49	RWX	TX_LANE_BIST_ACTVITY_DET: This bit indicates whether activity was detected in the PRBS checker. 0b0 = No activity. 0b1 = Activity was found during TXBIST.
50:51	RWX	TX_SEG_TEST_STATUS: This field contains the driver segment test result. Bit 0 is used for PAD P. Bit 1 is used for PAD N.
52:62	RO	constant = 0b00000000000
63	ROX	Reserved field.

Register Name	Transmit STAT1 Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#3.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_STAT1_PL
Address	80041C2F0601143F (SCOM)
Description	This register contains the first set of transmit status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_LANE_BIST_ERR: This bit indicates whether TXBIST found an error. 0b0 = No error. 0b1 = An error was found during TXBIST.
49	RWX	TX_LANE_BIST_ACTVITY_DET: This bit indicates whether activity was detected in the PRBS checker. 0b0 = No activity. 0b1 = Activity was found during TXBIST.
50:51	RWX	TX_SEG_TEST_STATUS: This field contains the driver segment test result. Bit 0 is used for PAD P. Bit 1 is used for PAD N.
52:62	RO	constant = 0b00000000000
63	ROX	Reserved field.

Register Name	Transmit STAT1 Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#3.TXPACK.DD.SLICE#4.DD.TX_BIT_REGS.TX_STAT1_PL
Address	80041C300601143F (SCOM)
Description	This register contains the first set of transmit status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RWX	TX_LANE_BIST_ERR: This bit indicates whether TXBIST found an error. 0b0 = No error. 0b1 = An error was found during TXBIST.
49	RWX	TX_LANE_BIST_ACTVITY_DET: This bit indicates whether activity was detected in the PRBS checker. 0b0 = No activity. 0b1 = Activity was found during TXBIST.
50:51	RWX	TX_SEG_TEST_STATUS: This field contains the driver segment test result. Bit 0 is used for PAD P. Bit 1 is used for PAD N.
52:62	RO	constant = 0b00000000000
63	ROX	Reserved field.

Register Name	**Transmit FIR Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#0.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_PL
Address	800424000601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#0.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_PL
Address	800424010601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#0.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_PL
Address	800424020601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#0.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_PL
Address	800424030601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#1.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_PL
Address	800424040601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#1.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_PL
Address	800424050601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#1.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_PL
Address	800424060601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#1.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_PL
Address	800424070601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#2.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_PL
Address	800424080601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#2.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_PL
Address	800424090601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#2.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004240A0601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#2.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004240B0601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004240C0601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004240D0601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004240E0601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004240F0601143F (SCOM)
Description	This is a reserved register.

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#3.TXPACK.DD.SLICE#4.DD.TX_BIT_REGS.TX_FIR_PL
Address	800424300601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#0.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C000601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#0.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C010601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#0.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C020601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#0.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C030601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#1.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C040601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.

Bits	SCOM	Field Mnemonic: Description
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#1.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C050601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#1.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C060601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#1.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C070601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#2.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C080601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#2.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C090601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#2.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0A0601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#2.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0B0601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0C0601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0D0601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0E0601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0F0601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.

Bits	SCOM	Field Mnemonic: Description
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#4.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C100601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#0.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C200601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#0.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C210601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#0.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C220601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#0.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C230601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#1.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C240601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#1.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C250601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#1.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C260601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#1.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C270601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#2.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C280601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit FIR Mask Per-Lane Register**
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#2.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C290601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.

Bits	SCOM	Field Mnemonic: Description
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#2.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C2A0601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#3.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C2F0601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#3.TXPACK.DD.SLICE#4.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C300601143F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#0.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434000601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#0.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434010601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#0.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434020601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#0.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434030601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.

Bits	SCOM	Field Mnemonic: Description
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#1.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434040601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#1.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434050601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#1.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434060601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#1.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434070601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#2.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434080601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#2.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434090601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#2.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340A0601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#2.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340B0601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340C0601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340D0601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340E0601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.

Bits	SCOM	Field Mnemonic: Description
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340F0601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX0.TXPACKS#3.TXPACK.DD.SLICE#4.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434100601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#0.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434200601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#0.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434210601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#0.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434220601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#0.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434230601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#1.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434240601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#1.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434250601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#1.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434260601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#1.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434270601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#2.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434280601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.

Bits	SCOM	Field Mnemonic: Description
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#2.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	800434290601143F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.

0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	RW	TX_PRBS_SEED_VALUE_0_15: Transmit per-lane PRBS seed value. This field is used to specify the loading value of the PRBS scramble pattern when the synchronous pattern is detected. This must be set consistent with rx_prbs_seed_value. When connected to legacy POWER8 memory buffer parts, the seed must load such that it matches the sequence of those legacy parts. The patterns listed here match that, including variants required to seed in full- or half-width mode. 0b0000000000000000 = TX PRBS tap points A and B, and TX half-width tap point A. 0b0000000000011110 = TX PRBS tap point C. 0b0000000000011111 = TX PRBS tap point D. 0b0000000000001111 = TX PRBS tap point E, and TX half-width tap point B. 0b0000000001111100 = TX PRBS tap point F. 0b0000110001100011 = TX PRBS tap point G. 0b0000111001110011 = TX PRBS tap point H. 0b0000000111101111 = TX half-width PRBS tap point C. 0b0000000111110001 = TX half-width PRBS tap point D. 0b0000000011111011 = TX half-width PRBS tap point E. 0b0000011111000010 = TX half-width PRBS tap point F. 0b1100011000110001 = TX half-width PRBS tap point G. 0b1110011100111001 = TX half-width PRBS tap point H.

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#1.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	800454270601143F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#2.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	800454280601143F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#2.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	800454290601143F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#2.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004542A0601143F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#2.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004542B0601143F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#3.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004542C0601143F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#3.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004542D0601143F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#3.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004542E0601143F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#3.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004542F0601143F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOF2.TX_WRAP.TX1.TXPACKS#3.TXPACK.DD.SLICE#4.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	800454300601143F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Spare Mode Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_SPARE_MODE_PG
Address	800800000601143F (SCOM)
Description	This register contains per-group spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PG_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	RX_PG_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	RX_PG_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	RX_PG_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	RX_PG_SPARE_MODE_4: This debug switch prevents the rx_sls_hndshk_state state machine and the rx_dyn_recal_hndshk_state state machine from ever being allowed to run at the same time. Setting this bit turns this feature off.
53:63	RO	constant = 0b00000000000

Register Name	Receive Spare Mode Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_SPARE_MODE_PG
Address	800800200601143F (SCOM)
Description	This register contains per-group spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PG_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	RX_PG_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	RX_PG_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	RX_PG_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	RX_PG_SPARE_MODE_4: This debug switch prevents the rx_sls_hndshk_state state machine and the rx_dyn_recal_hndshk_state state machine from ever being allowed to run at the same time. Setting this bit turns this feature off.
53:63	RO	constant = 0b00000000000

Register Name	Receive ID1 Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_ID1_PG
Address	800808000601143F (SCOM)
Description	This register is used to set the bus number of a clock group.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_BUS_ID: This field is used to programmatically set the bus number that a clock group belongs to.
54:63	RO	constant = 0b0000000000

Register Name	Receive ID1 Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_ID1_PG
Address	800808200601143F (SCOM)
Description	This register is used to set the bus number of a clock group.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_BUS_ID: This field is used to programmatically set the bus number that a clock group belongs to.
54:63	RO	constant = 0b0000000000

Register Name	Receive CTL Mode 1 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE1_EO_PG
Address	800810000601143F (SCOM)
Description	This register contains the first set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_CLKDIST_PDWN: This field is used to disable the receive group clocks and put them into a low-power state.
49:50	RO	constant = 0b00
51:56	RWX	RX_BIST_MIN_EYE_WIDTH: Receive BIST minimum eye width. This field sets the minimum eye width value, in phase-rotator steps, that is considered acceptable in order to pass.
57	RWX	RX_A_BIST_EN: BIST enable pin.
58:63	RO	constant = 0b000000

Register Name	Receive CTL Mode 1 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE1_EO_PG
Address	800810200601143F (SCOM)
Description	This register contains the first set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_CLKDIST_PDWN: This field is used to disable the receive group clocks and put them into a low-power state.
49:50	RO	constant = 0b00
51:56	RWX	RX_BIST_MIN_EYE_WIDTH: Receive BIST minimum eye width. This field sets the minimum eye width value, in phase-rotator steps, that is considered acceptable in order to pass.
57	RWX	RX_A_BIST_EN: BIST enable pin.
58:63	RO	constant = 0b000000

Register Name	Receive CTL Mode 2 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE2_EO_PG
Address	800818000601143F (SCOM)
Description	This register contains the second set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:49	RWX	RX_DFE_CA_CFG: Receive DFE clock adjustment settings. This 2-bit field contains an encoded value for K as follows: \n00 = 8 \n01 = 10 \n10 = 12 \n11 = 14 Lab testing is required to determine the proper value of K.
50:53	RWX	RX_SCOPE_CONTROL: This 4-bit value indicates which scope bit is being captured. Valid values are 0 - 9.
54:59	RO	constant = 0b000000
60	RWX	RX_DATA_PIPE_CLR_ON_READ_MODE: This bit sets the data pipe capture on read mode. When set, reading rx_data_pipe_16_31 automatically captures new data. Otherwise, rx_data_pipe_capture must be written.
61:63	RO	constant = 0b000

Register Name	**Receive CTL Mode 2 EO Per-Group Register**
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE2_EO_PG
Address	800818200601143F (SCOM)
Description	This register contains the second set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_DFE_CA_CFG: Receive DFE clock adjustment settings. This 2-bit field contains an encoded value for K as follows: \n00 = 8 \n01 = 10 \n10 = 12 \n11 = 14 Lab testing is required to determine the proper value of K.
50:53	RWX	RX_SCOPE_CONTROL: This 4-bit value indicates which scope bit is being captured. Valid values are 0 - 9.
54:59	RO	constant = 0b000000
60	RWX	RX_DATA_PIPE_CLR_ON_READ_MODE: This bit sets the data pipe capture on read mode. When set, reading rx_data_pipe_16_31 automatically captures new data. Otherwise, rx_data_pipe_capture must be written.
61:63	RO	constant = 0b000

Register Name	**Receive CTL Mode 3 EO Per-Group Register**
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE3_EO_PG
Address	800820000601143F (SCOM)
Description	This register contains the third set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_SERVO_THRESH3: This field contains the threshold used to end DFE servo operations early.
52:53	RWX	RX_DFE_HTAP_CFG: This field contains the multiplier used when running H2 - H12 operations.
54:57	RWX	RX_DFE_INIT_TIMEOUT: This field contains the timeout for DFE 2 - 12 operations during initialization.

Bits	SCOM	Field Mnemonic: Description
58:61	RWX	RX_DFE_RECAL_TIMEOUT: This field contains the timeout for DFE 2 - 12 operations during recalibration.
62:63	RO	constant = 0b00

Register Name	Receive CTL Mode 3 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE3_EO_PG
Address	800820200601143F (SCOM)
Description	This register contains the third set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_SERVO_THRESH3: This field contains the threshold used to end DFE servo operations early.
52:53	RWX	RX_DFE_HTAP_CFG: This field contains the multiplier used when running H2 - H12 operations.
54:57	RWX	RX_DFE_INIT_TIMEOUT: This field contains the timeout for DFE 2 - 12 operations during initialization.
58:61	RWX	RX_DFE_RECAL_TIMEOUT: This field contains the timeout for DFE 2 - 12 operations during recalibration.
62:63	RO	constant = 0b00

Register Name	Receive CTL Mode 4 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE4_EO_PG
Address	800828000601143F (SCOM)
Description	This register contains the fourth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_DISABLE_2TO12_CLEAR: This bit connects a configuration bit to disable the clear function when running the h1a_ratio cal.
49	RWX	RX_PEAK_ENABLE_DAC_CFG: This bit connects to a configuration bit so that the DAC can be disabled during peaking.
50	RWX	RX_AMIN_ENABLE_HDAC: This bit enables hDACs during amin measurements.
51	RWX	RX_USE_PREV_COARSE_VAL: This bit selects reading the previous integ coarse value as a starting point.
52:63	RO	constant = 0b000000000000

Register Name	Receive CTL Mode 4 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE4_EO_PG
Address	800828200601143F (SCOM)
Description	This register contains the fourth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_DISABLE_2TO12_CLEAR: This bit connects a configuration bit to disable the clear function when running the h1a_ratio cal.

Bits	SCOM	Field Mnemonic: Description
49	RWX	RX_PEAK_ENABLE_DAC_CFG: This bit connects to a configuration bit so that the DAC can be disabled during peaking.
50	RWX	RX_AMIN_ENABLE_HDAC: This bit enables hDACs during amin measurements.
51	RWX	RX_USE_PREV_COARSE_VAL: This bit selects reading the previous integ coarse value as a starting point.
52:63	RO	constant = 0b000000000000

Register Name	Receive CTL Mode 5 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE5_EO_PG
Address	800830000601143F (SCOM)
Description	This register contains the fifth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000
51:53	RWX	RX_DYN_RECAL_INTERVAL_TIMEOUT_SEL: Receive dynamic recalibration interval timeout selects. This timeout determines the time between status reporting timeouts. The actual time of sending a message is selected with rx_dyn_recal_status_rpt_timeout_sel. 0b000 = 1024 UI or 106.5 ns. 0b001 = 16k UI or 1.7 µs. 0b010 = 32k UI or 3.4 µs. 0b011 = 64k UI or 6.8 µs. 0b100 = 128k UI or 13.6 µs. 0b101 = 256k UI or 27.3 µs. 0b110 = 8192k UI or 872.4 µs. 0b111 = infinite.
54:55	RWX	RX_DYN_RECAL_STATUS_RPT_TIMEOUT_SEL: Receive dynamic recalibration status reporting timeout selects. This timeout determines the time that a status reporting timeout lasts. The first 1/4 is a blank period, the middle 1/2 is the command message, and the last 1/4 is another blank period. The time between messages is selected with rx_dyn_recal_interval_timeout_sel. 0B00 = 512 UI or 53.2 ns. 0B01 = 1024 UI or 106.5 ns. 0B10 = 2048 UI or 212.9 ns. 0B11 = 4096 UI or 426.0 ns.
56:59	RWX	RX_TRACKING_TIMEOUT_SEL: This field sets the time to wait for phase tracking to lock on the edge before proceeding in the state machine.
60:63	RWX	RX_PUP_LITE_WAIT_SEL: This field sets the time to wait for analog logic to power up an unused spare lane for recalibration and repair.

Register Name	Receive CTL Mode 5 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE5_EO_PG
Address	800830200601143F (SCOM)
Description	This register contains the fifth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
51:53	RWX	RX_DYN_RECAL_INTERVAL_TIMEOUT_SEL: Receive dynamic recalibration interval timeout selects. This timeout determines the time between status reporting timeouts. The actual time of sending a message is selected with rx_dyn_recal_status_rpt_timeout_sel. 0b000 = 1024 UI or 106.5 ns. 0b001 = 16k UI or 1.7 μs. 0b010 = 32k UI or 3.4 μs. 0b011 = 64k UI or 6.8 μs. 0b100 = 128k UI or 13.6 μs. 0b101 = 256k UI or 27.3 μs. 0b110 = 8192k UI or 872.4 μs. 0b111 = infinite.
54:55	RWX	RX_DYN_RECAL_STATUS_RPT_TIMEOUT_SEL: Receive dynamic recalibration status reporting timeout selects. This timeout determines the time that a status reporting timeout lasts. The first 1/4 is a blank period, the middle 1/2 is the command message, and the last 1/4 is another blank period. The time between messages is selected with rx_dyn_recal_interval_timeout_sel. 0B00 = 512 UI or 53.2 ns. 0B01 = 1024 UI or 106.5 ns. 0B10 = 2048 UI or 212.9 ns. 0B11 = 4096 UI or 426.0 ns
56:59	RWX	RX_TRACKING_TIMEOUT_SEL: This field sets the time to wait for phase tracking to lock on the edge before proceeding in the state machine.
60:63	RWX	RX_PUP_LITE_WAIT_SEL: This field sets the time to wait for analog logic to power up an unused spare lane for recalibration and repair.

Register Name	Receive CTL Mode 6 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE6_EO_PG
Address	800838000601143F (SCOM)
Description	This register contains the sixth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_EO_CONVERGED_END_COUNT: This field contains the end value of the receive eye-optimization convergence counter. This value represents the number of times through the vga + CTLE peaking substeps before giving up.
52:53	RWX	RX_HIST_MIN_EYE_WIDTH_MODE: This field indicates the receive historic eye width and height minimum measurement mode.
54:55	RWX	RX_HIST_MIN_EYE_HEIGHT_MODE: Receive historic eye-height minimum measurement mode. This field is inoperative on POWER8 processor with NVLink technology hardware. Use the rx_hist_min_eye_width_mode control instead. Set both the width and height_mode controls to the same value in test routines to maintain compatibility.
56:59	RWX	RX_AMP_GAIN_CNT_MAX: This field indicates the maximum number of attempts to adjust VGA gain before doing a peaking operation.
60:63	RO	constant = 0b0000

Register Name	Receive CTL Mode 6 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE6_EO_PG
Address	800838200601143F (SCOM)
Description	This register contains the sixth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_EO_CONVERGED_END_COUNT: This field contains the end value of the receive eye-optimization convergence counter. This value represents the number of times through the vga + CTLE peaking substeps before giving up.
52:53	RWX	RX_HIST_MIN_EYE_WIDTH_MODE: This field indicates the receive historic eye width and height minimum measurement mode.
54:55	RWX	RX_HIST_MIN_EYE_HEIGHT_MODE: Receive historic eye-height minimum measurement mode. This field is inoperative on POWER8 processor with NVLink technology hardware. Use the rx_hist_min_eye_width_mode control instead. Set both the width and height_mode controls to the same value in test routines to maintain compatibility.
56:59	RWX	RX_AMP_GAIN_CNT_MAX: This field indicates the maximum number of attempts to adjust VGA gain before doing a peaking operation.
60:63	RO	constant = 0b0000

Register Name	Receive CTL Mode 7 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE7_EO_PG
Address	800840000601143F (SCOM)
Description	This register contains the seventh set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_ABORT_CHECK_TIMEOUT_SEL: This field selects the abort check timeout value.
52:55	RWX	RX_POLLING_TIMEOUT_SEL: This field selects the polling read timeout value.
56:59	RWX	RX_PSAVE_MODE_TIMEOUT_SEL: This field indicates how long to wait for analog logic to power up an unused spare lane for recalibration and repair.
60:63	RWX	RX_DYN_RECAL_OVERALL_TIMEOUT_SEL: This field contains the dynamic recalibration overall timeout selects.

Register Name	Receive CTL Mode 7 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE7_EO_PG
Address	800840200601143F (SCOM)
Description	This register contains the seventh set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_ABORT_CHECK_TIMEOUT_SEL: This field selects the abort check timeout value.
52:55	RWX	RX_POLLING_TIMEOUT_SEL: This field selects the polling read timeout value.
56:59	RWX	RX_PSAVE_MODE_TIMEOUT_SEL: This field indicates how long to wait for analog logic to power up an unused spare lane for recalibration and repair.
60:63	RWX	RX_DYN_RECAL_OVERALL_TIMEOUT_SEL: This field contains the dynamic recalibration overall timeout selects.

Register Name	Receive CTL Mode 8 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE8_EO_PG
Address	800848000601143F (SCOM)
Description	This register contains the eighth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:55	RO	constant = 0b00000000000000000000000000000000000000000000000000000000
56:63	RWX	RX_MAX_BER_CHECK_COUNT: This field indicates the maximum acceptable number of bit errors allowable after recalibration.

Register Name	Receive CTL Mode 8 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE8_EO_PG
Address	800848200601143F (SCOM)
Description	This register contains the eighth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:55	RO	constant = 0b00000000000000000000000000000000000000000000000000000000
56:63	RWX	RX_MAX_BER_CHECK_COUNT: This field indicates the maximum acceptable number of bit errors allowable after recalibration.

Register Name	Receive CTL Mode 9 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE9_EO_PG
Address	800850000601143F (SCOM)
Description	This register contains the ninth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RX_MIN_EYE_WIDTH: This field indicates the minimum acceptable eye width used during initial or recalibration results checking. (EDI or EI4).
56:63	RWX	RX_MIN_EYE_HEIGHT: This field indicates the minimum acceptable eye height used during initial or recalibration results checking. (EDI only).

Register Name	Receive CTL Mode 9 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE9_EO_PG
Address	800850200601143F (SCOM)
Description	This register contains the ninth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RX_MIN_EYE_WIDTH: This field indicates the minimum acceptable eye width used during initial or recalibration results checking. (EDI or EI4).
56:63	RWX	RX_MIN_EYE_HEIGHT: This field indicates the minimum acceptable eye height used during initial or recalibration results checking. (EDI only).

Register Name	Receive CTL Mode 10 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE10_EO_PG
Address	800858000601143F (SCOM)
Description	This register contains the tenth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_AMP_INIT_CFG: This register controls the servo filter for amplitude measurements during initialization.
51:53	RWX	RX_AMP_RECAL_CFG: This register controls the servo filter for amplitude measurements during recalibration.
54:56	RWX	RX_PEAK_INIT_CFG: This register controls the servo filter for peaking during initialization.
57:59	RWX	RX_PEAK_RECAL_CFG: This register controls the servo filter for peaking during recalibration.
60:63	RWX	RX_AMP_CFG: This register controls the servo filter for rx_amp_0 and rx_amp_1 servo ops.

Register Name	Receive CTL Mode 10 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE10_EO_PG
Address	800858200601143F (SCOM)
Description	This register contains the tenth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_AMP_INIT_CFG: This register controls the servo filter for amplitude measurements during initialization.
51:53	RWX	RX_AMP_RECAL_CFG: This register controls the servo filter for amplitude measurements during recalibration.
54:56	RWX	RX_PEAK_INIT_CFG: This register controls the servo filter for peaking during initialization.
57:59	RWX	RX_PEAK_RECAL_CFG: This register controls the servo filter for peaking during recalibration.
60:63	RWX	RX_AMP_CFG: This register controls the servo filter for rx_amp_0 and rx_amp_1 servo ops.

Register Name	Receive CTL Mode 11 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE11_EO_PG
Address	800860000601143F (SCOM)
Description	This register contains the 11th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_OFF_INIT_CFG: This register controls the servo filter for offset measurements during initialization.
51:53	RWX	RX_OFF_RECAL_CFG: This register controls the servo filter for offset measurements during recalibration.
54:56	RWX	RX_CM_CFG: This register controls the servo during common-mode measurement.
57:59	RWX	RX_AMIN_CFG: This register controls the servo filtering used for amin measurements.

Bits	SCOM	Field Mnemonic: Description
60:63	RWX	RX_USERDEF_CFG: This register controls the servo filtering when running the user-defined servo operations.

Register Name	Receive CTL Mode 11 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE11_EO_PG
Address	800860200601143F (SCOM)
Description	This register contains the 11th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_OFF_INIT_CFG: This register controls the servo filter for offset measurements during initialization.
51:53	RWX	RX_OFF_RECAL_CFG: This register controls the servo filter for offset measurements during recalibration.
54:56	RWX	RX_CM_CFG: This register controls the servo during common-mode measurement.
57:59	RWX	RX_AMIN_CFG: This register controls the servo filtering used for amin measurements.
60:63	RWX	RX_USERDEF_CFG: This register controls the servo filtering when running the user-defined servo operations.

Register Name	Receive CTL Mode 12 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE12_EO_PG
Address	800868000601143F (SCOM)
Description	This register contains the 12th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_SERVO_CHG_CFG: This register controls the minimum acceptable changes of the accumulator for a valid servo operation. It is used to assure that we have reached a stable point.
52:54	RWX	RX_DAC_BO_CFG: This register controls the time of the DAC black out time.
55:56	RWX	RX_FILTER_MODE: Servo filter mode. 00 = Normal filter during the entire operation. 01 = Use the 1/4 - 1/2 mode. 10 = 1/8 - 1/4 mode. 11 = Automatic convergence detect mode.
57:58	RWX	RX_MISC_CFG: These are per-group receive miscellaneous configuration bits. Bit 0 is used to re-enable the progressive filter mode for peaking. Bit 1, when 1, enables the clearing of H1 during the amp0, amp1, and user-defined servo operations.
59	RWX	RX_DISABLE_H1_CLEAR: Per group. When set, this bit disables the clearing when running servo operations that typically clear and restore the H1 registers.
60:62	RWX	RX_VOFF_CFG: This is a per-group configuration register that is used for setting the filter value when running the VREF version of offset on edge latches.
63	RWX	RX_LOFF_AMP_EN: When set to 1, the amp DAC is enabled during the loff versions of local latch offset cancellation.

Register Name	Receive CTL Mode 12 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE12_EO_PG
Address	800868200601143F (SCOM)
Description	This register contains the 12th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_SERVO_CHG_CFG: This register controls the minimum acceptable changes of the accumulator for a valid servo operation. It is used to assure that we have reached a stable point.
52:54	RWX	RX_DAC_BO_CFG: This register controls the time of the DAC black out time.
55:56	RWX	RX_FILTER_MODE: Servo filter mode. 00 = Normal filter during the entire operation. 01 = Use the 1/4 - 1/2 mode. 10 = 1/8 - 1/4 mode. 11 = Automatic convergence detect mode.
57:58	RWX	RX_MISC_CFG: These are per-group receive miscellaneous configuration bits. Bit 0 is used to re-enable the progressive filter mode for peaking. Bit 1, when 1, enables the clearing of H1 during the amp0, amp1, and user-defined servo operations.
59	RWX	RX_DISABLE_H1_CLEAR: Per group. When set, this bit disables the clearing when running servo operations that typically clear and restore the H1 registers.
60:62	RWX	RX_VOFF_CFG: This is a per-group configuration register that is used for setting the filter value when running the VREF version of offset on edge latches.
63	RWX	RX_LOFF_AMP_EN: When set to 1, the amp DAC is enabled during the loff versions of local latch offset cancellation.

Register Name	Receive CTL Mode 13 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE13_EO_PG
Address	800870000601143F (SCOM)
Description	This register contains the 13th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49:55	RWX	RX_CM_OFFSET_VAL: This field contains the value used to offset the amp DAC when running common mode.
56:59	RWX	RX_SERVO_THRESH1: This field contains the value used as a threshold of when to switch to normal filtering mode.
60:63	RWX	RX_SERVO_THRESH2: This field contains the value used as a threshold of when we think the servo has converged.

Register Name	Receive CTL Mode 13 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE13_EO_PG
Address	800870200601143F (SCOM)
Description	This register contains the 13th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49:55	RWX	RX_CM_OFFSET_VAL: This field contains the value used to offset the amp DAC when running common mode.
56:59	RWX	RX_SERVO_THRESH1: This field contains the value used as a threshold of when to switch to normal filtering mode.
60:63	RWX	RX_SERVO_THRESH2: This field contains the value used as a threshold of when we think the servo has converged.

