustment or a negative phase adjustment.
59	RW	DLL_EN_DRIVER_INVFB_DC: Enable driver inverter feedback. This bit controls when cross-coupled inverters are included across DLL output drivers. Adding the inverters can improve driver performance, but might introduce excessive current if the DLL outputs are not close to their final values. The intent is to exclude the cross-coupled inverters during initial calibration, but possibly include them, when repeating fine calibration only, because DLL outputs are close to their optimal values during fine calibration 0 = Disable use of cross-coupled inverters on DLL output drivers. 1 = Enable use of cross-coupled inverters on DLL output drivers.
60	RW	Reserved.
61	ROX	CAL_GOOD: (Read only.) When 1, calibration finished successfully. When 0, calibration is on-going or resulted in an error if either CAL_ERROR or CAL_ERROR_FINE is set. Note: This is the local copy of CAL_GOOD directly from the DLL calibration logic. Thus, it alternates between 0 and 1 when fine calibration runs continuously.
62	ROX	CAL_ERROR: (Read only.) When 1, VREG or coarse calibration finished with an error.
63	ROX	CAL_ERROR_FINE: (Read only.) When 1, fine calibration finished with an error.

Note: This is the local copy of CAL_GOOD directly from the DLL calibration logic. Thus, it alternates between 0 and 1 when fine calibration runs continuously.
62	ROX	CAL_ERROR: (Read only.) When 1, VREG or coarse calibration finished with an error.
63	ROX	CAL_ERROR_FINE: (Read only.) When 1, fine calibration finished with an error.

Register Name	DP16 DLL DAC Lower 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DLL_DAC_LOWER0_P0_[n]
Address	800000260701103F (SCOM), +0x0400_0000_0000
Description	This register holds the lower bound for DLL calibration logic. CAUTION: This register must not be written while hardware calibration is active.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:62	RWX	REGS_RXDLL_VREG_DAC_LOWER: This field controls the value of VREG during fine calibration. Bits set to 1 are independent of each other. It is the total number of them that matter. For example, these settings have the same effect: b100...00, b001...00, b000...10. VREG and delay line element propagation time are inversely proportional because higher values of VREG mean faster delay elements. Therefore, adding more 1s increases VREG and makes faster delay elements. Recommendation: Change bits in thermometer code fashion because that is how the digital calibration logic does it.
63	RWX	RESERVED_63: Reserved.

Register Name	DP16 DLL VREG Control 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DLL_VREG_CONTROL0_P0_[n]
Address	8000002A0701103F (SCOM), +0x0400_0000_0000
Description	This register controls the voltage regulator of the DLL calibration logic. CAUTION: This register must not be written while hardware calibration is active.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:50	RW	RXREG_VREG_COMPCON_DC: This field affects the compensation capacitor for the regulator. Contact your IBM representative for details.
51	RW	Reserved.
52	RW	RXREG_VREG_DAC_PULLUP_DC: This is a mode switch for the regulator. It is typically not changed.
53:55	RW	RXREG_VREG_DRVCON_DC: This field determines the positive field-effect transistor (PFET) size for the regulator. It is a mode switch that is typically not changed.
56:58	RW	RXREG_VREG_REF_SEL_DC: This field adjusts the target value of VREG for VREG calibration. The lowest value (b000) corresponds to the highest VREG target. The highest value (b111) corresponds to the lowest VREG target. The recommended value is b011.

Bits	SCOM	Field Mnemonic: Description
59	RW	REGS_RXDLL_COARSE_ADJ_BY0: Typically, the transition from coarse to fine calibration decrements the code by 1. Therefore, fine calibration always tries to increase the delay by lowering VREG. Sometimes, however, the typical calibration routine produces a less ideal setting. When set, this bit does not decrement the code. Therefore, fine calibration tries to decrease the delay by increasing VREG. 0 = This bit has no effect. 1 = Do not decrement the coarse code during the transition from coarse to fine calibration. Note: This bit takes priority over REGS_RXDLL_COARSE_ADJ_BY2 if both are set.
60:61	RO	Reserved.
62	RW	DLL_DRVREN_MODE: This bit selects which method is used to control DLL output driver disabling. 0 = POWER8 mode (thermometer style, enabling all drivers up to the one that is used). 1 = POWER9 mode (a sliding group of four drivers enabled).
63	RW	DLL_CAL_CKTS_ACTIVE: This mode switch forces DLL calibration analog circuits to always be powered on. 0 = After VREG calibration, some analog circuits are powered down. 1 = Override auto power down, keeping analog calibration circuits active.

Register Name	DP16 DLL VREG Control 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DLL_VREG_CONTROL0_P1_[n]
Address	8000002A0701143F (SCOM), +0x0400_0000_0000
Description	This register controls the voltage regulator of the DLL calibration logic. CAUTION: This register must not be written while hardware calibration is active.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:50	RW	RXREG_VREG_COMPCON_DC: This field affects the compensation capacitor for the regulator. Contact your IBM representative for details.
51	RW	Reserved.
52	RW	RXREG_VREG_DAC_PULLUP_DC: This is a mode switch for the regulator. It is typically not changed.
53:55	RW	RXREG_VREG_DRVCON_DC: This field determines the PFET size for the regulator. It is a mode switch that is typically not changed.
56:58	RW	RXREG_VREG_REF_SEL_DC: This field adjusts the target value of VREG for VREG calibration. The lowest value (b000) corresponds to the highest VREG target. The highest value (b111) corresponds to the lowest VREG target. The recommended value is b011.
59	RW	REGS_RXDLL_COARSE_ADJ_BY0: Typically, the transition from coarse to fine calibration decrements the code by 1. Therefore, fine calibration always tries to increase the delay by lowering VREG. Sometimes, however, the typical calibration routine produces a less ideal setting. When set, this bit does not decrement the code. Therefore, fine calibration tries to decrease the delay by increasing VREG. 0 = This bit has no effect. 1 = Do not decrement the coarse code during the transition from coarse to fine calibration. Note: This bit takes priority over REGS_RXDLL_COARSE_ADJ_BY2 if both are set.
60:61	RO	Reserved.
62	RW	DLL_DRVREN_MODE: This bit selects which method is used to control DLL output driver disabling. 0 = POWER8 mode (thermometer style, enabling all drivers up to the one that is used). 1 = POWER9 mode (a sliding group of four drivers enabled).
63	RW	DLL_CAL_CKTS_ACTIVE: This mode switch forces DLL calibration analog circuits to always be powered on. 0 = After VREG calibration, some analog circuits are powered down. 1 = Override auto power down, keeping analog calibration circuits active.

Bits	SCOM	Field Mnemonic: Description
56:62	RWX	REGS_RXDLL_VREG_DAC_COARSE: This field adjusts the value of VREG during VREG calibration. The smallest code (b0000000) produces the highest VREG voltage. The largest code (b1111111) produces the lowest VREG voltage. Usually, software reads this register at the end of VREG calibration to see where the setting ended up. However, under special situations (that is, lab testing), it can be written to force a VREG value.
63	RO	Constant = 0b0

Register Name	**DP16 DLL VREG Coarse 1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DLL_VREG_COARSE1_P2_[n]
Address	8000002D0701183F (SCOM), +0x0400_0000_0000
Description	This register controls the coarse calibration of DLL calibration logic. CAUTION: This register must not be written while hardware calibration is active.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48:53	RWX	REGS_RXDLL_COARSE_EN: This field adjusts the delay of each element in the delay line. The larger the code, the larger the delay. Usually, software reads this register at the end of coarse calibration to see where the setting ended up. However, under special situations (that is, lab testing), it can be written to force a specific delay. Note: The POWER9 version of analog DLL only uses 5 bits (48:52). Thus, only the lowest 5 bits of this register (49:53) are connected. Bit 48 exists in the digital logic, but is left unconnected at the digital/analog boundary.
54:55	RO	Constant = 0b00
56:62	RWX	REGS_RXDLL_VREG_DAC_COARSE: This field adjusts the value of VREG during VREG calibration. The smallest code (b0000000) produces the highest VREG voltage. The largest code (b1111111) produces the lowest VREG voltage. Usually, software reads this register at the end of VREG calibration to see where the setting ended up. However, under special situations (that is, lab testing), it can be written to force a VREG value.
63	RO	Constant = 0b0

63	RO	Constant = 0b0

Register Name	DP16 Write VREF Status 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_STATUS0_P0_[n]
Address	8000002E0701103F (SCOM), +0x0400_0000_0000
Description	This register reports information about the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	WR_CTR_NUM_WRRDREQ_CNT: This field counts the number of full-loop iterations used in the 1-dimensional (1D) algorithm.

Register Name	DP16 Write VREF Status 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_STATUS0_P1_[n]
Address	8000002E0701143F (SCOM), +0x0400_0000_0000
Description	This register reports information about the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	WR_CTR_NUM_WRRDREQ_CNT: This field counts the number of full-loop iterations used in the 1D algorithm.

Register Name	DP16 Write VREF Status 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_STATUS0_P2_[n]
Address	8000002E0701183F (SCOM), +0x0400_0000_0000
Description	This register reports information about the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	WR_CTR_NUM_WRRDREQ_CNT: This field counts the number of full-loop iterations used in the 1D algorithm.

Register Name	DP16 Write VREF Status 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_STATUS0_P3_[n]
Address	8000002E07011C3F (SCOM), +0x0400_0000_0000
Description	This register reports information about the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	WR_CTR_NUM_WRRDREQ_CNT: This field counts the number of full-loop iterations used in the 1D algorithm.

Register Name	DP16 Write VREF Status 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_STATUS1_P0_[n]
Address	8000002F0701103F (SCOM), +0x0400_0000_0000
Description	This register reports additional information about the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:56	RW	WR_CTR_NUM_VREFREQ_CNT: This field counts the number of VREF update requests that have been called.
57:63	RW	WR_CTR_CUR_VREF: This field contains the current VREF.

Register Name	DP16 Write VREF Status 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_STATUS1_P1_[n]
Address	8000002F0701143F (SCOM), +0x0400_0000_0000
Description	This register reports additional information about the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:56	RW	WR_CTR_NUM_VREFREQ_CNT: This field counts the number of VREF update requests that have been called.
57:63	RW	WR_CTR_CUR_VREF: This field contains the current VREF.

Register Name	DP16 Write VREF Status 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_STATUS1_P2_[n]
Address	8000002F0701183F (SCOM), +0x0400_0000_0000
Description	This register reports additional information about the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:56	RW	WR_CTR_NUM_VREFREQ_CNT: This field counts the number of VREF update requests that have been called.
57:63	RW	WR_CTR_CUR_VREF: This field contains the current VREF.

Register Name	DP16 Pattern Position 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_PATTERN_POS_0_P0_[n]
Address	800000320701103F (SCOM), +0x0400_0000_0000
Description	This register sets the relative position of data pins for calibration algorithms using custom patterns that use the reserved memory location. A position value of 00b indicates that the corresponding data pin is compared against SEQ Read/Write Data 0 bits 0 - 7 on the first 8 beats of data and rolls through the other SEQ Read/Write Data bits in order. A position value of 01b starts with SEQ Read/Write Data 0 bits 8 - 15. A position value of 10b starts with SEQ Read/Write Data 1 bits 0 - 7. A position value of 11b starts with SEQ Read/Write Data 1 bits 8 - 15. This register is typically set to 1B1Bh for custom write centering. The register is unused for custom read centering.

Bits	SCOM	Field Mnemonic: Description

62:63	RW	MEMINTD07_POS: MEMINTD07 pattern starting position.

Register Name	DP16 Pattern Position 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_PATTERN_POS_0_P3_[n]
Address	8000003207011C3F (SCOM), +0x0400_0000_0000
Description	This register sets the relative position of data pins for calibration algorithms using custom patterns that use the reserved memory location. A position value of 00b indicates that the corresponding data pin is compared against SEQ Read/Write Data 0 bits 0 - 7 on the first 8 beats of data and rolls through the other SEQ Read/Write Data bits in order. A position value of 01b starts with SEQ Read/Write Data 0 bits 8 - 15. A position value of 10b starts with SEQ Read/Write Data 1 bits 0 - 7. A position value of 11b starts with SEQ Read/Write Data 1 bits 8 - 15. This register is typically set to 1B1Bh for custom write centering. The register is unused for custom read centering.

56:59	ROX	OPERATE_MODE: DP16 operating mode as generated by the RC (read only).
60	RWX	EN_DQS_OFFSET: Enable DQS offset.
61	RWX	DQS_ALIGN_JITTER: Increase DQS alignment jitter noise immunity.
62	RWX	DIS_CLK_GATE: Disable clock gating of DQS-alignment-related latches.
63	RWX	MAX_DQS_ITER: Force the maximum DQS alignment iteration count.

Register Name	**DP16 DQSClk Offset Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQSCLK_OFFSET_P0_[n]
Address	800000370701103F (SCOM), +0x0400_0000_0000
Description	This register controls switching to the live DQS.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000000000000
49:55	RW	DQS_OFFSET: This field prevents switching to the live DQS too early or during the calibration routines. Set this field to: DQS_OFFSET = 10 + ceiling(peak_to_peak_jitter_magnitude_in_ticks / 2). or more specifically: DQS_OFFSET= 2 + ceiling(peak_to_peak_jitter_magnitude_in_ticks / 2) + (peak_to_peak_periodic_drift_in_ticks/2) where peak_to_peak_jitter_magnitude_in_ticks is a whole number equal to the read clock strobe (DQS) peak-to-peak jitter rounded up to the nearest 128th memory clock. and peak_to_peak_periodic_drift_in_ticks is the peak-to-peak drift of the read clock strobe (DQS) rounded up to the nearest 128th memory clock. The + 2 term in the equation accounts for the jitter sources within the DDR PHY.
56:63	RO	Constant = 0b00000000

Register Name	**DP16 DQSClk Offset Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQSCLK_OFFSET_P1_[n]
Address	800000370701143F (SCOM), +0x0400_0000_0000
Description	This register controls switching to the live DQS.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	DQS_OFFSET: This field prevents switching to the live DQS too early or during the calibration routines. Set this field to: DQS_OFFSET = 10 + ceiling(peak_to_peak_jitter_magnitude_in_ticks / 2). or more specifically: DQS_OFFSET= 2 + ceiling(peak_to_peak_jitter_magnitude_in_ticks / 2) + (peak_to_peak_periodic_drift_in_ticks/2) where peak_to_peak_jitter_magnitude_in_ticks is a whole number equal to the read clock strobe (DQS) peak-to-peak jitter rounded up to the nearest 128th memory clock. And peak_to_peak_periodic_drift_in_ticks is the peak-to-peak drift of the read clock strobe (DQS) rounded up to the nearest 128th memory clock. The + 2 term in the equation accounts for the jitter sources within the DDR PHY.
56:63	RO	Constant = 0b00000000

Address	8000003707011C3F (SCOM), +0x0400_0000_0000
Description	This register controls switching to the live DQS.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
49:55	RW	DQS_OFFSET: This field prevents switching to the live DQS too early or during the calibration routines. Set this field to: DQS_OFFSET = 10 + ceiling(peak_to_peak_jitter_magnitude_in_ticks / 2). or more specifically: DQS_OFFSET= 2 + ceiling(peak_to_peak_jitter_magnitude_in_ticks / 2) + (peak_to_peak_periodic_drift_in_ticks/2) where peak_to_peak_jitter_magnitude_in_ticks is a whole number equal to the read clock strobe (DQS) peak-to-peak jitter rounded up to the nearest 128th memory clock. and peak_to_peak_periodic_drift_in_ticks is the peak-to-peak drift of the read clock strobe (DQS) rounded up to the nearest 128th memory clock. The + 2 term in the equation accounts for the jitter sources within the DDR PHY.
56:63	RO	Constant = 0b00000000

Register Name	DP16 Write Delay Value 0 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_0_RP0_REG_P0_[n]
Address	800000380701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 0 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_0_RP0_REG_P1_[n]
Address	800000380701143F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 0 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_0_RP0_REG_P2_[n]
Address	800000380701183F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 5 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_5_RP0_REG_P0_[n]
Address	8000003D0701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 9 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_9_RP0_REG_P2_[n]
Address	800000410701183F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description

This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 14 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_14_RP0_REG_P0_[n]
Address	800000460701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 20 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_20_RP0_REG_P2_[n]
Address	8000004C0701183F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 20 RP0 Register [n] (n=0:4)

This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

Bits	SCOM	Field Mnemonic: Description
63	RO	Constant = 0b0

Register Name	DP16 Read Delay Value 2 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY2_RANK_PAIR0_P2_[n]
Address	800000520701183F (SCOM), +0x0400_0000_0000
Description	This register holds the read delay values for two of the MEMINTDnnB pins for one rank pair within the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:54	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	Constant = 0b0
56:62	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
63	RO	Constant = 0b0

Register Name	DP16 Write VREF Value 0 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE0_RANK_PAIR0_P0_[n]
Address	8000005E0701103F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.