Register Name	Receive CTL Mode 14 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE14_EO_PG
Address	800878000601143F (SCOM)
Description	This register contains the 14th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_AMP_INIT_TIMEOUT: This field is used for amplitude measurements during initialization.
52:55	RWX	RX_AMP_RECAL_TIMEOUT: This field is used for amplitude measurements during recalibration.
56:59	RWX	RX_PEAK_INIT_TIMEOUT: This field is used for peaking measurements during initialization.
60:63	RWX	RX_PEAK_RECAL_TIMEOUT: This field is used for peaking measurements during recalibration

Register Name	Receive CTL Mode 14 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE14_EO_PG
Address	800878200601143F (SCOM)
Description	This register contains the 14th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_AMP_INIT_TIMEOUT: This field is used for amplitude measurements during initialization.
52:55	RWX	RX_AMP_RECAL_TIMEOUT: This field is used for amplitude measurements during recalibration.
56:59	RWX	RX_PEAK_INIT_TIMEOUT: This field is used for peaking measurements during initialization.
60:63	RWX	RX_PEAK_RECAL_TIMEOUT: This field is used for peaking measurements during recalibration

Register Name	Receive CTL Mode 15 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE15_EO_PG
Address	800880000601143F (SCOM)
Description	This register contains the 15th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_OFF_INIT_TIMEOUT: This field is used for offset measurements during initialization.

Bits	SCOM	Field Mnemonic: Description
52:55	RWX	RX_OFF_RECAL_TIMEOUT: This field is used for offset measurements during recalibration.
56:59	RWX	RX_CM_TIMEOUT: This field is used for common-mode measurements.
60:63	RWX	RX_AMIN_TIMEOUT: This field is used for Amin measurements.

Register Name	Receive CTL Mode 15 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE15_EO_PG
Address	800880200601143F (SCOM)
Description	This register contains the 15th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_OFF_INIT_TIMEOUT: This field is used for offset measurements during initialization.
52:55	RWX	RX_OFF_RECAL_TIMEOUT: This field is used for offset measurements during recalibration.
56:59	RWX	RX_CM_TIMEOUT: This field is used for common-mode measurements.
60:63	RWX	RX_AMIN_TIMEOUT: This field is used for Amin measurements.

Register Name	Receive CTL Mode 16 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE16_EO_PG
Address	800888000601143F (SCOM)
Description	This register contains the 16th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_AMP_TIMEOUT: This timeout is used when running the generic amplitude servo operations.
52:55	RWX	RX_USERDEF_TIMEOUT: This timeout is used when using the user-defined servo operations.
56:59	RWX	RX_BER_TIMEOUT: This timeout is used when making bit error measurements with a servo operation.
60:63	RWX	RX_SPARE4_TIMEOUT: This timeout is currently a spare.

Register Name	Receive CTL Mode 16 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE16_EO_PG
Address	800888200601143F (SCOM)
Description	This register contains the 16th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_AMP_TIMEOUT: This timeout is used when running the generic amplitude servo operations.
52:55	RWX	RX_USERDEF_TIMEOUT: This timeout is used when using the user-defined servo operations.
56:59	RWX	RX_BER_TIMEOUT: This timeout is used when making bit error measurements with a servo operation.
60:63	RWX	RX_SPARE4_TIMEOUT: This timeout is currently a spare.

Register Name	Receive CTL Mode 17 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE17_EO_PG
Address	800890000601143F (SCOM)
Description	This register contains the 17th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_AMAX_HIGH: This field contains the receive Amax high target in amplitude DAC steps (as measured by the 2Ap-Amin method). The default is d120.
56:63	RWX	RX_AMAX_LOW: This field contains the receive Amax low target in amplitude DAC steps (as measured by the 2Ap-Amin method). The default is d80.

Register Name	Receive CTL Mode 17 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE17_EO_PG
Address	800890200601143F (SCOM)
Description	This register contains the 17th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_AMAX_HIGH: This field contains the receive Amax high target in amplitude DAC steps (as measured by the 2Ap-Amin method). The default is d120.
56:63	RWX	RX_AMAX_LOW: This field contains the receive Amax low target in amplitude DAC steps (as measured by the 2Ap-Amin method). The default is d80.

Register Name	Receive CTL Mode 18 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE18_EO_PG
Address	800898000601143F (SCOM)
Description	This register contains the 18th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_AMP0_FILTER_MASK: This register controls the filter and mask for the Amp_0 servo operations.
56:63	RWX	RX_AMP1_FILTER_MASK: This register controls the filter and mask for the Amp_1 servo operations.

Register Name	Receive CTL Mode 18 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE18_EO_PG
Address	800898200601143F (SCOM)
Description	This register contains the 18th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:55	RWX	RX_AMP0_FILTER_MASK: This register controls the filter and mask for the Amp_0 servo operations.
56:63	RWX	RX_AMP1_FILTER_MASK: This register controls the filter and mask for the Amp_1 servo operations.

Register Name	Receive CTL Mode 19 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE19_EO_PG
Address	8008A0000601143F (SCOM)
Description	This register contains the 19th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_CTLE_GAIN_MAX: This field contains the receive CTLE (VGA) gain maximum allowable gain value.
52:55	RO	constant = 0b0000
56:63	RWX	RX_AMP_START_VAL: This field contains the receive amp start value, used when making amplitude measurements as the starting point.

Register Name	Receive CTL Mode 19 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE19_EO_PG
Address	8008A0200601143F (SCOM)
Description	This register contains the 19th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_CTLE_GAIN_MAX: This field contains the receive CTLE (VGA) gain maximum allowable gain value.
52:55	RO	constant = 0b0000
56:63	RWX	RX_AMP_START_VAL: This field contains the receive amp start value, used when making amplitude measurements as the starting point.

Register Name	Receive CTL Mode 20 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE20_EO_PG
Address	8008A8000601143F (SCOM)
Description	This register contains the 20th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_DFE_CONVERGED_CNT_MAX: This field contains the number of iterations through DFE H1 and kH1Ap adjustment before ending DFE, unless it is ended by the rx_ap110ap010_delta criteria being met.
52:55	RWX	RX_AP110_AP010_DELTA_MAX: This field contains the maximum delta between Apx110 and Apx010 measurements to end DFE H1 and kH1Ap adjustment, unless ended by dfe_converged_cnt_max.
56:63	RO	constant = 0b00000000

Register Name	Receive CTL Mode 20 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE20_EO_PG
Address	8008A8200601143F (SCOM)
Description	This register contains the 20th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_DFE_CONVERGED_CNT_MAX: This field contains the number of iterations through DFE H1 and kH1Ap adjustment before ending DFE, unless it is ended by the rx_ap110ap010_delta criteria being met.
52:55	RWX	RX_AP110_AP010_DELTA_MAX: This field contains the maximum delta between Apx110 and Apx010 measurements to end DFE H1 and kH1Ap adjustment, unless ended by dfe_converged_cnt_max.
56:63	RO	constant = 0b00000000

Register Name	Receive CTL Mode 21 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE21_EO_PG
Address	8008B0000601143F (SCOM)
Description	This register contains the 21st set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_EO_ENABLE_INTEG_LATCH_OFFSET_CAL: This bit is the receive eye-optimization latch offset adjustment enable with an integrator-based disable.
49	RWX	RX_EO_ENABLE_CTLE_COARSE_CAL: This bit is the receive eye-optimization coarse CTLE/Peakin enable.
50	RWX	RX_EO_ENABLE_DAC_H1_CAL: This bit is the receive eye-optimization H! DAC calibration to reference.
51	RWX	RX_EO_ENABLE_VGA_CAL: This bit is the receive eye-optimization VGA gain and offset adjustment enable.
52	RWX	RX_EO_ENABLE_DFE_H1_CAL: This bit is the receive eye-optimization DFE H1 adjustment enable.
53	RWX	RX_EO_ENABLE_H1AP_TWEAK: This bit is the receive eye-optimization H1/AN PR adjust enable.
54	RWX	RX_EO_ENABLE_DDC: This bit is the receive eye-optimization dynamic data centering enable.
55	RWX	RX_EO_ENABLE_CM_COARSE_CAL: This bit is the receive eye-optimization common-mode coarse calibration enable.
56	RWX	RX_EO_ENABLE_CM_FINE_CAL: This bit is the receive eye-optimization common-mode fine calibration enable.
57	RWX	RX_EO_ENABLE_BER_TEST: This bit is the receive eye-optimization bit-error-rate test enable.
58	RWX	RX_EO_ENABLE_RESULT_CHECK: This bit is the receive eye-optimization final results check enable.
59	RWX	RX_EO_ENABLE_CTLE_EDGE_TRACK_ONLY: This bit is the receive eye-optimization CTLE/Peakin enable with edge tracking only.
60	RWX	RX_EO_ENABLE_DFE_H2_H12_CAL: This bit is the receive eye-optimization DFE H2-to-H12 calibration enable.
61	RWX	RX_EO_ENABLE_DAC_H1_TO_A_CAL: This bit is used for receive eye-optimization H! DAC-to-amplitude DAC cross-calibration.
62	RWX	RX_EO_ENABLE_FINAL_L2U_ADJ: This bit is the receive eye-optimization final receive FIFO load-to-unload delay adjustment enable.

Bits	SCOM	Field Mnemonic: Description
63	RWX	RX_EO_ENABLE_DONE_SIGNALING: This bit is the receive eye-optimization “eye-optimization done” signaling enable.

Register Name	Receive CTL Mode 21 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE21_EO_PG
Address	8008B0200601143F (SCOM)
Description	This register contains the 21st set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_EO_ENABLE_INTEG_LATCH_OFFSET_CAL: This bit is the receive eye-optimization latch offset adjustment enable with an integrator-based disable.
49	RWX	RX_EO_ENABLE_CTLE_COARSE_CAL: This bit is the receive eye-optimization coarse CTLE/Peakin enable.
50	RWX	RX_EO_ENABLE_DAC_H1_CAL: This bit is the receive eye-optimization H! DAC calibration to reference.
51	RWX	RX_EO_ENABLE_VGA_CAL: This bit is the receive eye-optimization VGA gain and offset adjustment enable.
52	RWX	RX_EO_ENABLE_DFE_H1_CAL: This bit is the receive eye-optimization DFE H1 adjustment enable.
53	RWX	RX_EO_ENABLE_H1AP_TWEAK: This bit is the receive eye-optimization H1/AN PR adjust enable.
54	RWX	RX_EO_ENABLE_DDC: This bit is the receive eye-optimization dynamic data centering enable.
55	RWX	RX_EO_ENABLE_CM_COARSE_CAL: This bit is the receive eye-optimization common-mode coarse calibration enable.
56	RWX	RX_EO_ENABLE_CM_FINE_CAL: This bit is the receive eye-optimization common-mode fine calibration enable.
57	RWX	RX_EO_ENABLE_BER_TEST: This bit is the receive eye-optimization bit-error-rate test enable.
58	RWX	RX_EO_ENABLE_RESULT_CHECK: This bit is the receive eye-optimization final results check enable.
59	RWX	RX_EO_ENABLE_CTLE_EDGE_TRACK_ONLY: This bit is the receive eye-optimization CTLE/Peakin enable with edge tracking only.
60	RWX	RX_EO_ENABLE_DFE_H2_H12_CAL: This bit is the receive eye-optimization DFE H2-to-H12 calibration enable.
61	RWX	RX_EO_ENABLE_DAC_H1_TO_A_CAL: This bit is used for receive eye-optimization H! DAC-to-amplitude DAC cross-calibration.
62	RWX	RX_EO_ENABLE_FINAL_L2U_ADJ: This bit is the receive eye-optimization final receive FIFO load-to-unload delay adjustment enable.
63	RWX	RX_EO_ENABLE_DONE_SIGNALING: This bit is the receive eye-optimization “eye-optimization done” signaling enable.

Register Name	Receive CTL Mode 22 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE22_EO_PG
Address	8008B8000601143F (SCOM)
Description	This register contains the 22nd set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_RC_ENABLE_INTEG_LATCH_OFFSET_CAL: This bit is the receive recalibration latch offset adjustment enable with integrator-based disable.
49	RWX	RX_RC_ENABLE_CTLE_COARSE_CAL: This bit is the receive recalibration coarse CTLE/Peakin enable.
50	RWX	RX_RC_ENABLE_DAC_H1_CAL: This bit is the receive recalibration H! DAC calibration to reference enable.
51	RWX	RX_RC_ENABLE_VGA_CAL: This bit is the receive recalibration VGA gain and offset adjustment enable.
52	RWX	RX_RC_ENABLE_DFE_H1_CAL: This bit is the receive recalibration DFE H1 adjustment enable.
53	RWX	RX_RC_ENABLE_H1AP_TWEAK: This bit is the receive recalibration H1/AN PR adjustment enable.
54	RWX	RX_RC_ENABLE_DDC: This bit is the receive recalibration dynamic data-centering enable.
55	RWX	RX_RC_ENABLE_CM_COARSE_CAL: This bit is the receive recalibration common-mode coarse calibration enable.
56	RWX	RX_RC_ENABLE_CM_FINE_CAL: This bit is the receive recalibration common-mode fine calibration enable.
57	RWX	RX_RC_ENABLE_BER_TEST: This bit is the receive recalibration bit-error-rate test enable. It is unsupported. Leave it at 0.
58	RWX	RX_RC_ENABLE_RESULT_CHECK: This bit is the receive recalibration final results check enable. It is unsupported. Leave it at 0.
59	RWX	RX_RC_ENABLE_CTLE_EDGE_TRACK_ONLY: This bit is the receive recalibration CTLE/peaking enable with edge tracking only.
60	RWX	RX_RC_ENABLE_DFE_H2_H12_CAL: This bit is the receive recalibration DFE H2-to-H12 calibration enable.
61	RWX	RX_RC_ENABLE_DAC_H1_TO_A_CAL: This bit is the receive recalibration H! DAC-to-amplitude DAC cross-calibration enable.
62:63	RO	constant = 0b00

Register Name	Receive CTL Mode 22 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE22_EO_PG
Address	8008B8200601143F (SCOM)
Description	This register contains the 22nd set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_RC_ENABLE_INTEG_LATCH_OFFSET_CAL: This bit is the receive recalibration latch offset adjustment enable with integrator-based disable.
49	RWX	RX_RC_ENABLE_CTLE_COARSE_CAL: This bit is the receive recalibration coarse CTLE/Peakin enable.
50	RWX	RX_RC_ENABLE_DAC_H1_CAL: This bit is the receive recalibration H! DAC calibration to reference enable.
51	RWX	RX_RC_ENABLE_VGA_CAL: This bit is the receive recalibration VGA gain and offset adjustment enable.
52	RWX	RX_RC_ENABLE_DFE_H1_CAL: This bit is the receive recalibration DFE H1 adjustment enable.
53	RWX	RX_RC_ENABLE_H1AP_TWEAK: This bit is the receive recalibration H1/AN PR adjustment enable.
54	RWX	RX_RC_ENABLE_DDC: This bit is the receive recalibration dynamic data-centering enable.

Bits	SCOM	Field Mnemonic: Description
55	RWX	RX_RC_ENABLE_CM_COARSE_CAL: This bit is the receive recalibration common-mode coarse calibration enable.
56	RWX	RX_RC_ENABLE_CM_FINE_CAL: This bit is the receive recalibration common-mode fine calibration enable.
57	RWX	RX_RC_ENABLE_BER_TEST: This bit is the receive recalibration bit-error-rate test enable. It is unsupported. Leave it at 0.
58	RWX	RX_RC_ENABLE_RESULT_CHECK: This bit is the receive recalibration final results check enable. It is unsupported. Leave it at 0.
59	RWX	RX_RC_ENABLE_CTLE_EDGE_TRACK_ONLY: This bit is the receive recalibration CTLE/peaking enable with edge tracking only.
60	RWX	RX_RC_ENABLE_DFE_H2_H12_CAL: This bit is the receive recalibration DFE H2-to-H12 calibration enable.
61	RWX	RX_RC_ENABLE_DAC_H1_TO_A_CAL: This bit is the receive recalibration H! DAC-to-amplitude DAC cross-calibration enable.
62:63	RO	constant = 0b00

Register Name	Receive CTL Mode 23 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE23_EO_PG
Address	8008C0000601143F (SCOM)
Description	This register contains the 23rd set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_QUAD_SEL: This field selects one of four possible phases for the deserialized receive I/O clock to send along with the data for integration flexibility and tuning for slack into the receive digital logic.
50:54	RO	constant = 0b00000
55	RWX	RX_PEAK_TUNE: Peak tune bit to analog.
56	RWX	RX_LTE_EN: This bit enables LTE.
57:58	RWX	RX_IQSPD_CFG: 00 = 7.8 Gbps to less than 9.6 Gbps. 01 = 9.6 Gbps to 12 Gbps. 10 = Unused. 11 = Greater than12 Gbps to 16 Gbps.
59	RWX	RX_DFEHISPD_EN: When 1, this bit puts the DFE into high-speed mode according to the per-system settings.
60	RWX	RX_DFE12_EN: When 1, the bit enables the logic for DFE H2 - H12.
61:63	RO	constant = 0b000

Register Name	Receive CTL Mode 23 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE23_EO_PG
Address	8008C0200601143F (SCOM)
Description	This register contains the 23rd set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_QUAD_SEL: This field selects one of four possible phases for the deserialized receive I/O clock to send along with the data for integration flexibility and tuning for slack into the receive digital logic.
50:54	RO	constant = 0b00000
55	RWX	RX_PEAK_TUNE: Peak tune bit to analog.
56	RWX	RX_LTE_EN: This bit enables LTE.
57:58	RWX	RX_IQSPD_CFG: 00 = 7.8 Gbps to less than 9.6 Gbps. 01 = 9.6 Gbps to 12 Gbps. 10 = Unused. 11 = Greater than12 Gbps to 16 Gbps.
59	RWX	RX_DFEHISPD_EN: When 1, this bit puts the DFE into high-speed mode according to the per-system settings.
60	RWX	RX_DFE12_EN: When 1, the bit enables the logic for DFE H2 - H12.
61:63	RO	constant = 0b000

Register Name	Receive CTL Mode 24 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE24_EO_PG
Address	8008C8000601143F (SCOM)
Description	This register contains the 24th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_H1AP_CFG: This register controls the maximum allowed ration of H1 and Ap. This is not a servo setting, but rather the setting of a ration between H1 and the value of Ap.
50	RWX	RX_CTLE_UPDATE_MODE: This bit controls updating of the CTLE_COARSE (peaking) values.
51:55	RO	constant = 0b00000
56:63	RWX	RX_USER_FILTER_MASK: This register controls the filter and mask for user-defined servo operations.

Register Name	Receive CTL Mode 24 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE24_EO_PG
Address	8008C8200601143F (SCOM)
Description	This register contains the 24th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_H1AP_CFG: This register controls the maximum allowed ration of H1 and Ap. This is not a servo setting, but rather the setting of a ration between H1 and the value of Ap.
50	RWX	RX_CTLE_UPDATE_MODE: This bit controls updating of the CTLE_COARSE (peaking) values.
51:55	RO	constant = 0b00000
56:63	RWX	RX_USER_FILTER_MASK: This register controls the filter and mask for user-defined servo operations.

Register Name	Receive CTL Mode 29 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE29_EO_PG
Address	8008D0000601143F (SCOM)
Description	This register contains the 29th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_APX111_HIGH: This field contains the receive Amax high target, in amplitude DAC steps (as measured by ap_x111 and an_x000). The default is d102.
56:63	RWX	RX_APX111_LOW: This field contains the receive Amax low target, in amplitude DAC steps (as measured by ap_x111 and an_x000). The default is d68.

Register Name	Receive CTL Mode 29 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE29_EO_PG
Address	8008D0200601143F (SCOM)
Description	This register contains the 29th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_APX111_HIGH: This field contains the receive Amax high target, in amplitude DAC steps (as measured by ap_x111 and an_x000). The default is d102.
56:63	RWX	RX_APX111_LOW: This field contains the receive Amax low target, in amplitude DAC steps (as measured by ap_x111 and an_x000). The default is d68.

Register Name	Receive CTL CNTL1 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL1_EO_PG
Address	8008D8000601143F (SCOM)
Description	This register contains the first set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_BER_EN: Diagnostic bit error rate (BER) error checking enable control. When 1, this bit enables error checking. When 0, the error checking is disabled. This control enables the BER timer. It also enables the error checker and BER counters. The assumption is that the drivers are currently driving PRBS23, and the link was trained before enabling BER checking.
49	RWX	RX_BER_TIMER_FREEZE_EN: Diagnostic bit-error-rate (BER) timer freeze enable. When set to 1, the timer is frozen when any lane error count saturates in that pack.
50	RWX	RX_BER_COUNT_FREEZE_EN: Diagnostic BER lane error counter freeze enable. When set to 1, the per-lane error counters are frozen when the timer saturates in that pack.

Bits	SCOM	Field Mnemonic: Description
51:54	RWX	RX_BER_COUNT_SEL: Diagnostic BER lane error counter saturation select. This field selects the number of errors that saturates the counter and causes a freeze event. The default value is used during initialization and must only be changed post initialization. 0b0000 = 1. 0b0001 = 2. 0b0010 = 4. 0b0011 = 8. 0b0100 = 16. 0b0101 = 32. 0b0110 = 64. 0b0111 = 128. 0b1000 = 256. 0b1001 = 512. 0b1010 = 1024. 0b1011 = unused1. 0b1100 = unused2. 0b1101 = unused3. 0b1110 = unused4. 0b1111 = unused5.
55	RO	constant = 0b0
56:58	RWX	RX_BER_TIMER_SEL: Diagnostic BER timer saturation select. This field selects the timer value that saturates the timer and causes a freeze event. The default value is used during initialization and must only be changed post initialization. 0b000 = 2^{31}. 0b001 = 2^{27}. 0b010 = 2^{23}. 0b011 = 2^{19}. 0b100 = 2^{17}. 0b101 = 2^{13}. 0b110 = 2^{9}. 0b111 = 2^{5}.
59	RWX	RX_BER_CLR_COUNT_ON_READ_EN: Diagnostic BER lane error counter clear on read. When set to 1, this bit enables clearing a lane's error counter when it is read.
60	RWX	RX_BER_CLR_TIMER_ON_READ_EN: Diagnostic BER timer clear on read. When set to 1, this bit enables clearing a lane's timer when it is read from any lane in the pack.
61:63	RO	constant = 0b000

Register Name	Receive CTL CNTL1 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL1_EO_PG
Address	8008D8200601143F (SCOM)
Description	This register contains the first set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_BER_EN: Diagnostic bit error rate (BER) error checking enable control. When 1, this bit enables error checking. When 0, the error checking is disabled. This control enables the BER timer. It also enables the error checker and BER counters. The assumption is that the drivers are currently driving PRBS23, and the link was trained before enabling BER checking.
49	RWX	RX_BER_TIMER_FREEZE_EN: Diagnostic bit-error-rate (BER) timer freeze enable. When set to 1, the timer is frozen when any lane error count saturates in that pack.

Bits	SCOM	Field Mnemonic: Description
50	RWX	RX_BER_COUNT_FREEZE_EN: Diagnostic BER lane error counter freeze enable. When set to 1, the per-lane error counters are frozen when the timer saturates in that pack.
51:54	RWX	RX_BER_COUNT_SEL: Diagnostic BER lane error counter saturation select. This field selects the number of errors that saturates the counter and causes a freeze event. The default value is used during initialization and must only be changed post initialization. 0b0000 = 1. 0b0001 = 2. 0b0010 = 4. 0b0011 = 8. 0b0100 = 16. 0b0101 = 32. 0b0110 = 64. 0b0111 = 128. 0b1000 = 256. 0b1001 = 512. 0b1010 = 1024. 0b1011 = unused1. 0b1100 = unused2. 0b1101 = unused3. 0b1110 = unused4. 0b1111 = unused5.
55	RO	constant = 0b0
56:58	RWX	RX_BER_TIMER_SEL: Diagnostic BER timer saturation select. This field selects the timer value that saturates the timer and causes a freeze event. The default value is used during initialization and must only be changed post initialization. 0b000 = 2^{31}. 0b001 = 2^{27}. 0b010 = 2^{23}. 0b011 = 2^{19}. 0b100 = 2^{17}. 0b101 = 2^{13}. 0b110 = 2^{9}. 0b111 = 2^{5}.
59	RWX	RX_BER_CLR_COUNT_ON_READ_EN: Diagnostic BER lane error counter clear on read. When set to 1, this bit enables clearing a lane's error counter when it is read.
60	RWX	RX_BER_CLR_TIMER_ON_READ_EN: Diagnostic BER timer clear on read. When set to 1, this bit enables clearing a lane's timer when it is read from any lane in the pack.
61:63	RO	constant = 0b000

Register Name	Receive CTL CNTL2 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL2_EO_PG
Address	8008E0000601143F (SCOM)
Description	This register contains the second set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:51	RWX	RX_TRC_MODE: Receive trace mode. 0b0000 = Training state machines. 0b0001 = Dynamic repair state machines. 0b0010 = SLS handshake state machines with recovery. 0b0011 = Dynamic recalibration state machines. 0b0100 = Recalibration handshake state machine with recovery. 0b0101 = CRC or ECC tallying logic. 0b0110 = Receive SLS commands. 0b0111 = Receive bad lanes. 0b1000 = Receive SLS lanes. 0b1001 = GCR. 0b1010 = Per lane/per pack trace (see rx_pp_trc_mode for details). 0b1011 = TBD. 0b1100 = TBD. 0b1101 = TBD. 0b1110 = TBD. 0b1111 = TBD.
52:63	RO	constant = 0b000000000000

Register Name	Receive CTL CNTL2 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL2_EO_PG
Address	8008E0200601143F (SCOM)
Description	This register contains the second set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_TRC_MODE: Receive trace mode. 0b0000 = Training state machines. 0b0001 = Dynamic repair state machines. 0b0010 = SLS handshake state machines with recovery. 0b0011 = Dynamic recalibration state machines. 0b0100 = Recalibration handshake state machine with recovery. 0b0101 = CRC or ECC tallying logic. 0b0110 = Receive SLS commands. 0b0111 = Receive bad lanes. 0b1000 = Receive SLS lanes. 0b1001 = GCR. 0b1010 = Per lane/per pack trace (see rx_pp_trc_mode for details). 0b1011 = TBD. 0b1100 = TBD. 0b1101 = TBD. 0b1110 = TBD. 0b1111 = TBD.
52:63	RO	constant = 0b000000000000

Register Name	Receive CTL CNTL3 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL3_EO_PG
Address	8008E8000601143F (SCOM)
Description	This register contains the third set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_INT_MODE: This field contains the receive interrupt mode setting.
52:63	RWX	RX_INT_CURRENT_STATE: This field contains the receive interrupt current state to stop on.

Register Name	Receive CTL CNTL3 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL3_EO_PG
Address	8008E8200601143F (SCOM)
Description	This register contains the third set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_INT_MODE: This field contains the receive interrupt mode setting.
52:63	RWX	RX_INT_CURRENT_STATE: This field contains the receive interrupt current state to stop on.

Register Name	Receive CTL CNTL4 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL4_EO_PG
Address	8008F0000601143F (SCOM)
Description	This register contains the fourth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_INT_ENABLE_ENC: This field contains the receive interrupt encoded enable.
52:63	RWX	RX_INT_NEXT_STATE: This field contains the receive interrupt next state to stop on.