Bits	SCOM	Field Mnemonic: Description
49	RWX	WR_VREF_RANGE_DRAM0: This bit contains the default and current value of the DRAM write (WR) VREF range for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in the Mode 6 Register (MR6) in the double data rate 4 (DDR4) JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM0: This field contains the default and current value of the DRAM WR VREF value for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 0 RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE0_RANK_PAIR0_P1_[n]
Address	8000005E0701143F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

49	RWX	WR_VREF_RANGE_DRAM0: This bit contains the default and current value of the DRAM WR VREF range for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM0: This field contains the default and current value of the DRAM WR VREF value for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Write VREF Value 0 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE0_RANK_PAIR0_P2_[n]
Address	8000005E0701183F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM0: This bit contains the default and current value of the DRAM WR VREF range for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM0: This field contains the default and current value of the DRAM WR VREF value for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Write VREF Value 0 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE0_RANK_PAIR0_P3_[n]
Address	8000005E07011C3F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM0: This bit contains the default and current value of the DRAM WR VREF range for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM0: This field contains the default and current value of the DRAM WR VREF value for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Bits	SCOM	Field Mnemonic: Description
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 1 RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR0_P0_[n]
Address	8000005F0701103F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 1 RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR0_P1_[n]
Address	8000005F0701143F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Bits	SCOM	Field Mnemonic: Description
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 1 RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR0_P2_[n]
Address	8000005F0701183F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 1 RP0 Register [n] (n=0:4)**

Address	8000005F07011C3F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Read Eye Size 0 RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE0_RANK_PAIR0_P0_[n]
Address	800000600701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 0 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE0_RANK_PAIR0_P1_[n]
Address	800000600701143F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Register Name	DP16 Read Eye Size 1 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE1_RANK_PAIR0_P2_[n]
Address	800000610701183F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 1 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE1_RANK_PAIR0_P3_[n]
Address	8000006107011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 2 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE2_RANK_PAIR0_P0_[n]
Address	800000620701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE4_RANK_PAIR0_P3_[n]
Address	8000006407011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 5 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE5_RANK_PAIR0_P0_[n]
Address	800000650701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Address	800000680701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 8 RP0 Register [n] (n=0:4)

Address	8000006B0701143F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 11 RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE11_RANK_PAIR0_P2_[n]
Address	8000006B0701183F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Write VREF Configuration 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_CONFIG0_P0_[n]
Address	8000006C0701103F (SCOM), +0x0400_0000_0000
Description	This register controls the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WR_CTR_1D_MODE_SWITCH: This bit forces running only the POWER8 memory buffer write-centering algorithm or the new VREF write-centering algorithm. 0 = Run the VREF (2D) write-centering algorithm. 1 = Run only the POWER8 mode write-centering algorithm.
49	RW	WR_CTR_RUN_FULL_1D: Always run the full 1D write-centering solution. As the 2D algorithm tries to find the widest write-centering eye solution, it runs the 1D algorithm many times. To speed up the run time, approximations can be made. 0 = Use the approximate algorithm while trying to find the best VREF. This setting runs the full algorithm only at the start and final VREF cases. 1 = Always runs the full 1D algorithm.
50:52	RW	WR_CTR_2D_SMALL_STEP_VAL: This field indicates the number of VREF steps to take when small stepping. A 1 is added to the value programmed here. That is, a register value of b000 causes the algorithm to step by 1.
53:56	RW	WR_CTR_2D_BIG_STEP_VAL: This field indicates the number of VREF steps to take when big stepping. A 1 is added to the value programmed here. That is, a register value of b0000 causes the algorithm to step by 1.

Bits	SCOM	Field Mnemonic: Description
57:59	RW	WR_CTR_NUM_BITS_TO_SKIP: This field sets the number of bits to skip when running intermediary VREFs, to speed up run time. This is, nominally set to b111, skipping all but one bit in a given DRAM. For x8 devices, all bits are used. For x4 devices, only bits 10 and 11 are used. For example, a b101 value skips 5 bits in a x8 device but only skips 1 bit in a x4 device.
60:62	RW	WR_CTR_NUM_NO_INC_VREF_COMP: This field sets the number of times during a VREF loop that an increase must not be found from the current maximum VREF to the current VREF before it is determined that the algorithm found the maximum VREF. A value of b000 corresponds to needing to see the same value or a decreasing value for one time in a row.
63	RW	DD2_WR_VREF_FIX_DISABLE: 0 = Enable the DD2 function for the write VREF algorithm. 1 = Enable the DD1 function.

Register Name	**DP16 Write VREF Configuration 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_CONFIG0_P1_[n]
Address	8000006C0701143F (SCOM), +0x0400_0000_0000
Description	This register controls the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WR_CTR_1D_MODE_SWITCH: This bit forces running only the POWER8 memory buffer write-centering algorithm or the new VREF write-centering algorithm. 0 = Run the VREF (2D) write-centering algorithm. 1 = Run only the POWER8 mode write-centering algorithm.
49	RW	WR_CTR_RUN_FULL_1D: Always run the full 1D write-centering solution. As the 2D algorithm tries to find the widest write-centering eye solution, it runs the 1D algorithm many times. To speed up the run time, approximations can be made. 0 = Use the approximate algorithm while trying to find the best VREF. Register Name	**DP16 Read Diagnostic Configuration 3 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_DIA_CONFIG3_P0_[n]
Address	8000006D0701103F (SCOM), +0x0400_0000_0000
Description	This register can be used to improve jitter filtering during the DQS-alignment calibration algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	DESIRED_EDGE_CNTR_TARGET_HIGH: This field allows firmware control over the maximum edges required before the initial DQS alignment algorithm stays locked into tracking mode. A larger count value makes the algorithm work harder before declaring that a phase lock between the DRAM DQS and the internal DQSCLK has occurred. This count value must always be greater than the DESIRED_EDGE_CNTR_TARGET_LOW value. Use the DESIRED_EDGE_CNTR_TARGET_HIGH value 12 to improve jitter filtering characteristics during the initial DQS alignment algorithm. This field is not used during the periodic DQS alignment algorithm.
56:63	RWX	DESIRED_EDGE_CNTR_TARGET_LOW: This field allows firmware control over the minimum edges required before the initial DQS alignment algorithm toggles between coarse search and tracking mode. A larger count value makes it simpler for the algorithm to return to coarse search mode, and harder to enter tracking mode. This count value must always be smaller than the DESIRED_EDGE_CNTR_TARGET_HIGH value and greater than zero. Use the DESIRED_EDGE_CNTR_TARGET_LOW value 8 to improve jitter filtering characteristics during the initial DQS alignment algorithm. This field is not used during the periodic DQS alignment algorithm.

Register Name	**DP16 Read Diagnostic Configuration 3 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_DIA_CONFIG3_P1_[n]
Address	8000006D0701143F (SCOM), +0x0400_0000_0000
Description	This register can be used to improve jitter filtering during the DQS-alignment calibration algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:55	RWX	DESIRED_EDGE_CNTR_TARGET_HIGH: This field allows firmware control over the maximum edges required before the initial DQS alignment algorithm stays locked into tracking mode. A larger count value makes the algorithm work harder before declaring that a phase lock between the DRAM DQS and the internal DQSCLK has occurred. This count value must always be greater than the DESIRED_EDGE_CNTR_TARGET_LOW value. Use the DESIRED_EDGE_CNTR_TARGET_HIGH value 12 to improve jitter filtering characteristics during the initial DQS alignment algorithm. This field is not used during the periodic DQS alignment algorithm.
56:63	RWX	DESIRED_EDGE_CNTR_TARGET_LOW: This field allows firmware control over the minimum edges required before the initial DQS alignment algorithm toggles between coarse search and tracking mode. A larger count value makes it simpler for the algorithm to return to coarse search mode, and harder to enter tracking mode. This count value must always be smaller than the DESIRED_EDGE_CNTR_TARGET_HIGH value and greater than zero. Use the DESIRED_EDGE_CNTR_TARGET_LOW value 8 to improve jitter filtering characteristics during the initial DQS alignment algorithm. This field is not used during the periodic DQS alignment algorithm.

Register Name	**DP16 Read Diagnostic Configuration 3 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_DIA_CONFIG3_P2_[n]
Address	8000006D0701183F (SCOM), +0x0400_0000_0000
Description	This register can be used to improve jitter filtering during the DQS-alignment calibration algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000

49	RWX	CDD2_RD_FIFO_FIX_DIS: Reserved. This bit must be set to 0b for normal operation.
50:63	RO	Reserved.

Register Name	DP16 Delay Line Power Control Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DELAY_LINE_PWR_CTL_P0_[n]
Address	8000006F0701103F (SCOM), +0x0400_0000_0000
Description	This register is used to control or observe the enables of the delay lines and, hence, the power used by the delay lines. For correct functional mainline operation, this register must not be written. Contact your IBM representative before changing the value of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	QUAD0_PWR_CTL: Quadrant 0 delay line control.
52:55	RWX	QUAD1_PWR_CTL: Quadrant 1 delay line control.
56:59	RWX	QUAD2_PWR_CTL: Quadrant 2 delay line control.

Bits	SCOM	Field Mnemonic: Description
60:63	RWX	QUAD3_PWR_CTL: Quadrant 3 delay line control.

Register Name	DP16 Delay Line Power Control Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DELAY_LINE_PWR_CTL_P1_[n]
Address	8000006F0701143F (SCOM), +0x0400_0000_0000
Description	This register is used to control or observe the enables of the delay lines and, hence, the power used by the delay lines. For correct functional mainline operation, this register must not be written. Contact your IBM representative before changing the value of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	QUAD0_PWR_CTL: Quadrant 0 delay line control.
52:55	RWX	QUAD1_PWR_CTL: Quadrant 1 delay line control.
56:59	RWX	QUAD2_PWR_CTL: Quadrant 2 delay line control.
60:63	RWX	QUAD3_PWR_CTL: Quadrant 3 delay line control.

Register Name	DP16 Delay Line Power Control Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DELAY_LINE_PWR_CTL_P2_[n]
Address	8000006F0701183F (SCOM), +0x0400_0000_0000
Description	This register is used to control or observe the enables of the delay lines and, hence, the power used by the delay lines. For correct functional mainline operation, this register must not be written. Contact your IBM representative before changing the value of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	QUAD0_PWR_CTL: Quadrant 0 delay line control.
52:55	RWX	QUAD1_PWR_CTL: Quadrant 1 delay line control.
56:59	RWX	QUAD2_PWR_CTL: Quadrant 2 delay line control.
60:63	RWX	QUAD3_PWR_CTL: Quadrant 3 delay line control.

Register Name	DP16 Delay Line Power Control Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DELAY_LINE_PWR_CTL_P3_[n]
Address	8000006F07011C3F (SCOM), +0x0400_0000_0000
Description	This register is used to control or observe the enables of the delay lines and, hence, the power used by the delay lines. For correct functional mainline operation, this register must not be written. Contact your IBM representative before changing the value of this register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	QUAD0_PWR_CTL: Quadrant 0 delay line control.
52:55	RWX	QUAD1_PWR_CTL: Quadrant 1 delay line control.

Bits	SCOM	Field Mnemonic: Description
56:59	RWX	QUAD2_PWR_CTL: Quadrant 2 delay line control.
60:63	RWX	QUAD3_PWR_CTL: Quadrant 3 delay line control.

Register Name	DP16 Read Timing Reference 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_TIMING_REFERENCE0_P0_[n]
Address	800000700701103F (SCOM), +0x0400_0000_0000
Description	This register holds reference values used by the hardware during periodic calibrations to adjust internal timing relationships that might drift over time. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	REFERENCE0: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11 during calibration. This value must not be altered via the programming interface, except for diagnostic use.
56	RO	Constant = 0b0
57:63	RW	REFERENCE1: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15 during calibration. This value must not be altered via the programming interface, except for diagnostic use.

Register Name	DP16 Read Timing Reference 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_TIMING_REFERENCE0_P1_[n]
Address	800000700701143F (SCOM), +0x0400_0000_0000
Description	This register holds reference values used by the hardware during periodic calibrations to adjust internal timing relationships that might drift over time. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	REFERENCE0: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11 during calibration. This value must not be altered via the programming interface, except for diagnostic use.
56	RO	Constant = 0b0
57:63	RW	REFERENCE1: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15 during calibration. This value must not be altered via the programming interface, except for diagnostic use.

Register Name	DP16 Read Timing Reference 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_TIMING_REFERENCE0_P2_[n]
Address	800000700701183F (SCOM), +0x0400_0000_0000
Description	This register holds reference values used by the hardware during periodic calibrations to adjust internal timing relationships that might drift over time. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	REFERENCE0: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11 during calibration. This value must not be altered via the programming interface, except for diagnostic use.
56	RO	Constant = 0b0
57:63	RW	REFERENCE1: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15 during calibration. This value must not be altered via the programming interface, except for diagnostic use.

Register Name	**DP16 Read Timing Reference 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_TIMING_REFERENCE0_P3_[n]
Address	8000007007011C3F (SCOM), +0x0400_0000_0000
Description	This register holds reference values used by the hardware during periodic calibrations to adjust internal timing relationships that might drift over time. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	REFERENCE0: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11 during calibration. This value must not be altered via the programming interface, except for diagnostic use.
56	RO	Constant = 0b0
57:63	RW	REFERENCE1: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15 during calibration. This value must not be altered via the programming interface, except for diagnostic use.

Register Name	**DP16 Read Timing Reference 1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_TIMING_REFERENCE1_P0_[n]
Address	8000007107011O3F (SCOM), +0x0400_0000_0000
Description	This register holds reference values used by the hardware during periodic calibrations to adjust internal timing relationships that might drift over time. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	REFERENCE2: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03, 16, 17 and nn{1} = 08, 09, 10, 11, 20, 21 during calibration. This value must not be altered via the programming interface, except for diagnostic use.
56	RO	Constant = 0b0
57:63	RW	REFERENCE3: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07, 18, 19 and nn{1} = 12, 13, 14, 15, 22, 23 during calibration. This value must not be altered via the programming interface, except for diagnostic use.

Register Name	DP16 Read Timing Reference 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_TIMING_REFERENCE1_P1_[n]
Address	800000710701143F (SCOM), +0x0400_0000_0000
Description	This register holds reference values used by the hardware during periodic calibrations to adjust internal timing relationships that might drift over time. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	REFERENCE2: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03, 16, 17 and nn{1} = 08, 09, 10, 11, 20, 21 during calibration. This value must not be altered via the programming interface, except for diagnostic use.
56	RO	Constant = 0b0
57:63	RW	REFERENCE3: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07, 18, 19 and nn{1} = 12, 13, 14, 15, 22, 23 during calibration. This value must not be altered via the programming interface, except for diagnostic use.

Register Name	DP16 Read Timing Reference 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_TIMING_REFERENCE1_P2_[n]
Address	800000710701183F (SCOM), +0x0400_0000_0000
Description	This register holds reference values used by the hardware during periodic calibrations to adjust internal timing relationships that might drift over time. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	REFERENCE2: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03, 16, 17 and nn{1} = 08, 09, 10, 11, 20, 21 during calibration. This value must not be altered via the programming interface, except for diagnostic use.
56	RO	Constant = 0b0
57:63	RW	REFERENCE3: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07, 18, 19 and nn{1} = 12, 13, 14, 15, 22, 23 during calibration. This value must not be altered via the programming interface, except for diagnostic use.

Register Name	DP16 Read Timing Reference 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_TIMING_REFERENCE1_P3_[n]
Address	8000007107011C3F (SCOM), +0x0400_0000_0000
Description	This register holds reference values used by the hardware during periodic calibrations to adjust internal timing relationships that might drift over time. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	REFERENCE2: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03, 16, 17 and nn{1} = 08, 09, 10, 11, 20, 21 during calibration. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
56	RO	Constant = 0b0
57:63	RW	REFERENCE3: This field contains a reference value used by hardware for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07, 18, 19 and nn{1} = 12, 13, 14, 15, 22, 23 during calibration. This value must not be altered via the programming interface, except for diagnostic use.

Register Name	DP16 Read DQS Timing Reference Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DQS_TIMING_REFERENCE_P0_[n]
Address	800000720701103F (SCOM), +0x0400_0000_0000
Description	This register holds a reference value used by the hardware during periodic calibrations to adjust internal timing relationships that might drift over time. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	REFERENCE: This field contains a reference value used by hardware for the DQS pins. This value must not be altered via the programming interface except for diagnostic use.
56:63	RO	Constant = 0b00000000

Register Name	DP16 Read DQS Timing Reference Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DQS_TIMING_REFERENCE_P1_[n]
Address	800000720701143F (SCOM), +0x0400_0000_0000
Description	This register holds a reference value used by the hardware during periodic calibrations to adjust internal timing relationships that might drift over time. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	REFERENCE: This field contains a reference value used by hardware for the DQS pins. This value must not be altered via the programming interface except for diagnostic use.
56:63	RO	Constant = 0b00000000

Register Name	DP16 Read DQS Timing Reference Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DQS_TIMING_REFERENCE_P2_[n]
Address	800000720701183F (SCOM), +0x0400_0000_0000
Description	This register holds a reference value used by the hardware during periodic calibrations to adjust internal timing relationships that might drift over time. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	REFERENCE: This field contains a reference value used by hardware for the DQS pins. This value must not be altered via the programming interface except for diagnostic use.
56:63	RO	Constant = 0b00000000

Register Name	DP16 Read DQS Timing Reference Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DQS_TIMING_REFERENCE_P3_[n]
Address	8000007207011C3F (SCOM), +0x0400_0000_0000
Description	This register holds a reference value used by the hardware during periodic calibrations to adjust internal timing relationships that might drift over time. This value must not be altered via the programming interface, except for diagnostic use.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	REFERENCE: This field contains a reference value used by hardware for the DQS pins. This value must not be altered via the programming interface except for diagnostic use.
56:63	RO	Constant = 0b00000000

Register Name	DP16 SysClk Phase Rotator Value Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_SYSCLK_PR_VALUE_P0_[n]
Address	800000730701103F (SCOM), +0x0400_0000_0000
Description	This register holds the current phase rotator value of the SysClk phase rotator.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	ROX	BB_LOCK0: For SysClk rotator 0. 1 = The dphy_gckn/SysClk phase alignment controller has reached alignment between the dphy_gckn and the SysClk as of the last update by the dphy_gckn/SysClk phase alignment controller. 0 = The dphy_gckn and SysClk are not in alignment as of the last update by the dphy_gckn/SysClk phase alignment controller. There are two types of locks. See the SYSCLK_ROT_OVERRIDE field in the DP16 SysClk 0 Phase Rotator Control Register.
49:55	ROX	SYSCLK_ROT0: For SysClk rotator 0. This is the internally calculated value of the memory controller clock (MEMCTLCLKI) phase to the SysClk (SYSCLK) phase offset. It is used to set the SysClk phase rotator when SYSCLK_ROT_OVERRIDE_EN = 0. These bits reset, but are continually loaded with the value that is calculated by the dphy_gckn to SysClk alignment circuit for the SysClk delay, exclusive of reset.
56	ROX	BB_LOCK1: For SysClk rotator 1. 1 = The dphy_gckn/SysClk phase alignment controller has reached alignment between the dphy_gckn and the SysClk as of the last update by the dphy_gckn/SysClk phase alignment controller. 0 = The dphy_gckn and SysClk are not in alignment as of the last update by the dphy_gckn/SysClk phase alignment controller. There are two types of locks. See the SYSCLK_ROT_OVERRIDE field in the DP16 SysClk 0 Phase Rotator Control Register.
57:63	ROX	SYSCLK_ROT1: For SysClk rotator 1. This is the internally calculated value of the memory controller clock (MEMCTLCLKI) phase to the SysClk (SYSCLK) phase offset. It is used to set the SysClk phase rotator when SYSCLK_ROT_OVERRIDE_EN = 0. These bits reset, but are continually loaded with the value that is calculated by the dphy_gckn to SysClk alignment circuit for the SysClk delay, exclusive of reset.

Register Name	DP16 SysClk Phase Rotator Value Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_SYSCLK_PR_VALUE_P1_[n]
Address	800000730701143F (SCOM), +0x0400_0000_0000
Description	This register holds the current phase rotator value of the SysClk phase rotator.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	ROX	BB_LOCK0: For SysClk rotator 0. 1 = The dphy_gckn/SysClk phase alignment controller has reached alignment between the dphy_gckn and the SysClk as of the last update by the dphy_gckn/SysClk phase alignment controller. 0 = The dphy_gckn and SysClk are not in alignment as of the last update by the dphy_gckn/SysClk phase alignment controller. There are two types of locks. See the SYSCLK_ROT_OVERRIDE field in the DP16 SysClk 0 Phase Rotator Control Register.
49:55	ROX	SYSCLK_ROT0: For SysClk rotator 0. This is the internally calculated value of the memory controller clock (MEMCTLCLKI) phase to the SysClk (SYSCLK) phase offset. It is used to set the SysClk phase rotator when SYSCLK_ROT_OVERRIDE_EN = 0. These bits reset, but are continually loaded with the value that is calculated by the dphy_gckn to SysClk alignment circuit for the SysClk delay, exclusive of reset.
56	ROX	BB_LOCK1: For SysClk rotator 1. 1 = The dphy_gckn/SysClk phase alignment controller has reached alignment between the dphy_gckn and the SysClk as of the last update by the dphy_gckn/SysClk phase alignment controller. 0 = The dphy_gckn and SysClk are not in alignment as of the last update by the dphy_gckn/SysClk phase alignment controller. There are two types of locks. See the SYSCLK_ROT_OVERRIDE field in the DP16 SysClk 0 Phase Rotator Control Register.
57:63	ROX	SYSCLK_ROT1: For SysClk rotator 1. This is the internally calculated value of the memory controller clock (MEMCTLCLKI) phase to the SysClk (SYSCLK) phase offset. It is used to set the SysClk phase rotator when SYSCLK_ROT_OVERRIDE_EN = 0. These bits reset, but are continually loaded with the value that is calculated by the dphy_gckn to SysClk alignment circuit for the SysClk delay, exclusive of reset.

Register Name	DP16 SysClk Phase Rotator Value Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_SYSCLK_PR_VALUE_P2_[n]
Address	800000730701183F (SCOM), +0x0400_0000_0000
Description	This register holds the current phase rotator value of the SysClk phase rotator.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	ROX	BB_LOCK0: For SysClk rotator 0. 1 = The dphy_gckn/SysClk phase alignment controller has reached alignment between the dphy_gckn and the SysClk as of the last update by the dphy_gckn/SysClk phase alignment controller. 0 = The dphy_gckn and SysClk are not in alignment as of the last update by the dphy_gckn/SysClk phase alignment controller. There are two types of locks. See the SYSCLK_ROT_OVERRIDE field in the DP16 SysClk 0 Phase Rotator Control Register.
49:55	ROX	SYSCLK_ROT0: For SysClk rotator 0. This is the internally calculated value of the memory controller clock (MEMCTLCLKI) phase to the SysClk (SYSCLK) phase offset. It is used to set the SysClk phase rotator when SYSCLK_ROT_OVERRIDE_EN = 0. These bits reset, but are continually loaded with the value that is calculated by the dphy_gckn to SysClk alignment circuit for the SysClk delay, exclusive of reset.

Bits	SCOM	Field Mnemonic: Description
56	ROX	BB_LOCK1: For SysClk rotator 1. 1 = The dphy_gckn/SysClk phase alignment controller has reached alignment between the dphy_gckn and the SysClk as of the last update by the dphy_gckn/SysClk phase alignment controller. 0 = The dphy_gckn and SysClk are not in alignment as of the last update by the dphy_gckn/SysClk phase alignment controller. There are two types of locks. See the SYSCLK_ROT_OVERRIDE field in the DP16 SysClk 0 Phase Rotator Control Register.
57:63	ROX	SYSCLK_ROT1: For SysClk rotator 1. This is the internally calculated value of the memory controller clock (MEMCTLCLKI) phase to the SysClk (SYSCLK) phase offset. It is used to set the SysClk phase rotator when SYSCLK_ROT_OVERRIDE_EN = 0. These bits reset, but are continually loaded with the value that is calculated by the dphy_gckn to SysClk alignment circuit for the SysClk delay, exclusive of reset.

Register Name	**DP16 SysClk Phase Rotator Value Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_SYSCLK_PR_VALUE_P3_[n]
Address	8000007307011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the current phase rotator value of the SysClk phase rotator.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	ROX	BB_LOCK0: For SysClk rotator 0. 1 = The dphy_gckn/SysClk phase alignment controller has reached alignment between the dphy_gckn and the SysClk as of the last update by the dphy_gckn/SysClk phase alignment controller. 0 = The dphy_gckn and SysClk are not in alignment as of the last update by the dphy_gckn/SysClk phase alignment controller. There are two types of locks. See the SYSCLK_ROT_OVERRIDE field in the DP16 SysClk 0 Phase Rotator Control Register.
49:55	ROX	SYSCLK_ROT0: For SysClk rotator 0. This is the internally calculated value of the memory controller clock (MEMCTLCLKI) phase to the SysClk (SYSCLK) phase offset. It is used to set the SysClk phase rotator when SYSCLK_ROT_OVERRIDE_EN = 0. These bits reset, but are continually loaded with the value that is calculated by the dphy_gckn to SysClk alignment circuit for the SysClk delay, exclusive of reset.
56	ROX	BB_LOCK1: For SysClk rotator 1. 1 = The dphy_gckn/SysClk phase alignment controller has reached alignment between the dphy_gckn and the SysClk as of the last update by the dphy_gckn/SysClk phase alignment controller. 0 = The dphy_gckn and SysClk are not in alignment as of the last update by the dphy_gckn/SysClk phase alignment controller. There are two types of locks. See the SYSCLK_ROT_OVERRIDE field in the DP16 SysClk 0 Phase Rotator Control Register.
57:63	ROX	SYSCLK_ROT1: For SysClk rotator 1. This is the internally calculated value of the memory controller clock (MEMCTLCLKI) phase to the SysClk (SYSCLK) phase offset. It is used to set the SysClk phase rotator when SYSCLK_ROT_OVERRIDE_EN = 0. These bits reset, but are continually loaded with the value that is calculated by the dphy_gckn to SysClk alignment circuit for the SysClk delay, exclusive of reset.

Register Name	DP16 WrClk Phase Rotator Offset Value Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WRCLK_PR_P0_[n]
Address	800000740701103F (SCOM), +0x0400_0000_0000
Description	This register holds the phase rotator static offset value that is used to determine the phase of the WrClk with respect to the SysClk.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	TSYS_WRCLK: This field contains the static value of the system clock (SysClk) phase rotator to the write clock (WrClk) phase rotator. Set to ‘12’h for 2666 MT/s. Set to ‘10’h for 2400 MT/s. Set to ‘0F’h for 2133 MT/s. Set to ‘0D’h for 1866 MT/s. For zero delay simulations, or simulations where the delay of the SysClk tree and the WrClk tree are equal, set this field to 60h.
56:63	RO	Constant = 0b00000000

Register Name	DP16 WrClk Phase Rotator Offset Value Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WRCLK_PR_P1_[n]
Address	800000740701143F (SCOM), +0x0400_0000_0000
Description	This register holds the phase rotator static offset value that is used to determine the phase of the WrClk with respect to the SysClk.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	TSYS_WRCLK: This field contains the static value of the system clock (SysClk) phase rotator to the write clock (WrClk) phase rotator. Set to ‘12’h for 2666 MT/s. Set to ‘10’h for 2400 MT/s. Set to ‘0F’h for 2133 MT/s. Set to ‘0D’h for 1866 MT/s. For zero delay simulations, or simulations where the delay of the SysClk tree and the WrClk tree are equal, set this field to 60h.
56:63	RO	Constant = 0b00000000

Register Name	DP16 WrClk Phase Rotator Offset Value Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WRCLK_PR_P2_[n]
Address	800000740701183F (SCOM), +0x0400_0000_0000
Description	This register holds the phase rotator static offset value that is used to determine the phase of the WrClk with respect to the SysClk.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
49:55	RW	TSYS_WRCLK: This field contains the static value of the system clock (SysClk) phase rotator to the write clock (WrClk) phase rotator. Set to '12'h for 2666 MT/s. Set to '10'h for 2400 MT/s. Set to '0F'h for 2133 MT/s. Set to '0D'h for 1866 MT/s. For zero delay simulations, or simulations where the delay of the SysClk tree and the WrClk tree are equal, set this field to 60h.
56:63	RO	Constant = 0b00000000

Register Name	DP16 WrClk Phase Rotator Offset Value Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WRCLK_PR_P3_[n]
Address	8000007407011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the phase rotator static offset value that is used to determine the phase of the WrClk with respect to the SysClk.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	TSYS_WRCLK: This field contains the static value of the system clock (SysClk) phase rotator to the write clock (WrClk) phase rotator. Set to '12'h for 2666 MT/s. Set to '10'h for 2400 MT/s. Set to '0F'h for 2133 MT/s. Set to '0D'h for 1866 MT/s. For zero delay simulations, or simulations where the delay of the SysClk tree and the WrClk tree are equal, set this field to 60h.
56:63	RO	Constant = 0b00000000

Register Name	DP16 IO TX Configuration 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_IO_TX_CONFIG0_P0_[n]
Address	800000750701103F (SCOM), +0x0400_0000_0000
Description	This register contains the receiver configuration for the DP16.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	STRENGTH: Phase rotator strength bits. Set this field as follows for the given data rate: 0000 = DDR PHY is not operational 0001 = 1866 MT/s. 0010 = 2133 MT/s. 0100 = 2400 MT/s. 1000 = 2666 MT/s. All other values are reserved.
52	RW	DD2_RESET_READ_FIX_DISABLE: 0 = Enable the DD2 function to remove the register reset on read feature on status registers. 1 = Enable the DD1 function.
53:63	RW	Reserved.

Register Name	DP16 IO TX Configuration 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_IO_TX_CONFIG0_P1_[n]
Address	800000750701143F (SCOM), +0x0400_0000_0000
Description	This register contains the receiver configuration for the DP16.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

53:63	RW	Reserved.

Register Name	**DP16 Read VREF DAC Comparator Ouptut Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_CAL_EN_P0_[n]
Address	800000760701103F (SCOM), +0x0400_0000_0000
Description	Each bit of this register drives the read VREF calibration enable control to the analog logic controlling a DQ data bit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RWX	VREF_CAL_EN: Bits 48:63 drive analog controls for DQ 0:15. When 0, the bit is disabled and is not used in calibration. When 1, the bit is used if it is the lowest order enabled bit in each pair. If the lower bit of each pair is enabled, it is used. The higher order bit is used if and only if the lower-order bit is disabled. For example: 0xFFFF or 0xAAAA enable all the even bits; 0x5555 enables all the odd bits. 0xFFFF works in most cases.

Register Name	**DP16 Read VREF DAC Comparator Ouptut Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_CAL_EN_P1_[n]
Address	800000760701143F (SCOM), +0x0400_0000_0000
Description	Each bit of this register drives the read VREF calibration enable control to the analog logic controlling a DQ data bit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RWX	VREF_CAL_EN: Bits 48:63 drive analog controls for DQ 0:15. When 0, the bit is disabled and is not used in calibration. When 1, the bit is used if it is the lowest order enabled bit in each pair. If the lower bit of each pair is enabled, it is used. The higher order bit is used if and only if the lower-order bit is disabled. For example: 0xFFFF or 0xAAAA enable all the even bits; 0x5555 enables all the odd bits. 0xFFFF works in most cases.

Register Name	DP16 Read VREF DAC Comparator Ouptut Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_CAL_EN_P2_[n]
Address	800000760701183F (SCOM), +0x0400_0000_0000
Description	Each bit of this register drives the read VREF calibration enable control to the analog logic controlling a DQ data bit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RWX	VREF_CAL_EN: Bits 48:63 drive analog controls for DQ 0:15. When 0, the bit is disabled and is not used in calibration. When 1, the bit is used if it is the lowest order enabled bit in each pair. If the lower bit of each pair is enabled, it is used. The higher order bit is used if and only if the lower-order bit is disabled. For example: 0xFFFF or 0xAAAA enable all the even bits; 0x5555 enables all the odd bits. 0xFFFF works in most cases.

Register Name	DP16 Read VREF DAC Comparator Ouptut Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_CAL_EN_P3_[n]
Address	8000007607011C3F (SCOM), +0x0400_0000_0000
Description	Each bit of this register drives the read VREF calibration enable control to the analog logic controlling a DQ data bit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RWX	VREF_CAL_EN: Bits 48:63 drive analog controls for DQ 0:15. When 0, the bit is disabled and is not used in calibration. The higher order bit is used if and only if the lower-order bit is disabled. For example: 0xFFFF or 0xAAAA enable all the even bits; 0x5555 enables all the odd bits. 0xFFFF works in most cases.

Register Name	DP16 DLL/VREG Configuration 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DLL_CONFIG1_P0_[n]
Address	800000770701103F (SCOM), +0x0400_0000_0000
Description	This is the second of two registers that provide configuration for a variety of DLL and VREG programming values.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:51	RW	HS_DLLMUX_SEL_0_0_3: Select 1 of 16 phases of DLL to send out to the high-speed multiplex structure (for DP8 associated with bits 0:7).
52	RW	Reserved. Hold for future expansion, HS_DLLMUX_SEL_0(4).
53:56	RW	HS_DLLMUX_SEL_1_0_3: Select 1 of 16 phases of DLL to send out to the high-speed multiplex structure (for DP8 associated with bits 8:15).
57	RW	Reserved.
58:59	RW	Reserved.

Bits	SCOM	Field Mnemonic: Description
60	RW	Reserved.
61	RW	S0INSDLYTAP: This register bit is connected to the S0INSDLYTAP input of the DP16 analog core. For proper functional operation, this bit must be 0b.
62	RW	S1INSDLYTAP: This register bit is connected to the S1INSDLYTAP input of the DP16 analog core. For proper functional operation, this bit must be 0b.
63	RW	Reserved.

Register Name	DP16 DLL/VREG Configuration 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DLL_CONFIG1_P1_[n]
Address	800000770701143F (SCOM), +0x0400_0000_0000
Description	This is the second of two registers that provide configuration for a variety of DLL and VREG programming values.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000
48:51	RW	HS_DLLMUX_SEL_0_0_3: Select 1 of 16 phases of DLL to send out to the high-speed multiplex structure (for DP8 associated with bits 0:7).
52	RW	Reserved. Hold for future expansion, HS_DLLMUX_SEL_0(4).
53:56	RW	HS_DLLMUX_SEL_1_0_3: Select 1 of 16 phases of DLL to send out to the high-speed multiplex structure (for DP8 associated with bits 8:15).
57	RW	Reserved.
58:59	RW	Reserved.
60	RW	Reserved.
61	RW	S0INSDLYTAP: This register bit is connected to the S0INSDLYTAP input of the DP16 analog core. For proper functional operation, this bit must be 0b.
62	RW	S1INSDLYTAP: This register bit is connected to the S1INSDLYTAP input of the DP16 analog core. For proper functional operation, this bit must be 0b.
63	RW	Reserved.

Register Name	DP16 DLL/VREG Configuration 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DLL_CONFIG1_P2_[n]
Address	800000770701183F (SCOM), +0x0400_0000_0000
Description	This is the second of two registers that provide configuration for a variety of DLL and VREG programming values.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000
48:51	RW	HS_DLLMUX_SEL_0_0_3: Select 1 of 16 phases of DLL to send out to the high-speed multiplex structure (for DP8 associated with bits 0:7).
52	RW	Reserved. Hold for future expansion, HS_DLLMUX_SEL_0(4).
53:56	RW	HS_DLLMUX_SEL_1_0_3: Select 1 of 16 phases of DLL to send out to the high-speed multiplex structure (for DP8 associated with bits 8:15).

Bits	SCOM	Field Mnemonic: Description
57	RW	Reserved.
58:59	RW	Reserved.
60	RW	Reserved.
61	RW	S0INSDLYTAP: This register bit is connected to the S0INSDLYTAP input of the DP16 analog core. For proper functional operation, this bit must be 0b.
62	RW	S1INSDLYTAP: This register bit is connected to the S1INSDLYTAP input of the DP16 analog core. For proper functional operation, this bit must be 0b.
63	RW	Reserved.