Register Name	Receive CTL CNTL4 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL4_EO_PG
Address	8008F0200601143F (SCOM)
Description	This register contains the fourth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_INT_ENABLE_ENC: This field contains the receive interrupt encoded enable.
52:63	RWX	RX_INT_NEXT_STATE: This field contains the receive interrupt next state to stop on.

Register Name	Receive CTL CNTL5 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL5_EO_PG
Address	8008F8000601143F (SCOM)
Description	This register contains the fifth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:51	RO	constant = 0b0000000000000000000000000000000000000000000000000000
52:63	RWX	RX_INT_GOTO_STATE: This field contains the receive interrupt state to go to upon an interrupt trigger.

Register Name	Receive CTL CNTL5 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL5_EO_PG
Address	8008F8200601143F (SCOM)
Description	This register contains the fifth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:51	RO	constant = 0b0000000000000000000000000000000000000000000000000000
52:63	RWX	RX_INT_GOTO_STATE: This field contains the receive interrupt state to go to upon an interrupt trigger.

Register Name	Receive CTL CNTL6 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL6_EO_PG
Address	800900000601143F (SCOM)
Description	This register contains the sixth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:51	RO	constant = 0b0000000000000000000000000000000000000000000000000000
52:63	RWX	RX_INT_RETURN_STATE: This field contains the receive interrupt state to go to upon return from an interrupt code.

Register Name	Receive CTL CNTL6 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL6_EO_PG
Address	800900200601143F (SCOM)
Description	This register contains the sixth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:51	RO	constant = 0b0000000000000000000000000000000000000000000000000000
52:63	RWX	RX_INT_RETURN_STATE: This field contains the receive interrupt state to go to upon return from an interrupt code.

Register Name	Receive CTL CNTL7 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTLX7_EO_PG
Address	800908000601143F (SCOM)
Description	This register contains the seventh set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_CAL_LANE_GCRMSG: This field contains the encoded calibration lane in relation to the entire receive bus (including multi-groups or partial groups).
55	RWX	RX_CAL_LANE_VAL_GCRMSG: This bit indicates that the receive calibration lane is valid.
56:60	RWX	RX_CAL_LANE_PG_PHY_GCRMSG: This field contains the encoded calibration lane in relation to the local, physical group.
61:63	RO	constant = 0b000

Register Name	Receive CTL CNTL7 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTLX7_EO_PG
Address	800908200601143F (SCOM)
Description	This register contains the seventh set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_CAL_LANE_GCRMSG: This field contains the encoded calibration lane in relation to the entire receive bus (including multi-groups or partial groups).
55	RWX	RX_CAL_LANE_VAL_GCRMSG: This bit indicates that the receive calibration lane is valid.
56:60	RWX	RX_CAL_LANE_PG_PHY_GCRMSG: This field contains the encoded calibration lane in relation to the local, physical group.
61:63	RO	constant = 0b000

Register Name	Receive CTL CNTL8 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL8_EO_PG
Address	800910000601143F (SCOM)
Description	This register contains the eighth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:62	RWX	RX_SERVO_OP: This field contains the servo operation code. It is written by the global training state machine.
63	RWX	RX_SERVO_DONE: This bit indicates that the servo operation completed. It is read by the global training state machine.

Register Name	Receive CTL CNTL8 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL8_EO_PG
Address	800910200601143F (SCOM)
Description	This register contains the eighth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:62	RWX	RX_SERVO_OP: This field contains the servo operation code. It is written by the global training state machine.
63	RWX	RX_SERVO_DONE: This bit indicates that the servo operation completed. It is read by the global training state machine.

Register Name	Receive CTL CNTL9 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL9_EO_PG
Address	800918000601143F (SCOM)
Description	This register contains the ninth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_BIST_EN: This bit enables the receive BIST state machine to begin testing. It is set by the BIST helper sequencer through a GCR message. To properly initialize and run the receive BIST, set the rx_start_bist register bit.
49	RWX	RX_BIST_EXT_START_MODE: This bit enables the receive BIST state machine to begin testing. It is set by the BIST helper sequencer through a GCR message. To properly initialize and run the receive BIST, set the rx_start_bist register bit.
50:52	RWX	RX_BIST_INIT_DISABLE: Each bit disables an individual step of the receive BIST initialization state machine when raised. Bit 0 disables the CU PLL lock. Bit 1 disables the receive FIFO initialization. Bit 2 disables eye optimization/training.
53	RWX	RX_BIST_CUPLL_LOCK_CHECK_EN: This bit enables the CU PLL lock check mode of the receive BIST initialization state machine. When set high, the test checks for the PLL lock signal and sets an error if it is not present.
54:59	RWX	RX_BIST_STORE_EYES_LANE_SEL: This register selects which lane to store receive BIST eye-width data from. The data is stored in the rx_bist_eye_a_width and rx_bist_eye_b_width registers.
60:61	RWX	RX_BIST_STORE_EYES_BANK_SEL: This register selects which bank to store receive BIST eye-width data from. 0b00 = Store bank A widths. 0b01 = Store bank B widths. 0b10 = Store bank E widths. 0b11 = EDI+ bank A.
62	RWX	RX_PERVASIVE_CAPT: This bit latches glb_ctl and jtag_bndy pervasive signals in iocrc_pervasive_capt when set high. RO register bit rx_prvcpt_change_det goes high when latched values differ from pervasive inputs.
63	RO	constant = 0b0

Register Name	Receive CTL CNTL9 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL9_EO_PG
Address	800918200601143F (SCOM)
Description	This register contains the ninth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_BIST_EN: This bit enables the receive BIST state machine to begin testing. It is set by the BIST helper sequencer through a GCR message. To properly initialize and run the receive BIST, set the rx_start_bist register bit.
49	RWX	RX_BIST_EXT_START_MODE: This bit enables the receive BIST state machine to begin testing. It is set by the BIST helper sequencer through a GCR message. To properly initialize and run the receive BIST, set the rx_start_bist register bit.

Bits	SCOM	Field Mnemonic: Description
50:52	RWX	RX_BIST_INIT_DISABLE: Each bit disables an individual step of the receive BIST initialization state machine when raised. Bit 0 disables the CU PLL lock. Bit 1 disables the receive FIFO initialization. Bit 2 disables eye optimization/training.
53	RWX	RX_BIST_CUPLL_LOCK_CHECK_EN: This bit enables the CU PLL lock check mode of the receive BIST initialization state machine. When set high, the test checks for the PLL lock signal and sets an error if it is not present.
54:59	RWX	RX_BIST_STORE_EYES_LANE_SEL: This register selects which lane to store receive BIST eye-width data from. The data is stored in the rx_bist_eye_a_width and rx_bist_eye_b_width registers.
60:61	RWX	RX_BIST_STORE_EYES_BANK_SEL: This register selects which bank to store receive BIST eye-width data from. 0b00 = Store bank A widths. 0b01 = Store bank B widths. 0b10 = Store bank E widths. 0b11 = EDI+ bank A.
62	RWX	RX_PERVASIVE_CAPT: This bit latches glb_ctl and jtag_bndy pervasive signals in iocrc_pervasive_capt when set high. RO register bit rx_prvcpt_change_det goes high when latched values differ from pervasive inputs.
63	RO	constant = 0b0

Register Name	Receive CTL CNTL10 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL10_EO_PG
Address	800920000601143F (SCOM)
Description	This register contains the tenth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_BIST_PRBS_TEST_TIME: This field controls how long the receive BIST tests the PRBS7 data for errors.
52	RWX	RX_BIST_BUS_DATA_MODE: This bit enables a mode where the receive BIST tests data from the bus.
53:56	RWX	RX_BIST_PRBS_PROP_TIME: This field controls how long the receive BIST waits between incrementing a phase rotator and beginning to test the PRBS data.
57:60	RWX	RX_BIST_PLL_LOCK_TIMEOUT: This field controls how long the receive BIST initialization waits for the PLL lock signal before timing out.
61:63	RO	constant = 0b000

Register Name	Receive CTL CNTL10 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL10_EO_PG
Address	800920200601143F (SCOM)
Description	This register contains the tenth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_BIST_PRBS_TEST_TIME: This field controls how long the receive BIST tests the PRBS7 data for errors.

Bits	SCOM	Field Mnemonic: Description
52	RWX	RX_BIST_BUS_DATA_MODE: This bit enables a mode where the receive BIST tests data from the bus.
53:56	RWX	RX_BIST_PRBS_PROP_TIME: This field controls how long the receive BIST waits between incrementing a phase rotator and beginning to test the PRBS data.
57:60	RWX	RX_BIST_PLL_LOCK_TIMEOUT: This field controls how long the receive BIST initialization waits for the PLL lock signal before timing out.
61:63	RO	constant = 0b000

Register Name	Receive CTL CNTL11 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL11_EO_PG
Address	800928000601143F (SCOM)
Description	This register contains the 11th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:56	RWX	RX_DACTEST_LLMT: This control register is used to lower the threshold limit.
57	RWX	RX_DACTEST_RESET: This control register is used to reset the DACTEST.
58	RWX	RX_DACTEST_START: This control register is used to start the DACTEST.
59:63	RO	constant = 0b00000

Register Name	Receive CTL CNTL11 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL11_EO_PG
Address	800928200601143F (SCOM)
Description	This register contains the 11th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:56	RWX	RX_DACTEST_LLMT: This control register is used to lower the threshold limit.
57	RWX	RX_DACTEST_RESET: This control register is used to reset the DACTEST.
58	RWX	RX_DACTEST_START: This control register is used to start the DACTEST.
59:63	RO	constant = 0b00000

Register Name	Receive CTL CNTL12 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL12_EO_PG
Address	800930000601143F (SCOM)
Description	This register contains the 12th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:56	RWX	RX_DACTEST_HLMT: This control register is used to set a higher threshold limit.
57:63	RO	constant = 0b0000000

Register Name	Receive CTL CNTL12 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL12_EO_PG
Address	800930200601143F (SCOM)
Description	This register contains the 12th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:56	RWX	RX_DACTEST_HLMT: This control register is used to set a higher threshold limit.
57:63	RO	constant = 0b0000000

Register Name	Receive CTL CNTL13 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL13_EO_PG
Address	800938000601143F (SCOM)
Description	This register contains the 13th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_HIST_MIN_EYE_WIDTH_VALID: This bit indicates that the receive historic eye width minimum value and lane are valid.
49:53	RWX	RX_HIST_MIN_EYE_WIDTH_LANE: This field contains the receive historic eye width lane number.
54:61	RWX	RX_HIST_MIN_EYE_WIDTH: This field contains the receive historic eye width and height minimum measurement mode.
62:63	RO	constant = 0b00

Register Name	Receive CTL CNTL13 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL13_EO_PG
Address	800938200601143F (SCOM)
Description	This register contains the 13th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_HIST_MIN_EYE_WIDTH_VALID: This bit indicates that the receive historic eye width minimum value and lane are valid.
49:53	RWX	RX_HIST_MIN_EYE_WIDTH_LANE: This field contains the receive historic eye width lane number.
54:61	RWX	RX_HIST_MIN_EYE_WIDTH: This field contains the receive historic eye width and height minimum measurement mode.
62:63	RO	constant = 0b00

Register Name	Receive CTL CNTL14 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL14_EO_PG
Address	800940000601143F (SCOM)
Description	This register contains the 14th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_HIST_MIN_EYE_HEIGHT_VALID: This bit indicates that the receive historic eye height minimum value and lane are valid.
49:53	RWX	RX_HIST_MIN_EYE_HEIGHT_LANE: This field contains the receive historic eye height lane number.
54:61	RWX	RX_HIST_MIN_EYE_HEIGHT: This field contains the receive historic eye height minimum measurement mode. It is inoperative on POWER8 processor with NVLink technology hardware. Use the rx_hist_min_eye_width_mode control instead. Set both the width and height_mode controls to the same value in test routines to maintain compatibility.
62:63	RO	constant = 0b00

Register Name	Receive CTL CNTL14 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL14_EO_PG
Address	800940200601143F (SCOM)
Description	This register contains the 14th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_HIST_MIN_EYE_HEIGHT_VALID: This bit indicates that the receive historic eye height minimum value and lane are valid.
49:53	RWX	RX_HIST_MIN_EYE_HEIGHT_LANE: This field contains the receive historic eye height lane number.
54:61	RWX	RX_HIST_MIN_EYE_HEIGHT: This field contains the receive historic eye height minimum measurement mode. It is inoperative on POWER8 processor with NVLink technology hardware. Use the rx_hist_min_eye_width_mode control instead. Set both the width and height_mode controls to the same value in test routines to maintain compatibility.
62:63	RO	constant = 0b00

Register Name	Receive CTL CNTL15 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL15_EO_PG
Address	800948000601143F (SCOM)
Description	This register contains the 15th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WTL_TEST_CLOCK: This bit is a signal from the main WT machine to start testing the clock lane.
49	RWX	RX_WTL_TEST_DATA: This bit is a signal from the main WT machine to start testing the data lane.
50	RWX	RX_WT_BS_CLOCK_EN_BYP: When asserted, this bit forces the BS enable for the clock. It can be used to override the WT state machine controls.

Bits	SCOM	Field Mnemonic: Description
51	RWX	RX_WT_BS_DATA_EN_BYP: When asserted, this bit forces the BS enable for the data. It can be used to override the WT state machine controls.
52:63	RO	constant = 0b000000000000

Register Name	Receive CTL CNTL15 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL15_EO_PG
Address	800948200601143F (SCOM)
Description	This register contains the 15th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WTL_TEST_CLOCK: This bit is a signal from the main WT machine to start testing the clock lane.
49	RWX	RX_WTL_TEST_DATA: This bit is a signal from the main WT machine to start testing the data lane.
50	RWX	RX_WT_BS_CLOCK_EN_BYP: When asserted, this bit forces the BS enable for the clock. It can be used to override the WT state machine controls.
51	RWX	RX_WT_BS_DATA_EN_BYP: When asserted, this bit forces the BS enable for the data. It can be used to override the WT state machine controls.
52:63	RO	constant = 0b000000000000

Register Name	Receive CTL STAT1 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT1_EO_PG
Address	800950000601143F (SCOM)
Description	This register contains the servo operation result.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_SERVO_RESULT: This field contains the servo operation result. It is read by the global training state machine.
56:63	RO	constant = 0b00000000

Register Name	Receive CTL STAT1 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT1_EO_PG
Address	800950200601143F (SCOM)
Description	This register contains the servo operation result.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_SERVO_RESULT: This field contains the servo operation result. It is read by the global training state machine.
56:63	RO	constant = 0b00000000

Register Name	Receive CTL STAT2 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT2_EO_PG
Address	800958000601143F (SCOM)
Description	This register contains the status of the receive BIST.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_BIST_INIT_DONE: This bit signals completion of the receive BIST initialization state machine.
49	RWX	RX_BIST_DONE: This bit signals completion of the entire receive BIST procedure.
50	RWX	RX_BIST_CU_PLL_ERR: This bit indicates that an error was detected during an rx_cu_pll lock error. \n0 = No error. \n1 = Error.
51	RWX	RX_BIST_NO_EDGE_DET: This bit indicates that one eye was counted to be significantly large (over 60 phase rotator steps).
52:57	RWX	RX_BIST_EYE_A_WIDTH: This register holds the counted eye A width of one particular lane.
58:63	RWX	RX_BIST_EYE_B_WIDTH: This register holds the counted eye B width of one particular lane.

Register Name	Receive CTL STAT2 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT2_EO_PG
Address	800958200601143F (SCOM)
Description	This register contains the status of the receive BIST.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_BIST_INIT_DONE: This bit signals completion of the receive BIST initialization state machine.
49	RWX	RX_BIST_DONE: This bit signals completion of the entire receive BIST procedure.
50	RWX	RX_BIST_CU_PLL_ERR: This bit indicates that an error was detected during an rx_cu_pll lock error. \n0 = No error. \n1 = Error.
51	RWX	RX_BIST_NO_EDGE_DET: This bit indicates that one eye was counted to be significantly large (over 60 phase rotator steps).
52:57	RWX	RX_BIST_EYE_A_WIDTH: This register holds the counted eye A width of one particular lane.
58:63	RWX	RX_BIST_EYE_B_WIDTH: This register holds the counted eye B width of one particular lane.

Register Name	Receive CTL STAT3 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT3_EO_PG
Address	800960000601143F (SCOM)
Description	This register contains the status of the wire-test lane machine.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_WTL_SM_STATUS: This field indicates the wire-test lane machine status.
53:63	RO	constant = 0b00000000000

Register Name	Receive CTL STAT3 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT3_EO_PG
Address	800960200601143F (SCOM)
Description	This register contains the status of the wire-test lane machine.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_WTL_SM_STATUS: This field indicates the wire-test lane machine status.
53:63	RO	constant = 0b00000000000

Register Name	Receive CTL Mode 26 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE26_EO_PG
Address	800968000601143F (SCOM)
Description	This register contains the 26th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_EO_ENABLE_CTLE_1ST_LATCH_OFFSET_CAL: Receive eye-optimization; first latch offset adjustment enable with CTLE-based disable.
49	RWX	RX_EO_ENABLE_CTLE_2ND_LATCH_OFFSET_CAL: Receive eye-optimization; second latch offset adjustment enable with CTLE-based disable.
50	RWX	RX_EO_ENABLE_VGA_AMAX_MODE: Receive eye-optimization; VGA Ap measurement mode.
51:61	RWX	RX_EO_ENABLE_DFE_H2_H12_SUBSTEP: Receive eye optimization; this field contains individual controls for DFE H2-to-H12 tap optimization.
62	RWX	RX_EO_ENABLE_DFE_VOLTAGE_MODE: Receive eye optimization; this bit enables DFE H2-to-H12 voltage-mode adjustment.
63	RWX	RX_EO_ENABLE_DFE_H6_H12_FAST_MODE: Receive eye optimization; this bit enables DFE H2-to-H12 fast mode.

Register Name	Receive CTL Mode 26 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE26_EO_PG
Address	800968200601143F (SCOM)
Description	This register contains the 26th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_EO_ENABLE_CTLE_1ST_LATCH_OFFSET_CAL: Receive eye-optimization; first latch offset adjustment enable with CTLE-based disable.
49	RWX	RX_EO_ENABLE_CTLE_2ND_LATCH_OFFSET_CAL: Receive eye-optimization; second latch offset adjustment enable with CTLE-based disable.
50	RWX	RX_EO_ENABLE_VGA_AMAX_MODE: Receive eye-optimization; VGA Ap measurement mode.

Bits	SCOM	Field Mnemonic: Description
51:61	RWX	RX_EO_ENABLE_DFE_H2_H12_SUBSTEP: Receive eye optimization; this field contains individual controls for DFE H2-to-H12 tap optimization.
62	RWX	RX_EO_ENABLE_DFE_VOLTAGE_MODE: Receive eye optimization; this bit enables DFE H2-to-H12 voltage-mode adjustment.
63	RWX	RX_EO_ENABLE_DFE_H6_H12_FAST_MODE: Receive eye optimization; this bit enables DFE H2-to-H12 fast mode.

Register Name	Receive CTL Mode 27 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE27_EO_PG
Address	800970000601143F (SCOM)
Description	This register contains the 27th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_RC_ENABLE_CTLE_1ST_LATCH_OFFSET_CAL: Receive recalibration; first latch offset adjustment enable with CTLE-based disable.
49	RWX	RX_RC_ENABLE_CTLE_2ND_LATCH_OFFSET_CAL: Receive recalibration; second latch offset adjustment enable with CTLE-based disable.
50	RWX	RX_RC_ENABLE_VGA_AMAX_MODE: Receive recalibration; VGA Ap measurement mode.
51:61	RWX	RX_RC_ENABLE_DFE_H2_H12_SUBSTEP: Receive recalibration; This field contains individual controls for DFE H2-to-H12 tap optimization.
62	RWX	RX_RC_ENABLE_DFE_VOLTAGE_MODE: Receive recalibration; this bit enables DFE H2-to-H12 voltage-mode adjustment.
63	RWX	RX_RC_ENABLE_DFE_H6_H12_FAST_MODE: Receive recalibration; this bit enables DFE H6-to-H12 fast mode.

Register Name	Receive CTL Mode 27 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE27_EO_PG
Address	800970200601143F (SCOM)
Description	This register contains the 27th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_RC_ENABLE_CTLE_1ST_LATCH_OFFSET_CAL: Receive recalibration; first latch offset adjustment enable with CTLE-based disable.
49	RWX	RX_RC_ENABLE_CTLE_2ND_LATCH_OFFSET_CAL: Receive recalibration; second latch offset adjustment enable with CTLE-based disable.
50	RWX	RX_RC_ENABLE_VGA_AMAX_MODE: Receive recalibration; VGA Ap measurement mode.
51:61	RWX	RX_RC_ENABLE_DFE_H2_H12_SUBSTEP: Receive recalibration; This field contains individual controls for DFE H2-to-H12 tap optimization.
62	RWX	RX_RC_ENABLE_DFE_VOLTAGE_MODE: Receive recalibration; this bit enables DFE H2-to-H12 voltage-mode adjustment.
63	RWX	RX_RC_ENABLE_DFE_H6_H12_FAST_MODE: Receive recalibration; this bit enables DFE H6-to-H12 fast mode.

Register Name	Receive CTL Mode 28 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE28_EO_PG
Address	800978000601143F (SCOM)
Description	This register contains the 28th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_DC_ENABLE_CM_COARSE_CAL: This bit enables receive DC calibration eye-optimization common-mode coarse calibration.
49	RWX	RX_DC_ENABLE_CM_FINE_CAL: This bit enables receive DC calibration eye-optimization common-mode fine calibration.
50	RWX	RX_DC_ENABLE_CTLE_1ST_LATCH_OFFSET_CAL: Receive DC calibration eye-optimization latch offset adjustment enable done prior to CTLE.
51	RWX	RX_DC_ENABLE_CTLE_2ND_LATCH_OFFSET_CAL: Receive DC calibration eye-optimization latch offset adjustment enable done after CTLE.
52	RWX	RX_DC_ENABLE_INTEG_LATCH_OFFSET_CAL: Receive DC calibration eye-optimization latch offset adjustment enable done prior to integrator.
53	RWX	RX_DC_ENABLE_DAC_H1_CAL: Receive DC cal eye optimization H1 DAC calibration.
54	RWX	RX_DC_ENABLE_DAC_H1_TO_A_CAL: Receive DC cal eye optimization H1 DAC to amplitude DAC calibration.
55:63	RO	constant = 0b000000000

Register Name	Receive CTL Mode 28 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE28_EO_PG
Address	800978200601143F (SCOM)
Description	This register contains the 28th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_DC_ENABLE_CM_COARSE_CAL: This bit enables receive DC calibration eye-optimization common-mode coarse calibration.
49	RWX	RX_DC_ENABLE_CM_FINE_CAL: This bit enables receive DC calibration eye-optimization common-mode fine calibration.
50	RWX	RX_DC_ENABLE_CTLE_1ST_LATCH_OFFSET_CAL: Receive DC calibration eye-optimization latch offset adjustment enable done prior to CTLE.
51	RWX	RX_DC_ENABLE_CTLE_2ND_LATCH_OFFSET_CAL: Receive DC calibration eye-optimization latch offset adjustment enable done after CTLE.
52	RWX	RX_DC_ENABLE_INTEG_LATCH_OFFSET_CAL: Receive DC calibration eye-optimization latch offset adjustment enable done prior to integrator.
53	RWX	RX_DC_ENABLE_DAC_H1_CAL: Receive DC cal eye optimization H1 DAC calibration.
54	RWX	RX_DC_ENABLE_DAC_H1_TO_A_CAL: Receive DC cal eye optimization H1 DAC to amplitude DAC calibration.
55:63	RO	constant = 0b000000000

Register Name	Receive ID2 Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_ID2_PG
Address	800980000601143F (SCOM)
Description	This register is used to set lane positions.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49:55	RWX	RX_START_LANE_ID: This field is used to programmatically set the first lane position in the group, but relative to the bus.
56	RO	constant = 0b0
57:63	RWX	RX_END_LANE_ID: This field is used to programmatically set the last lane position in the group, but relative to the bus.

Register Name	Receive ID2 Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_ID2_PG
Address	800980200601143F (SCOM)
Description	This register is used to set lane positions.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49:55	RWX	RX_START_LANE_ID: This field is used to programmatically set the first lane position in the group, but relative to the bus.
56	RO	constant = 0b0
57:63	RWX	RX_END_LANE_ID: This field is used to programmatically set the last lane position in the group, but relative to the bus.

Register Name	Receive CTL Mode 1 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE1_E_PG
Address	800990000601143F (SCOM)
Description	This register contains the first set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_MASTER_MODE: Master mode. This bit is used to set a chip bus as the master side of the interface. The master side of the interface is where training is kicked off and coordinated in the logic. 0b0 = Slave. 0b1 = Master.
49	RWX	RX_DISABLE_FENCE_RESET: This bit is set to disable clearing of the receive and transmit fence controls at the end of training. 0b0 = Clear the fence bit (default). 0b1 = Leave the fence in its current state.
50:56	RO	constant = 0b0000000

Bits	SCOM	Field Mnemonic: Description
57	RWX	RX_FENCE: Receive and transmit fence bit. 0b0 = Functional data is driven to and from the nest logic. 0b1 = Functional data is gated to zeros to and from nest logic. This setting also indicates that link training not yet complete.
58	RWX	RX_PDWN_LITE_DISABLE: This bit disables the power-down lite feature of unused spare lanes (generally, it should match tx_pdwn_lite_disable).
59	RWX	RX_USE_SLS_AS_SPR: This bit determines whether the receive SLS lane can be used as a spare lane on the bus to repair bad lanes. **Note:** If yes, recalibration is disabled after the SLS lane is used as a spare lane. This also applies to the transmit side.
60	RWX	RX_DYN_RECAL_SUSPEND: This bit suspends dynamic recalibration. Otherwise, it starts automatically after link training.
61	RO	constant = 0b0
62:63	RWX	RX_WT_PATTERN_LENGTH: Receive wire-test pattern length. This field specifies the length of N in the 3N-up/1N-down wire-test pattern. 0b00 = 128 (default). 0b01 = 256. 0b10 = 512. 0b11 = 1024.

Register Name	Receive CTL Mode 1 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE1_E_PG
Address	800990200601143F (SCOM)
Description	This register contains the first set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_MASTER_MODE: Master mode. This bit is used to set a chip bus as the master side of the interface. The master side of the interface is where training is kicked off and coordinated in the logic. 0b0 = Slave. 0b1 = Master.
49	RWX	RX_DISABLE_FENCE_RESET: This bit is set to disable clearing of the receive and transmit fence controls at the end of training. 0b0 = Clear the fence bit (default). 0b1 = Leave the fence in its current state.
50:56	RO	constant = 0b0000000
57	RWX	RX_FENCE: Receive and transmit fence bit. 0b0 = Functional data is driven to and from the nest logic. 0b1 = Functional data is gated to zeros to and from nest logic. This setting also indicates that link training not yet complete.
58	RWX	RX_PDWN_LITE_DISABLE: This bit disables the power-down lite feature of unused spare lanes (generally, it should match tx_pdwn_lite_disable).
59	RWX	RX_USE_SLS_AS_SPR: This bit determines whether the receive SLS lane can be used as a spare lane on the bus to repair bad lanes. **Note:** If yes, recalibration is disabled after the SLS lane is used as a spare lane. This also applies to the transmit side.
60	RWX	RX_DYN_RECAL_SUSPEND: This bit suspends dynamic recalibration. Otherwise, it starts automatically after link training.
61	RO	constant = 0b0

Bits	SCOM	Field Mnemonic: Description
62:63	RWX	RX_WT_PATTERN_LENGTH: Receive wire-test pattern length. This field specifies the length of N in the 3N-up/1N-down wire-test pattern. 0b00 = 128 (default). 0b01 = 256. 0b10 = 512. 0b11 = 1024.