Register Name	**DP16 DLL/VREG Configuration 1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DLL_CONFIG1_P3_[n]
Address	8000007707011C3F (SCOM), +0x0400_0000_0000
Description	This is the second of two registers that provide configuration for a variety of DLL and VREG programming values.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	HS_DLLMUX_SEL_0_0_3: Select 1 of 16 phases of DLL to send out to the high-speed multiplex structure (for DP8 associated with bits 0:7).
52	RW	Reserved. Hold for future expansion, HS_DLLMUX_SEL_0(4).
53:56	RW	HS_DLLMUX_SEL_1_0_3: Select 1 of 16 phases of DLL to send out to the high-speed multiplex structure (for DP8 associated with bits 8:15).
57	RW	Reserved.
58:59	RW	Reserved.
60	RW	Reserved.
61	RW	S0INSDLYTAP: This register bit is connected to the S0INSDLYTAP input of the DP16 analog core. For proper functional operation, this bit must be 0b.
62	RW	S1INSDLYTAP: This register bit is connected to the S1INSDLYTAP input of the DP16 analog core. For proper functional operation, this bit must be 0b.
63	RW	Reserved.

Register Name	**DP16 IO Driver FET Slice Enable Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_IO_TX_FET_SLICE_P0_[n]
Address	800000780701103F (SCOM), +0x0400_0000_0000
Description	This register provides driver NFET and PFET slice enables. These values are used for all of the drivers on this DP16 instance when driving data out.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.

Bits	SCOM	Field Mnemonic: Description
49:55	RW	EN_SLICE_N_WR: This field provides the driver NFET slice enable at 240 W/slice. Each bit in this multibit field controls one slice. 0 = Disable the FET slice. 1 = Enable the FET slice. The default value is 1111111b for 34 W.
56	RW	Reserved.
57:63	RW	EN_SLICE_P_WR: This field provides the driver PFET slice enable at 240 W/slice. Each bit in this multibit field controls one slice. 0 = Disable the FET slice. 1 = Enable the FET slice. The default value is 1111111b for 34 W.

Register Name	DP16 IO Driver FET Slice Enable Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_IO_TX_FET_SLICE_P1_[n]
Address	800000780701143F (SCOM), +0x0400_0000_0000
Description	This register provides driver NFET and PFET slice enables. These values are used for all of the drivers on this DP16 instance when driving data out.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	EN_SLICE_N_WR: This field provides the driver NFET slice enable at 240 W/slice. Each bit in this multibit field controls one slice. 0 = Disable the FET slice. 1 = Enable the FET slice. The default value is 1111111b for 34 W.
56	RW	Reserved.
57:63	RW	EN_SLICE_P_WR: This field provides the driver PFET slice enable at 240 W/slice. Each bit in this multibit field controls one slice. 0 = Disable the FET slice. 1 = Enable the FET slice. The default value is 1111111b for 34 W.

Register Name	DP16 IO Driver FET Slice Enable Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_IO_TX_FET_SLICE_P2_[n]
Address	800000780701183F (SCOM), +0x0400_0000_0000
Description	This register provides driver NFET and PFET slice enables. These values are used for all of the drivers on this DP16 instance when driving data out.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	EN_SLICE_N_WR: This field provides the driver NFET slice enable at 240 W/slice. Each bit in this multibit field controls one slice. 0 = Disable the FET slice. 1 = Enable the FET slice. The default value is 1111111b for 34 W.

Bits	SCOM	Field Mnemonic: Description
56	RW	Reserved.
57:63	RW	EN_SLICE_P_WR: This field provides the driver PFET slice enable at 240 W/slice. Each bit in this multibit field controls one slice. 0 = Disable the FET slice. 1 = Enable the FET slice. The default value is 1111111b for 34 W.

Register Name	DP16 IO Driver FET Slice Enable Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_IO_TX_FET_SLICE_P3_[n]
Address	8000007807011C3F (SCOM), +0x0400_0000_0000
Description	This register provides driver NFET and PFET slice enables. These values are used for all of the drivers on this DP16 instance when driving data out.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	EN_SLICE_N_WR: This field provides the driver NFET slice enable at 240 W/slice. Each bit in this multibit field controls one slice. 0 = Disable the FET slice. 1 = Enable the FET slice. The default value is 1111111b for 34 W.
56	RW	Reserved.
57:63	RW	EN_SLICE_P_WR: This field provides the driver PFET slice enable at 240 W/slice. Each bit in this multibit field controls one slice. 0 = Disable the FET slice. 1 = Enable the FET slice. The default value is 1111111b for 34 W.

Register Name	DP16 Low Speed Probe Select Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_LO_PROBE_SELECT_P0_[n]
Address	8000007907011O3F (SCOM), +0x0400_0000_0000
Description	This register selects the sources of low-speed probing in DP16.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:49	RW	Reserved.
50:55	RW	LO_PROBE_SEL_A: Select source A into the low-speed probe tree.
56:57	RW	Reserved.
58:63	RW	LO_PROBE_SEL_B: Select source B into the low-speed probe tree.

Register Name	DP16 Low Speed Probe Select Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_LO_PROBE_SELECT_P1_[n]
Address	800000790701143F (SCOM), +0x0400_0000_0000
Description	This register selects the sources of low-speed probing in DP16.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:49	RW	Reserved.
50:55	RW	LO_PROBE_SEL_A: Select source A into the low-speed probe tree.
56:57	RW	Reserved.
58:63	RW	LO_PROBE_SEL_B: Select source B into the low-speed probe tree.

Register Name	DP16 Low Speed Probe Select Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_LO_PROBE_SELECT_P2_[n]
Address	800000790701183F (SCOM), +0x0400_0000_0000
Description	This register selects the sources of low-speed probing in DP16.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:49	RW	Reserved.
50:55	RW	LO_PROBE_SEL_A: Select source A into the low-speed probe tree.
56:57	RW	Reserved.

Register Name	DP16 Low Speed Probe Select Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_LO_PROBE_SELECT_P3_[n]
Address	8000007907011C3F (SCOM), +0x0400_0000_0000
Description	This register selects the sources of low-speed probing in DP16.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:49	RW	Reserved.
50:55	RW	LO_PROBE_SEL_A: Select source A into the low-speed probe tree.
56:57	RW	Reserved.
58:63	RW	LO_PROBE_SEL_B: Select source B into the low-speed probe tree.

Register Name	DP16 Read VREF Calibration Error Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_CAL_ERROR_P0_[n]
Address	8000007A0701103F (SCOM), +0x0400_0000_0000
Description	The status of VREF calibration is reported in this register. Bits 48:63 correspond to the read VREF calibration circuitry in each bit of DQ 0:15.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RWX	VREF_CAL_ERROR: The status of VREF calibration for each bit of DQ 0:15 is reported in this register. When 1, no acceptable answer was found for the bit the last time calibration was run. No 0 →1 transition was found.

Register Name	DP16 Read VREF Calibration Error Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_CAL_ERROR_P1_[n]
Address	8000007A0701143F (SCOM), +0x0400_0000_0000
Description	The status of VREF calibration is reported in this register. Bits 48:63 correspond to the read VREF calibration circuitry in each bit of DQ 0:15.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RWX	VREF_CAL_ERROR: The status of VREF calibration for each bit of DQ 0:15 is reported in this register. When 1, no acceptable answer was found for the bit the last time calibration was run. No 0 →1 transition was found.

Register Name	DP16 Read VREF Calibration Error Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_CAL_ERROR_P2_[n]
Address	8000007A0701183F (SCOM), +0x0400_0000_0000
Description	The status of VREF calibration is reported in this register. Bits 48:63 correspond to the read VREF calibration circuitry in each bit of DQ 0:15.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RWX	VREF_CAL_ERROR: The status of VREF calibration for each bit of DQ 0:15 is reported in this register. When 1, no acceptable answer was found for the bit the last time calibration was run. No 0 →1 transition was found.

Register Name	DP16 Write DQ Offset Value RP0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQ_WR_OFFSET_RP0_P0_[n]
Address	8000007E0701103F (SCOM), +0x0400_0000_0000
Description	This register contains an offset value for each quadrant. This offset allows the centered write data bits in each quadrant to be offset from the center as determined by the write-centering calibration algorithm. This register is used by the write-centering calibration state machine. This register must be configured, if needed, before the write-centering calibration algorithm is initiated. Changing the value of this register without running the write-centering calibration algorithm has no effect on the data bit write delay values.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:51	RW	DQ_WR_OFFSET_N0: This field contains the four most-significant bits of a 5-bit value. The 5-bit value is a twos complement number added to the center phase-rotator value determined by the write-centering calibration algorithm. This value is added to the center value by the write-centering calibration algorithm as the final step of write centering these pins: MEMINTD00B(n). MEMINTD01B(n). MEMINTD02B(n). MEMINTD03B(n). The least-significant bit of the 5-bit value is always 0b.

Bits	SCOM	Field Mnemonic: Description
52:55	RW	DQ_WR_OFFSET_N1: This field contains the four most-significant bits of a 5-bit value. The 5-bit value is a twos complement number added to the center phase-rotator value determined by the write-centering calibration algorithm. This value is added to the center value by the write-centering calibration algorithm as the final step of write centering these pins: MEMINTD04B(n). MEMINTD05B(n). MEMINTD06B(n). MEMINTD07B(n). The least-significant bit of the 5-bit value is always 0b.
56:59	RW	DQ_WR_OFFSET_N2: This field contains the four most-significant bits of a 5-bit value. The 5-bit value is a twos complement number added to the center phase-rotator value determined by the write-centering calibration algorithm. This value is added to the center value by the write-centering calibration algorithm as the final step of write centering these pins: MEMINTD08B(n). MEMINTD09B(n). MEMINTD10B(n). MEMINTD11B(n). The least-significant bit of the 5-bit value is always 0b.
60:63	RW	DQ_WR_OFFSET_N3: This field contains the four most-significant bits of a 5-bit value. The 5-bit value is a twos complement number added to the center phase-rotator value determined by the write-centering calibration algorithm. This value is added to the center value by the write-centering calibration algorithm as the final step of write centering these pins: MEMINTD12B(n). MEMINTD13B(n). MEMINTD14B(n). MEMINTD15B(n). The least-significant bit of the 5-bit value is always 0b.

Register Name	**DP16 Write DQ Offset Value RP0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQ_WR_OFFSET_RP0_P1_[n]
Address	8000007E0701143F (SCOM), +0x0400_0000_0000
Description	This register contains an offset value for each quadrant. This offset allows the centered write data bits in each quadrant to be offset from the center as determined by the write-centering calibration algorithm. This register is used by the write-centering calibration state machine. This register must be configured, if needed, before the write-centering calibration algorithm is initiated. Changing the value of this register without running the write-centering calibration algorithm has no effect on the data bit write delay values.

Register Name	DP16 SysClk 1 Phase Rotator Control Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_SYSCLK_PR1_P0_[n]
Address	8000007F0701103F (SCOM), +0x0400_0000_0000
Description	This register controls the circuit that aligns the internal SysClk 1 to the incoming dphy_gckn clock.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.

Bits	SCOM	Field Mnemonic: Description
49:55	RW	SYSCLK_ROT_OVERRIDE: System clock (SysClk) phase rotator override value. This field has a dual purpose: override control and lock control. When SYSCLK_ROT_OVERRIDE_EN = 1b, this field is in override control mode. When SYSCLK_ROT_OVERRIDE_EN = 0b, this field is in lock control mode. For override control: The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by four dphy_gckn clock cycles. Back-to-back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register is reserved. For lock control: Write this field to all zeros unless instructed otherwise by your IBM representative. Bit 50: Lock select: Selects between lock status and sticky lock. 0 = Selects the status of the lock. When the dphy_gckn detects that it has reached alignment between the dphy_gckn and SysClk, the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register is asserted. 1 = Selects the sticky lock to the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register. The sticky lock is controlled by bit 52, sticky lock enable. After the sticky lock is set, it remains set. Bit 52: Sticky lock enable. Bits 53:55 000 = At most, a 1-count increment or decrement occurs to indicate a lock. 001 = At most, a 2-count increment or decrement occurs to indicate a lock. 010 = At most, a 3-count increment or decrement occurs to indicate a lock. 011 = At most, a 4-count increment or decrement occurs to indicate a lock. 100 = At most, a 5-count increment or decrement occurs to indicate a lock.
56	RW	SYSCLK_ROT_OVERRIDE_EN: This field enables the use of the SYSCLK_ROT_OVERRIDE field, rather than the internally calculated SYSCLK_ROT value, when set to 1b. The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by four dphy_gckn clock cycles. Back-to-back advanced peripheral bus (APB) write operations to this register provide the required separation. When this bit is written to 0b and was 1b, the SYSCLK_ROT value in the DP16 SysClk 1 Phase Rotator Control Register resets to zero.
57	RW	SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_gckn, the SysClk phase alignment controller. Must be asserted after the PLL locks, and must be active for at least five SysClk cycles.
58	RW	SYSCLK_PHASE_CNTL_EN: Alignment enable to dphy_gckn, the SysClk phase alignment controller. Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	SYSCLK_PHASE_DEFAULT_EN: This field enables default startup values to be output by dphy_gckn, the SysClk phase alignment controller. This bit must be asserted during system reset and de-asserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	SYSCLK_POS_EDGE_ALIGN: This field must be 0b for proper functional operation. It is an edge-alignment strap to dphy_gckn, the SysClk phase alignment controller. 0 = Negative edge alignment of the SysClk to the positive edge of dphy_gckn. 1 = Positive edge alignment of the SysClk to the positive edge of dphy_gckn.
61	RW	CONTINUOUS_UPDATE: 0 = The dphy_gckn, the SysClk phase alignment controller, is only updated periodically under hardware control when an update does not interfere with the PHY functional operations. 1 = The dphy_gckn, the SysClk phase alignment controller, runs continuously. Thus, it continuously aligns the dphy_gckn clock to the internal SysClk clock.
62:63	RO	Constant = 0b00

Register Name	DP16 SysClk 1 Phase Rotator Control Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_SYSCLK_PR1_P1_[n]
Address	8000007F0701143F (SCOM), +0x0400_0000_0000
Description	This register controls the circuit that aligns the internal SysClk 1 to the incoming dphy_gckn clock.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	SYSCLK_ROT_OVERRIDE: System clock (SysClk) phase rotator override value. This field has a dual purpose: override control and lock control. When SYSCLK_ROT_OVERRIDE_EN = 1b, this field is in override control mode. When SYSCLK_ROT_OVERRIDE_EN = 0b, this field is in lock control mode. For override control: The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by four dphy_gckn clock cycles. Back-to-back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register is reserved. For lock control: Write this field to all zeros unless instructed otherwise by your IBM representative. Bit 50: Lock select: Selects between lock status and sticky lock. 0 = Selects the status of the lock. When the dphy_gckn detects that it has reached alignment between the dphy_gckn and SysClk, the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register is asserted. 1 = Selects the sticky lock to the BB_LOCK field in the DP16 SysClk 1 Phase Rotator Control Register. The sticky lock is controlled by bit 52, sticky lock enable. After the sticky lock is set, it remains set. Bit 52: Sticky lock enable. Bits 53:55 000 = At most, a 1-count increment or decrement occurs to indicate a lock. 001 = At most, a 2-count increment or decrement occurs to indicate a lock. 010 = At most, a 3-count increment or decrement occurs to indicate a lock. 011 = At most, a 4-count increment or decrement occurs to indicate a lock. 100 = At most, a 5-count increment or decrement occurs to indicate a lock.
56	RW	SYSCLK_ROT_OVERRIDE_EN: This field enables the use of the SYSCLK_ROT_OVERRIDE field, rather than the internally calculated SYSCLK_ROT value, when set to 1b. The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by four dphy_gckn clock cycles. Back-to-back APB write operations to this register provide the required separation. When this bit is written to 0b and was 1b, the SYSCLK_ROT value in the DP16 SysClk 1 Phase Rotator Control Register resets to zero.
57	RW	SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_gckn, the SysClk phase alignment controller. Must be asserted after the PLL locks, and must be active for at least five SysClk cycles.
58	RW	SYSCLK_PHASE_CNTL_EN: Alignment enable to dphy_gckn, the SysClk phase alignment controller. Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	SYSCLK_PHASE_DEFAULT_EN: This field enables default startup values to be output by dphy_gckn, the SysClk phase alignment controller. This bit must be asserted during system reset and de-asserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	SYSCLK_POS_EDGE_ALIGN: This field must be 0b for proper functional operation. It is an edge-alignment strap to dphy_gckn, the SysClk phase alignment controller. 0 = Negative edge alignment of the SysClk to the positive edge of dphy_gckn. 1 = Positive edge alignment of the SysClk to the positive edge of dphy_gckn.

Bits	SCOM	Field Mnemonic: Description
61	RW	CONTINUOUS_UPDATE: 0 = The dphy_gckn, the SysClk phase alignment controller, is only updated periodically under hardware control when an update does not interfere with the PHY functional operations. 1 = The dphy_gckn, the SysClk phase alignment controller, runs continuously. Thus, it continuously aligns the dphy_gckn clock to the internal SysClk clock.
62:63	RO	Constant = 0b00

Register Name	DP16 SysClk 1 Phase Rotator Control Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_SYSCLK_PR1_P2_[n]
Address	8000007F0701183F (SCOM), +0x0400_0000_0000
Description	This register controls the circuit that aligns the internal SysClk 1 to the incoming dphy_gckn clock.