Register Name	Receive CTL Mode 2 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE2_E_PG
Address	800998000601143F (SCOM)
Description	This register contains the second set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_WTR_MAX_BAD_LANES: This field contains the wire-test maximum number of bad lanes allowed per clock group. It is also the static repair, dynamic repair, and recalibration maximum number of bad lanes per RX bus. **Note:** This field must match the transmit side.
53:56	RWX	RX_SLS_EXTEND_SEL: This field indicates how long to extend sending of the transmit SLS command (that is, how long to delay sending gcr_wrt_done to the state machine.
57:63	RWX	RX_DYN_RPR_ENC_BAD_DATA_LANE_SHFT_AMT: CRC/ECC dynamic repair. This programmable register value is subtracted from the enc_bad_data_lane value provided from the CRC/ECC check logic (except for the all 1s clear pattern). For example, it must be set to 0x07 for the zMCI logic to compensate for disabled lanes. Otherwise, it is generally 0x00. **Note:** Always check the figtree for current settings.

Register Name	Receive CTL Mode 2 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE2_E_PG
Address	800998200601143F (SCOM)
Description	This register contains the second set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_WTR_MAX_BAD_LANES: This field contains the wire-test maximum number of bad lanes allowed per clock group. It is also the static repair, dynamic repair, and recalibration maximum number of bad lanes per RX bus. **Note:** This field must match the transmit side.
53:56	RWX	RX_SLS_EXTEND_SEL: This field indicates how long to extend sending of the transmit SLS command (that is, how long to delay sending gcr_wrt_done to the state machine.
57:63	RWX	RX_DYN_RPR_ENC_BAD_DATA_LANE_SHFT_AMT: CRC/ECC dynamic repair. This programmable register value is subtracted from the enc_bad_data_lane value provided from the CRC/ECC check logic (except for the all 1s clear pattern). For example, it must be set to 0x07 for the zMCI logic to compensate for disabled lanes. Otherwise, it is generally 0x00. **Note:** Always check the figtree for current settings.

Register Name	Receive CTL Mode 3 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE3_E_PG
Address	8009A0000601143F (SCOM)
Description	This register contains the third set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_SLS_TIMEOUT_SEL: This field selects the spare-lane signaling timeout value, which indicates how long to wait for a SLS handshake command. The value must be four times larger than tx_dyn_recal_interval_timeout_sel when performing recalibration aborts and four times rx_dyn_recal_overall_timeout_sel.
52:55	RWX	RX_CL_TIMEOUT_SEL: This field selects the clock lock timeout value.
56:59	RWX	RX_DS_SKEW_TIMEOUT_SEL: This field selects the deskew timeout value.
60:63	RWX	RX_DS_TIMEOUT_SEL: This field selects the deskew timeout value.

Register Name	Receive CTL Mode 3 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE3_E_PG
Address	8009A0200601143F (SCOM)
Description	This register contains the third set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_SLS_TIMEOUT_SEL: This field selects the spare-lane signaling timeout value, which indicates how long to wait for a SLS handshake command. The value must be four times larger than tx_dyn_recal_interval_timeout_sel when performing recalibration aborts and four times rx_dyn_recal_overall_timeout_sel.
52:55	RWX	RX_CL_TIMEOUT_SEL: This field selects the clock lock timeout value.
56:59	RWX	RX_DS_SKEW_TIMEOUT_SEL: This field selects the deskew timeout value.
60:63	RWX	RX_DS_TIMEOUT_SEL: This field selects the deskew timeout value.

Register Name	Receive CTL Mode 4 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE4_E_PG
Address	8009A8000601143F (SCOM)
Description	This register contains the fourth set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_WT_CHECK_COUNT: This field selects the number of extra times the wire--test pattern is checked for a good lane.
53:56	RWX	RX_PGOOD_TIMEOUT_SEL: This field selects the PLL partial-good reset timeout value.
57:60	RWX	RX_PLL_LOCK_TIMEOUT_SEL: This field selects the PLL lock timeout value.
61	RWX	RX_PSAVE_TIMER_WAKEUP_MODE: This bit enables a wakeup timer on a psave mode wakeup.

Bits	SCOM	Field Mnemonic: Description
62	RWX	RX_PSAVE_WAKEUP_LANE0_ENABLE: This bit enables lane 0 at all times as the wakeup lane from psave mode.
63	RO	constant = 0b0

Register Name	Receive CTL Mode 4 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE4_E_PG
Address	8009A8200601143F (SCOM)
Description	This register contains the fourth set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_WT_CHECK_COUNT: This field selects the number of extra times the wire--test pattern is checked for a good lane.
53:56	RWX	RX_PGOOD_TIMEOUT_SEL: This field selects the PLL partial-good reset timeout value.
57:60	RWX	RX_PLL_LOCK_TIMEOUT_SEL: This field selects the PLL lock timeout value.
61	RWX	RX_PSAVE_TIMER_WAKEUP_MODE: This bit enables a wakeup timer on a psave mode wakeup.
62	RWX	RX_PSAVE_WAKEUP_LANE0_ENABLE: This bit enables lane 0 at all times as the wakeup lane from psave mode.
63	RO	constant = 0b0

Register Name	Receive CTL Mode 5 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE5_E_PG
Address	8009B0000601143F (SCOM)
Description	This register contains the fifth set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_FIFO_INITIAL_L2U_DLY: This field indicates the receive FIFO initial load to unload delay. For the setting X, the latency is 4 x X to 4 x X + 4 UI. The default is 16 - 20 UI.
52:55	RWX	RX_FIFO_FINAL_L2U_DLY: This field indicates the receive FIFO final load to unload delay. For the setting X, the latency is 4 x X to 4 x X + 4 UI. The default is 8 - 12 UI.
56:59	RWX	RX_WT_TIMEOUT_SEL: This field selects the wire-test timeout value.
60:63	RO	constant = 0b0000

Register Name	Receive CTL Mode 5 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE5_E_PG
Address	8009B0200601143F (SCOM)
Description	This register contains the fifth set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:51	RWX	RX_FIFO_INITIAL_L2U_DLY: This field indicates the receive FIFO initial load to unload delay. For the setting X, the latency is 4 x X to 4 x X + 4 UI. The default is 16 - 20 UI.
52:55	RWX	RX_FIFO_FINAL_L2U_DLY: This field indicates the receive FIFO final load to unload delay. For the setting X, the latency is 4 x X to 4 x X + 4 UI. The default is 8 - 12 UI.
56:59	RWX	RX_WT_TIMEOUT_SEL: This field selects the wire-test timeout value.
60:63	RO	constant = 0b0000

Register Name	Receive CTL Mode 6 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE6_E_PG
Address	8009B8000601143F (SCOM)
Description	This register contains the sixth set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_TX_BUS_WIDTH: This field contains the transmit bus width.
55:61	RWX	RX_RX_BUS_WIDTH: This field contains the receive bus width.
62:63	RO	constant = 0b00

Register Name	Receive CTL Mode 6 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE6_E_PG
Address	8009B8200601143F (SCOM)
Description	This register contains the sixth set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_TX_BUS_WIDTH: This field contains the transmit bus width.
55:61	RWX	RX_RX_BUS_WIDTH: This field contains the receive bus width.
62:63	RO	constant = 0b00

Register Name	Receive CTL Mode 7 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE7_E_PG
Address	8009C0000601143F (SCOM)
Description	This register contains the seventh set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_SLS_DISABLE: This bit disables receiving and decoding SLS commands.

Bits	SCOM	Field Mnemonic: Description
49	RWX	TX_SLS_DISABLE: If set, the SLS command being sent is always just be a NOP. To actually disable the full SLS logic path, also perform some combination of the following: • Set the rx_sls_disable. • Manually override the tx_snd_sls_cmd_gcrmsg per pack registers. (However, if you do not also disable the various sending SMs, this will eventually get overwritten.) • Set tx_sls_lane_val_gcrmsg to 0. (If there is no valid transmit SLS lane, no SLS command gets sent on it). • Disable the recalibration, repair, and recovery SMs (rx_dyn_recal_suspend, rx_dyn_rpr_disable, rx_sls_rcvy_disable) that initiate the sending of SLS commands.
50:51	RWX	RX_SLS_CNTR_TAP_PTS: This field indicates how long the SLS receive command must be stable. Ensure that this scales with tx_dyn_recal_interval_timeout and status_rpt_timeout. 0b00 = 8 c16 clocks. 0b01 = 16 c16 clocks. 0b10 = 32 c16 clocks. 0b11 = 64 c16 clocks.
52:53	RWX	RX_NONSLS_CNTR_TAP_PTS: This field indicates how long a non-SLS receive command must be stable (to know that we have switched from an SLS command to data). Ensure that this scales with tx_dyn_recal_interval_timeout and status_rpt_timeout. 0b00 = 16 c16 clocks. 0b01 = 32 c16 clocks. 0b10 = 64 c16 clocks. 0b11 = 128 c16 clocks.
54:58	RO	constant = 0b00000
59	RWX	RX_SLS_EXCEPTION2_CS: This is a debug switch for the SLS exception2 command. Set this bit when mixing allv3 and later logic with logic previous to allv3. If set to 1, set rx_sls_timeout_sel to more than four times recal_overall_timeout_sel to avoid sending an exception on an SR interval and seeing a false exception RESMR.
60:61	RWX	RX_DYN_RPR_ERR_CNTR1_FILTER_MODE: To counteract possible DFE error ringing, select a filter that ignores syndrome tally errors for a number of fast clock cycles after a counted error. 0b00 = No filter, counts all errors. 0b01 = Skips one cycle after any error cycle. 0b10 = Skips three cycles after any error cycle. 0b11 = Skips seven cycles after any error cycle.
62:63	RO	constant = 0b00

Register Name	**Receive CTL Mode 7 E Per-Group Register**
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE7_E_PG
Address	8009C0200601143F (SCOM)
Description	This register contains the seventh set of receive CTL E mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_SLS_DISABLE: This bit disables receiving and decoding SLS commands.
49	RWX	TX_SLS_DISABLE: If set, the SLS command being sent is always just be a NOP. To actually disable the full SLS logic path, also perform some combination of the following: • Set the rx_sls_disable. • Manually override the tx_snd_sls_cmd_gcrmsg per pack registers. (However, if you do not also disable the various sending SMs, this will eventually get overwritten.) • Set tx_sls_lane_val_gcrmsg to 0. (If there is no valid transmit SLS lane, no SLS command gets sent on it). • Disable the recalibration, repair, and recovery SMs (rx_dyn_recal_suspend, rx_dyn_rpr_disable, rx_sls_rcvy_disable) that initiate the sending of SLS commands.

Bits	SCOM	Field Mnemonic: Description
50:51	RWX	RX_SLS_CNTR_TAP_PTS: This field indicates how long the SLS receive command must be stable. Ensure that this scales with tx_dyn_recal_interval_timeout and status_rpt_timeout. 0b00 = 8 c16 clocks. 0b01 = 16 c16 clocks. 0b10 = 32 c16 clocks. 0b11 = 64 c16 clocks.
52:53	RWX	RX_NONSLS_CNTR_TAP_PTS: This field indicates how long a non-SLS receive command must be stable (to know that we have switched from an SLS command to data). Ensure that this scales with tx_dyn_recal_interval_timeout and status_rpt_timeout. 0b00 = 16 c16 clocks. 0b01 = 32 c16 clocks. 0b10 = 64 c16 clocks. 0b11 = 128 c16 clocks.
54:58	RO	constant = 0b00000
59	RWX	RX_SLS_EXCEPTION2_CS: This is a debug switch for the SLS exception2 command. Set this bit when mixing allv3 and later logic with logic previous to allv3. If set to 1, set rx_sls_timeout_sel to more than four times recal_overall_timeout_sel to avoid sending an exception on an SR interval and seeing a false exception RESMR.
60:61	RWX	RX_DYN_RPR_ERR_CNTR1_FILTER_MODE: To counteract possible DFE error ringing, select a filter that ignores syndrome tally errors for a number of fast clock cycles after a counted error. 0b00 = No filter, counts all errors. 0b01 = Skips one cycle after any error cycle. 0b10 = Skips three cycles after any error cycle. 0b11 = Skips seven cycles after any error cycle.
62:63	RO	constant = 0b00

Register Name	**Receive CTL Mode 8 E Per-Group Register**
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE8_E_PG
Address	8009C8000601143F (SCOM)
Description	This register contains CRC/ECC dynamic repair information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_DYN_RPR_BAD_LANE_MAX: CRC/ECC dynamic repair. This field indicates the maximum number of times a lane can be found bad before it is repaired.

Bits	SCOM	Field Mnemonic: Description
55:58	RWX	RX_DYN_RPR_ERR_CNTR1_DURATION: CRC/ECC dynamic repair. This field indicates how long lane error counter 1 can run before it is cleared. This determines what error frequency is allowed. In slow clock cycles: 0b0000 = 32. 0b0001 = 1024. 0b0010 = 32 K. 0b0011 = 1 M. 0b0100 = 2 M. 0b0101 = 4 M. 0b0110 = 8 M. 0b0111 = 16 M. 0b1000 = 32 M. 0b1001 = 64 M. 0b1010 = 128 M. 0b1011 = 256 M. 0b1100 = 512 M. 0b1101 = 1 G. 0b1110 = 2 G. 0b1111 = Infinite.
59	RWX	RX_DYN_RPR_CLR_ERR_CNTR1: CRC/ECC dynamic repair. This bit enables firmware-based clearing of the Lane Error Counter1 Register.
60	RWX	RX_DYN_RPR_DISABLE: CRC/ECC dynamic repair. When set, this bit disables dynamic repair error tallying for both per-lane and per-bus error counters (cntr1 and cntr2).
61:63	RWX	RX_DYN_RPR_ENC_BAD_DATA_LANE_WIDTH: CRC/ECC dynamic repair. This field contains the width of the enc_bad_data_lane vector used to determine the number of ones in the clear code.

Register Name	Receive CTL Mode 8 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE8_E_PG
Address	8009C8200601143F (SCOM)
Description	This register contains CRC/ECC dynamic repair information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_DYN_RPR_BAD_LANE_MAX: CRC/ECC dynamic repair. This field indicates the maximum number of times a lane can be found bad before it is repaired.

Bits	SCOM	Field Mnemonic: Description
55:58	RWX	RX_DYN_RPR_ERR_CNTR1_DURATION: CRC/ECC dynamic repair. This field indicates how long lane error counter 1 can run before it is cleared. This determines what error frequency is allowed. In slow clock cycles: 0b0000 = 32. 0b0001 = 1024. 0b0010 = 32 K. 0b0011 = 1 M. 0b0100 = 2 M. 0b0101 = 4 M. 0b0110 = 8 M. 0b0111 = 16 M. 0b1000 = 32 M. 0b1001 = 64 M. 0b1010 = 128 M. 0b1011 = 256 M. 0b1100 = 512 M. 0b1101 = 1 G. 0b1110 = 2 G. 0b1111 = Infinite.
59	RWX	RX_DYN_RPR_CLR_ERR_CNTR1: CRC/ECC dynamic repair. This bit enables firmware-based clearing of the Lane Error Counter1 Register.
60	RWX	RX_DYN_RPR_DISABLE: CRC/ECC dynamic repair. When set, this bit disables dynamic repair error tallying for both per-lane and per-bus error counters (cntr1 and cntr2).
61:63	RWX	RX_DYN_RPR_ENC_BAD_DATA_LANE_WIDTH: CRC/ECC dynamic repair. This field contains the width of the enc_bad_data_lane vector used to determine the number of ones in the clear code.

Register Name	**Receive CTL Mode 9 E Per-Group Register**
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE9_E_PG
Address	8009D0000601143F (SCOM)
Description	This register contains CRC/ECC dynamic repair information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_DYN_RPR_BAD_BUS_MAX: CRC/ECC dynamic repair. This field indicates the maximum number of times CRC or ECC errors can be found on the bus (not included in the bad lane cntr1 tally) before setting a FIR error.

Bits	SCOM	Field Mnemonic: Description
55:58	RWX	RX_DYN_RPR_ERR_CNTR2_DURATION: CRC/ECC dynamic repair. This field indicates how long the bad bus cntr2 error counter can run before it is divided by 2. This determines what error frequency is allowed. On a 833 ps and 1250 ps slow clock: 0b0000 = 26.7 ns and 40.0 nS. 0b0001 = 853.0 ns and 1.3 μS. 0b0010 = 27.3 μS and 41.0 μS. 0b0011 = 873.5 μS and 1.3 mS. 0b0100 = 1.7 mS and 2.6 mS. 0b0101 = 3.5 mS and 5.1 mS. 0b0110 = 7.0 mS and 10.5 mS. 0b0111 = 14.0 mS and 21.0 mS. 0b1000 = 28.0 mS and 41.9 mS. 0b1001 = 55.9 mS and 83.9 mS. 0b1010 = 111.8 mS and 167.8 mS. 0b1011 = 223.6 mS and 335.5 mS. 0b1100 = 447.2 mS and 671.1 mS. 0b1101 = 894.4 mS and 1.3 S. 0b1110 = 1.8 S and 2.7 S. 0b1111 = Infinite.
59	RWX	RX_DYN_RPR_CLR_ERR_CNTR2: CRC/ECC dynamic repair. This bit enables firmware-based clearing of the Bus Error Counter2 Register.
60	RWX	RX_DYN_RPR_DISABLE2: CRC/ECC dynamic repair. When set, this bit disables the repair from the dynamic repair error tallying for both per-lane and per-bus error counters (cntr1 and cntr2). However, it leaves the counters running.
61:63	RO	constant = 0b000

Register Name	**Receive CTL Mode 9 E Per-Group Register**
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE9_E_PG
Address	8009D0200601143F (SCOM)
Description	This register contains CRC/ECC dynamic repair information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_DYN_RPR_BAD_BUS_MAX: CRC/ECC dynamic repair. This field indicates the maximum number of times CRC or ECC errors can be found on the bus (not included in the bad lane cntr1 tally) before setting a FIR error.

Bits	SCOM	Field Mnemonic: Description
55:58	RWX	RX_DYN_RPR_ERR_CNTR2_DURATION: CRC/ECC dynamic repair. This field indicates how long the bad bus cntr2 error counter can run before it is divided by 2. This determines what error frequency is allowed. On a 833 ps and 1250 ps slow clock: 0b0000 = 26.7 ns and 40.0 nS. 0b0001 = 853.0 ns and 1.3 µS . 0b0010 = 27.3 µS and 41.0 µS . 0b0011 = 873.5 µS and 1.3 mS. 0b0100 = 1.7 mS and 2.6 mS. 0b0101 = 3.5 mS and 5.1 mS. 0b0110 = 7.0 mS and 10.5 mS. 0b0111 = 14.0 mS and 21.0 mS. 0b1000 = 28.0 mS and 41.9 mS. 0b1001 = 55.9 mS and 83.9 mS. 0b1010 = 111.8 mS and 167.8 mS. 0b1011 = 223.6 mS and 335.5 mS. 0b1100 = 447.2 mS and 671.1 mS. 0b1101 = 894.4 mS and 1.3 S. 0b1110 = 1.8 S and 2.7 S. 0b1111 = Infinite.
59	RWX	RX_DYN_RPR_CLR_ERR_CNTR2: CRC/ECC dynamic repair. This bit enables firmware-based clearing of the Bus Error Counter2 Register.
60	RWX	RX_DYN_RPR_DISABLE2: CRC/ECC dynamic repair. When set, this bit disables the repair from the dynamic repair error tallying for both per-lane and per-bus error counters (cntr1 and cntr2). However, it leaves the counters running.
61:63	RO	constant = 0b000

Register Name	Receive CTL Mode 10 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE10_E_PG
Address	8009D8000601143F (SCOM)
Description	This register contains the maximum deskew limit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_DESKEW_MAX_LIMIT: This field contains the maximum deskewable skew fail threshold.
52:63	RO	constant = 0b000000000000

Register Name	Receive CTL Mode 10 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE10_E_PG
Address	8009D8200601143F (SCOM)
Description	This register contains the maximum deskew limit.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_DESKEW_MAX_LIMIT: This field contains the maximum deskewable skew fail threshold.
52:63	RO	constant = 0b000000000000

Register Name	Receive CTL Mode 11 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE11_E_PG
Address	8009E0000601143F (SCOM)
Description	This register sets which lanes are ignored by the training logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	RWX	RX_LANE_DISABLED_VEC_0_15: This field is used to set which lanes, of group lanes 0 - 15, are ignored by the training logic. This does not affect power down. **Note:** Disabled lanes must be contiguous.

Register Name	Receive CTL Mode 11 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE11_E_PG
Address	8009E0200601143F (SCOM)
Description	This register sets which lanes are ignored by the training logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	RWX	RX_LANE_DISABLED_VEC_0_15: This field is used to set which lanes, of group lanes 0 - 15, are ignored by the training logic. This does not affect power down. **Note:** Disabled lanes must be contiguous.

Register Name	Receive CTL Mode 12 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE12_E_PG
Address	8009E8000601143F (SCOM)
Description	This register sets which lanes are ignored by the training logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_LANE_DISABLED_VEC_16_23: This field is used to set which lanes, of group lanes 16 - 23, are ignored by the training logic. This does not affect power down. **Note:** Disabled lanes must be contiguous.
56:63	RO	constant = 0b00000000

Register Name	Receive CTL Mode 12 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE12_E_PG
Address	8009E8200601143F (SCOM)
Description	This register sets which lanes are ignored by the training logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:55	RWX	RX_LANE_DISABLED_VEC_16_23: This field is used to set which lanes, of group lanes 16 - 23, are ignored by the training logic. This does not affect power down. **Note:** Disabled lanes must be contiguous.
56:63	RO	constant = 0b00000000

Register Name	**Receive CTL CNTL1 E Per-Group Register**
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL1_E_PG
Address	8009F0000601143F (SCOM)
Description	This register controls the training state machine.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_START_WIRETEST: When this register is written to a 1, the training state machine runs the wire-test portion of the training states.
49	RWX	RX_START_DESKEW: When this register is written to a 1, the training state machine runs the deskew portion of the training states.
50	RWX	RX_START_EYE_OPT: When this register is written to a 1, the training state machine runs the data eye-optimization portion of the training states.
51	RWX	RX_START_REPAIR: When this register is written to a 1, the training state machine runs the static lane-repair portion of the training states.
52	RWX	RX_START_FUNC_MODE: When this register is written to a 1, the training state machine runs the transition-to-functional-data portion of the training states.
53	RWX	RX_START_DC_CALIBRATE: When this register is written to a 1, the training state machine runs the DC calibrate substeps defined in eye optimizations.
54:63	RO	constant = 0b0000000000

Register Name	**Receive CTL CNTL1 E Per-Group Register**
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL1_E_PG
Address	8009F0200601143F (SCOM)
Description	This register controls the training state machine.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_START_WIRETEST: When this register is written to a 1, the training state machine runs the wire-test portion of the training states.
49	RWX	RX_START_DESKEW: When this register is written to a 1, the training state machine runs the deskew portion of the training states.
50	RWX	RX_START_EYE_OPT: When this register is written to a 1, the training state machine runs the data eye-optimization portion of the training states.
51	RWX	RX_START_REPAIR: When this register is written to a 1, the training state machine runs the static lane-repair portion of the training states.
52	RWX	RX_START_FUNC_MODE: When this register is written to a 1, the training state machine runs the transition-to-functional-data portion of the training states.

Bits	SCOM	Field Mnemonic: Description
53	RWX	RX_START_DC_CALIBRATE: When this register is written to a 1, the training state machine runs the DC calibrate substeps defined in eye optimizations.
54:63	RO	constant = 0b0000000000

Register Name	**Receive CTL CNTL4 E Per-Group Register**
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL4_E_PG
Address	8009F8000601143F (SCOM)
Description	This register contains the fourth set of CTL CNTL E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WT_CU_PLL_PGOOD: This bit enables the PLL/DLL. 0b1 = Sets PGOOD on the receive PLL for locking. 0b0 = Places the receive PLL in reset.
49	RWX	RX_WT_CU_BYP_PLL_LOCK: This bit overrides the receive PLL/DLL lock. It must be ORed into places where PLL locked is checked (that is, the WT state machine). It is used to bypass waiting for a PLL lock.
50	RWX	RX_WT_PLL_REFCLKSEL: This bit selects between the I/O clock and the BIST reference clock. 0b0 = Selects the I/O clock. 0b1 = Selects the BIST reference clock.
51	RWX	RX_PLL_REFCLKSEL_SCOM_EN: This bit selects between the PLL controls and the GCR register to select the reference clock. 0b0 = Uses the PLL control to select the reference clock. 0b1 = Uses the GCR register, rx_wt_pll_refclksel, to select the reference clock.
52	RWX	RX_IORESET: This bit resets the given receive clock group, including the GCR slave.
53:63	RO	constant = 0b00000000000

Register Name	**Receive CTL CNTL4 E Per-Group Register**
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL4_E_PG
Address	8009F8200601143F (SCOM)
Description	This register contains the fourth set of CTL CNTL E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WT_CU_PLL_PGOOD: This bit enables the PLL/DLL. 0b1 = Sets PGOOD on the receive PLL for locking. 0b0 = Places the receive PLL in reset.
49	RWX	RX_WT_CU_BYP_PLL_LOCK: This bit overrides the receive PLL/DLL lock. It must be ORed into places where PLL locked is checked (that is, the WT state machine). It is used to bypass waiting for a PLL lock.
50	RWX	RX_WT_PLL_REFCLKSEL: This bit selects between the I/O clock and the BIST reference clock. 0b0 = Selects the I/O clock. 0b1 = Selects the BIST reference clock.
51	RWX	RX_PLL_REFCLKSEL_SCOM_EN: This bit selects between the PLL controls and the GCR register to select the reference clock. 0b0 = Uses the PLL control to select the reference clock. 0b1 = Uses the GCR register, rx_wt_pll_refclksel, to select the reference clock.

Bits	SCOM	Field Mnemonic: Description
52	RWX	RX_IORESET: This bit resets the given receive clock group, including the GCR slave.
53:63	RO	constant = 0b00000000000

Register Name	**Receive CTL CNTL4 E Per-Group Register**
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTLX11_E_PG
Address	800A30000601143F (SCOM)
Description	This register contains the 11th set of CTL CNTL E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_DESKEW_SEQ_GCRMSG: Receive deskew sequencer GCR messages. 0b000 = Indicate that the prior group deskewed. 0b001 = Indicate that all groups deskewed. 0b010 = Indicate that the prior group completed deskew. 0b011 = Indicate that all groups completed deskew. 0b100 = Transmit skew values from the prior group. 0b101 = Transmit the maximum skew values to all groups. 0b110 = Unused. 0b111 = No message.
51	RO	constant = 0b0
52:55	RWX	RX_DESKEW_SKMIN_GCRMSG: This field contains the minimum skew value for the deskew sequence.
56:59	RWX	RX_DESKEW_SKMAX_GCRMSG: This field contains the maximum skew value for the deskew sequence.
60:63	RO	constant = 0b0000

Register Name	**Receive CTL CNTLX11 E Per_Group Register**
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTLX11_E_PG
Address	800A30200601143F (SCOM)
Description	This register contains the 11th set of CTL CNTLX E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_DESKEW_SEQ_GCRMSG: Receive deskew sequencer GCR messages. 0b000 = Indicate that the prior group deskewed. 0b001 = Indicate that all groups deskewed. 0b010 = Indicate that the prior group completed deskew. 0b011 = Indicate that all groups completed deskew. 0b100 = Transmit skew values from the prior group. 0b101 = Transmit the maximum skew values to all groups. 0b110 = Unused. 0b111 = No message.
51	RO	constant = 0b0
52:55	RWX	RX_DESKEW_SKMIN_GCRMSG: This field contains the minimum skew value for the deskew sequence.
56:59	RWX	RX_DESKEW_SKMAX_GCRMSG: This field contains the maximum skew value for the deskew sequence.
60:63	RO	constant = 0b0000

Register Name	Receive CTL STAT1 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT1_E_PG
Address	800A38000601143F (SCOM)
Description	This register contains the first set of CTL status E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WIRETEST_DONE: When this bit is read as a 1, the wire-test training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state.
49	RWX	RX_DESKEW_DONE: When this bit is read as a 1, the deskew training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state.
50	RWX	RX_EYE_OPT_DONE: When this bit is read as a 1, the eye-optimization training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state.
51	RWX	RX_REPAIR_DONE: When this bit is read as a 1, the static-lane-repair training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state.
52	RWX	RX_FUNC_MODE_DONE: When this bit is read as a 1, the transition-to-functional-data training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state.
53	RWX	RX_DC_CALIBRATE_DONE: When this bit is read as a 1, the DC calibration steps have been completed. Check the corresponding rx_dc_calibration_failed register field for the pass/fail status of the operation state.
54:55	RO	constant = 0b00
56	RWX	RX_WIRETEST_FAILED: When this bit is read as a 1, the wire-test training state encountered an error.
57	RWX	RX_DESKEW_FAILED: When this bit is read as a 1, the deskew training state encountered an error.
58	RWX	RX_EYE_OPT_FAILED: When this bit is read as a 1, the eye-optimization training state encountered an error.
59	RWX	RX_REPAIR_FAILED: When this bit is read as a 1, the static-lane-repair training state encountered an error.
60:63	RO	constant = 0b0000

Register Name	Receive CTL STAT1 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT1_E_PG
Address	800A38200601143F (SCOM)
Description	This register contains the first set of CTL status E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WIRETEST_DONE: When this bit is read as a 1, the wire-test training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state.
49	RWX	RX_DESKEW_DONE: When this bit is read as a 1, the deskew training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state.
50	RWX	RX_EYE_OPT_DONE: When this bit is read as a 1, the eye-optimization training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state.
51	RWX	RX_REPAIR_DONE: When this bit is read as a 1, the static-lane-repair training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state.
52	RWX	RX_FUNC_MODE_DONE: When this bit is read as a 1, the transition-to-functional-data training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state.

Bits	SCOM	Field Mnemonic: Description
53	RWX	RX_DC_CALIBRATE_DONE: When this bit is read as a 1, the DC calibration steps have been completed. Check the corresponding rx_dc_calibration_failed register field for the pass/fail status of the operation state.
54:55	RO	constant = 0b00
56	RWX	RX_WIRETEST_FAILED: When this bit is read as a 1, the wire-test training state encountered an error.
57	RWX	RX_DESKEW_FAILED: When this bit is read as a 1, the deskew training state encountered an error.
58	RWX	RX_EYE_OPT_FAILED: When this bit is read as a 1, the eye-optimization training state encountered an error.
59	RWX	RX_REPAIR_FAILED: When this bit is read as a 1, the static-lane-repair training state encountered an error.
60:63	RO	constant = 0b0000

Register Name	**Receive CTL STAT 2 E Per-Group Register**
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT2_E_PG
Address	800A40000601143F (SCOM)
Description	This register contains the second set of CTL status E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	RWX	RX_LANE_BAD_VEC_0_15: This field is used to report lanes found bad by hardware (status) or as a method to force a lane bad from software (control). The bad_lane vector is only updated during initial training.

Register Name	**Receive CTL STAT 2 E Per-Group Register**
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT2_E_PG
Address	800A40200601143F (SCOM)
Description	This register contains the second set of CTL status E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	RWX	RX_LANE_BAD_VEC_0_15: This field is used to report lanes found bad by hardware (status) or as a method to force a lane bad from software (control). The bad_lane vector is only updated during initial training.

Register Name	**Receive CTL STAT 4 E Per-Group Register**
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT4_E_PG
Address	800A50000601143F (SCOM)
Description	This register contains the fourth set of CTL status E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_LANE_BAD_VEC_16_23: This field is used to report lanes found bad by hardware (status) or as a method to force a lane bad from software (control).
56:63	RO	constant = 0b00000000

Register Name	**Receive CTL STAT 4 E Per-Group Register**
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT4_E_PG
Address	800A50200601143F (SCOM)
Description	This register contains the fourth set of CTL status E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_LANE_BAD_VEC_16_23: This field is used to report lanes found bad by hardware (status) or as a method to force a lane bad from software (control).
56:63	RO	constant = 0b00000000

Register Name	**Receive CTL STAT 5 E Per-Group Register**
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT5_E_PG
Address	800A58000601143F (SCOM)
Description	This register contains the fifth set of CTL status E fields.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49	RWX	RX_WT_CLK_LANE_INVERTED: Clock wire-test lane inverted/swapped status. 0b0 = Not swapped or inverted. 0b1 = P-N swapped or inverted.
50:52	RWX	RX_WT_CLK_LANE_BAD_CODE: Clock wire-test lane bad code. 0b000 = Lane tested good. 0b001 = N leg stuck at 1. 0b010 = N leg stuck at 0. 0b011 = P leg stuck at 1. 0b100 = P leg stuck at 0. 0b101 = N or P leg floating or swapping undetermined. 0b110 = Unused. 0b111 = Unused.
53:63	RO	constant = 0b00000000000

Register Name	**Receive CTL STAT 5 E Per-Group Register**
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT5_E_PG
Address	800A58200601143F (SCOM)
Description	This register contains the fifth set of CTL status E fields.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49	RWX	RX_WT_CLK_LANE_INVERTED: Clock wire-test lane inverted/swapped status. 0b0 = Not swapped or inverted. 0b1 = P-N swapped or inverted.

Bits	SCOM	Field Mnemonic: Description
50:52	RWX	RX_WT_CLK_LANE_BAD_CODE: Clock wire-test lane bad code. 0b000 = Lane tested good. 0b001 = N leg stuck at 1. 0b010 = N leg stuck at 0. 0b011 = P leg stuck at 1. 0b100 = P leg stuck at 0. 0b101 = N or P leg floating or swapping undetermined. 0b110 = Unused. 0b111 = Unused.
53:63	RO	constant = 0b00000000000

Register Name	**Receive CTL STAT 6 E Per-Group Register**
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT6_E_PG
Address	800A60000601143F (SCOM)
Description	This register contains the sixth set of CTL status E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_DESKEW_MINSKEW_GRP: This field contains the deskew per-group raw skew minimum.
52:55	RWX	RX_DESKEW_MAXSKEW_GRP: This field contains the deskew per-group raw skew maximum.
56:63	RO	constant = 0b00000000

Register Name	**Receive CTL STAT 6 E Per-Group Register**
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT6_E_PG
Address	800A60200601143F (SCOM)
Description	This register contains the sixth set of CTL status E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_DESKEW_MINSKEW_GRP: This field contains the deskew per-group raw skew minimum.
52:55	RWX	RX_DESKEW_MAXSKEW_GRP: This field contains the deskew per-group raw skew maximum.
56:63	RO	constant = 0b00000000

Register Name	**Receive CTL STATX 8 E Per-Group Register**
Mnemonic	IOF2.RX.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STATX8_E_PG
Address	800A68000601143F (SCOM)
Description	This register contains the eighth set of CTL status E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WT_PREV_DONE_GCRMSG: This bit indicates the the previous clock group completed the wire test.
49	RWX	RX_WT_ALL_DONE_GCRMSG: This bit indicates that all clock groups completed the wire test.

Bits	SCOM	Field Mnemonic: Description
50:51	RO	constant = 0b00
52	RWX	RX_CNTLS_PREV_LDED_GCRMSG: This bit indicates that the previous clock group finished updating the receive SLS/bad lane and repair controls.
53:63	RO	constant = 0b00000000000

Register Name	Receive CTL STATX 8 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STATX8_E_PG
Address	800A68200601143F (SCOM)
Description	This register contains the eighth set of CTL status E fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WT_PREV_DONE_GCRMSG: This bit indicates the the previous clock group completed the wire test.
49	RWX	RX_WT_ALL_DONE_GCRMSG: This bit indicates that all clock groups completed the wire test.
50:51	RO	constant = 0b00
52	RWX	RX_CNTLS_PREV_LDED_GCRMSG: This bit indicates that the previous clock group finished updating the receive SLS/bad lane and repair controls.
53:63	RO	constant = 0b00000000000

Register Name	Receive GLBSM Spare Mode Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_SPARE_MODE_PG
Address	800A80000601143F (SCOM)
Description	This register contains per-group controls and spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PG_GLBSM_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	RX_PG_GLBSM_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	RX_PG_GLBSM_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	RX_PG_GLBSM_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	RX_PG_GLBSM_SPARE_MODE_4: Per-group spare mode latch.
53	RWX	RX_PG_GLBSM_SPARE_MODE_5: Per-group spare mode latch.
54	RWX	RX_PG_GLBSM_SPARE_MODE_6: Per-group spare mode latch.
55	RWX	RX_PG_GLBSM_SPARE_MODE_7: Per-group spare mode latch.
56	RWX	RX_DESKEW_BUMP_AFTER: During deskew, choose to bump the clock to the center of the data after the lane deskewing operations have completed or before PRBS synchronization. 0b0 = Bump to center before deskew starts. 0b1 = Bump to center before PRBS synchronization starts.
57	RWX	RX_SLS_RCVY_DISABLE: This bit disables the SLS recovery state machine.
58:63	RO	constant = 0b000000

Register Name	Receive GLBSM Spare Mode Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.GLBSM.REGS.RX_GLBSM_SPARE_MODE_PG
Address	800A80200601143F (SCOM)
Description	This register contains per-group controls and spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PG_GLBSM_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	RX_PG_GLBSM_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	RX_PG_GLBSM_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	RX_PG_GLBSM_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	RX_PG_GLBSM_SPARE_MODE_4: Per-group spare mode latch.
53	RWX	RX_PG_GLBSM_SPARE_MODE_5: Per-group spare mode latch.
54	RWX	RX_PG_GLBSM_SPARE_MODE_6: Per-group spare mode latch.
55	RWX	RX_PG_GLBSM_SPARE_MODE_7: Per-group spare mode latch.
56	RWX	RX_DESKEW_BUMP_AFTER: During deskew, choose to bump the clock to the center of the data after the lane deskewing operations have completed or before PRBS synchronization. 0b0 = Bump to center before deskew starts. 0b1 = Bump to center before PRBS synchronization starts.
57	RWX	RX_SLS_RCVY_DISABLE: This bit disables the SLS recovery state machine.
58:63	RO	constant = 0b000000

Register Name	Receive FIR1 Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_FIR1_PG
Address	800A88000601143F (SCOM)
Description	This is a reserved register.

Register Name	Receive FIR1 Mask Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_FIR1_MASK_PG
Address	800A90000601143F (SCOM)
Description	This register masks receive FIR per-group errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:62	RWX	RX_Per Group_FIR1_ERRS_MASK: This field provides a FIR mask for register or state-machine parity checkers in the per-group receive logic. A value of 1 masks the error from generating a FIR error. Bit 0 = (mask_pg_regs) RXCTL Register parity error mask. Bit 1 = Reserved. Bit 2 = Reserved. Bit 3 = (mask_gcrs_ld_sm) RXCTL GCR load state machine parity error mask. Bit 4 = (mask_gcrs_unld_sm) RXCTL GCR unload state machine parity error mask. Bit 5 = (mask_snd_msg_sm) RXCTL Send message parity error mask. Bit 6 = (mask_main_init_sm) RXCTL main init state machine parity error mask. Bit 7 = (mask_wtm_sm) RXCTL wire-test main state machine parity error mask.
63	RO	constant = 0b0

Register Name	Receive FIR1 Mask Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.GLBSM.REGS.RX_FIR1_MASK_PG
Address	800A90200601143F (SCOM)
Description	This register masks receive FIR per-group errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:62	RWX	RX_Per Group_FIR1_ERRS_MASK: This field provides a FIR mask for register or state-machine parity checkers in the per-group receive logic. A value of 1 masks the error from generating a FIR error. Bit 0 = (mask_pg_regs) RXCTL Register parity error mask. Bit 1 = Reserved. Bit 2 = Reserved. Bit 3 = (mask_gcrs_ld_sm) RXCTL GCR load state machine parity error mask. Bit 4 = (mask_gcrs_unld_sm) RXCTL GCR unload state machine parity error mask. Bit 5 = (mask_snd_msg_sm) RXCTL Send message parity error mask. Bit 6 = (mask_main_init_sm) RXCTL main init state machine parity error mask. Bit 7 = (mask_wtm_sm) RXCTL wire-test main state machine parity error mask.
63	RO	constant = 0b0

Register Name	Receive FIR1 Error Inject Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_FIR1_ERROR_INJECT_PG
Address	800A98000601143F (SCOM)
Description	This register is used to inject parity errors into the per-group receive registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:62	RWX	RX_PG_FIR1_ERR_INJ: IOTK ALIAS: Receive per-group parity error injection. This field enables the injection of non-destructive parity errors in either register or state-machine latch banks. The register or state value is not affected.
63	RO	constant = 0b0

Register Name	Receive FIR1 Error Inject Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.GLBSM.REGS.RX_FIR1_ERROR_INJECT_PG
Address	800A98200601143F (SCOM)
Description	This register is used to inject parity errors into the per-group receive registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:62	RWX	RX_PG_FIR1_ERR_INJ: IOTK ALIAS: Receive per-group parity error injection. This field enables the injection of non-destructive parity errors in either register or state-machine latch banks. The register or state value is not affected.
63	RO	constant = 0b0

Register Name	Receive FIR Training Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_FIR_TRAINING_PG
Address	800AA0000601143F (SCOM)
Description	This register is used for FIR training.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PG_FIR_TRAINING_ERROR: This field is now defunct. It is permanently masked in the rx_fir_training_mask_pg FIR isolation register.
49	RWX	RX_PG_FIR_STATIC_SPARE_DEPLOYED: A spare lane was deployed during training to heal a lane that was detected as bad. The RX_Static_Spare_Deployed (SSD) bit is set after the repair training step if, during training, either wire-test, deskew, eye-optimization, or repair operations were detected or one or more bad lanes were detected. The rx_bad_lane_enc_gcrmsg_pg register can be read to isolate which lanes were healed and the rx_bad_lane.
50	RWX	RX_PG_FIR_STATIC_MAX_SPARES_EXCEEDED: A lane was detected as bad during training, but there are no spare lanes available to heal it. This FIR is not set until the repair training step has run. **Note:** This is a catastrophic failure for the bus when in mission mode, but all training steps are still run on whatever good lanes there are. The rx_static_max_spares_exceeded bit is set if wire-test, deskew, eye-optimization or repair operations find an excessive number of bad lanes.
51	RWX	RX_PG_FIR_DYNAMIC_REPAIR_ERROR: A dynamic repair error occurred. The Recal Error FFDC registers can be read to help isolate to a particular piece of logic.
52	RWX	RX_PG_FIR_DYNAMIC_SPARE_DEPLOYED: A spare lane was deployed by the ECC/CRC logic to heal a lane that was detected as bad. The rx_bad_lane_enc_gcrmsg_pg register can be read to isolate which lanes were healed.
53	RWX	RX_PG_FIR_DYNAMIC_MAX_SPARES_EXCEEDED: A lane was detected as bad by the ECC/CRC logic, but there are no spare lanes to heal it. **Note:** This is a catastrophic failure for the bus.
54	RWX	RX_PG_FIR_RECAL_ERROR: A recalibration error occurred. The Recal Error FFDC registers can be read to help isolate the error to a particular piece of logic.
55	RWX	RX_PG_FIR_RECAL_SPARE_DEPLOYED: A spare lane was deployed during recalibration to heal a lane that was detected as bad. The rx_bad_lane_enc_gcrmsg_pg register can be read to isolate which lanes were healed.
56	RWX	RX_PG_FIR_RECAL_MAX_SPARES_EXCEEDED: A lane was detected as bad during recalibration, but there are no spare lanes to heal it. **Note:** This is a catastrophic failure for the bus.

Bits	SCOM	Field Mnemonic: Description
57	RWX	RX_PG_FIR_TOO_MANY_BUS_ERRORS: More than one lane was detected as having too many errors during functional operation. **Note:** This is a catastrophic failure for the bus.
58:63	RO	constant = 0b000000

Register Name	Receive FIR Training Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.GLBSM.REGS.RX_FIR_TRAINING_PG
Address	800AA0200601143F (SCOM)
Description	This register is used for FIR training.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PG_FIR_TRAINING_ERROR: This field is now defunct. It is permanently masked in the rx_fir_training_mask_pg FIR isolation register.
49	RWX	RX_PG_FIR_STATIC_SPARE_DEPLOYED: A spare lane was deployed during training to heal a lane that was detected as bad. The RX_Static_Spare_Deployed (SSD) bit is set after the repair training step if, during training, either wire-test, deskew, eye-optimization, or repair operations were detected or one or more bad lanes were detected. The rx_bad_lane_enc_gcrmsg_pg register can be read to isolate which lanes were healed and the rx_bad_lane.
50	RWX	RX_PG_FIR_STATIC_MAX_SPARES_EXCEEDED: A lane was detected as bad during training, but there are no spare lanes available to heal it. 55	ROX	Reserved field.
56:63	RO	constant = 0b00000000

Register Name	Receive GLBSM STAT5 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.GLBSM.REGS.RX_GLBSM_STAT5_EO_PG
Address	800AD8200601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50:54	ROX	Reserved field.
55	ROX	Reserved field.
56:63	RO	constant = 0b00000000

Register Name	Receive GLBSM CNTL2 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_CNTL2_EO_PG
Address	800AE0000601143F (SCOM)
Description	This register controls single-lane recalibration and dynamic repair.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_DYN_RPR_REQ_MANUAL: When rx_dyn_rpr_sm_manual is set, this bit requests a dynamic repair of the encoded lane set in rx_enc_bus_lane2rpr_manual.
49	RWX	RX_CNT_SINGLE_LANE_RECAL: This bit selects single-lane recalibration monitor mode.
50:54	RWX	RX_RECAL_LANE_TO_MONITOR: This field designates the lane to monitor when rx_cnt_single_lane_recal is 1.
55	RWX	RX_DYN_RPR_SM_MANUAL: When set, this bit only allows the dynamic repair state machine to respond to a repair request from the rx_dyn_rpr_req_manual register bit. To run syndrome tallying without triggering the dynamic repair state machine, set this bit and clear rx_dyn_rpr_disable.

Bits	SCOM	Field Mnemonic: Description
56	RWX	RX_DIS_SYND_TALLYING: When set, this bit prevents syndrome tallying logic from counting any incoming errors reported.
57:63	RWX	RX_ENC_BUS_LANE2RPR_MANUAL: If a manual dynamic repair is requested (rx_dyn_rpr_req_manual), this is the lane to repair. This value must be set to the physical lane to repair, not to the functional data lane.

Register Name	Receive GLBSM CNTL2 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.GLBSM.REGS.RX_GLBSM_CNTL2_EO_PG
Address	800AE0200601143F (SCOM)
Description	This register controls single-lane recalibration and dynamic repair.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_DYN_RPR_REQ_MANUAL: When rx_dyn_rpr_sm_manual is set, this bit requests a dynamic repair of the encoded lane set in rx_enc_bus_lane2rpr_manual.
49	RWX	RX_CNT_SINGLE_LANE_RECAL: This bit selects single-lane recalibration monitor mode.
50:54	RWX	RX_RECAL_LANE_TO_MONITOR: This field designates the lane to monitor when rx_cnt_single_lane_recal is 1.
55	RWX	RX_DYN_RPR_SM_MANUAL: When set, this bit only allows the dynamic repair state machine to respond to a repair request from the rx_dyn_rpr_req_manual register bit. To run syndrome tallying without triggering the dynamic repair state machine, set this bit and clear rx_dyn_rpr_disable.
56	RWX	RX_DIS_SYND_TALLYING: When set, this bit prevents syndrome tallying logic from counting any incoming errors reported.
57:63	RWX	RX_ENC_BUS_LANE2RPR_MANUAL: If a manual dynamic repair is requested (rx_dyn_rpr_req_manual), this is the lane to repair. This value must be set to the physical lane to repair, not to the functional data lane.

Register Name	Receive GLBSM CNTL3 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_CNTL3_EO_PG
Address	800AE8000601143F (SCOM)
Description	This register controls manual recalibration and timers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_MANUAL_RECAL_REQUEST: This bit indicates a recalibration request from the microcontroller.
49:50	RO	constant = 0b00
51:55	RWX	RX_MANUAL_RECAL_LANE: This field specifies the recalibration lane from the microcontroller.
56:57	RWX	RX_SLS_TIMEOUT_EXT_SEL: This field selects an extension multiplier for the rx_sls_timeout_sel register.
58	RWX	RX_HALF_RATE_MODE_GLBSM: When set to 1, this bit enables timers on the slow clock domain to consistently count UI when in 4-bit legacy mode. Otherwise, the slow clock domain counts only half of the UI when in 4-bit legacy mode.
59:63	RO	constant = 0b00000

Register Name	**Receive GLBSM CNTL3 EO Per-Group Register**
Mnemonic	IOF2.RX.RX1.RXCTL.GLBSM.REGS.RX_GLBSM_CNTL3_EO_PG
Address	800AE8200601143F (SCOM)
Description	This register controls manual recalibration and timers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_MANUAL_RECAL_REQUEST: This bit indicates a recalibration request from the microcontroller.
49:50	RO	constant = 0b00
51:55	RWX	RX_MANUAL_RECAL_LANE: This field specifies the recalibration lane from the microcontroller.
56:57	RWX	RX_SLS_TIMEOUT_EXT_SEL: This field selects an extension multiplier for the rx_sls_timeout_sel register.
58	RWX	RX_HALF_RATE_MODE_GLBSM: When set to 1, this bit enables timers on the slow clock domain to consistently count UI when in 4-bit legacy mode. Otherwise, the slow clock domain counts only half of the UI when in 4-bit legacy mode.
59:63	RO	constant = 0b00000

Register Name	**Receive GLBSM CNTL4 EO Per-Group Register**
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_CNTL4_EO_PG
Address	800AF0000601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Register Name	Receive FIR2 Mask Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_FIR2_MASK_PG
Address	800B08000601143F (SCOM)
Description	This register masks receive FIR2 errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	RWX	RX_PG_FIR2_ERRS_MASK: IOTK ALIAS: This field provides a mask for rx_fir2_pg errors.

Register Name	Receive FIR2 Mask Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.GLBSM.REGS.RX_FIR2_MASK_PG
Address	800B08200601143F (SCOM)
Description	This register masks receive FIR2 errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	RWX	RX_PG_FIR2_ERRS_MASK: IOTK ALIAS: This field provides a mask for rx_fir2_pg errors.

Register Name	Receive FIR2 Error Inject Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_FIR2_ERROR_INJECT_PG
Address	800B10000601143F (SCOM)
Description	This register is used to inject parity errors into the per-group receive registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	RWX	RX_PG_FIR2_ERR_INJ: IOTK ALIAS: Receive per-group parity error injection. This field enables the injection of non-destructive parity errors in either register or state-machine latch banks. The register or state value is not affected.

Register Name	Receive FIR2 Error Inject Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.GLBSM.REGS.RX_FIR2_ERROR_INJECT_PG
Address	800B10200601143F (SCOM)
Description	This register is used to inject parity errors into the per-group receive registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	RWX	RX_PG_FIR2_ERR_INJ: IOTK ALIAS: Receive per-group parity error injection. This field enables the injection of non-destructive parity errors in either register or state-machine latch banks. The register or state value is not affected.

Register Name	Receive GLBSM STAT1 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_STAT1_E_PG
Address	800B18000601143F (SCOM)
Description	This is a reserved register.

Register Name	Receive GLBSM STAT9 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_STAT9_E_PG
Address	800B58000601143F (SCOM)
Description	This register contains information about bad lanes.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_BAD_LANE1: Encoded bad lane one in relation to the entire receive bus.
55:61	RWX	RX_BAD_LANE2: Encoded bad lane two in relation to the entire receive bus.
62:63	RWX	RX_BAD_LANE_CODE: Receive bad-lane code. 0b00 = Zero bad lanes. 0b01 = Bad lane 1 valid. 0b10 = Bad lanes 1 and 2 valid. 0b11 = Three or more bad lanes.

Register Name	Receive GLBSM STAT9 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.GLBSM.REGS.RX_GLBSM_STAT9_E_PG
Address	800B58200601143F (SCOM)
Description	This register contains information about bad lanes.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_BAD_LANE1: Encoded bad lane one in relation to the entire receive bus.
55:61	RWX	RX_BAD_LANE2: Encoded bad lane two in relation to the entire receive bus.

Bits	SCOM	Field Mnemonic: Description
62:63	RWX	RX_BAD_LANE_CODE: Receive bad-lane code. 0b00 = Zero bad lanes. 0b01 = Bad lane 1 valid. 0b10 = Bad lanes 1 and 2 valid. 0b11 = Three or more bad lanes.

Register Name	Receive GLBSM STAT10 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_STAT10_E_PG
Address	800B60000601143F (SCOM)
Description	This register indicates the state of servo lane calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_SERVO_RECAL_IP: This bit indicates that receive servo lane calibration is in progress.
49	RO	constant = 0b0
50:55	ROX	Reserved field.
56	RO	constant = 0b0
57:63	ROX	Reserved field.

Register Name	Receive GLBSM STAT10 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.GLBSM.REGS.RX_GLBSM_STAT10_E_PG
Address	800B60200601143F (SCOM)
Description	This register indicates the state of servo lane calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_SERVO_RECAL_IP: This bit indicates that receive servo lane calibration is in progress.
49	RO	constant = 0b0
50:55	ROX	Reserved field.
56	RO	constant = 0b0
57:63	ROX	Reserved field.

Register Name	Receive DATASM Spare Mode Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_SPARE_MODE_PG
Address	800B80000601143F (SCOM)
Description	This register contains per-group spare mode latches and is used to put logic into clock off mode.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PG_DATASM_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	RX_PG_DATASM_SPARE_MODE_1: Per-group spare mode latch.