When this bit is written to 0b and was 1b, the SYSCLK_ROT value in the DP16 SysClk 1 Phase Rotator Control Register resets to zero.
57	RW	SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_gckn, the SysClk phase alignment controller. Must be asserted after the PLL locks, and must be active for at least five SysClk cycles.
58	RW	SYSCLK_PHASE_CNTL_EN: Alignment enable to dphy_gckn, the SysClk phase alignment controller. Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	SYSCLK_PHASE_DEFAULT_EN: This field enables default startup values to be output by dphy_gckn, the SysClk phase alignment controller. This bit must be asserted during system reset and de-asserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	SYSCLK_POS_EDGE_ALIGN: This field must be 0b for proper functional operation. It is an edge-alignment strap to dphy_gckn, the SysClk phase alignment controller. 0 = Negative edge alignment of the SysClk to the positive edge of dphy_gckn. 1 = Positive edge alignment of the SysClk to the positive edge of dphy_gckn.
61	RW	CONTINUOUS_UPDATE: 0 = The dphy_gckn, the SysClk phase alignment controller, is only updated periodically under hardware control when an update does not interfere with the PHY functional operations. 1 = The dphy_gckn, the SysClk phase alignment controller, runs continuously. Thus, it continuously aligns the dphy_gckn clock to the internal SysClk clock.
62:63	RO	Constant = 0b00

Register Name	DP16 DCD Control 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DCD_CONTROL0_P0_[n]
Address	800000A40701103F (SCOM), +0x0400_0000_0000
Description	This register controls the duty cycle distortion (DCD) analog circuitry on the clock feeding the DLL. Note: When writing the register, software must write bit 63 to b0 to avoid a parity error.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	DLL_DCD_ADJUST: This value controls the amount of duty cycle correction that occurs on the grid clock before it enters the DLL. As the value increases, the clock = 1 part gets longer. As values decrease, the clock = 0 part gets longer. This is the seed value for the DCD calibration algorithm.
56	RW	DLL_DCD_CORRECT_EN: This bit determines whether the duty cycle distortion logic in the DLL includes a loop to further correct for DCD. 0 = The loop is not included. 1 = The loop is included.
57	RW	DLL_DCD_ITER_A: This bit controls the connection of the DCD comparator input to the null out comparator offset. 0 = B answer. 1 = A answer. The A and B answers must be averaged to determine the DLL_DCD_ADJUST value.
58	RW	DLL_DCD_CAL_ENABLE: This is the DCD calibration enable bit. 0 = Resets the calibration state machine (clears DLL_DCD_CAL_DONE and DLL_DCD_CAL_ERROR). 1 = Enables calibration (calibration is complete with the assertion of DLL_DCD_CAL_DONE).

Bits	SCOM	Field Mnemonic: Description
59	RO	Reserved.
60	RW	DLL_DCD_POWERDOWN: 0 = Normal operation. 1 = Power down the DCD circuit for power savings.
61	RWX	DLL_DCD_CAL_DONE: When DCD_CAL_ENABLE is set, this bit indicates that the calibration is complete and the calibrated value has been loaded into the DLL_DCD_ADJUST field of this register.
62	RWX	DLL_DCD_CAL_ERROR: If this bit is asserted along with DLL_DCD_CAL_DONE, it indicates that the calibration failed to find a solution. Either DLL_DCD_ADJUST reached a maximum value of 0xFF, or a minimum value of 0x00.
63	RO	DLL_DCD_COMPARE_OUT: (Read only.) This bit indicates the result of the DCD comparator. 0 = Need to increase DLL_DCD_ADJUST. 1 = Need to decrease DLL_DCD_ADJUST.

Register Name	**DP16 DCD Control 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DCD_CONTROL0_P1_[n]

Register Name	**DP16 DLL Software Control 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DLL_SW_CONTROL0_P0_[n]
Address	800000A60701103F (SCOM), +0x0400_0000_0000
Description	This register exposes internal DLL signals to software to allow it to override the hardware DLL calibration algorithm. "META" indicates that the signals have safely crossed into the grid clock domain, so they should not exhibit metastability. Non-meta signals can be read after they stabilize.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	DLL_SW_OVERRIDE: When 0, the hardware DLL algorithm is used. When 1, this register takes control over the DLL analog inputs and outputs, allowing firmware to perform calibration.
49	RW	DLL_SW_CAL_PD_ENABLE: When DLL_SW_OVERRIDE = 1, this value is sent to the analog DLL as RXCAL_DLL_CAL_PD_ENABLE_SLOW.
50	RW	DLL_SW_MAIN_PD_ENABLE: When DLL_SW_OVERRIDE = 1, this value is sent to the analog DLL as RXCAL_DLL_MAIN_PD_ENABLE_SLOW.
51	RW	DLL_SW_DETECT_REQ: When DLL_SW_OVERRIDE = 1, this value is sent to the analog DLL as RXCAL_DLL_DETECT_REQ_SLOW.
52	RW	SLAVE_CAL_CKT_POWERDOWN: This bit controls the CAL_CIRCUIT_POWERDOWN input to the slave regulators. When 1, regulators are powered down. When 0, regulators are powered up.

Bits	SCOM	Field Mnemonic: Description
53:55	RO	Constant = 0b000
56	ROX	VREG_RXCAL_COMP_OUT_META: (Read only.) This bit indicates the result of the master VREG comparator, used during VREG calibration. 1 = VREG is less than the reference set by REF_SEL(0:2). 0 = VREG is greater than the reference set by REF_SEL(0:2).
57	ROX	RXCAL_DETECT_DONE_META: (Read only.) This bit is used during coarse and fine calibration. When 0, it means that the analog lead/lag comparator values are still being determined. When 1, it means that the analog lead/lag comparator values are valid and ready to read.
58	ROX	RXCAL_PD_CAL_LAG_META: (Read only.) This bit is used during coarse and fine calibration. 1 = The grid clock and 67.5 degree delay line output clock are in a lag relationship. 0 = Indeterminate. Either the calibration (CAL) filter/phase detector (PD) needs more time to evaluate, or clocks are in a lead relationship.
59	ROX	RXCAL_PD_MAIN_LEAD_META: (Read only.) This bit is used during coarse and fine calibration. 1 = The grid clock and 360 degree delay line output clock are in a lead relationship. 0 = Indeterminate. Either the main PD filter/phase detector needs more time to evaluate, or clocks are in a lag relationship.
60	ROX	RXCAL_PD_MAIN_LAG_META: (Read only.) This bit is used during coarse and fine calibration. 1 = The grid clock and 360 degree delay line output clock are in a lag relationship. 0 = Indeterminate. Either the main PD filter/phase detector needs more time to evaluate, or clocks are in a lead relationship.
61	ROX	VREG_SLAVE_COMP_OUT: (Read only.) This bit indicates the result of the slave VREG comparator. 1 = VREG is less than the reference set by REF_SEL(0:2). 0 = VREG is greater than the reference set by REF_SEL(0:2). It is safe to read after 256 grid clock cycles after REF_SEL is changed.
62:63	RO	Constant = 0b00

Register Name	DP16 DLL Software Control 0 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DLL_SW_CONTROL0_P1_[n]
Address	800000A60701143F (SCOM), +0x0400_0000_0000
Description	This register exposes internal DLL signals to software to allow it to override the hardware DLL calibration algorithm. "META" indicates that the signals have safely crossed into the grid clock domain, so they should not exhibit metastability. Non-meta signals can be read after they stabilize.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	DLL_SW_OVERRIDE: When 0, the hardware DLL algorithm is used. When 1, this register takes control over the DLL analog inputs and outputs, allowing firmware to perform calibration.
49	RW	DLL_SW_CAL_PD_ENABLE: When DLL_SW_OVERRIDE = 1, this value is sent to the analog DLL as RXCAL_DLL_CAL_PD_ENABLE_SLOW.
50	RW	DLL_SW_MAIN_PD_ENABLE: When DLL_SW_OVERRIDE = 1, this value is sent to the analog DLL as RXCAL_DLL_MAIN_PD_ENABLE_SLOW.
51	RW	DLL_SW_DETECT_REQ: When DLL_SW_OVERRIDE = 1, this value is sent to the analog DLL as RXCAL_DLL_DETECT_REQ_SLOW.
52	RW	SLAVE_CAL_CKT_POWERDOWN: This bit controls the CAL_CIRCUIT_POWERDOWN input to the slave regulators. When 1, regulators are powered down. When 0, regulators are powered up.

Bits	SCOM	Field Mnemonic: Description
53:55	RO	Constant = 0b000
56	ROX	VREG_RXCAL_COMP_OUT_META: (Read only.) This bit indicates the result of the master VREG comparator, used during VREG calibration. 1 = VREG is less than the reference set by REF_SEL(0:2). 0 = VREG is greater than the reference set by REF_SEL(0:2).
57	ROX	RXCAL_DETECT_DONE_META: (Read only.) This bit is used during coarse and fine calibration. When 0, it means that the analog lead/lag comparator values are still being determined. When 1, it means that the analog lead/lag comparator values are valid and ready to read.
58	ROX	RXCAL_PD_CAL_LAG_META: (Read only.) This bit is used during coarse and fine calibration. 1 = The grid clock and 67.5 degree delay line output clock are in a lag relationship. 0 = Indeterminate. Either the calibration (CAL) filter/phase detector (PD) needs more time to evaluate, or clocks are in a lead relationship.
59	ROX	RXCAL_PD_MAIN_LEAD_META: (Read only.) This bit is used during coarse and fine calibration. 1 = The grid clock and 360 degree delay line output clock are in a lead relationship. 0 = Indeterminate. Either the main PD filter/phase detector needs more time to evaluate, or clocks are in a lag relationship.
60	ROX	RXCAL_PD_MAIN_LAG_META: (Read only.) This bit is used during coarse and fine calibration. 1 = The grid clock and 360 degree delay line output clock are in a lag relationship. 0 = Indeterminate. Either the main PD filter/phase detector needs more time to evaluate, or clocks are in a lead relationship.
61	ROX	VREG_SLAVE_COMP_OUT: (Read only.) This bit indicates the result of the slave VREG comparator. 1 = VREG is less than the reference set by REF_SEL(0:2). 0 = VREG is greater than the reference set by REF_SEL(0:2). It is safe to read after 256 grid clock cycles after REF_SEL is changed.
62:63	RO	Constant = 0b00

Register Name	**DP16 DLL Software Control 0 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DLL_SW_CONTROL0_P2_[n]
Address	800000A60701183F (SCOM), +0x0400_0000_0000
Description	This register exposes internal DLL signals to software to allow it to override the hardware DLL calibration algorithm. "META" indicates that the signals have safely crossed into the grid clock domain, so they should not exhibit metastability. Non-meta signals can be read after they stabilize.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	DLL_SW_OVERRIDE: When 0, the hardware DLL algorithm is used. When 1, this register takes control over the DLL analog inputs and outputs, allowing firmware to perform calibration.
49	RW	DLL_SW_CAL_PD_ENABLE: When DLL_SW_OVERRIDE = 1, this value is sent to the analog DLL as RXCAL_DLL_CAL_PD_ENABLE_SLOW.
50	RW	DLL_SW_MAIN_PD_ENABLE: When DLL_SW_OVERRIDE = 1, this value is sent to the analog DLL as RXCAL_DLL_MAIN_PD_ENABLE_SLOW.
51	RW	DLL_SW_DETECT_REQ: When DLL_SW_OVERRIDE = 1, this value is sent to the analog DLL as RXCAL_DLL_DETECT_REQ_SLOW.
52	RW	SLAVE_CAL_CKT_POWERDOWN: This bit controls the CAL_CIRCUIT_POWERDOWN input to the slave regulators. When 1, regulators are powered down. When 0, regulators are powered up.

Bits	SCOM	Field Mnemonic: Description
53:55	RO	Constant = 0b000
56	ROX	VREG_RXCAL_COMP_OUT_META: (Read only.) This bit indicates the result of the master VREG comparator, used during VREG calibration. 1 = VREG is less than the reference set by REF_SEL(0:2). 0 = VREG is greater than the reference set by REF_SEL(0:2).
57	ROX	RXCAL_DETECT_DONE_META: (Read only.) This bit is used during coarse and fine calibration. When 0, it means that the analog lead/lag comparator values are still being determined. When 1, it means that the analog lead/lag comparator values are valid and ready to read.
58	ROX	RXCAL_PD_CAL_LAG_META: (Read only.) This bit is used during coarse and fine calibration. 1 = The grid clock and 67.5 degree delay line output clock are in a lag relationship. 0 = Indeterminate. Either the calibration (CAL) filter/phase detector (PD) needs more time to evaluate, or clocks are in a lead relationship.
59	ROX	RXCAL_PD_MAIN_LEAD_META: (Read only.) This bit is used during coarse and fine calibration. 1 = The grid clock and 360 degree delay line output clock are in a lead relationship. 0 = Indeterminate. Either the main PD filter/phase detector needs more time to evaluate, or clocks are in a lag relationship.
60	ROX	RXCAL_PD_MAIN_LAG_META: (Read only.) This bit is used during coarse and fine calibration. 1 = The grid clock and 360 degree delay line output clock are in a lag relationship. 0 = Indeterminate. For example, these settings have the same effect: b100...00, b001...00, b000...10. Adding more 1s increases the VREG. Recommendation: Change bits in thermometer code fashion.

Register Name	**DP16 Read VREF DAC 2 [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_2_P0_[n]
Address	800000C00701103F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT4_VREF_DAC: DAC setting to control VREF on bit 4 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.

Bits	SCOM	Field Mnemonic: Description
57:63	RW	BIT5_VREF_DAC: DAC setting to control VREF on bit 5 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 2 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_2_P1_[n]
Address	800000C00701143F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT4_VREF_DAC: DAC setting to control VREF on bit 4 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT5_VREF_DAC: DAC setting to control VREF on bit 5 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 2 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_2_P2_[n]
Address	800000C00701183F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT4_VREF_DAC: DAC setting to control VREF on bit 4 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT5_VREF_DAC: DAC setting to control VREF on bit 5 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 2 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_2_P3_[n]
Address	800000C007011C3F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT4_VREF_DAC: DAC setting to control VREF on bit 4 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT5_VREF_DAC: DAC setting to control VREF on bit 5 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 3 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_3_P0_[n]
Address	800000C10701103F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT6_VREF_DAC: DAC setting to control VREF on bit 6 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT7_VREF_DAC: DAC setting to control VREF on bit 7 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 3 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_3_P1_[n]
Address	800000C10701143F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.

Bits	SCOM	Field Mnemonic: Description
49:55	RW	BIT6_VREF_DAC: DAC setting to control VREF on bit 6 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT7_VREF_DAC: DAC setting to control VREF on bit 7 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 3 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_3_P2_[n]
Address	800000C10701183F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT6_VREF_DAC: DAC setting to control VREF on bit 6 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT7_VREF_DAC: DAC setting to control VREF on bit 7 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 3 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_3_P3_[n]
Address	800000C107011C3F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT6_VREF_DAC: DAC setting to control VREF on bit 6 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT7_VREF_DAC: DAC setting to control VREF on bit 7 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 4 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_4_P0_[n]
Address	800000C20701103F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT8_VREF_DAC: DAC setting to control VREF on bit 8 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT9_VREF_DAC: DAC setting to control VREF on bit 9 in DP16. This value is overwritten by the hardware when Read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 4 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_4_P1_[n]
Address	800000C20701143F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT8_VREF_DAC: DAC setting to control VREF on bit 8 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT9_VREF_DAC: DAC setting to control VREF on bit 9 in DP16. This value is overwritten by the hardware when Read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 4 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_4_P2_[n]
Address	800000C20701183F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RW	Reserved.
49:55	RW	BIT8_VREF_DAC: DAC setting to control VREF on bit 8 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT9_VREF_DAC: DAC setting to control VREF on bit 9 in DP16. This value is overwritten by the hardware when Read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	**DP16 Read VREF DAC 4 [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_4_P3_[n]
Address	800000C207011C3F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT8_VREF_DAC: DAC setting to control VREF on bit 8 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT9_VREF_DAC: DAC setting to control VREF on bit 9 in DP16. This value is overwritten by the hardware when Read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	**DP16 Read VREF DAC 5 [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_5_P0_[n]
Address	800000C30701103F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT10_VREF_DAC: DAC setting to control VREF on bit 10 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.

Bits	SCOM	Field Mnemonic: Description
57:63	RW	BIT11_VREF_DAC: DAC setting to control VREF on bit 11 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	**DP16 Read VREF DAC 5 [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_5_P1_[n]
Address	800000C30701143F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT10_VREF_DAC: DAC setting to control VREF on bit 10 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT11_VREF_DAC: DAC setting to control VREF on bit 11 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	**DP16 Read VREF DAC 5 [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_5_P2_[n]
Address	800000C30701183F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT10_VREF_DAC: DAC setting to control VREF on bit 10 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT11_VREF_DAC: DAC setting to control VREF on bit 11 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 5 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_5_P3_[n]
Address	800000C307011C3F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT10_VREF_DAC: DAC setting to control VREF on bit 10 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT11_VREF_DAC: DAC setting to control VREF on bit 11 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 6 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_6_P0_[n]
Address	800000C40701103F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT12_VREF_DAC: DAC setting to control VREF on bit 12 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT13_VREF_DAC: DAC setting to control VREF on bit 13 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 6 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_6_P1_[n]
Address	800000C40701143F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.