Bits	SCOM	Field Mnemonic: Description
50	RWX	RX_PG_DATASM_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	RX_PG_DATASM_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	RX_PG_DATASM_SPARE_MODE_4: Per-group spare mode latch.
53	RWX	RX_PG_DATASM_SPARE_MODE_5: Per-group spare mode latch.
54	RWX	RX_PG_DATASM_SPARE_MODE_6: Per-group spare mode latch.
55	RWX	RX_PG_DATASM_SPARE_MODE_7: Per-group spare mode latch.
56:59	RWX	RX_SERVO_CONFIG: Per-group servo configuration bits.
60	RWX	RX_CTL_DATASM_CLKDIST_PDWN: This bit is used to put additional rx_ctl_datasm_mac logic into clock off mode.
61:63	RO	constant = 0b000

Register Name	Receive DATASM Spare Mode Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.DATASM.DATASM_REGS.RX_DATASM_SPARE_MODE_PG
Address	800B80200601143F (SCOM)
Description	This register contains per-group spare mode latches and is used to put logic into clock off mode.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PG_DATASM_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	RX_PG_DATASM_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	RX_PG_DATASM_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	RX_PG_DATASM_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	RX_PG_DATASM_SPARE_MODE_4: Per-group spare mode latch.
53	RWX	RX_PG_DATASM_SPARE_MODE_5: Per-group spare mode latch.
54	RWX	RX_PG_DATASM_SPARE_MODE_6: Per-group spare mode latch.
55	RWX	RX_PG_DATASM_SPARE_MODE_7: Per-group spare mode latch.
56:59	RWX	RX_SERVO_CONFIG: Per-group servo configuration bits.
60	RWX	RX_CTL_DATASM_CLKDIST_PDWN: This bit is used to put additional rx_ctl_datasm_mac logic into clock off mode.
61:63	RO	constant = 0b000

Register Name	Receive DATASM CNTLX1 EO Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_CNTLX1_EO_PG
Address	800B88000601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49	NCX	Reserved field.

Register Name	Receive DATASM STAT11 EO Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT11_EO_PG
Address	800BE0200601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	ROX	Reserved field.

Register Name	Receive DATASM CNTL1 E Per-Group Register
Mnemonic	IOF2.RX.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_CNTL1_E_PG
Address	800BE8000601143F (SCOM)
Description	Register

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_PG_PRBS_SCRAMBLE_MODE: This bit selects the PRBS scramble sequence length. 0b00 = PRBS 23 (default). 0b01 = PRBS 7 (used by RX BIST). 0b10 = PRBS 11. 0b11 = PRBS 15.
50	RWX	RX_PG_PRBS_SEED_MODE: Set this bit to enable seeding of the descramble PRBS block from the incoming data stream.
51	RWX	RX_DESKEW_RATE: Transmit deskew rate. This bit selects between a div1 (1100) and div2 (11110000) deskew pattern rate for both pattern A and B. 0b0 = Divided deskew pattern for POWER9. 0b1 = Regular deskew pattern for POWER8 memory buffer.
52	RWX	RX_RUN_DYN_RECAL_TIMER: This bit enables checking for the 12/24 UI scramble synchronization pulse that enables the SLS status reporting timer. This bit must remain set to 1 to run the dynamic recalibration interval timer until a new full initialization is attempted. 0b0 = Disable checking (forces run_dyn_recal_timer to 0). 0b1 = Enable checking (run_dyn_recal_timer might go to 1 and stay that way after identifying the synchronization pulse).
53:54	RWX	RX_DESKEW_PATTCHK_TIMEOUT_SEL: This generic timer control is used to set the duration of the deskew pattern checking search. It allows multiple pattern periods (pattern length of 128 UI) to be included to increase confidence in an error-free deskew alignment.
55:62	RWX	RX_PG_PRBS_SLS_EXPECT: When an SLS message is expected on the incoming data stream, but it must be masked to complete PRBS seeding, write the expected value here. It is reverted, and the pure PRBS pattern enters the PRBS block.
63	RWX	RX_HALF_RATE_MODE_DATASM: When set to 1, this bit enables timers on the slow clock domain to consistently count UI when in 4-bit legacy mode. Otherwise, the slow clock domain counts only half of the UI when in 4-bit legacy mode.

Register Name	Receive DATASM CNTL1 E Per-Group Register
Mnemonic	IOF2.RX.RX1.RXCTL.DATASM.DATASM_REGS.RX_DATASM_CNTL1_E_PG
Address	800BE8200601143F (SCOM)
Description	Register

Mnemonic	IOF2.RX.RX1.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT13_E_PG
Address	800BF8200601143F (SCOM)
Description	This register disables clearing the bad bus lane error counter.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_BAD_BUS_LANE_ERR_CNTR_DIS_CLR: This bit disables clearing of the bad bus lane error counter (also known as counter1) when the next CRC/ECC error comes in on a new lane.
49:55	ROX	Reserved field.
56	RO	constant = 0b0
57:63	ROX	Reserved field.

Register Name	Transmit Spare Mode Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_SPARE_MODE_PG
Address	800C04000601143F (SCOM)
Description	This register contains per-group spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PG_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	TX_PG_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	TX_PG_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	TX_PG_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	TX_PG_SPARE_MODE_4: Per-group spare mode latch.
53	RWX	TX_PG_SPARE_MODE_5: Per-group spare mode latch.
54	RWX	TX_PG_SPARE_MODE_6: Per-group spare mode latch.
55	RWX	TX_PG_SPARE_MODE_7: Per-group spare mode latch.

Bits	SCOM	Field Mnemonic: Description
56:57	RWX	TX_PG_SPARE_MODE_8_9: Per-group spare mode latch.
58:63	RO	constant = 0b000000

Register Name	Transmit Spare Mode Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_SPARE_MODE_PG
Address	800C04200601143F (SCOM)
Description	This register contains per-group spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PG_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	TX_PG_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	TX_PG_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	TX_PG_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	TX_PG_SPARE_MODE_4: Per-group spare mode latch.
53	RWX	TX_PG_SPARE_MODE_5: Per-group spare mode latch.
54	RWX	TX_PG_SPARE_MODE_6: Per-group spare mode latch.
55	RWX	TX_PG_SPARE_MODE_7: Per-group spare mode latch.
56:57	RWX	TX_PG_SPARE_MODE_8_9: Per-group spare mode latch.
58:63	RO	constant = 0b000000

Register Name	Transmit ID1 Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_ID1_PG
Address	800C0C000601143F (SCOM)
Description	This register is used to programmatically set the bus number that a group belongs to.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	TX_BUS_ID: This field is used to programmatically set the bus number that a group belongs to.
54:63	RO	constant = 0b0000000000

Register Name	Transmit ID1 Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_ID1_PG
Address	800C0C200601143F (SCOM)
Description	This register is used to programmatically set the bus number that a group belongs to.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	TX_BUS_ID: This field is used to programmatically set the bus number that a group belongs to.

Bits	SCOM	Field Mnemonic: Description
54:63	RO	constant = 0b0000000000

Register Name	Transmit CTL Mode 1 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_MODE1_EO_PG
Address	800C14000601143F (SCOM)
Description	This register contains transmit control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_CLKDIST_PDWN: This field is used to disable the transmit group clocks and put them into a low-power state. It does not control per-lane circuits or logic
49:50	RO	constant = 0b00
51	RW	TX_BIST_EN: This bit enables the transmit BIST state machine to begin testing.
52	RW	TX_EXBIST_MODE: This bit is used to disable the BIST enable through external I/O.
53:57	RWX	TX_MAX_BAD_LANES: Static repair, dynamic repair, and recalibration maximum number of bad lanes per transmit bus. **Note:** This field must match the receive side.
58	RWX	TX_MSBSWAP: This bit is used to enable an end-for-end or MSb swap of transmit lanes. For example, lanes 0 and N-1 swap, lanes 1 and N-2 swap, and so on. 0b0 = No swap (default). 0b1 = End-for-end swap mode.
59	RWX	TX_PDWN_LITE_DISABLE: This bit disables the power-down lite feature of unused spare lanes. (In general, it must match rx_pdwn_lite_disable.)
60:61	RWX	TX_WT_PATTERN_LENGTH: Transmit wire-test pattern length. This field specifies the length of N in the 3N-up/1N-down wire-test pattern. 0b00 = 128 (default). 0b01 = 256. 0b10 = 512. 0b11 = 1024.
62	RWX	TX_DESKEW_RATE: Transmit deskew rate. This bit selects between a div1 (1100) and div2 (11110000) deskew pattern rate for both pattern A and B. 0b0 = Divided deskew pattern for POWER9. 0b1 = Regular deskew pattern for POWER8 memory buffer.
63	RO	constant = 0b0

Register Name	Transmit CTL Mode 1 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_MODE1_EO_PG
Address	800C14200601143F (SCOM)
Description	This register contains transmit control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_CLKDIST_PDWN: This field is used to disable the transmit group clocks and put them into a low-power state. It does not control per-lane circuits or logic
49:50	RO	constant = 0b00

Bits	SCOM	Field Mnemonic: Description
51	RW	TX_BIST_EN: This bit enables the transmit BIST state machine to begin testing.
52	RW	TX_EXBIST_MODE: This bit is used to disable the BIST enable through external I/O.
53:57	RWX	TX_MAX_BAD_LANES: Static repair, dynamic repair, and recalibration maximum number of bad lanes per transmit bus. **Note:** This field must match the receive side.
58	RWX	TX_MSBSWAP: This bit is used to enable an end-for-end or MSb swap of transmit lanes. For example, lanes 0 and N-1 swap, lanes 1 and N-2 swap, and so on. 0b0 = No swap (default). 0b1 = End-for-end swap mode.
59	RWX	TX_PDWN_LITE_DISABLE: This bit disables the power-down lite feature of unused spare lanes. (In general, it must match rx_pdwn_lite_disable.)
60:61	RWX	TX_WT_PATTERN_LENGTH: Transmit wire-test pattern length. This field specifies the length of N in the 3N-up/1N-down wire-test pattern. 0b00 = 128 (default). 0b01 = 256. 0b10 = 512. 0b11 = 1024.
62	RWX	TX_DESKEW_RATE: Transmit deskew rate. This bit selects between a div1 (1100) and div2 (11110000) deskew pattern rate for both pattern A and B. 0b0 = Divided deskew pattern for POWER9. 0b1 = Regular deskew pattern for POWER8 memory buffer.
63	RO	constant = 0b0

Register Name	**Transmit CTL Mode 2 EO Per-Group Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_MODE2_EO_PG
Address	800C1C000601143F (SCOM)
Description	This register contains transmit control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	TX_SLS_SCRAMBLE_MODE: This field selects SLS PRBS scramble mode for the ninth pattern. 0b00 = Use PRBS23. 0b01 = Use PRBS7. 0b10 = Use PRBS11. 0b11 = Use PRBS15.
50	RWX	TX_CLK_UNLOAD_CLK_DISABLE: This bit is set to 0 to clock off the synchronization logic on the clock slice and save power. It should not be necessary to use the synchronization logic on the clock slice because it has no FIFO, but control is available just in case.
51	RWX	TX_CLK_RUN_COUNT: Set this bit to 1 to enable the transmit clock slice serializer. This bit should be enabled at all times, but control is available as a precaution.
52:54	RWX	TX_CLK_UNLOAD_SEL: This field controls the preset value of the transmit clock slice unload counter. It should not be necessary to use this on the clock slice, but it is available as a precaution.
55	RWX	TX_CLK_HALF_WIDTH_MODE: This bit controls the 4-to-1 pin on the transmit clock slice. This bit should remain 0, but the control is provided as a precaution.
56:62	RWX	TX_BUS_WIDTH: This field provides the transmit bus width.
63	RO	constant = 0b0

Register Name	Transmit CTL Mode 2 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_MODE2_EO_PG
Address	800C1C200601143F (SCOM)
Description	This register contains transmit control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	TX_SLS_SCRAMBLE_MODE: This field selects SLS PRBS scramble mode for the ninth pattern. 0b00 = Use PRBS23. 0b01 = Use PRBS7. 0b10 = Use PRBS11. 0b11 = Use PRBS15.
50	RWX	TX_CLK_UNLOAD_CLK_DISABLE: This bit is set to 0 to clock off the synchronization logic on the clock slice and save power. It should not be necessary to use the synchronization logic on the clock slice because it has no FIFO, but control is available just in case.
51	RWX	TX_CLK_RUN_COUNT: Set this bit to 1 to enable the transmit clock slice serializer. This bit should be enabled at all times, but control is available as a precaution.
52:54	RWX	TX_CLK_UNLOAD_SEL: This field controls the preset value of the transmit clock slice unload counter. It should not be necessary to use this on the clock slice, but it is available as a precaution.
55	RWX	TX_CLK_HALF_WIDTH_MODE: This bit controls the 4-to-1 pin on the transmit clock slice. This bit should remain 0, but the control is provided as a precaution.
56:62	RWX	TX_BUS_WIDTH: This field provides the transmit bus width.
63	RO	constant = 0b0

Register Name	Transmit CTL CNTLG1 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG1_EO_PG
Address	800C24000601143F (SCOM)
Description	This register contains the transmit drive patterns.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	TX_DRV_CLK_PATTERN_GCRMSG: Transmit clock drive patterns. 0b00 = Drive all 0s pattern. 0b01 = Drive wire-test pattern. 0b10 = Drive clock pattern. 0b11 = Unused.

Bits	SCOM	Field Mnemonic: Description
50:53	RWX	TX_DRV_DATA_PATTERN_GCRMSG: Transmit drive patterns. 0b0000 = Drive all 0s pattern. 0b0001 = Drive wire-test pattern. 0b0010 = Drive all 1s pattern. 0b0011 = Drive deskew pattern A. 0b0100 = Drive deskew pattern B. 0b0101 = PRBS full-speed scramble pattern (see tx_prbs_tap_id). 0b0110 = Alternate PRBS7 pattern for RX BIST. 0b0111 = PRBS calibration or 9th pattern. 0b1000 = PRBS7 pattern. 0b1001 = PRBS11 pattern. 0b1010 = Drives TDR pulse-square waves. 0b1011 = PRBS15 pattern. 0b1100 = Alternate PRBS23 for NVBUS. 0b1101 = PRBS31 pattern. 0b1110 = 1-to-1 clock pattern. 0b1111 = Unused.
54:63	RO	constant = 0b0000000000

Register Name	Transmit CTL CNTLG1 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG1_EO_PG
Address	800C24200601143F (SCOM)
Description	This register contains the transmit drive patterns.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	TX_DRV_CLK_PATTERN_GCRMSG: Transmit clock drive patterns. 0b00 = Drive all 0s pattern. 0b01 = Drive wire-test pattern. 0b10 = Drive clock pattern. 0b11 = Unused.
50:53	RWX	TX_DRV_DATA_PATTERN_GCRMSG: Transmit drive patterns. 0b0000 = Drive all 0s pattern. 0b0001 = Drive wire-test pattern. 0b0010 = Drive all 1s pattern. 0b0011 = Drive deskew pattern A. 0b0100 = Drive deskew pattern B. 0b0101 = PRBS full-speed scramble pattern (see tx_prbs_tap_id). 0b0110 = Alternate PRBS7 pattern for RX BIST. 0b0111 = PRBS calibration or 9th pattern. 0b1000 = PRBS7 pattern. 0b1001 = PRBS11 pattern. 0b1010 = Drives TDR pulse-square waves. 0b1011 = PRBS15 pattern. 0b1100 = Alternate PRBS23 for NVBUS. 0b1101 = PRBS31 pattern. 0b1110 = 1-to-1 clock pattern. 0b1111 = Unused.
54:63	RO	constant = 0b0000000000

Register Name	Transmit CTL CNTL2 EO Per-Group Register	
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL2_EO_PG	
Address	800C2C000601143F (SCOM)	
Description	This register contains per-group transmit control fields.	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	TX_ERR_INJ_A_FINE_SEL: This field contains the random LSB/fine-grained cycle offset variation control for pattern A, where cycles are deserialized domain cycles. 0b000 = Random offset in the range of 1 - 32 cycles(default). 0b001 = Random offset in the range of 1 - 16 cycles. 0b010 = Random offset in the range of 1 - 8 cycles. 0b011 = Random offset in the range of 1 - 4 cycles. 0b100 = Random offset in the range of 1 - 2 cycles. 0b101 = Fixed offset of 1 cycle. 0b110 = Fixed offset of 3 cycles. 0b111 = Fixed offset of 7 cycles.
51:54	RWX	TX_ERR_INJ_A_COARSE_SEL: This field contains the random MSB/coarse-grained multiplier for the base error rate counter, which controls bit-error-rate variation for pattern A. There are also a number of nonrandom settings that are specifically chosen to avoid powers of two.
55:60	RWX	TX_ERR_INJ_A_BER_SEL: This field is used to set the random bit-error injection rate for pattern A. When set to a binary value of N, the average bit error rate is 1/(2^N x beats x mean(MSB)).
61	RWX	TX_ERR_INJ_ENABLE: This bit is the overall error injection enable. When set to 0, all other injection is gated.
62	RWX	TX_ERR_INJ_CLOCK_ENABLE: This bit enables clocks to larger counter and PRBS logic. Use this to stagger start times and effectively seed the injection mechanism randomly.
63	RO	constant = 0b0

Register Name	Transmit CTL CNTL2 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL2_EO_PG
Address	800C2C200601143F (SCOM)
Description	This register contains per-group transmit control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

51:54	RWX	TX_ERR_INJ_B_COARSE_SEL: This field contains the random MSB/coarse-grained multiplier for the base error-rate counter, which controls the bit-error-rate variation for pattern B. There are also a number of nonrandom settings that are specifically chosen to avoid powers of two.
55:60	RWX	TX_ERR_INJ_B_BER_SEL: This field is used to set the random bit-error injection rate for pattern B. When set to a binary value of N, the average bit error rate is 1/(2^N x beats x mean(MSB)).
61:63	RO	constant = 0b000

Register Name	Transmit ID2 Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_ID2_PG
Address	800C84000601143F (SCOM)
Description	This register is used to set the first and last lane positions in the group relative to the bus.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49:55	RWX	TX_START_LANE_ID: This field is used to programmatically set the first lane position in the group relative to the bus.
56	RO	constant = 0b0
57:63	RWX	TX_END_LANE_ID: This field is used to programmatically set the last lane position in the group relative to the bus.

Register Name	Transmit ID2 Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_ID2_PG
Address	800C84200601143F (SCOM)
Description	This register is used to set the first and last lane positions in the group relative to the bus.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49:55	RWX	TX_START_LANE_ID: This field is used to programmatically set the first lane position in the group relative to the bus.
56	RO	constant = 0b0
57:63	RWX	TX_END_LANE_ID: This field is used to programmatically set the last lane position in the group relative to the bus.

Register Name	Transmit CTL Mode 1 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_MODE1_E_PG
Address	800C8C000601143F (SCOM)
Description	This register contains the first set of transmit mode E controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RWX	TX_CLK_INVERT: This bit is used to invert the polarity of the clock. 0b0 = Normal clock polarity (default). 0b1 = Invert the clock.
49:50	RWX	TX_CLK_QUIESCE: This bit is used to force the output of the clock lane to a particular value. 0b00 = Functional data (default). 0b01 = Quiesce the clock lane to a static 0 value. 0b10 = Quiesce the clock lane to a static 1 value. 0b11 = Tri-state the clock lane output.
51:52	RO	constant = 0b00
53:54	RWX	TX_CLK_RATE: This bit is used to select the transmit bus clock rate. 0b00 = ODR/C8 mode. 0b01 = QDR/C4 mode. 0b10 = DDR/C2 mode. 0b11 = Unused.
55:57	RWX	TX_DYN_RECAL_INTERVAL_TIMEOUT_SEL: TX Dynamic recalibration interval timeout selects. This timeout determines the time between status reporting timeouts. The actual time of sending a message is selected with rx_dyn_recal_status_rpt_timeout_sel. 0B000 = 1024 UI or 106.5 ns. This very small value is for simulation only. 0b001 = 64k UI or 3.4 µs. 0b010 = 32k UI or 3.4 µs. 0b011 = 64k UI or 6.8 µs. 0b100 = 128k UI or 13.6 µs. 0b101 = 256k UI or 27.3 µs. 0b110 = 8192k UI or 872.4 µs. 0b111 = Infinite.
58:59	RWX	TX_DYN_RECAL_STATUS_RPT_TIMEOUT_SEL: Transmit dynamic recalibration status reporting timeout selects. This timeout determines the time that a status reporting timeout lasts. The first 1/4 is a blank period, the middle 1/2 is the command message, and the last 1/4 is another blank period. The time between messages is selected with rx_dyn_recal_interval_timeout_sel. **Note:** The first 1/4 and last 1/4 of this time are actually sending the PRBS pattern, so the actual time that the SLS command is on the lane is 1/2 of this value. 0B00 = 512 UI or 53.2 ns. 0B01 = 1024 UI or 106.5 ns. 0B10 = 2048 UI or 212.9 ns. 0B11 = 4096 UI or 426.0 ns.
60:63	RO	constant = 0b0000

Register Name	**Transmit CTL Mode 1 E Per-Group Register**
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_MODE1_E_PG
Address	800C8C200601143F (SCOM)
Description	This register contains the first set of transmit mode E controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_CLK_INVERT: This bit is used to invert the polarity of the clock. 0b0 = Normal clock polarity (default). 0b1 = Invert the clock.

60:63	RO	constant = 0b0000

Register Name	Transmit CTL Mode 2 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL2_E_PG
Address	800C9C000601143F (SCOM)
Description	This register contains the second set of transmit mode E controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit clock group and GCR slave.
49:50	RO	constant = 0b00
51	RWX	TX_ERR_INJ_SLS_MODE: This bit is used to set the random bit error injection for pattern A to work during SLS transmission only.
52	RWX	TX_ERR_INJ_SLS_ALL_CMD: This bit is used to qualify the SLS mode error injection for pattern A, to inject on all SLS command transmissions.
53	RWX	TX_ERR_INJ_SLS_RECAL: This bit is used to qualify the SLS mode error injection for pattern A, to inject on the calibration lane only when not sending an SLS command.
54:59	RWX	TX_ERR_INJ_SLS_CMD: This field is used to qualify the SLS mode error injection for pattern A, to inject on only this SLS command transmission.
60:63	RO	constant = 0b0000

Register Name	Transmit CTL Mode 2 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL2_E_PG
Address	800C9C200601143F (SCOM)
Description	This register contains the second set of transmit mode E controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit clock group and GCR slave.
49:50	RO	constant = 0b00
51	RWX	TX_ERR_INJ_SLS_MODE: This bit is used to set the random bit error injection for pattern A to work during SLS transmission only.
52	RWX	TX_ERR_INJ_SLS_ALL_CMD: This bit is used to qualify the SLS mode error injection for pattern A, to inject on all SLS command transmissions.
53	RWX	TX_ERR_INJ_SLS_RECAL: This bit is used to qualify the SLS mode error injection for pattern A, to inject on the calibration lane only when not sending an SLS command. See workbook for details.
54:59	RWX	TX_ERR_INJ_SLS_CMD: This field is used to qualify the SLS mode error injection for pattern A, to inject on only this SLS command transmission.
60:63	RO	constant = 0b0000

Register Name	Transmit CTL CNTLG3 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG3_E_PG
Address	800CA4000601143F (SCOM)
Description	This register is used for SLS commands.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_SND_SLS_CMD_GCRMSG: When set, this bit enables sending SLS commands or recalibration data.
49	RWX	TX_DYN_RECAL_TSR_IGNORE_GCRMSG: When set, this bit enables sending dynamic recalibration SLS commands all the time, not just during the status reporting interval.
50:55	RWX	TX_SLS_CMD_GCRMSG: This field contains the transmit SLS command.
56	RWX	TX_SND_SLS_CMD_PREV_GCRMSG: When set, this bit indicates to revert to sending the previous SLS command or recalibration data after the recovery repair is made.
57	RWX	TX_SND_SLS_USING_REG_SCRAMBLE: When set, this bit indicates to send the SLS command using the normal scramble pattern instead of calibration or the ninth pattern.
58:63	RO	constant = 0b000000

Register Name	Transmit CTL CNTLG3 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG3_E_PG
Address	800CA4200601143F (SCOM)
Description	This register is used for SLS commands.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RWX	TX_SND_SLS_CMD_GCRMSG: When set, this bit enables sending SLS commands or recalibration data.
49	RWX	TX_DYN_RECAL_TSR_IGNORE_GCRMSG: When set, this bit enables sending dynamic recalibration SLS commands all the time, not just during the status reporting interval.
50:55	RWX	TX_SLS_CMD_GCRMSG: This field contains the transmit SLS command.
56	RWX	TX_SND_SLS_CMD_PREV_GCRMSG: When set, this bit indicates to revert to sending the previous SLS command or recalibration data after the recovery repair is made.
57	RWX	TX_SND_SLS_USING_REG_SCRAMBLE: When set, this bit indicates to send the SLS command using the normal scramble pattern instead of calibration or the ninth pattern.
58:63	RO	constant = 0b000000

Register Name	**Transmit CTL CNTLG4 E Per-Group Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG4_E_PG
Address	800CAC000601143F (SCOM)
Description	This register is used for SLS lanes.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	TX_SLS_LANE_GCRMSG: This field contains the encoded SLS lane in relation to the entire transmit bus.
55	RWX	TX_SLS_LANE_VAL_GCRMSG: This bit indicates that the transmit SLS lane is valid.
56	RWX	TX_SLS_LANE_ENC_SPR1_GCRMSG: This bit is used for the transmit SLS lane control spare signal.
57:63	RO	constant = 0b0000000

Register Name	**Transmit CTL CNTLG4 E Per-Group Register**
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG4_E_PG
Address	800CAC200601143F (SCOM)
Description	This register is used for SLS lanes.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	TX_SLS_LANE_GCRMSG: This field contains the encoded SLS lane in relation to the entire transmit bus.
55	RWX	TX_SLS_LANE_VAL_GCRMSG: This bit indicates that the transmit SLS lane is valid.
56	RWX	TX_SLS_LANE_ENC_SPR1_GCRMSG: This bit is used for the transmit SLS lane control spare signal.
57:63	RO	constant = 0b0000000

Register Name	**Transmit CTL CNTLG5 E Per-Group Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG5_E_PG
Address	800CB4000601143F (SCOM)
Description	This register is used for SLS lane shadowing.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_SLS_LANE_SHDW_GCRMSG: This bit enables SLS lane shadowing or unshadowing functional data. This is used to set up transmit multiplex controls and to enable powering up of the next SLS lane).
49	RWX	TX_SLS_LANE_SHDW_RPR_GCRMSG: This bit enables SLS lane shadowing or unshadowing functional data during a repair action. This is used to set up transmit multiplex controls and to enable powering up of the last good SLS lane.
50	RWX	TX_SLS_LANE_MUX_SPR1_GCRMSG: This bit enables SLS lane shadowing, unshadowing, or multiplexing spare control signal 1, to which the tx_set_sls_ln controller is sensitive.
51	RWX	TX_SLS_LANE_MUX_SPR2_GCRMSG: This bit enables SLS lane shadowing, unshadowing, or multiplexing spare control signal 2, to which the tx_set_sls_ln controller is sensitive.
52:63	RO	constant = 0b000000000000

Register Name	**Transmit CTL CNTLG5 E Per-Group Register**
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG5_E_PG
Address	800CB4200601143F (SCOM)
Description	This register is used for SLS lane shadowing.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_SLS_LANE_SHDW_GCRMSG: This bit enables SLS lane shadowing or unshadowing functional data. This is used to set up transmit multiplex controls and to enable powering up of the next SLS lane).
49	RWX	TX_SLS_LANE_SHDW_RPR_GCRMSG: This bit enables SLS lane shadowing or unshadowing functional data during a repair action. This is used to set up transmit multiplex controls and to enable powering up of the last good SLS lane.
50	RWX	TX_SLS_LANE_MUX_SPR1_GCRMSG: This bit enables SLS lane shadowing, unshadowing, or multiplexing spare control signal 1, to which the tx_set_sls_ln controller is sensitive.
51	RWX	TX_SLS_LANE_MUX_SPR2_GCRMSG: This bit enables SLS lane shadowing, unshadowing, or multiplexing spare control signal 2, to which the tx_set_sls_ln controller is sensitive.
52:63	RO	constant = 0b000000000000

Register Name	**Transmit CTL CNTLG6 E Per-Group Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG6_E_PG
Address	800CBC000601143F (SCOM)
Description	This register is used for SLS lanes.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_SLV_MV_SLS_SHDW_REQ_GCRMSG: This bit is a request to the transmit slave to move the SLS lane.
49	RWX	TX_SLV_MV_SLS_SHDW_RPR_REQ_GCRMSG: This bit is a request to the transmit slave to move the SLS lane and set the bad lane register.
50	RWX	TX_SLV_MV_SLS_UNSHDW_REQ_GCRMSG: This bit is a request to the transmit slave to move the SLS lane.