Bits	SCOM	Field Mnemonic: Description
49:55	RW	BIT12_VREF_DAC: DAC setting to control VREF on bit 12 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT13_VREF_DAC: DAC setting to control VREF on bit 13 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	**DP16 Read VREF DAC 6 [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_6_P2_[n]
Address	800000C40701183F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT12_VREF_DAC: DAC setting to control VREF on bit 12 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT13_VREF_DAC: DAC setting to control VREF on bit 13 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	**DP16 Read VREF DAC 6 [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_6_P3_[n]
Address	800000C407011C3F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49:55	RW	BIT12_VREF_DAC: DAC setting to control VREF on bit 12 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT13_VREF_DAC: DAC setting to control VREF on bit 13 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 7 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_7_P0_[n]
Address	800000C50701103F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	DD2_PERBIT_RDVREF_DISABLE: 0 = Enable DD2 per-bit read VREF support. 1 = Enable averaging function per nibble.
49:55	RW	BIT14_VREF_DAC: DAC setting to control VREF on bit 14 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT15_VREF_DAC: DAC setting to control VREF on bit 15 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 7 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_7_P1_[n]
Address	800000C50701143F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	DD2_PERBIT_RDVREF_DISABLE: 0 = Enable DD2 per-bit read VREF support. 1 = Enable averaging function per nibble.
49:55	RW	BIT14_VREF_DAC: DAC setting to control VREF on bit 14 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT15_VREF_DAC: DAC setting to control VREF on bit 15 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	DP16 Read VREF DAC 7 [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_7_P2_[n]
Address	800000C50701183F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	DD2_PERBIT_RDVREF_DISABLE: 0 = Enable DD2 per-bit read VREF support. 1 = Enable averaging function per nibble.
49:55	RW	BIT14_VREF_DAC: DAC setting to control VREF on bit 14 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT15_VREF_DAC: DAC setting to control VREF on bit 15 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	**DP16 Read VREF DAC 7 [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_7_P3_[n]
Address	800000C507011C3F (SCOM), +0x0400_0000_0000
Description	This register controls the DAC settings of the read VREF in the DP16 unit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	DD2_PERBIT_RDVREF_DISABLE: 0 = Enable DD2 per-bit read VREF support. 1 = Enable averaging function per nibble.
49:55	RW	BIT14_VREF_DAC: DAC setting to control VREF on bit 14 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.
56	RW	Reserved.
57:63	RW	BIT15_VREF_DAC: DAC setting to control VREF on bit 15 in DP16. This value is overwritten by the hardware when read VREF calibration is performed with the value calculated by the algorithm. If a value is written in here manually, it is used in the read VREF DAC functionally unless read VREF calibration is performed again. If DD2_PERBIT_RDVREF_DISABLE = 1, this field has no function.

Register Name	**DP16 Write VREF Configuration 1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_CONFIG1_P0_[n]
Address	800000EC0701103F (SCOM), +0x0400_0000_0000
Description	This register controls the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	WR_CTR_VREF_RANGE_SELECT: This bit controls the default write VREF range. Set this to the desired MR6 A6 value. 0 = Use the write VREF range 1. 1 = Use the write VREF range 2.

Bits	SCOM	Field Mnemonic: Description
49:55	RW	WR_CTR_VREF_RANGE_CROSSOVER: This field enables the user to configure the crossover point between the write VREF ranges. The default value is where the range 2 value equals the range 1 value of all zeros. The value must always be greater than or equal to this crossover point. Note: This value is taken from the JEDEC specification.
56:62	RW	WR_CTR_VREF_SINGLE_RANGE_MAX: This field enables the user to configure the maximum value in a single write VREF range. If the user wants to change this from the default value, it must have a value less than the default value. (wr_ctr_vref_single_range_max + wr_ctr_vref_range_crossover = wr_ctr_max_vref_range) is the maximum value to which the algorithm will run. Note: This value is taken from the JEDEC specification.
63	RW	Reserved.

Register Name	DP16 Write VREF Configuration 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_CONFIG1_P1_[n]
Address	800000EC0701143F (SCOM), +0x0400_0000_0000
Description	This register controls the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WR_CTR_VREF_RANGE_SELECT: This bit controls the default write VREF range. Set this to the desired MR6 A6 value. 0 = Use the write VREF range 1. 1 = Use the write VREF range 2.
49:55	RW	WR_CTR_VREF_RANGE_CROSSOVER: This field enables the user to configure the crossover point between the write VREF ranges. The default value is where the range 2 value equals the range 1 value of all zeros. The value must always be greater than or equal to this crossover point. Note: This value is taken from the JEDEC specification.
56:62	RW	WR_CTR_VREF_SINGLE_RANGE_MAX: This field enables the user to configure the maximum value in a single write VREF range. If the user wants to change this from the default value, it must have a value less than the default value. (wr_ctr_vref_single_range_max + wr_ctr_vref_range_crossover = wr_ctr_max_vref_range) is the maximum value to which the algorithm will run. Note: This value is taken from the JEDEC specification.
63	RW	Reserved.

Register Name	DP16 Write VREF Configuration 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_CONFIG1_P2_[n]
Address	800000EC0701183F (SCOM), +0x0400_0000_0000
Description	This register controls the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WR_CTR_VREF_RANGE_SELECT: This bit controls the default write VREF range. Set this to the desired MR6 A6 value. 0 = Use the write VREF range 1. 1 = Use the write VREF range 2.

Bits	SCOM	Field Mnemonic: Description
49:55	RW	WR_CTR_VREF_RANGE_CROSSOVER: This field enables the user to configure the crossover point between the write VREF ranges. The default value is where the range 2 value equals the range 1 value of all zeros. The value must always be greater than or equal to this crossover point. Note: This value is taken from the JEDEC specification.
56:62	RW	WR_CTR_VREF_SINGLE_RANGE_MAX: This field enables the user to configure the maximum value in a single write VREF range. (wr_ctr_vref_single_range_max + wr_ctr_vref_range_crossover = wr_ctr_max_vref_range) is the maximum value to which the algorithm will run. Note: This value is taken from the JEDEC specification.
63	RW	Reserved.

Register Name	DP16 Write VREF Configuration 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_CONFIG1_P3_[n]
Address	800000EC07011C3F (SCOM), +0x0400_0000_0000
Description	This register controls the write VREF operation.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	WR_CTR_VREF_RANGE_SELECT: This bit controls the default write VREF range. Set this to the desired MR6 A6 value. 0 = Use the write VREF range 1. 1 = Use the write VREF range 2.
49:55	RW	WR_CTR_VREF_RANGE_CROSSOVER: This field enables the user to configure the crossover point between the write VREF ranges. The default value is where the range 2 value equals the range 1 value of all zeros. The value must always be greater than or equal to this crossover point. Note: This value is taken from the JEDEC specification.
56:62	RW	WR_CTR_VREF_SINGLE_RANGE_MAX: This field enables the user to configure the maximum value in a single write VREF range. If the user wants to change this from the default value, it must have a value less than the default value. (wr_ctr_vref_single_range_max + wr_ctr_vref_range_crossover = wr_ctr_max_vref_range) is the maximum value to which the algorithm will run. Note: This value is taken from the JEDEC specification.
63	RW	Reserved.

Register Name	DP16 Read VREF DAC Comparator Output Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_COMP_OUT_P0_[n]
Address	800000F60701103F (SCOM), +0x0400_0000_0000
Description	The output of the read VREF DAC comparators is captured in this register. Bits 48:63 correspond to the read VREF calibration circuitry in each bit of DQ 0:15.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:63	ROX	VREF_DAC_COMP_OUT: This field captures the output of the comparators in the read VREF circuitry. The DAC value to be used is entered in the corresponding nibble field in the DP16 Read VREF DAC 0 and DP16 Read VREF DAC 1 Registers. The enable bits are set in the DP16 Read VREF DAC Comparator Ouptut Register. The enable bits are forced to the analog circuitry by forcing the appropriate nibble in the DP16 Read VREF DAC 0 and DP16 Read VREF DAC 1 Registers. The value captured is the result of the following relationship: Output = 0 when Vpad < VREF and enable = 1. Output = 1 when Vpad > VREF or enable = 0.

Register Name	**DP16 Read VREF DAC Comparator Output Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_COMP_OUT_P1_[n]
Address	800000F60701143F (SCOM), +0x0400_0000_0000
Description	The output of the read VREF DAC comparators is captured in this register. Bits 48:63 correspond to the read VREF calibration circuitry in each bit of DQ 0:15.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	ROX	VREF_DAC_COMP_OUT: This field captures the output of the comparators in the read VREF circuitry. The DAC value to be used is entered in the corresponding nibble field in the DP16 Read VREF DAC 0 and DP16 Read VREF DAC 1 Registers. The enable bits are set in the DP16 Read VREF DAC Comparator Ouptut Register. The enable bits are forced to the analog circuitry by forcing the appropriate nibble in the DP16 Read VREF DAC 0 and DP16 Read VREF DAC 1 Registers. The value captured is the result of the following relationship: Output = 0 when Vpad < VREF and enable = 1. Output = 1 when Vpad > VREF or enable = 0.

Register Name	**DP16 Read VREF DAC Comparator Output Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_COMP_OUT_P2_[n]
Address	800000F60701183F (SCOM), +0x0400_0000_0000
Description	The output of the read VREF DAC comparators is captured in this register. Bits 48:63 correspond to the read VREF calibration circuitry in each bit of DQ 0:15.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:63	ROX	VREF_DAC_COMP_OUT: This field captures the output of the comparators in the read VREF circuitry. The DAC value to be used is entered in the corresponding nibble field in the DP16 Read VREF DAC 0 and DP16 Read VREF DAC 1 Registers. The enable bits are set in the DP16 Read VREF DAC Comparator Ouptut Register. The enable bits are forced to the analog circuitry by forcing the appropriate nibble in the DP16 Read VREF DAC 0 and DP16 Read VREF DAC 1 Registers. The value captured is the result of the following relationship: Output = 0 when Vpad < VREF and enable = 1. Output = 1 when Vpad > VREF or enable = 0.

Register Name	DP16 Read VREF DAC Comparator Output Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_RD_VREF_DAC_COMP_OUT_P3_[n]
Address	800000F607011C3F (SCOM), +0x0400_0000_0000
Description	The output of the read VREF DAC comparators is captured in this register. Bits 48:63 correspond to the read VREF calibration circuitry in each bit of DQ 0:15.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	ROX	VREF_DAC_COMP_OUT: This field captures the output of the comparators in the read VREF circuitry. The DAC value to be used is entered in the corresponding nibble field in the DP16 Read VREF DAC 0 and DP16 Read VREF DAC 1 Registers. The enable bits are set in the DP16 Read VREF DAC Comparator Ouptut Register. The enable bits are forced to the analog circuitry by forcing the appropriate nibble in the DP16 Read VREF DAC 0 and DP16 Read VREF DAC 1 Registers. The value captured is the result of the following relationship: Output = 0 when Vpad < VREF and enable = 1. Output = 1 when Vpad > VREF or enable = 0.

Register Name	DP16 Write VREF Error Mask 1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_ERROR_MASK1_P0_[n]
Address	800000FA0701103F (SCOM), +0x0400_0000_0000
Description	This register provides masks for error information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	WR_VREF_MAX_RANGE_MASK2: DRAM 2. 0 = No mask. 1 = The error is masked.

58:63	RO	Reserved.

Register Name	DP16 Write Clock Enable and Selection RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WRCLK_EN_RP1_P0_[n]
Address	800001050701103F (SCOM), +0x0400_0000_0000
Description	This register configures which output pins on the DP16 are used as clocks or strobes to capture outgoing data on which data pins. This register must be configured exactly the same as the DP16 Read Clock Enable and Selection Register. The following are legal configurations for bits 48:53: 110000 = by-8 memory using CLK16 000011 = by-8 memory using CLK18 100001 = by-4 memory, not cross-coupled 010010 = by-4 memory, cross-coupled 000000 = Byte is not used. Other values are reserved. The following are legal configurations for bits 54:57: 1100 = by-8 memory using CLK20 0011 = by-8 memory using CLK22 1001 = by-4 memory, not cross-coupled 0110 = by-4 memory, cross-coupled 0000 = Byte is not used. Other values are reserved. The same configuration should be loaded for all active ranks.

Register Name	DP16 DQS Read Phase Select RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQS_RD_PHASE_SELECT_RANK_PAIR1_P0_[n]
Address	800001090701103F (SCOM), +0x0400_0000_0000
Description	This register contains a dynamic value that represents the phase differences between the memory clock, strobes, and the receiver clocks. Hardware determines these values during initial calibration and maintains them during periodic calibrations. One register stores phase selects for each rank pair for a total of four registers. This register is provided for diagnostic use. Do not use software to write to this register during normal use.

62:63	RW	RDCLK_SELECT3: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 12, 13, 14, 15.

Register Name	DP16 DQS Read Phase Select RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQS_RD_PHASE_SELECT_RANK_PAIR1_P3_[n]
Address	8000010907011C3F (SCOM), +0x0400_0000_0000
Description	This register contains a dynamic value that represents the phase differences between the memory clock, strobes, and the receiver clocks. Hardware determines these values during initial calibration and maintains them during periodic calibrations. One register stores phase selects for each rank pair for a total of four registers. This register is provided for diagnostic use. Do not use software to write to this register during normal use.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:49	RW	DQSCLK_SELECT0: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03.
50:51	RW	RDCLK_SELECT0: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03.
52:53	RW	DQSCLK_SELECT1: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07.
54:55	RW	RDCLK_SELECT1: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07.

Bits	SCOM	Field Mnemonic: Description
56:57	RW	DQSCLK_SELECT2: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 08, 09, 10, 11.
58:59	RW	RDCLK_SELECT2: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 08, 09, 10, 11.
60:61	RW	DQSCLK_SELECT3: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 12, 13, 14, 15.
62:63	RW	RDCLK_SELECT3: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 12, 13, 14, 15.

Register Name	**DP16 Read Delay Offset 0 RP1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY_OFFSET0_RANK_PAIR1_P0_[n]
Address	8000010C0701103F (SCOM), +0x0400_0000_0000
Description	Each register field holds the read delay offsets for four of the MEMINTDnnB pins for one rank pair in the DP16.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	OFFSET0: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.
56	RO	Constant = 0b0
57:63	RW	OFFSET1: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.

Register Name	**DP16 DQSClk Phase Rotator Value 0 RP1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQSCLK_PR0_RANK_PAIR1_P0_[n]
Address	800001300701103F (SCOM), +0x0400_0000_0000
Description	Two phase rotator values are contained within each register. Two registers exist for each rank pair. These phase rotator values are the values needed to align the internal SysClk to the incoming DQS strobe for each group of data pins.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	DQSCLK_ROT_CLK_N0: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD00B – MEMINTD03B in register 0 and MEMINTD08B – MEMINTD11B in register 1. This value is updated by hardware.
56	RO	Constant = 0b0
57:63	RW	DQSCLK_ROT_CLK_N1: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINTD15B in register 1. This value is updated by hardware.

Register Name	DP16 DQSClk Phase Rotator Value 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQSCLK_PR0_RANK_PAIR1_P1_[n]
Address	800001300701143F (SCOM), +0x0400_0000_0000
Description	Two phase rotator values are contained within each register. Two registers exist for each rank pair. These phase rotator values are the values needed to align the internal SysClk to the incoming DQS strobe for each group of data pins.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	DQSCLK_ROT_CLK_N0: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD00B – MEMINTD03B in register 0 and MEMINTD08B – MEMINTD11B in register 1. This value is updated by hardware.
56	RO	Constant = 0b0
57:63	RW	DQSCLK_ROT_CLK_N1: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINTD15B in register 1. This value is updated by hardware.

Register Name	DP16 DQSClk Phase Rotator Value 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQSCLK_PR0_RANK_PAIR1_P2_[n]
Address	800001300701183F (SCOM), +0x0400_0000_0000
Description	Two phase rotator values are contained within each register. Two registers exist for each rank pair. These phase rotator values are the values needed to align the internal SysClk to the incoming DQS strobe for each group of data pins.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	DQSCLK_ROT_CLK_N0: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD00B – MEMINTD03B in register 0 and MEMINTD08B – MEMINTD11B in register 1. This value is updated by hardware.
56	RO	Constant = 0b0
57:63	RW	DQSCLK_ROT_CLK_N1: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINTD15B in register 1. This value is updated by hardware.

Register Name	DP16 DQSClk Phase Rotator Value 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQSCLK_PR0_RANK_PAIR1_P3_[n]
Address	8000013007011C3F (SCOM), +0x0400_0000_0000
Description	Two phase rotator values are contained within each register. Two registers exist for each rank pair. These phase rotator values are the values needed to align the internal SysClk to the incoming DQS strobe for each group of data pins.

Bits	SCOM	Field Mnemonic: Description

56	RO	Constant = 0b0
57:63	RW	DQSCLK_ROT_CLK_N3: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINTD15B in register 1. This value is updated by hardware.

Register Name	DP16 Write Delay Value 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_0_RP1_REG_P0_[n]
Address	800001380701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_0_RP1_REG_P1_[n]
Address	800001380701143F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_0_RP1_REG_P2_[n]
Address	800001380701183F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Register Name	DP16 Write Delay Value 2 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_2_RP1_REG_P3_[n]
Address	8000013A07011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 3 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_3_RP1_REG_P0_[n]
Address	8000013B0701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description

Address	8000013F0701143F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 7 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_7_RP1_REG_P2_[n]
Address	8000013F0701183F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. 48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 12 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_12_RP1_REG_P0_[n]
Address	800001440701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 16 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_16_RP1_REG_P2_[n]
Address	800001480701183F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.

Register Name	**DP16 Read Delay Value 4 RP1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY4_RANK_PAIR1_P2_[n]
Address	800001540701183F (SCOM), +0x0400_0000_0000
Description	This register holds the read delay values for two of the MEMINTDnnB pins for one rank pair within the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:54	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	Constant = 0b0
56:62	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
63	RO	Constant = 0b0

Register Name	**DP16 Read Delay Value 4 RP1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY4_RANK_PAIR1_P3_[n]
Address	8000015407011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the read delay values for two of the MEMINTDnnB pins for one rank pair within the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

56	RO	Reserved.
57:63	RO	INITIAL_DQS_ROT_N1: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	**DP16 Initial DQS Alignment 0 RP1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN0_RANK_PAIR1_P1_[n]
Address	8000015C0701143F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N0: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.
56	RO	Reserved.
57:63	RO	INITIAL_DQS_ROT_N1: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	DP16 Initial DQS Alignment 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN0_RANK_PAIR1_P2_[n]
Address	8000015C0701183F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N0: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.
56	RO	Reserved.
57:63	RO	INITIAL_DQS_ROT_N1: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	DP16 Initial DQS Alignment 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN0_RANK_PAIR1_P3_[n]
Address	8000015C07011C3F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N0: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.
56	RO	Reserved.
57:63	RO	INITIAL_DQS_ROT_N1: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	DP16 Initial DQS Alignment 1 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN1_RANK_PAIR1_P0_[n]
Address	8000015D0701103F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N2: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.

Bits	SCOM	Field Mnemonic: Description
56	RO	Constant = 0b0
57:63	RO	INITIAL_DQS_ROT_N3: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	DP16 Initial DQS Alignment 1 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN1_RANK_PAIR1_P1_[n]
Address	8000015D0701143F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

56	RO	Constant = 0b0
57:63	RO	INITIAL_DQS_ROT_N3: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	DP16 Initial DQS Alignment 1 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN1_RANK_PAIR1_P3_[n]
Address	8000015D07011C3F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N2: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.
56	RO	Constant = 0b0
57:63	RO	INITIAL_DQS_ROT_N3: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	DP16 Write VREF Value 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE0_RANK_PAIR1_P0_[n]
Address	8000015E0701103F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM0: This bit contains the default and current value of the DRAM WR VREF range for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM0: This field contains the default and current value of the DRAM WR VREF value for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Write VREF Value 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE0_RANK_PAIR1_P1_[n]
Address	8000015E0701143F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM0: This bit contains the default and current value of the DRAM WR VREF range for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM0: This field contains the default and current value of the DRAM WR VREF value for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Write VREF Value 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE0_RANK_PAIR1_P2_[n]
Address	8000015E0701183F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM0: This bit contains the default and current value of the DRAM WR VREF range for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM0: This field contains the default and current value of the DRAM WR VREF value for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Bits	SCOM	Field Mnemonic: Description
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 0 RP1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE0_RANK_PAIR1_P3_[n]
Address	8000015E07011C3F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM0: This bit contains the default and current value of the DRAM WR VREF range for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM0: This field contains the default and current value of the DRAM WR VREF value for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 1 RP1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR1_P0_[n]
Address	8000015F0701103F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Bits	SCOM	Field Mnemonic: Description
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 1 RP1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR1_P1_[n]
Address	8000015F0701143F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 1 RP1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR1_P2_[n]
Address	8000015F0701183F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 1 RP1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR1_P3_[n]
Address	8000015F07011C3F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Read Eye Size 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE0_RANK_PAIR1_P0_[n]
Address	800001600701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 0 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE0_RANK_PAIR1_P1_[n]
Address	800001600701143F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 3 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE3_RANK_PAIR1_P2_[n]
Address	800001630701183F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	**DP16 Read Eye Size 6 RP1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE6_RANK_PAIR1_P3_[n]
Address	8000016607011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 10 RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE10_RANK_PAIR1_P0_[n]
Address	8000016A0701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000

Register Name	DP16 DQ Bit Disable RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQ_BIT_DISABLE_RP1_P0_[n]
Address	8000017C0701103F (SCOM), +0x0400_0000_0000
Description	This register is used to disable each of the 16 pins on the DP16. During calibration operations, the hardware sets the bit in this register that corresponds to a pin on the DP16 that failed a calibration step. This register indicates which DQ pins on the DP16 failed a calibration step. This register does not indicate which calibration step failed.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RW	DQ_BIT_DISABLE_0_15: 1 = Indicates that the DP16 bit is disabled and does not participate in any calibration steps. 0 = Indicates that the DP16 bit is not disabled. Bit 48 controls MEMINTD00B(n). Bit 49 controls MEMINTD01B(n). Bit 50 controls MEMINTD02B(n). ... Bit 63 controls MEMINTD15B(n). where n is the DP16 instance number.

Register Name	DP16 DQ Bit Disable RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQ_BIT_DISABLE_RP1_P1_[n]
Address	8000017C0701143F (SCOM), +0x0400_0000_0000
Description	This register is used to disable each of the 16 pins on the DP16. During calibration operations, the hardware sets the bit in this register that corresponds to a pin on the DP16 that failed a calibration step. This register indicates which DQ pins on the DP16 failed a calibration step. This register does not indicate which calibration step failed.

Bits 52:53 indicate the disable state of the DQS associated with QUAD2, as defined by the configurations of the DP16 Read Clock Enable and Selection Register and the DP16 Write Clock Enable and Selection Register. Bits 54:55 indicate the disable state of the DQS associated with QUAD3, as defined by the configurations of the DP16 Read Clock Enable and Selection Register and the DP16 Write Clock Enable and Selection Register.
56:63	RO	Constant = 0b00000000

Register Name	DP16 DQS Bit Disable RP1 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQS_BIT_DISABLE_RP1_P2_[n]
Address	8000017D0701183F (SCOM), +0x0400_0000_0000
Description	This register is used to disable each of the eight DQS pins on the DP16. During calibration operations, the hardware sets the bit in this register that corresponds to a pin on the DP16 that failed a calibration step. This register indicates which DQS pins on the DP16 failed a calibration step. This register does not indicate which calibration step failed.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:55	RW	DQS_BIT_DISABLE_16_23: Bits are grouped in pairs. Bits 48:49, 50:51, 52:53, and 54:55 correspond to the differential DQS bits for each pair. 1 = Indicates that the DQS bits are disabled and do not participate in any calibration steps. Both DQS bits in the pair are set to 1b. 0 = Indicates that the DQS bits are not disabled. Both DQS bits in the pair are set to 0b. Bits 48:49 indicate the disable state of the DQS associated with QUAD0, as defined by the configurations of the DP16 Read Clock Enable and Selection Register and the DP16 Write Clock Enable and Selection Register. Bits 50:51 indicate the disable state of the DQS associated with QUAD1, as defined by the configurations of the DP16 Read Clock Enable and Selection Register and the DP16 Write Clock Enable and Selection Register. Bits 52:53 indicate the disable state of the DQS associated with QUAD2, as defined by the configurations of the DP16 Read Clock Enable and Selection Register and the DP16 Write Clock Enable and Selection Register. Register Name	**DP16 Write DQ Offset Value RP1 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQ_WR_OFFSET_RP1_P0_[n]
Address	8000017E0701103F (SCOM), +0x0400_0000_0000
Description	This register contains an offset value for each quadrant. This offset allows the centered write data bits in each quadrant to be offset from the center as determined by the write-centering calibration algorithm. This register is used by the write-centering calibration state machine. This register must be configured, if needed, before the write-centering calibration algorithm is initiated. Changing the value of this register without running the write-centering calibration algorithm has no effect on the data bit write delay values.

Bits	SCOM	Field Mnemonic: Description

Register Name	DP16 DQS Read Phase Select RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQS_RD_PHASE_SELECT_RANK_PAIR2_P0_[n]
Address	800002090701103F (SCOM), +0x0400_0000_0000
Description	This register contains a dynamic value that represents the phase differences between the memory clock, strobes, and the receiver clocks. Hardware determines these values during initial calibration and maintains them during periodic calibrations. One register stores phase selects for each rank pair for a total of four registers. This register is provided for diagnostic use. Do not use software to write to this register during normal use.

Register Name	DP16 DQS Read Phase Select RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQS_RD_PHASE_SELECT_RANK_PAIR2_P2_[n]
Address	800002090701183F (SCOM), +0x0400_0000_0000
Description	This register contains a dynamic value that represents the phase differences between the memory clock, strobes, and the receiver clocks. Hardware determines these values during initial calibration and maintains them during periodic calibrations. One register stores phase selects for each rank pair for a total of four registers. This register is provided for diagnostic use. Do not use software to write to this register during normal use.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Register Name	**DP16 Read Delay Offset 0 RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY_OFFSET0_RANK_PAIR2_P0_[n]
Address	8000020C0701103F (SCOM), +0x0400_0000_0000
Description	Each register field holds the read delay offsets for four of the MEMINTDnnB pins for one rank pair in the DP16.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	OFFSET0: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.
56	RO	Constant = 0b0
57:63	RW	OFFSET1: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.

Bits	SCOM	Field Mnemonic: Description
60	RO	Constant = 0b0
61:63	RW	DQS_GATE_DELAY_N3: This field determines when the DQS gate is opened to receive the read strobe on DQ12 - DQ15 inputs. This field determines when the read gate is opened. It contains the number of MEMINTCLKO clock cycles. ‘0’h to ‘5’h = 0 - 5 MEMINTCLKO clock cycles. ‘6’h to ‘7’h = Unused.

Register Name	**DP16 DQS Gate Delay RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQS_GATE_DELAY_RP2_P3_[n]
Address	8000021307011C3F (SCOM), +0x0400_0000_0000
Description	This register contains the DQS gate delay settings for each incoming read clock. One register exists for each rank pair. This register must be reset or written to its reset value before running or rerunning initial calibration.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:51	RW	DQS_GATE_DELAY_N0: This field determines when the DQS gate is opened to receive the read strobe on the DQ00 - DQ03 inputs. This field determines when the read gate is opened. It contains the number of MEMINTCLKO clock cycles. ‘0’h to ‘5’h = 0 - 5 MEMINTCLKO clock cycles. ‘6’h to ‘7’h = Unused.
52	RO	Constant = 0b0
53:55	RW	DQS_GATE_DELAY_N1: This field determines when the DQS gate is opened to receive the read strobe on the DQ04 - DQ07 inputs. This field determines when the read gate is opened. It contains the number of MEMINTCLKO clock cycles. ‘0’h to ‘5’h = 0 - 5 MEMINTCLKO clock cycles. ‘6’h to ‘7’h = Unused.
56	RO	Constant = 0b0
57:59	RW	DQS_GATE_DELAY_N2: This field determines when the DQS gate is opened to receive the read strobe on DQ08 - DQ11 inputs. This field determines when the read gate is opened. It contains the number of MEMINTCLKO clock cycles. ‘0’h to ‘5’h = 0 - 5 MEMINTCLKO clock cycles. ‘6’h to ‘7’h = Unused.
60	RO	Constant = 0b0
61:63	RW	DQS_GATE_DELAY_N3: This field determines when the DQS gate is opened to receive the read strobe on DQ12 - DQ15 inputs. This field determines when the read gate is opened. It contains the number of MEMINTCLKO clock cycles. ‘0’h to ‘5’h = 0 - 5 MEMINTCLKO clock cycles. ‘6’h to ‘7’h = Unused.

Register Name	**DP16 DQSClk Phase Rotator Value 0 RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQSCLK_PR0_RANK_PAIR2_P0_[n]
Address	800002300701103F (SCOM), +0x0400_0000_0000
Description	Two phase rotator values are contained within each register. Two registers exist for each rank pair. These phase rotator values are the values needed to align the internal SysClk to the incoming DQS strobe for each group of data pins.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	DQSCLK_ROT_CLK_N0: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD00B – MEMINTD03B in register 0 and MEMINTD08B – MEMINTD11B in register 1. This value is updated by hardware.
56	RO	Constant = 0b0
57:63	RW	DQSCLK_ROT_CLK_N1: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINTD15B in register 1. This value is updated by hardware.

Register Name	DP16 DQSClk Phase Rotator Value 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQSCLK_PR0_RANK_PAIR2_P1_[n]
Address	800002300701143F (SCOM), +0x0400_0000_0000
Description	Two phase rotator values are contained within each register. Two registers exist for each rank pair. These phase rotator values are the values needed to align the internal SysClk to the incoming DQS strobe for each group of data pins.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	DQSCLK_ROT_CLK_N0: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD00B – MEMINTD03B in register 0 and MEMINTD08B – MEMINTD11B in register 1. This value is updated by hardware.
56	RO	Constant = 0b0
57:63	RW	DQSCLK_ROT_CLK_N1: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINTD15B in register 1. This value is updated by hardware.

Register Name	DP16 DQSClk Phase Rotator Value 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQSCLK_PR0_RANK_PAIR2_P2_[n]
Address	800002300701183F (SCOM), +0x0400_0000_0000
Description	Two phase rotator values are contained within each register. Two registers exist for each rank pair. These phase rotator values are the values needed to align the internal SysClk to the incoming DQS strobe for each group of data pins.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	DQSCLK_ROT_CLK_N0: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD00B – MEMINTD03B in register 0 and MEMINTD08B – MEMINTD11B in register 1. This value is updated by hardware.
56	RO	Constant = 0b0
57:63	RW	DQSCLK_ROT_CLK_N1: This field contains the DQS clock rotator value used to align the SysClk to the incoming DQS strobe for DQ pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINTD15B in register 1. This value is updated by hardware.

Register Name	DP16 Write Delay Value 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_0_RP2_REG_P0_[n]
Address	800002380701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_0_RP2_REG_P1_[n]
Address	800002380701143F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 2 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_2_RP2_REG_P1_[n]
Address	8000023A0701143F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 2 RP2 Register [n] (n=0:4)

Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_6_RP2_REG_P3_[n]
Address	8000023E07011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 7 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_7_RP2_REG_P0_[n]
Address	8000023F0701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000

Address	800002430701143F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 11 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_11_RP2_REG_P2_[n]
Address	800002430701183F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 16 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_16_RP2_REG_P0_[n]
Address	800002480701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 16 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_16_RP2_REG_P1_[n]
Address	800002480701143F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description

0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 22 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_22_RP2_REG_P0_[n]
Address	8000024E0701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 22 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_22_RP2_REG_P1_[n]
Address	8000024E0701143F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 22 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_22_RP2_REG_P2_[n]
Address	8000024E0701183F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 22 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_22_RP2_REG_P3_[n]
Address	8000024E07011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Read Delay Value 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY0_RANK_PAIR2_P0_[n]
Address	800002500701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read delay values for two of the MEMINTDnnB pins for one rank pair within the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:54	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	Constant = 0b0
56:62	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
63	RO	Constant = 0b0

Register Name	DP16 Read Delay Value 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY0_RANK_PAIR2_P1_[n]
Address	800002500701143F (SCOM), +0x0400_0000_0000
Description	This register holds the read delay values for two of the MEMINTDnnB pins for one rank pair within the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:54	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	Constant = 0b0
56:62	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

Bits	SCOM	Field Mnemonic: Description
63	RO	Constant = 0b0

Register Name	DP16 Read Delay Value 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY0_RANK_PAIR2_P2_[n]
Address	800002500701183F (SCOM), +0x0400_0000_0000
Description	This register holds the read delay values for two of the MEMINTDnnB pins for one rank pair within the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description

Address	800002540701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read delay values for two of the MEMINTDnnB pins for one rank pair within the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:54	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	Constant = 0b0
56:62	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
63	RO	Constant = 0b0

Register Name	DP16 Read Delay Value 7 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY7_RANK_PAIR2_P3_[n]
Address	8000025707011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the read delay values for two of the MEMINTDnnB pins for one rank pair within the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:54	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	Constant = 0b0

Bits	SCOM	Field Mnemonic: Description
56:62	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
63	RO	Constant = 0b0

Register Name	**DP16 Initial DQS Alignment 0 RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN0_RANK_PAIR2_P0_[n]
Address	8000025C0701103F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N0: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.
56	RO	Reserved.
57:63	RO	INITIAL_DQS_ROT_N1: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	**DP16 Initial DQS Alignment 0 RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN0_RANK_PAIR2_P1_[n]
Address	8000025C0701143F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N0: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.
56	RO	Reserved.
57:63	RO	INITIAL_DQS_ROT_N1: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	DP16 Initial DQS Alignment 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN0_RANK_PAIR2_P2_[n]
Address	8000025C0701183F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N0: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.
56	RO	Reserved.
57:63	RO	INITIAL_DQS_ROT_N1: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	DP16 Initial DQS Alignment 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN0_RANK_PAIR2_P3_[n]
Address	8000025C07011C3F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N0: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.
56	RO	Reserved.
57:63	RO	INITIAL_DQS_ROT_N1: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	DP16 Initial DQS Alignment 1 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN1_RANK_PAIR2_P0_[n]
Address	8000025D0701103F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N2: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.

Bits	SCOM	Field Mnemonic: Description
56	RO	Constant = 0b0
57:63	RO	INITIAL_DQS_ROT_N3: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	**DP16 Initial DQS Alignment 1 RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN1_RANK_PAIR2_P1_[n]
Address	8000025D0701143F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N2: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.
56	RO	Constant = 0b0
57:63	RO	INITIAL_DQS_ROT_N3: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	**DP16 Initial DQS Alignment 1 RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN1_RANK_PAIR2_P2_[n]
Address	8000025D0701183F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N2: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.
56	RO	Constant = 0b0
57:63	RO	INITIAL_DQS_ROT_N3: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	DP16 Initial DQS Alignment 1 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_INITIAL_DQS_ALIGN1_RANK_PAIR2_P3_[n]
Address	8000025D07011C3F (SCOM), +0x0400_0000_0000
Description	These registers hold the DQSClk phase rotator values computed by initial calibration, They are updated at multiple times during the calibration. Periodic DQS alignment uses the values to compare against for determining long-term drift.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RO	INITIAL_DQS_ROT_N2: This field holds the initial DQSClk rotator value for pins MEMINTD00B - MEMINTD03B in register 0 and MEMINTD08B - MEMINGTD11B in register 1. This value is updated by hardware.
56	RO	Constant = 0b0
57:63	RO	INITIAL_DQS_ROT_N3: This field holds the initial DQSClk rotator value for pins MEMINTD04B - MEMINTD07B in register 0 and MEMINTD12B - MEMINGTD15B in register 1.This value is updated by hardware.