Bits	SCOM	Field Mnemonic: Description
51	RWX	TX_SLV_MV_SLS_UNSHDW_RPR_REQ_GCRMSG: This bit is a request to the transmit slave to move the SLS lane and set the bad lane register.
52	RWX	TX_SLV_MV_SLS_SPR1_GCRMSG: This bit is spare request 1 to the transmit slave, to which SLS lane movement is sensitive.
53	RWX	TX_SLV_MV_SLS_SPR2_GCRMSG: This bit is spare request 2 to the transmit slave, to which SLS lane movement is sensitive.
54:58	RO	constant = 0b00000
59	RWX	TX_SLV_MV_SLS_RPR_REQ_GCRMSG: This bit is a request to the transmit slave to move the SLS lane and set the bad lane register.
60	RWX	TX_SLS_LANE_SEL_LG_GCRMSG: This bit sets the tx_sls_lane_sel_gcrmsg for the last good lane per bus during recalibration bad lane scenarios.
61	RWX	TX_SLS_LANE_UNSEL_LG_GCRMSG: This bit clears the tx_sls_lane_sel_gcrmsg for the last good lane per bus during recalibration bad lane scenarios.
62	RWX	TX_SPR_LNS_PDWN_LITE_GCRMSG: This bit signals the transmit side to power down lite (data gate) unused spare lanes at the end of static repair.
63	RWX	TX_SLV_LGL_RPR_REQ_GCRMSG: This bit is a request to the transmit slave to set the bad lane register to the last good lane of the bus (during recalibration bad lane scenarios).

Register Name	Transmit CTL CNTLG6 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG6_E_PG
Address	800CBC200601143F (SCOM)
Description	This register is used for SLS lanes.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_SLV_MV_SLS_SHDW_REQ_GCRMSG: This bit is a request to the transmit slave to move the SLS lane.
49	RWX	TX_SLV_MV_SLS_SHDW_RPR_REQ_GCRMSG: This bit is a request to the transmit slave to move the SLS lane and set the bad lane register.
50	RWX	TX_SLV_MV_SLS_UNSHDW_REQ_GCRMSG: This bit is a request to the transmit slave to move the SLS lane.
51	RWX	TX_SLV_MV_SLS_UNSHDW_RPR_REQ_GCRMSG: This bit is a request to the transmit slave to move the SLS lane and set the bad lane register.
52	RWX	TX_SLV_MV_SLS_SPR1_GCRMSG: This bit is spare request 1 to the transmit slave, to which SLS lane movement is sensitive.
53	RWX	TX_SLV_MV_SLS_SPR2_GCRMSG: This bit is spare request 2 to the transmit slave, to which SLS lane movement is sensitive.
54:58	RO	constant = 0b00000
59	RWX	TX_SLV_MV_SLS_RPR_REQ_GCRMSG: This bit is a request to the transmit slave to move the SLS lane and set the bad lane register.
60	RWX	TX_SLS_LANE_SEL_LG_GCRMSG: This bit sets the tx_sls_lane_sel_gcrmsg for the last good lane per bus during recalibration bad lane scenarios.
61	RWX	TX_SLS_LANE_UNSEL_LG_GCRMSG: This bit clears the tx_sls_lane_sel_gcrmsg for the last good lane per bus during recalibration bad lane scenarios.
62	RWX	TX_SPR_LNS_PDWN_LITE_GCRMSG: This bit signals the transmit side to power down lite (data gate) unused spare lanes at the end of static repair.

Bits	SCOM	Field Mnemonic: Description
63	RWX	TX_SLV_LGL_RPR_REQ_GCRMSG: This bit is a request to the transmit slave to set the bad lane register to the last good lane of the bus (during recalibration bad lane scenarios).

Register Name	Transmit CTL CNTLG7 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG7_E_PG
Address	800CC4000601143F (SCOM)
Description	This register enables wire-test driver segments.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_WT_EN_ALL_CLK_SEGS_GCRMSG: Transmit clock wire-test driver segments enable.
49	RWX	TX_WT_EN_ALL_DATA_SEGS_GCRMSG: Transmit data wire-test driver segments enable.
50:63	RO	constant = 0b00000000000000

Register Name	Transmit CTL CNTLG7 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG7_E_PG
Address	800CC4200601143F (SCOM)
Description	This register enables wire-test driver segments.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_WT_EN_ALL_CLK_SEGS_GCRMSG: Transmit clock wire-test driver segments enable.
49	RWX	TX_WT_EN_ALL_DATA_SEGS_GCRMSG: Transmit data wire-test driver segments enable.
50:63	RO	constant = 0b00000000000000

Register Name	Transmit CTL CNTL8 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL8_EO_PG
Address	800CCC000601143F (SCOM)
Description	This register is used to control the TDR function.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	TX_TDR_DAC_CNTL: This field controls the variable threshold receiver for the TDR function.
56	RO	constant = 0b0
57	RWX	TX_TDR_PHASE_SEL: This field controls phase select for the TDR function. 0 = _n leg. 1 = _p leg.
58:63	RO	constant = 0b000000

Register Name	**Transmit CTL CNTL8 EO Per-Group Register**
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL8_EO_PG
Address	800CCC200601143F (SCOM)
Description	This register is used to control the TDR function.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

48:61	RWX	TX_TDR_PULSE_OFFSET: This field contains the offset value for the TDR pulse.
62:63	RO	constant = 0b00

Register Name	**Transmit CTL CNTL10 EO Per-Group Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL10_EO_PG
Address	800CDC000601143F (SCOM)
Description	This register is used to control the TDR function.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:56	RWX	TX_TDR_PULSE_WIDTH: The field controls the width of the TDR pulse.
57:63	RO	constant = 0b0000000

Register Name	Transmit CTL CNTL10 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL10_EO_PG
Address	800CDC200601143F (SCOM)
Description	This register is used to control the TDR function.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:56	RWX	TX_TDR_PULSE_WIDTH: The field controls the width of the TDR pulse.
57:63	RO	constant = 0b0000000

Register Name	Transmit CTL STATG1 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_STATG1_E_PG
Address	800CE4000601143F (SCOM)
Description	This register encodes bad lanes.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	TX_BAD_LANE1_GCRMSG: This field contains encoded bad lane one in relation to the entire transmit bus.
55:61	RWX	TX_BAD_LANE2_GCRMSG: This field contains encoded bad lane two in relation to the entire transmit bus.
62:63	RWX	TX_BAD_LANE_CODE_GCRMSG: Transmit bad lane code. 0b00 = Zero bad lanes. 0b01 = Bad lane 1 is valid. 0b10 = Bad lanes 1 and 2 are valid. 0b11 = 3+ bad lanes.

Register Name	Transmit CTL STATG1 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_STATG1_E_PG
Address	800CE4200601143F (SCOM)
Description	This register encodes bad lanes.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	TX_BAD_LANE1_GCRMSG: This field contains encoded bad lane one in relation to the entire transmit bus.
55:61	RWX	TX_BAD_LANE2_GCRMSG: This field contains encoded bad lane two in relation to the entire transmit bus.
62:63	RWX	TX_BAD_LANE_CODE_GCRMSG: Transmit bad lane code. 0b00 = Zero bad lanes. 0b01 = Bad lane 1 is valid. 0b10 = Bad lanes 1 and 2 are valid. 0b11 = 3+ bad lanes.

Register Name	Transmit CRL Mode 2 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_MODE2_E_PG
Address	800CEC000601143F (SCOM)
Description	This register controls which group lanes are ignored by the training logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	RWX	TX_LANE_DISABLED_VEC_0_15: This field is used to set which of group lanes 0 - 15 are ignored by the training logic. These settings do not affect power down. **Note:** Disabled lanes must be contiguous.

Register Name	Transmit CRL Mode 2 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_MODE2_E_PG
Address	800CEC200601143F (SCOM)
Description	This register controls which group lanes are ignored by the training logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	RWX	TX_LANE_DISABLED_VEC_0_15: This field is used to set which of group lanes 0 - 15 are ignored by the training logic. These settings do not affect power down. **Note:** Disabled lanes must be contiguous.

Register Name	Transmit CRL Mode 3 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_MODE3_E_PG
Address	800CF4000601143F (SCOM)
Description	This register controls which group lanes are ignored by the training logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	TX_LANE_DISABLED_VEC_16_23: This field is used to set which of group lanes 16 - 23 are ignored by the training logic. These do not affect power down. **Note:** Disabled lanes must be contiguous.
56:63	RO	constant = 0b00000000

Register Name	Transmit CRL Mode 3 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_MODE3_E_PG
Address	800CF4200601143F (SCOM)
Description	This register controls which group lanes are ignored by the training logic.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:55	RWX	TX_LANE_DISABLED_VEC_16_23: This field is used to set which of group lanes 16 - 23 are ignored by the training logic. These do not affect power down. **Note:** Disabled lanes must be contiguous.
56:63	RO	constant = 0b00000000

Register Name	Transmit Group FIR Error Source
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_FIR_PG
Address	800D04000601143F (SCOM)
Description	This is an isolation register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52	ROX	Reserved field.
53:62	RO	constant = 0b0000000000
63	ROX	Reserved field.

Register Name	Transmit Group FIR Error Source
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_FIR_PG
Address	800D04200601143F (SCOM)
Description	This is an isolation register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52	ROX	Reserved field.
53:62	RO	constant = 0b0000000000
63	ROX	Reserved field.

Register Name	Transmit Group FIR Error Mask Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_FIR_MASK_PG
Address	800D0C000601143F (SCOM)
Description	This register masks transmit FIR per-group errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	TX_Per Group_FIR_ERRS_MASK: This field contains the FIR mask for register or state-machine parity checkers in the per-group TXCTL logic. A value of 1 masks the error from generating a FIR error. Bit 0 = par_err_mask_txctl_regs. Bit 1 = par_err_mask_gcr_buff. Bit 2 = Reserved. Bit 3 = par_err_mask_tx_stt_rpr_snd_msg_state. Bit 4 = par_err_mask_gcrs_ld_state. Bit 5 = par_err_mask_gcrs_unld_state. Bit 6 = Reserved. Bit 7 = Reserved.
53:62	RO	constant = 0b0000000000
63	RWX	TX_PL_FIR_ERR_MASK: IOTK ALIAS: This bit is a FIR mask for the per-lane transmit register checker.

Register Name	Transmit Group FIR Error Mask Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_FIR_MASK_PG
Address	800D0C200601143F (SCOM)
Description	This register masks transmit FIR per-group errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	TX_Per Group_FIR_ERRS_MASK: This field contains the FIR mask for register or state-machine parity checkers in the per-group TXCTL logic. A value of 1 masks the error from generating a FIR error. Bit 0 = par_err_mask_txctl_regs. Bit 1 = par_err_mask_gcr_buff. Bit 2 = Reserved. Bit 3 = par_err_mask_tx_stt_rpr_snd_msg_state. Bit 4 = par_err_mask_gcrs_ld_state. Bit 5 = par_err_mask_gcrs_unld_state. Bit 6 = Reserved. Bit 7 = Reserved.
53:62	RO	constant = 0b0000000000
63	RWX	TX_PL_FIR_ERR_MASK: IOTK ALIAS: This bit is a FIR mask for the per-lane transmit register checker.

Register Name	Transmit Reset Control Action Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_FIR_RESET_PG
Address	800D14000601143F (SCOM)
Description	This register controls per-group transmit latches.

Bits	SCOM	Field Mnemonic: Description
0:61	RO	constant = 0b00000000000000000000000000000000000000000000000000000000000000
62	RWX	TX_CLR_PAR_ERRS: Clear all transmit parity error latches. Toggle this field 0→1→0 to clear all transmit parity error latches.
63	RWX	TX_FIR_RESET: FIR reset. Toggle this field 0→1→0 to reset all transmit FIR-related latches including parity error latches.

Register Name	Transmit Reset Control Action Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_FIR_RESET_PG
Address	800D14200601143F (SCOM)
Description	This register controls per-group transmit latches.

Bits	SCOM	Field Mnemonic: Description
0:61	RO	constant = 0b00000000000000000000000000000000000000000000000000000000000000
62	RWX	TX_CLR_PAR_ERRS: Clear all transmit parity error latches. Toggle this field 0→1→0 to clear all transmit parity error latches.
63	RWX	TX_FIR_RESET: FIR reset. Toggle this field 0→1→0 to reset all transmit FIR-related latches including parity error latches.

Register Name	Transmit Per-Group FIR Error Injection Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_FIR_ERROR_INJECT_PG
Address	800D1C000601143F (SCOM)
Description	This register is used to inject errors into per-group transmit registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	TX_PG_FIR_ERR_INJ: IOTK ALIAS: While 1, inverts the parity check bit to force an error on the per-group TXCTL register or the state-machine parity checkers.
53:63	RO	constant = 0b00000000000

Register Name	Transmit Per-Group FIR Error Injection Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_FIR_ERROR_INJECT_PG
Address	800D1C200601143F (SCOM)
Description	This register is used to inject errors into per-group transmit registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	TX_PG_FIR_ERR_INJ: IOTK ALIAS: While 1, inverts the parity check bit to force an error on the per-group TXCTL register or the state-machine parity checkers.
53:63	RO	constant = 0b00000000000

Register Name	Transmit CTLSM Spare Mode Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_SPARE_MODE_PG
Address	800D24000601143F (SCOM)
Description	This register contains per-group spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PG_CTL_SM_SPARE_MODE_0: Per-group spare mode latch.

Bits	SCOM	Field Mnemonic: Description
49	RWX	TX_PG_CTL_SM_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	TX_PG_CTL_SM_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	TX_PG_CTL_SM_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	TX_PG_CTL_SM_SPARE_MODE_4: Per-group spare mode latch.
53	RWX	TX_PG_CTL_SM_SPARE_MODE_5: Per-group spare mode latch.
54	RWX	TX_PG_CTL_SM_SPARE_MODE_6: Per-group spare mode latch.
55	RWX	TX_PG_CTL_SM_SPARE_MODE_7: Per-group spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	**Transmit CTLSM Spare Mode Per-Group Register**
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_SPARE_MODE_PG
Address	800D24200601143F (SCOM)
Description	This register contains per-group spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PG_CTL_SM_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	TX_PG_CTL_SM_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	TX_PG_CTL_SM_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	TX_PG_CTL_SM_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	TX_PG_CTL_SM_SPARE_MODE_4: Per-group spare mode latch.
53	RWX	TX_PG_CTL_SM_SPARE_MODE_5: Per-group spare mode latch.
54	RWX	TX_PG_CTL_SM_SPARE_MODE_6: Per-group spare mode latch.
55	RWX	TX_PG_CTL_SM_SPARE_MODE_7: Per-group spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	**Transmit CTLSM Mode 1 EO Per-Group Register**
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_MODE1_EO_PG
Address	800D2C000601143F (SCOM)
Description	This register controls the driver segment test and other settings.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PSAVE_WAKEUP_LANE0_ENABLE: This bit enables lane 0 at all times as the wakeup lane from psave mode.
49	RWX	TX_PSAVE_FENCE_ENABLE: This bit enables fencing of the transmitter when the psave_mode_ip output of the receiver is high.
50:57	RWX	TX_SEG_TEST_MODE: Driver segment test mode. When this field is all 0s, it means normal function mode. When this field is not all 0s, the segment test begins.
58	RO	constant = 0b0

Bits	SCOM	Field Mnemonic: Description
59	RWX	TX_FFE_BOOST_EN: Driver segment test. This bit enables the boost function of the NVLink transmit.
60	RO	constant = 0b0
61	RWX	TX_SEG_TEST_LEAKAGE_CTRL: This bit controls txr_txc_sst_ctl_dc in every transmit slice. 1 = Run the segment test in low-leakage mode.
62	RWX	TX_HALF_RATE_MODE: When set to 1, this bit enables timers on the slow clock domain to consistently count UI when in 4-bit legacy mode. Otherwise, the slow clock domain counts only half of the UI when in 4-bit legacy mode.
63	RO	constant = 0b0

Register Name	Transmit CTLSM Mode 1 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_MODE1_EO_PG
Address	800D2C200601143F (SCOM)
Description	This register controls the driver segment test and other settings.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PSAVE_WAKEUP_LANE0_ENABLE: This bit enables lane 0 at all times as the wakeup lane from psave mode.
49	RWX	TX_PSAVE_FENCE_ENABLE: This bit enables fencing of the transmitter when the psave_mode_ip output of the receiver is high.
50:57	RWX	TX_SEG_TEST_MODE: Driver segment test mode. When this field is all 0s, it means normal function mode. When this field is not all 0s, the segment test begins.
58	RO	constant = 0b0
59	RWX	TX_FFE_BOOST_EN: Driver segment test. This bit enables the boost function of the NVLink transmit.
60	RO	constant = 0b0
61	RWX	TX_SEG_TEST_LEAKAGE_CTRL: This bit controls txr_txc_sst_ctl_dc in every transmit slice. 1 = Run the segment test in low-leakage mode.
62	RWX	TX_HALF_RATE_MODE: When set to 1, this bit enables timers on the slow clock domain to consistently count UI when in 4-bit legacy mode. Otherwise, the slow clock domain counts only half of the UI when in 4-bit legacy mode.
63	RO	constant = 0b0

Register Name	Transmit CTLSM CNTL1 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL1_EO_PG
Address	800D34000601143F (SCOM)
Description	This register contains transmit pseg controls.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000
51:55	RWX	TX_PSEG_PRE_EN: This field is used for pre-bank pseg enable.
56:60	RWX	TX_PSEG_PRE_SEL: This field is used for pre-bank pseg mode selection.
61:63	RO	constant = 0b000

Register Name	Transmit CTLSM CNTL1 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL1_EO_PG
Address	800D34200601143F (SCOM)
Description	This register contains transmit pseg controls.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000
51:55	RWX	TX_PSEG_PRE_EN: This field is used for pre-bank pseg enable.
56:60	RWX	TX_PSEG_PRE_SEL: This field is used for pre-bank pseg mode selection.
61:63	RO	constant = 0b000

Register Name	Transmit CTLSM CNTL2 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL2_EO_PG
Address	800D3C000601143F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000
51:55	RWX	TX_NSEG_PRE_EN: This field is used for pre-bank nseg enable.
56:60	RWX	TX_NSEG_PRE_SEL: This field is used for pre-bank nseg mode selection.
61:63	RO	constant = 0b000

Register Name	Transmit CTLSM CNTL2 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL2_EO_PG
Address	800D3C200601143F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000
51:55	RWX	TX_NSEG_PRE_EN: This field is used for pre-bank nseg enable.
56:60	RWX	TX_NSEG_PRE_SEL: This field is used for pre-bank nseg mode selection.
61:63	RO	constant = 0b000

Register Name	Transmit CTLSM CNTL3 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL3_EO_PG
Address	800D44000601143F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:55	RWX	TX_PSEG_MARGINPU_EN: This field is used for margin pull-up bank pseg enable.
56:63	RWX	TX_PSEG_MARGINPD_EN: This field is used for margin pull-down bank pseg enable.

Register Name	Transmit CTLSM CNTL3 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL3_EO_PG
Address	800D44200601143F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	TX_PSEG_MARGINPU_EN: This field is used for margin pull-up bank pseg enable.
56:63	RWX	TX_PSEG_MARGINPD_EN: This field is used for margin pull-down bank pseg enable.

Register Name	Transmit CTLSM CNTL4 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL4_EO_PG
Address	800D4C000601143F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	TX_NSEG_MARGINPU_EN: This field is used for margin pull-up bank nseg enable.
56:63	RWX	TX_NSEG_MARGINPD_EN: This field is used for margin pull-down bank nseg enable.

Register Name	Transmit CTLSM CNTL4 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL4_EO_PG
Address	800D4C200601143F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	TX_NSEG_MARGINPU_EN: This field is used for margin pull-up bank nseg enable.
56:63	RWX	TX_NSEG_MARGINPD_EN: This field is used for margin pull-down bank nseg enable.

Register Name	Transmit CTLSM CNTL5 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL5_EO_PG
Address	800D54000601143F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	TX_MARGINPU_SEL: This field is used for margin pull-up bank mode selection.
56:63	RWX	TX_MARGINPD_SEL: This field is used for margin pull-down bank mode selection.

Register Name	Transmit CTLSM CNTL5 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL5_EO_PG
Address	800D54200601143F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	TX_MARGINPU_SEL: This field is used for margin pull-up bank mode selection.
56:63	RWX	TX_MARGINPD_SEL: This field is used for margin pull-down bank mode selection.

Register Name	Transmit CTLSM CNTL6 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL6_EO_PG
Address	800D5C000601143F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000
51:63	RWX	TX_PSEG_MAIN_EN: This field is used for main bank pseg enable.

Register Name	Transmit CTLSM CNTL6 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL6_EO_PG
Address	800D5C200601143F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000
51:63	RWX	TX_PSEG_MAIN_EN: This field is used for main bank pseg enable.

Register Name	Transmit CTLSM CNTL7 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL7_EO_PG
Address	800D64000601143F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
51:63	RWX	TX_NSEG_MAIN_EN: This field is used for main bank nseg enable.

Register Name	Transmit CTLSM CNTL7 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL7_EO_PG
Address	800D64200601143F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000
51:63	RWX	TX_NSEG_MAIN_EN: This field is used for main bank nseg enable.

Register Name	Transmit CTLSM STAT1 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_STAT1_EO_PG
Address	800D6C000601143F (SCOM)
Description	This register contains TXBIST information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_CLK_BIST_ERR: This bit indicates that a TXBIST clock side error occurred. 0b0 = No error. 0b1 = A clock side error was found.
49	RWX	TX_CLK_BIST_ACTIVITY_DET: This bit indicates that activity was detected in the PRBS checker for the clock pattern. 0b0 = No activity. 0b1 = Activity was found during TXBIST.
50	ROX	Reserved field.
51:55	ROX	Reserved field.
56:63	RO	constant = 0b00000000

Register Name	Transmit CTLSM STAT1 EO Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_STAT1_EO_PG
Address	800D6C200601143F (SCOM)
Description	This register contains TXBIST information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_CLK_BIST_ERR: This bit indicates that a TXBIST clock side error occurred. 0b0 = No error. 0b1 = A clock side error was found.
49	RWX	TX_CLK_BIST_ACTIVITY_DET: This bit indicates that activity was detected in the PRBS checker for the clock pattern. 0b0 = No activity. 0b1 = Activity was found during TXBIST.

Bits	SCOM	Field Mnemonic: Description
50	ROX	Reserved field.
51:55	ROX	Reserved field.
56:63	RO	constant = 0b00000000

Register Name	Transmit CTLSM CNTLG1 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTLG1_E_PG
Address	800D84000601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CTLSM CNTLG1 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTLG1_E_PG
Address	800D84200601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CTLSM STAT1 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_STAT1_E_PG
Address	800D8C000601143F (SCOM)
Description	This register contains the driver segment test results.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	constant = 0b00000000000000000000000000000000000000000000000000
50:51	RWX	TX_SEG_TEST_CLK_STATUS: This field contains the driver segment test result for the clock lane. Bit 0 is used for PAD P. Bit 1 is used for PAD N.
52:63	RO	constant = 0b000000000000

Register Name	Transmit CTLSM STAT1 E Per-Group Register
Mnemonic	IOF2.TX_WRAP.TX1.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_STAT1_E_PG
Address	800D8C200601143F (SCOM)
Description	This register contains the driver segment test results.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	constant = 0b00000000000000000000000000000000000000000000000000
50:51	RWX	TX_SEG_TEST_CLK_STATUS: This field contains the driver segment test result for the clock lane. Bit 0 is used for PAD P. Bit 1 is used for PAD N.
52:63	RO	constant = 0b000000000000

Register Name	Transmit Impedance Calibration Per-Bus Register
Mnemonic	IOF2.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL_PB
Address	800F04000601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49	NCX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52	ROX	Reserved field.
53	NCX	Reserved field.
54	ROX	Reserved field.
55:63	ROX	Reserved field.

Register Name	Transmit Impedance Calibration NVAL Per-Bus Register
Mnemonic	IOF2.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL_NVAL_PB
Address	800F0C000601143F (SCOM)
Description	This register is used for impedance calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:56	RWX	TX_ZCAL_N: Calibration circuit NSeg enable value. This field holds the current value of the enabled segments. It is a 4x multiple of the actual segment count. It can be read for the current calibration result set during the calibration sequence. It can be written to immediately update circuit enables on each write. It is used with tx_zcal_swo_* for manual calibration. Do not write to this field when tx_zcal_req = 1. (binary code - 0x00 is zero slices, and 0xA1 is maximum slices).
57:63	RO	constant = 0b0000000

Register Name	Transmit Impedance Calibration PVAL Per-Bus Register
Mnemonic	IOF2.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL_PVAL_PB
Address	800F14000601143F (SCOM)
Description	This register is used for impedance calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:56	RWX	TX_ZCAL_P: Calibration circuit PSeg enable value. This field holds the current value of the enabled segments. It is a 4x multiple of the actual segment count. It can be read for the current calibration result set during the calibration sequence. It can be written to immediately update circuit enables on each write. It is used with tx_zcal_swo_* for manual calibration. Do not write this field when tx_zcal_req = 1. (binary code - 0x00 is zero slices, and 0xA1 is maximum slices).
57:63	RO	constant = 0b0000000

Register Name	Transmit Impedance Calibration P 4X Per-Bus Register
Mnemonic	IOF2.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL_P_4X_PB
Address	800F1C000601143F (SCOM)
Description	This register is used for impedance calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	TX_ZCAL_P_4X: Calibration circuit PSeg-4X enable value. This field holds the current value of the enabled segments. It is a 2x multiple of the actual segment count. It can be read for the current calibration result set during the calibration sequence. It can be written to immediately update circuit enables on each write. It is used with tx_zcal_swo_* for manual calibration. Do not write this field when tx_zcal_req = 1. (binary code - 0x00 is zero slices and 0x15 is maximum slices).
53:63	RO	constant = 0b00000000000

Register Name	Transmit Impedance Calibration SWO1 Per-Bus Register
Mnemonic	IOF2.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL_SWO1_PB
Address	800F24000601143F (SCOM)
Description	This register is used for impedance calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_ZCAL_SWO_EN: Impedance calibration software override. This bit steers all calibration controls directly from these register fields. It effectively disables the state-machine logic (default). 0b0 = Inactive. 0b1 = Enable.
49	RWX	TX_ZCAL_SWO_CAL_SEGS: Impedance calibration software bank select. This bit enables PSeg calibration (default). 0b0 = Select NSeg bank comparison. 0b1 = Select PSeg bank comparison.
50	RWX	TX_ZCAL_SWO_CMP_INV: Impedance calibration software compare invert. This bit swaps calibration circuit comparator inputs (default). 0b0 = Select NSeg bank comparison. 0b1 = Select PSeg bank comparison.
51	RWX	TX_ZCAL_SWO_CMP_OFFSET: Impedance calibration software offset flush. This bit equalizes the comparator offset in the calibration circuit (default). 0b0 = Disable offset. 0b1 = Enable offset.