Register Name	DP16 Write VREF Value 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE0_RANK_PAIR2_P0_[n]
Address	8000025E0701103F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM0: This bit contains the default and current value of the DRAM WR VREF range for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM0: This field contains the default and current value of the DRAM WR VREF value for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Write VREF Value 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE0_RANK_PAIR2_P1_[n]
Address	8000025E0701143F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM0: This bit contains the default and current value of the DRAM WR VREF range for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM0: This field contains the default and current value of the DRAM WR VREF value for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Write VREF Value 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE0_RANK_PAIR2_P2_[n]
Address	8000025E0701183F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM0: This bit contains the default and current value of the DRAM WR VREF range for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM0: This field contains the default and current value of the DRAM WR VREF value for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Bits	SCOM	Field Mnemonic: Description
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Write VREF Value 0 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE0_RANK_PAIR2_P3_[n]
Address	8000025E07011C3F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM0: This bit contains the default and current value of the DRAM WR VREF range for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM0: This field contains the default and current value of the DRAM WR VREF value for DRAM0 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Write VREF Value 1 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR2_P0_[n]
Address	8000025F0701103F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Bits	SCOM	Field Mnemonic: Description
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 1 RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR2_P1_[n]
Address	8000025F0701143F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 1 RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR2_P2_[n]
Address	8000025F0701183F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Write VREF Value 1 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR2_P3_[n]
Address	8000025F07011C3F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Read Eye Size 0 RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE0_RANK_PAIR2_P0_[n]
Address	800002600701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	**DP16 Read Eye Size 0 RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE0_RANK_PAIR2_P1_[n]
Address	800002600701143F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description

58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 3 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE3_RANK_PAIR2_P0_[n]
Address	800002630701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 6 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE6_RANK_PAIR2_P1_[n]
Address	800002660701143F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 6 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE6_RANK_PAIR2_P2_[n]
Address	800002660701183F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 9 RP2 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE9_RANK_PAIR2_P2_[n]
Address	800002690701183F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Bits	SCOM	Field Mnemonic: Description
48:55	RW	DQS_BIT_DISABLE_16_23: Bits are grouped in pairs. Bits 48:49, 50:51, 52:53, and 54:55 correspond to the differential DQS bits for each pair. 1 = Indicates that the DQS bits are disabled and do not participate in any calibration steps. Both DQS bits in the pair are set to 1b. 0 = Indicates that the DQS bits are not disabled. Both DQS bits in the pair are set to 0b. Bits 48:49 indicate the disable state of the DQS associated with QUAD0, as defined by the configurations of the DP16 Read Clock Enable and Selection Register and the DP16 Write Clock Enable and Selection Register. Bits 50:51 indicate the disable state of the DQS associated with QUAD1, as defined by the configurations of the DP16 Read Clock Enable and Selection Register and the DP16 Write Clock Enable and Selection Register. Bits 52:53 indicate the disable state of the DQS associated with QUAD2, as defined by the configurations of the DP16 Read Clock Enable and Selection Register and the DP16 Write Clock Enable and Selection Register. Bits 54:55 indicate the disable state of the DQS associated with QUAD3, as defined by the configurations of the DP16 Read Clock Enable and Selection Register and the DP16 Write Clock Enable and Selection Register.
56:63	RO	Constant = 0b00000000

Register Name	**DP16 DQS Bit Disable RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQS_BIT_DISABLE_RP2_P1_[n]
Address	8000027D0701143F (SCOM), +0x0400_0000_0000
Description	This register is used to disable each of the eight DQS pins on the DP16. During calibration operations, the hardware sets the bit in this register that corresponds to a pin on the DP16 that failed a calibration step. This register indicates which DQS pins on the DP16 failed a calibration step. This register does not indicate which calibration step failed.

56:63	RO	Constant = 0b00000000

Register Name	**DP16 Write DQ Offset Value RP2 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQ_WR_OFFSET_RP2_P0_[n]
Address	8000027E0701103F (SCOM), +0x0400_0000_0000
Description	This register contains an offset value for each quadrant. This offset allows the centered write data bits in each quadrant to be offset from the center as determined by the write-centering calibration algorithm. This register is used by the write-centering calibration state machine. This register must be configured, if needed, before the write-centering calibration algorithm is initiated. Changing the value of this register without running the write-centering calibration algorithm has no effect on the data bit write delay values.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:51	RW	DQ_WR_OFFSET_N0: This field contains the four most-significant bits of a 5-bit value. The 5-bit value is a twos complement number added to the center phase-rotator value determined by the write-centering calibration algorithm. This value is added to the center value by the write-centering calibration algorithm as the final step of write centering these pins: MEMINTD00B(n). MEMINTD01B(n). MEMINTD02B(n). MEMINTD03B(n). The least-significant bit of the 5-bit value is always 0b.
52:55	RW	DQ_WR_OFFSET_N1: This field contains the four most-significant bits of a 5-bit value. The 5-bit value is a twos complement number added to the center phase-rotator value determined by the write-centering calibration algorithm. This value is added to the center value by the write-centering calibration algorithm as the final step of write centering these pins: MEMINTD04B(n). MEMINTD05B(n). MEMINTD06B(n). MEMINTD07B(n). The least-significant bit of the 5-bit value is always 0b.

Bits	SCOM	Field Mnemonic: Description
56:59	RW	DQ_WR_OFFSET_N2: This field contains the four most-significant bits of a 5-bit value. The 5-bit value is a twos complement number added to the center phase-rotator value determined by the write-centering calibration algorithm. This value is added to the center value by the write-centering calibration algorithm as the final step of write centering these pins: MEMINTD08B(n). MEMINTD09B(n). MEMINTD10B(n). MEMINTD11B(n). The least-significant bit of the 5-bit value is always 0b.
60:63	RW	DQ_WR_OFFSET_N3: This field contains the four most-significant bits of a 5-bit value. The 5-bit value is a twos complement number added to the center phase-rotator value determined by the write-centering calibration algorithm. This value is added to the center value by the write-centering calibration algorithm as the final step of write centering these pins: MEMINTD12B(n). MEMINTD13B(n). MEMINTD14B(n). MEMINTD15B(n). The least-significant bit of the 5-bit value is always 0b.

Register Name	DP16 DQS Read Phase Select RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQS_RD_PHASE_SELECT_RANK_PAIR3_P0_[n]
Address	800003090701103F (SCOM), +0x0400_0000_0000
Description	This register contains a dynamic value that represents the phase differences between the memory clock, strobes, and the receiver clocks. Hardware determines these values during initial calibration and maintains them during periodic calibrations. One register stores phase selects for each rank pair for a total of four registers. This register is provided for diagnostic use. Do not use software to write to this register during normal use.

0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:49	RW	DQSCLK_SELECT0: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03.
50:51	RW	RDCLK_SELECT0: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03.
52:53	RW	DQSCLK_SELECT1: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07.
54:55	RW	RDCLK_SELECT1: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07.
56:57	RW	DQSCLK_SELECT2: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 08, 09, 10, 11.
58:59	RW	RDCLK_SELECT2: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 08, 09, 10, 11.
60:61	RW	DQSCLK_SELECT3: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 12, 13, 14, 15.
62:63	RW	RDCLK_SELECT3: This field contains the phase select for the MEMINTDnnB pins, where nn{0} = 12, 13, 14, 15.

Register Name	**DP16 DQS Read Phase Select RP3 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQS_RD_PHASE_SELECT_RANK_PAIR3_P1_[n]
Address	800003090701143F (SCOM), +0x0400_0000_0000
Description	This register contains a dynamic value that represents the phase differences between the memory clock, strobes, and the receiver clocks. Hardware determines these values during initial calibration and maintains them during periodic calibrations. One register stores phase selects for each rank pair for a total of four registers. This register is provided for diagnostic use. Do not use software to write to this register during normal use.

Bits	SCOM	Field Mnemonic: Description

Register Name	**DP16 Read Delay Offset 0 RP3 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY_OFFSET0_RANK_PAIR3_P0_[n]
Address	8000030C0701103F (SCOM), +0x0400_0000_0000
Description	Each register field holds the read delay offsets for four of the MEMINTDnnB pins for one rank pair in the DP16.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:55	RW	OFFSET0: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03 and nn{1} = 08, 09, 10, 11. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.
56	RO	Constant = 0b0
57:63	RW	OFFSET1: This field holds the read delay offset for the MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07 and nn{1} = 12, 13, 14, 15. This value can be written via the programming interface. It is stored in twos complement form; therefore, the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register must not be set to a nonzero value unless detailed timing analysis shows that, for a particular configuration, the read-centering algorithm places the sampling point off from the eye center.

Register Name	**DP16 DQS Gate Delay RP3 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQS_GATE_DELAY_RP3_P0_[n]
Address	800003130701103F (SCOM), +0x0400_0000_0000
Description	This register contains the DQS gate delay settings for each incoming read clock. One register exists for each rank pair. This register must be reset or written to its reset value before running or rerunning initial calibration.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	Constant = 0b000000000000000000000000000000000000000000000000
49:51	RW	DQS_GATE_DELAY_N0: This field determines when the DQS gate is opened to receive the read strobe on the DQ00 - DQ03 inputs. This field determines when the read gate is opened. It contains the number of MEMINTCLKO clock cycles. ‘0’h to ‘5’h = 0 - 5 MEMINTCLKO clock cycles. ‘6’h to ‘7’h = Unused.
52	RO	Constant = 0b0
53:55	RW	DQS_GATE_DELAY_N1: This field determines when the DQS gate is opened to receive the read strobe on the DQ04 - DQ07 inputs. This field determines when the read gate is opened. It contains the number of MEMINTCLKO clock cycles. ‘0’h to ‘5’h = 0 - 5 MEMINTCLKO clock cycles. ‘6’h to ‘7’h = Unused.
56	RO	Constant = 0b0
57:59	RW	DQS_GATE_DELAY_N2: This field determines when the DQS gate is opened to receive the read strobe on DQ08 - DQ11 inputs. This field determines when the read gate is opened. It contains the number of MEMINTCLKO clock cycles. ‘0’h to ‘5’h = 0 - 5 MEMINTCLKO clock cycles. ‘6’h to ‘7’h = Unused.
60	RO	Constant = 0b0
61:63	RW	DQS_GATE_DELAY_N3: This field determines when the DQS gate is opened to receive the read strobe on DQ12 - DQ15 inputs. This field determines when the read gate is opened. It contains the number of MEMINTCLKO clock cycles. ‘0’h to ‘5’h = 0 - 5 MEMINTCLKO clock cycles. ‘6’h to ‘7’h = Unused.

Register Name	**DP16 DQS Gate Delay RP3 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_DQS_GATE_DELAY_RP3_P1_[n]
Address	800003130701143F (SCOM), +0x0400_0000_0000
Description	This register contains the DQS gate delay settings for each incoming read clock. One register exists for each rank pair. This register must be reset or written to its reset value before running or rerunning initial calibration.

Register Name	DP16 Write Delay Value 0 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_0_RP3_REG_P0_[n]
Address	800003380701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 0 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_0_RP3_REG_P1_[n]
Address	800003380701143F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 1 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_1_RP3_REG_P3_[n]
Address	8000033907011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 2 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_2_RP3_REG_P0_[n]
Address	8000033A0701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_6_RP3_REG_P1_[n]
Address	8000033E0701143F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 6 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_6_RP3_REG_P2_[n]
Address	8000033E0701183F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 6 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_6_RP3_REG_P3_[n]
Address	8000033E07011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 11 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_11_RP3_REG_P0_[n]
Address	800003430701103F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000
48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Write Delay Value 15 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_DELAY_VALUE_15_RP3_REG_P2_[n]
Address	800003470701183F (SCOM), +0x0400_0000_0000
Description	This register holds the write delay values for one of the MEMINTDnnB pins for one rank pair within the DP16. The write-leveling calibration algorithms write this register. The write-leveling algorithm does not reset this register. The write eye-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

48:57	RW	WR_DELAY: This field contains the write delay for the MEMINTD{0-23}B pin. This value can be written via the programming interface or determined by the write eye-centering algorithm. This value is used to determine the final write phase rotator value for the given DP16 pin. The valid range of values for this field is 0 - 1FFh, which represents WR_DELAY/128 memory clock cycles of delay. These registers must be reset before running or rerunning the initial calibration. Refer to the EN_RESET_WR_DELAY_WL bit in the WC Configuration 2 Register. If this value is written via the programming interface, bit 0 must be set to 0.
58:63	RO	Constant = 0b000000

Register Name	DP16 Read Delay Value 0 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY0_RANK_PAIR3_P0_[n]
Address	800003500701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read delay values for two of the MEMINTDnnB pins for one rank pair within the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:54	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	Constant = 0b0
56:62	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
63	RO	Constant = 0b0

0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:54	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	Constant = 0b0
56:62	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
63	RO	Constant = 0b0

Register Name	DP16 Read Delay Value 3 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY3_RANK_PAIR3_P3_[n]
Address	8000035307011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the read delay values for two of the MEMINTDnnB pins for one rank pair within the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000

Description	This register holds the read delay values for two of the MEMINTDnnB pins for one rank pair within the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:54	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	Constant = 0b0
56:62	RW	RD_DELAY: This field holds the read delay for the MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface or determined by the read-centering algorithm. This value is used to determine the final read phase rotator value for the given DP16 pin. If a calibration algorithm that modifies this field sets the corresponding disable bit in the DP16 DQ Bit Disable and DP16 DQS Bit Disable Registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

Bits	SCOM	Field Mnemonic: Description
63	RO	Constant = 0b0

Register Name	DP16 Read Delay Value 7 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_DELAY7_RANK_PAIR3_P2_[n]
Address	800003570701183F (SCOM), +0x0400_0000_0000
Description	This register holds the read delay values for two of the MEMINTDnnB pins for one rank pair within the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b000000000000000000000000000000000000000000000000

The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM1: This bit contains the default and current value of the DRAM WR VREF range for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM1: This field contains the default and current value of the DRAM WR VREF value for DRAM1 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	**DP16 Write VREF Value 1 RP3 Register [n] (n=0:4)**
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR3_P0_[n]
Address	8000035F0701103F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Bits	SCOM	Field Mnemonic: Description
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Write VREF Value 1 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR3_P1_[n]
Address	8000035F0701143F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Write VREF Value 1 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR3_P2_[n]
Address	8000035F0701183F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Write VREF Value 1 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_WR_VREF_VALUE1_RANK_PAIR3_P3_[n]
Address	8000035F07011C3F (SCOM), +0x0400_0000_0000
Description	This register contains the starting and ending values of calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48	RW	Reserved.
49	RWX	WR_VREF_RANGE_DRAM2: This bit contains the default and current value of the DRAM WR VREF range for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The algorithm overwrites the initial value with the final value.
50:55	RWX	WR_VREF_VALUE_DRAM2: This bit contains the default and current value of the DRAM WR VREF value for DRAM2 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
56	RW	Reserved.
57	RWX	WR_VREF_RANGE_DRAM3: This bit contains the default and current value of the DRAM WR VREF range for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. This bit corresponds to bit A6 in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.
58:63	RWX	WR_VREF_VALUE_DRAM3: This bit contains the default and current value of the DRAM WR VREF value for DRAM3 (both x8 and x4 DRAM), as referenced by the PHY. The user configures the starting value to the value programmed by initial MRS commands. These bits correspond to bits A5 - A0 (bit 2 corresponds to bit A5) in MR6 in the DDR4 JEDEC specification. The algorithm overwrites the initial value with the final value.

Register Name	DP16 Read Eye Size 0 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE0_RANK_PAIR3_P0_[n]
Address	800003600701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 0 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE0_RANK_PAIR3_P1_[n]
Address	800003600701143F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description

Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE2_RANK_PAIR3_P2_[n]
Address	800003620701183F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 2 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE2_RANK_PAIR3_P3_[n]
Address	8000036207011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description

Address	8000036507011C3F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 6 RP3 Register [n] (n=0:4)

Address	800003690701103F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	Constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.
56:57	RO	Constant = 0b00
58:63	RWX	RD_EYE_SIZE: This field contains the read eye size for the MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps that captured valid data during the read-centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface or determined by the read-centering algorithm. This value, in addition to the corresponding RD_DELAY field in the DP16 Read Delay Value {0-11} Register, determines the left, right, and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the read delay value.

Register Name	DP16 Read Eye Size 9 RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_READ_EYE_SIZE9_RANK_PAIR3_P1_[n]
Address	800003690701143F (SCOM), +0x0400_0000_0000
Description	This register holds the read eye size for two of the MEMINTDnnB pins for one rank pair in the DP16. The read-centering calibration algorithm writes this register. The read-centering algorithm does not reset this register. The read-centering algorithm uses this register value as a starting point for the algorithm.

Register Name	DP16 DQ Bit Disable RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQ_BIT_DISABLE_RP3_P0_[n]
Address	8000037C0701103F (SCOM), +0x0400_0000_0000
Description	This register is used to disable each of the 16 pins on the DP16. During calibration operations, the hardware sets the bit in this register that corresponds to a pin on the DP16 that failed a calibration step. This register indicates which DQ pins on the DP16 failed a calibration step. This register does not indicate which calibration step failed.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	Constant = 0b00000000000000000000000000000000000000000000000000000000
48:63	RW	DQ_BIT_DISABLE_0_15: 1 = Indicates that the DP16 bit is disabled and does not participate in any calibration steps. 0 = Indicates that the DP16 bit is not disabled. Bit 48 controls MEMINTD00B(n). Bit 49 controls MEMINTD01B(n). Bit 50 controls MEMINTD02B(n). ... Bit 63 controls MEMINTD15B(n). where n is the DP16 instance number.

Register Name	DP16 DQ Bit Disable RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQ_BIT_DISABLE_RP3_P1_[n]
Address	8000037C0701143F (SCOM), +0x0400_0000_0000
Description	This register is used to disable each of the 16 pins on the DP16. Bit 48 controls MEMINTD00B(n). Bit 49 controls MEMINTD01B(n). Bit 50 controls MEMINTD02B(n). ... Bit 63 controls MEMINTD15B(n). where n is the DP16 instance number.

Register Name	DP16 DQ Bit Disable RP3 Register [n] (n=0:4)
Mnemonic	IOM0.DDRPHY_DP16_DQ_BIT_DISABLE_RP3_P2_[n]
Address	8000037C0701183F (SCOM), +0x0400_0000_0000
Description	This register is used to disable each of the 16 pins on the DP16. During calibration operations, the hardware sets the bit in this register that corresponds to a pin on the DP16 that failed a calibration step. This register indicates which DQ pins on the DP16 failed a calibration step. This register does not indicate which calibration step failed.

Bits	SCOM	Field Mnemonic: Description