Bits	SCOM	Field Mnemonic: Description
52	RWX	TX_ZCAL_SWO_CMP_RESET: Impedance calibration software comparator reset. This bit resets the comparator in the calibration circuit (default). 0b0 = Disable reset. 0b1 = Enable reset.
53	RWX	TX_ZCAL_SWO_POWERDOWN: Impedance calibration software circuit power down. This bit enables the power-down calibration circuit (default). 0b0 = Disable power down. 0b1 = Enable power down.
54	RWX	TX_ZCAL_SWO_TCOIL: Impedance calibration software circuit TCoil.
55	RWX	TX_ZCAL_RANGE_CHECK: This bit controls the usage of tx_zcal_sm_min/max_val. 0 = These two registers are used to define the range of zcal. 1 = The calibration range is 1 - 80, and the minimum/maximum registers are only used to check whether the result is in range.
56	RWX	TX_ZCAL_CYA_DATA_INV: Impedance calibration CYA sample inversion. This bit selects inverted comparator values in case of a hardware error (default). 0b0 = No sample inversion. 0b1 = Invert samples.
57	RWX	TX_ZCAL_TEST_OVR_2R: Impedance calibration test-only 2R segment override.
58	RWX	TX_ZCAL_TEST_OVR_1R: Impedance calibration test-only 1R segment override.
59	RWX	TX_ZCAL_TEST_OVR_4X_SEG: Impedance calibration test-only 4x segment override.
60	RWX	TX_ZCAL_TEST_CLK_DIV: This register controls the clock for impedance BIST. 1 = The clock is divided by 32. 0 = PLL bypass mode is needed.
61:63	RO	constant = 0b000

Register Name	Transmit Impedance Calibration SWO2 Per-Bus Register
Mnemonic	IOF2.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL_SWO2_PB
Address	800F2C000601143F (SCOM)
Description	This register is used for impedance calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	TX_ZCAL_SM_MIN_VAL: Impedance calibration minimum search threshold. This low-side segment count limit is used in the calibration process. (binary code - 0x00 is zero slices, and 0x50 is maximum slices).
55:61	RWX	TX_ZCAL_SM_MAX_VAL: Impedance calibration maximum search threshold. This high-side segment count limit is used in the calibration process. (binary code - 0x00 is zero slices and 0x50 is maximum slices).
62:63	RO	constant = 0b00

Register Name	Spare Mode Per-Bus Register
Mnemonic	IOF2.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.SPARE_MODE_PB
Address	800F34000601143F (SCOM)
Description	This register contains per-bus spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RWX	PB_SPARE_MODE_0: Per-bus spare mode latch.
49	RWX	PB_SPARE_MODE_1: Per-bus spare mode latch.
50	RWX	PB_SPARE_MODE_2: Per-bus spare mode latch.
51	RWX	PB_SPARE_MODE_3: Per-bus spare mode latch.
52	RWX	PB_SPARE_MODE_4: Per-bus spare mode latch.
53	RWX	PB_SPARE_MODE_5: Per-bus spare mode latch.
54	RWX	PB_SPARE_MODE_6: Per-bus spare mode latch.
55	RWX	PB_SPARE_MODE_7: Per-bus spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	**Transmit IMPCAL2 Per-Bus Register**
Mnemonic	IOF2.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL2_PB
Address	800F3C000601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49	ROX	Reserved field.
50	ROX	Reserved field.
51:52	RO	constant = 0b00
53	NCX	Reserved field.
54	ROX	Reserved field.
55	ROX	Reserved field.
56:63	RO	constant = 0b00000000

Register Name	**Receive FIR Reset Per-Bus Register**
Mnemonic	IOF2.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.RX_FIR_RESET_PB
Address	800F80000601143F (SCOM)
Description	This register controls per-bus transmit latches.

Bits	SCOM	Field Mnemonic: Description
0:61	RO	constant = 0b00000000000000000000000000000000000000000000000000000000000000
62	RWX	RX_PB_CLR_PAR_ERRS: Clear all receive parity error latches. Toggle this field 0→1→0 to clear parity-error latches in the BUSCTL logic.
63	RWX	RX_PB_FIR_RESET: FIR reset. Toggle this field 0→1→0 to reset the BUSCTL logic FIR-related latches, including the isolation and parity-error latches.

Register Name	Receive FIR Per-Bus Register
Mnemonic	IOF2.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.RX_FIR_PB
Address	800F88000601143F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:57	ROX	Reserved field.
58:63	RO	constant = 0b000000

Register Name	Receive FIR Mask Per-Bus Register
Mnemonic	IOF2.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.RX_FIR_MASK_PB
Address	800F90000601143F (SCOM)
Description	This register masks receive FIR per-bus errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:57	RWX	RX_PB_FIR_ERRS_MASK: IOTK ALIAS: This field is a FIR mask for rx_fir_pb errors.
58:63	RO	constant = 0b000000

Register Name	Receive FIR Error Inject Per-Bus Register
Mnemonic	IOF2.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.RX_FIR_ERROR_INJECT_PB
Address	800F98000601143F (SCOM)
Description	This register is used to inject errors into the per-bus receive registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:57	RWX	RX_PB_FIR_ERRS_INJ: IOTK ALIAS: Receive per-bus parity error injection. This field allows injection of non-destructive parity errors in either register or state-machine latch banks. The register or state value is not affected.
58:63	RO	constant = 0b000000

5. OB 0 Chiplet

The POWER9 processor registers are listed alphabetically by mnemonic in the following address table.

The POWER9 processor registers are listed in the following tables.

Register Name	Chiplet Control Register 0
Mnemonic	TP.TCOB0.OB.CPLT_CTRL0
Address	0000000009000000 (SCOM) 0000000009000010 (SCOM1) 0000000009000020 (SCOM2)
Description	This register contains the first set of vital chiplet controls.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_OR	WO_CLEAR	CTRL_CC_ABSTCLK_MUXSEL_DC: Select the ABIST clock source for arrays on a chiplet boundary. When set to 1, clocks are used from a chiplet with ABIST.
1	RW	WO_OR	WO_CLEAR	TC_UNIT_SYNCCLK_MUXSEL_DC: Select the synchronous clock for asynchronous latches. (The initial value is 1.)
2	RW	WO_OR	WO_CLEAR	CTRL_CC_FLUSHMODE_INH_DC: Prevent pipeline latches from going into flush mode. (The initial value is 1.)
3	RW	WO_OR	WO_CLEAR	CTRL_CC_FORCE_ALIGN_DC: Force an alignment signal to be sent. (The initial value is 1. Drop before dropping flushmode_inh.)
4	RW	WO_OR	WO_CLEAR	TC_UNIT_ARY_WRT_THRU_DC: Set the array into write-through mode. Used for LBIST.
5	RW	WO_OR	WO_CLEAR	TC_UNIT_AVP_MODE: Switches from refresh pulse to phase counter.
6	RW	WO_OR	WO_CLEAR	FREE_USAGE_6A: Free usage.
7	RW	WO_OR	WO_CLEAR	FREE_USAGE_7A: Free usage.
8	RW	WO_OR	WO_CLEAR	CTRL_CC_ABIST_RECOV_DISABLE_DC: New signal to disable recovery.
9	RW	WO_OR	WO_CLEAR	FREE_USAGE_9A: Free usage.
10	RW	WO_OR	WO_CLEAR	TC_UNIT_IOBIST_TX_WRAP_ENABLE_DC:
11	RW	WO_OR	WO_CLEAR	RESERVED_11A: Reserved.
12	RW	WO_OR	WO_CLEAR	TC_SKIT_MODE_BIST_DC:
13	RW	WO_OR	WO_CLEAR	TC_UNIT_DETERMINISTIC_TEST_ENABLE_DC: Forces login into deterministic test mode. For example, for LBIST.
14	RW	WO_OR	WO_CLEAR	TC_UNIT_CONSTRAIN_SAFESCAN_DC: Safe scan of N1L latches. Prevent lock when switching SE.
15	RW	WO_OR	WO_CLEAR	TC_UNIT_RRFA_TEST_ENABLE_DC:
16	RW	WO_OR	WO_CLEAR	TC_NBTI_HDR_ENABLE_OVR_DC: NBTI.
17	RW	WO_OR	WO_CLEAR	TC_NBTI_PROBE_GATE_DC: NBTI.
18	RW	WO_OR	WO_CLEAR	RESERVED_18A: Reserved.
19	RW	WO_OR	WO_CLEAR	RESERVED_19A: Reserved.
20:27	RW	WO_OR	WO_CLEAR	TC_PSRO_SEL_DC: PSRO select.
28	RW	WO_OR	WO_CLEAR	TC_BSC_WRAPSEL_DC: Wrap select for BSC.
29	RW	WO_OR	WO_CLEAR	TC_BSC_INTMODE_DC: INT Mode for BSC.
30	RW	WO_OR	WO_CLEAR	TC_BSC_INV_DC: INV for BSC mode.
31	RW	WO_OR	WO_CLEAR	TC_BSC_EXTMODE_DC: EXT mode for BSC.
32	RW	WO_OR	WO_CLEAR	TC_REFCLK_DRVR_EN_DC: Reference clock driver enable.
33	RW	WO_OR	WO_CLEAR	RESERVED_33A: Reserved.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
34	RW	WO_OR	WO_CLEAR	RESERVED_34A: Reserved.
35	RW	WO_OR	WO_CLEAR	RESERVED_35A: Reserved.
36	RW	WO_OR	WO_CLEAR	TC_OELCC_EDGE_DELAYED_DC: Allows to delay the alignment by one fast cycle. Only used in dual mesh chiplets.
37	RW	WO_OR	WO_CLEAR	TC_OELCC_ALIGN_FLUSH_DC: Forces the alignment and odd/even toggling latch into a flush state. For DFT only.
38	RW	WO_OR	WO_CLEAR	RESERVED_38A: Reserved.
39	RW	WO_OR	WO_CLEAR	RESERVED_39A: Reserved.
40:41	RW	WO_OR	WO_CLEAR	CTRL_MISC_CLKDIV_SEL_DC: Clock divider select. 00 = 1024:1 01 = 64:1 10 = 16:1 11 = 4:1
42	RW	WO_OR	WO_CLEAR	RESERVED_42A: Reserved.
43	RW	WO_OR	WO_CLEAR	RESERVED_43A: Reserved.
44	RW	WO_OR	WO_CLEAR	CTRL_CC_DCTEST_DC: TE = 1 only. Enable DCTEST.
45	RW	WO_OR	WO_CLEAR	CTRL_CC_OTP_PRGMODE_DC: TE = 1 only. OTP ROM program mode.
46	RW	WO_OR	WO_CLEAR	CTRL_CC_SSS_CALIBRATE_DC: TE = 1 only. Sensors calibration.
47	RW	WO_OR	WO_CLEAR	CTRL_CC_PIN_LBIST_DC: TE = 1 only. PIN LBIST mode. The LBIST is controlled by the pin, not by the OPCG.
48	RW	WO_OR	WO_CLEAR	FREE_USAGE_48A: Free usage.
49	RW	WO_OR	WO_CLEAR	FREE_USAGE_49A: Free usage.
50	RW	WO_OR	WO_CLEAR	FREE_USAGE_50A: Free usage.
51	RW	WO_OR	WO_CLEAR	FREE_USAGE_51A: Free usage.
52	RW	WO_OR	WO_CLEAR	FREE_USAGE_52A: Free usage.
53	RW	WO_OR	WO_CLEAR	FREE_USAGE_53A: Free usage.
54	RW	WO_OR	WO_CLEAR	FREE_USAGE_54A: Free usage.
55	RW	WO_OR	WO_CLEAR	FREE_USAGE_55A: Free usage.
56	RW	WO_OR	WO_CLEAR	FREE_USAGE_56A: Free usage.
57	RW	WO_OR	WO_CLEAR	FREE_USAGE_57A: Free usage.
58	RW	WO_OR	WO_CLEAR	FREE_USAGE_58A: Free usage.
59	RW	WO_OR	WO_CLEAR	FREE_USAGE_59A: Free usage.
60	RW	WO_OR	WO_CLEAR	FREE_USAGE_60A: Free usage.
61	RW	WO_OR	WO_CLEAR	FREE_USAGE_61A: Free usage.
62	RW	WO_OR	WO_CLEAR	FREE_USAGE_62A: Free usage.
63	RW	WO_OR	WO_CLEAR	FREE_USAGE_63A: Free usage.

Register Name	Chiplet Control Register 1
Mnemonic	TP.TCOB0.OB.CPLT_CTRL1
Address	0000000009000001 (SCOM) 0000000009000011 (SCOM1) 0000000009000021 (SCOM2)
Description	This register contains the second set of vital chiplet controls.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_OR	WO_CLEAR	UNUSED_0B: Unused.
1	RW	WO_OR	WO_CLEAR	UNUSED_1B: Unused.
2	RW	WO_OR	WO_CLEAR	UNUSED_2B: Unused.
3	RW	WO_OR	WO_CLEAR	TC_VITL_REGION_FENCE: VITL fence. Protect the VITL region logic from pollution by other regions during LBIST, or when the chiplet is not initialized and running yet.
4	RW	WO_OR	WO_CLEAR	TC_PERV_REGION_FENCE: Fence for pervasive region.
5	RW	WO_OR	WO_CLEAR	TC_REGION1_FENCE: Fence for region pbiooa0 (PB).
6	RW	WO_OR	WO_CLEAR	TC_REGION2_FENCE: Fence for region ioo0 (IOO).
7	RW	WO_OR	WO_CLEAR	UNUSED_7B: Unused.
8	RW	WO_OR	WO_CLEAR	UNUSED_8B: Unused.
9	RW	WO_OR	WO_CLEAR	UNUSED_9B: Unused.
10	RW	WO_OR	WO_CLEAR	UNUSED_10B: Unused.
11	RW	WO_OR	WO_CLEAR	UNUSED_11B: Unused.
12	RW	WO_OR	WO_CLEAR	UNUSED_12B: Unused.
13	RW	WO_OR	WO_CLEAR	UNUSED_13B: Unused.
14	RW	WO_OR	WO_CLEAR	UNUSED_14B: Unused.
15	RW	WO_OR	WO_CLEAR	RESERVED: Reserved.
16	RW	WO_OR	WO_CLEAR	TC_UNIT_MULTICYCLE_TEST_FENCE:
17	RW	WO_OR	WO_CLEAR	UNUSED_17B: Unused.
18	RW	WO_OR	WO_CLEAR	UNUSED_18B: Unused.
19	RW	WO_OR	WO_CLEAR	UNUSED_19B: Unused.
20	RW	WO_OR	WO_CLEAR	UNUSED_20B: Unused.
21	RW	WO_OR	WO_CLEAR	TC_PERV_MESH_CTRL:
22	RW	WO_OR	WO_CLEAR	UNUSED_22B: Unused.
23	RW	WO_OR	WO_CLEAR	UNUSED_23B: Unused.
24	RW	WO_OR	WO_CLEAR	UNUSED_24B: Unused.
25	RW	WO_OR	WO_CLEAR	UNUSED_25B: Unused.
26	RW	WO_OR	WO_CLEAR	UNUSED_26B: Unused.
27	RW	WO_OR	WO_CLEAR	UNUSED_27B: Unused.
28	RW	WO_OR	WO_CLEAR	UNUSED_28B: Unused.
29	RW	WO_OR	WO_CLEAR	UNUSED_29B: Unused.
30	RW	WO_OR	WO_CLEAR	UNUSED_30B: Unused.
31	RW	WO_OR	WO_CLEAR	UNUSED_31B: Unused.

Register Name	Chiplet Configuration Register 0
Mnemonic	TP.TCOB0.OB.CPLT_CONF0
Address	0000000009000008 (SCOM) 0000000009000018 (SCOM1) 0000000009000028 (SCOM2)
Description	This register contains the first set of vital chiplet configuration functions.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:5	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE0_SEL_DC: Probe 0 select.
6	RW	WO_OR	WO_CLEAR	RESERVED_6C: Reserved.
7	RW	WO_OR	WO_CLEAR	RESERVED_7C: Reserved.
8:13	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE1_SEL_DC: Probe 1 select.
14	RW	WO_OR	WO_CLEAR	RESERVED_14C: Reserved.
15	RW	WO_OR	WO_CLEAR	RESERVED_15C: Reserved.
16:21	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE2_SEL_DC: Probe 2 select.
22	RW	WO_OR	WO_CLEAR	RESERVED_22C: Reserved.
23	RW	WO_OR	WO_CLEAR	RESERVED_23C: Reserved.
24:29	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE3_SEL_DC: Probe 3 select.
30	RW	WO_OR	WO_CLEAR	RESERVED_30C: Reserved.
31	RW	WO_OR	WO_CLEAR	RESERVED_31C: Reserved.
32	RW	WO_OR	WO_CLEAR	CTRL_CC_OFLOW_FEH_SEL_DC: Enables ABIST overflow or failure indication.
33	RW	WO_OR	WO_CLEAR	CTRL_CC_SCAN_PROTECT_DC: Enables scan protection and the scan collision error mechanism.
34	RW	WO_OR	WO_CLEAR	CTRL_CC_SDIS_DC_N: Disables the scan diagnostic scan path.
35	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_35C: Reserved for test control.
36	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_36C: Reserved for test control.
37	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_37C: Reserved for test control.
38	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_38C: Reserved for test control.
39	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_39C: Reserved for test control.
40	RW	WO_OR	WO_CLEAR	CTRL_EPS_MASK_VITL_PCB_ERR_DC: Mask VITL PCB errors from CC or CPLT_CTRL.
41	RW	WO_OR	WO_CLEAR	CTRL_CC_MASK_VITL_SCAN_OPCG_ERR_DC: Mask VITL errors in CC, which are not PCB related.
42	RW	WO_OR	WO_CLEAR	RESERVED_42C: Reserved.
43	RW	WO_OR	WO_CLEAR	RESERVED_43C: Reserved.
44	RW	WO_OR	WO_CLEAR	FREE_USAGE_44C: Free usage.
45	RW	WO_OR	WO_CLEAR	FREE_USAGE_45C: Free usage.
46	RW	WO_OR	WO_CLEAR	FREE_USAGE_46C: Free usage.
47	RW	WO_OR	WO_CLEAR	FREE_USAGE_47C: Free usage.
48:51	RW	WO_OR	WO_CLEAR	TC_UNIT_GROUP_ID_DC: Group ID.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
52:54	RW	WO_OR	WO_CLEAR	TC_UNIT_CHIP_ID_DC: Chip ID.
55	RW	WO_OR	WO_CLEAR	RESERVED_ID_55C: Reserved ID.
56:60	RW	WO_OR	WO_CLEAR	TC_UNIT_SYS_ID_DC: SYS ID.
61	RW	WO_OR	WO_CLEAR	RESERVED_ID_61C: Reserved ID.
62	RW	WO_OR	WO_CLEAR	RESERVED_ID_62C: Reserved ID.
63	RW	WO_OR	WO_CLEAR	RESERVED_ID_63C: Reserved ID.

Register Name	Chiplet Configuration Register 1
Mnemonic	TP.TCOB0.OB.CPLT_CONF1
Address	0000000009000009 (SCOM) 0000000009000019 (SCOM1) 0000000009000029 (SCOM2)
Description	This register contains the second set of vital chiplet configuration functions.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_OR	WO_CLEAR	UNUSED_0D: Unused.
1	RW	WO_OR	WO_CLEAR	UNUSED_1D: Unused.
2	RW	WO_OR	WO_CLEAR	UNUSED_2D: Unused.
3	RW	WO_OR	WO_CLEAR	UNUSED_3D: Unused.
4	RW	WO_OR	WO_CLEAR	TC_PBIOO0_IOVALID:
5	RW	WO_OR	WO_CLEAR	TC_PBIOO1_IOVALID:
6	RW	WO_OR	WO_CLEAR	IOVALID_6D:
7	RW	WO_OR	WO_CLEAR	IOVALID_7D:
8	RW	WO_OR	WO_CLEAR	IOVALID_8D:
9	RW	WO_OR	WO_CLEAR	IOVALID_9D:
10	RW	WO_OR	WO_CLEAR	IOVALID_10D:
11	RW	WO_OR	WO_CLEAR	IOVALID_11D:
12	RW	WO_OR	WO_CLEAR	FREE_USAGE_12D: Free usage.
13	RW	WO_OR	WO_CLEAR	FREE_USAGE_13D: Free usage.
14	RW	WO_OR	WO_CLEAR	FREE_USAGE_14D: Free usage.
15	RW	WO_OR	WO_CLEAR	FREE_USAGE_15D: Free usage.
16:17	RW	WO_OR	WO_CLEAR	TC_OB_RATIO_DC:
18	RW	WO_OR	WO_CLEAR	FREE_USAGE_18D: Free usage.
19	RW	WO_OR	WO_CLEAR	FREE_USAGE_19D: Free usage.
20	RW	WO_OR	WO_CLEAR	FREE_USAGE_20D: Free usage.
21	RW	WO_OR	WO_CLEAR	FREE_USAGE_21D: Free usage.
22	RW	WO_OR	WO_CLEAR	FREE_USAGE_22D: Free usage.
23	RW	WO_OR	WO_CLEAR	FREE_USAGE_23D: Free usage.
24	RW	WO_OR	WO_CLEAR	FREE_USAGE_24D: Free usage.
25	RW	WO_OR	WO_CLEAR	FREE_USAGE_25D: Free usage.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
26	RW	WO_OR	WO_CLEAR	FREE_USAGE_26D: Free usage.
27	RW	WO_OR	WO_CLEAR	FREE_USAGE_27D: Free usage.
28	RW	WO_OR	WO_CLEAR	FREE_USAGE_28D: Free usage.
29	RW	WO_OR	WO_CLEAR	FREE_USAGE_29D: Free usage.
30	RW	WO_OR	WO_CLEAR	FREE_USAGE_30D: Free usage.
31	RW	WO_OR	WO_CLEAR	FREE_USAGE_31D: Free usage.

Register Name	Chiplet Status Register
Mnemonic	TP.TCOB0.OB.CPLT_STAT0
Address	0000000009000100 (SCOM)
Description	An interrupt is sent out on a bit change if not masked by the Chiplet Mask Register. A mask only masks the interrupt, not the status register.

Bits	SCOM	Field Mnemonic: Description
0	ROX	SRAM_ABIST_DONE_DC: SRAM, eDRAM, and ABIST done.
1	ROX	DRAM_ABIST_DONE_DC: Unused in POWER9 DD1.
2	ROX	RESERVED_2E: Reserved.
3	ROX	RESERVED_3E: Reserved.
4	ROX	TC_DIAG_PORT0_OUT: Diagnostic output port.
5	ROX	TC_DIAG_PORT1_OUT: Diagnostic output port.
6	ROX	RESERVED_6E: Reserved.
7	ROX	PLL_DESTOUT: Reserved.
8	ROX	CC_CTRL_OPCG_DONE_DC: OPCG done. For LBIST, ABIST, or other OPCG runs.
9	ROX	CC_CTRL_CHIPLET_IS_ALIGNED_DC: Indicates that a chiplet is aligned.
10	ROX	FREE_USAGE_10E: Free usage.
11	ROX	FREE_USAGE_11E: Free usage.
12	ROX	FREE_USAGE_12E: Free usage.
13	ROX	FREE_USAGE_13E: Free usage.
14	ROX	FREE_USAGE_14E: Free usage.
15	ROX	FREE_USAGE_15E: Free usage.
16	ROX	FREE_USAGE_16E: Free usage.
17	ROX	FREE_USAGE_17E: Free usage.
18	ROX	FREE_USAGE_18E: Free usage.
19	ROX	FREE_USAGE_19E: Free usage.
20	ROX	FREE_USAGE_20E: Free usage.
21	ROX	FREE_USAGE_21E: Free usage.
22	ROX	FREE_USAGE_22E: Free usage.
23	ROX	FREE_USAGE_23E: Free usage.

Register Name	Chiplet Mask Register
Mnemonic	TP.TCOB0.OB.CPLT_MASK0
Address	0000000009000101 (SCOM)
Description	This register masks an interrupt when a bit changes in the Chiplet Status Register. It does not mask the status itself.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CPLTMASK0: Bitwise masking of the Chiplet Status Register.

Register Name	Control Protect Mode Register
Mnemonic	TP.TCOB0.OB.CTRL_PROTECT_MODE_REG
Address	00000000090003FE (SCOM)
Description	This register enables read and write protection.

Bits	SCOM	Field Mnemonic: Description
0	RW	CTRL_READ_PROTECT_ENABLE: Enables read protection.
1	RW	CTRL_WRITE_PROTECT_ENABLE: Enables write protection.

Register Name	Atomic Lock Register
Mnemonic	TP.TCOB0.OB.CTRL_ATOMIC_LOCK_REG
Address	00000000090003FF (SCOM)
Description	This register enables an atomic lock and an atomic lock counter.

Bits	SCOM	Field Mnemonic: Description
0	RW	CTRL_ATOMIC_LOCK_ENABLE: Enables atomic lock.
1:4	ROX	CTRL_ATOMIC_ID: Atomic ID.
5:7	RO	constant = 0b000
8:15	ROX	CTRL_ATOMIC_ACTIVITY: Atomic lock counter.

Register Name	PSCOMLE Mode Register
Mnemonic	TP.TCOB0.OB.EPS.PSC.PSC.PSCOM_MODE_REG
Address	0000000009010000 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) mode register.

Bits	SCOM	Field Mnemonic: Description
0	RW	ABORT_ON_PCB_ADDR_PARITY_ERROR: Abort on PCB address parity error.
1	RW	ABORT_ON_PCB_WDATA_PARITY_ERROR: Abort on PCB write data parity error.
2	RW	ABORT_ON_DL_RETURN_P0_ERROR: Unused.
3	RW	ABORT_ON_DL_RETURN_WDATA_PARITY_ERROR: Abort on DL return write data parity error.
4	RW	WATCHDOG_ENABLE: Enable watchdog.

Bits	SCOM	Field Mnemonic: Description
5:6	RW	SCOM_HANG_LIMIT: 0b11 = 256 0b10 = 512 0b01 = 768 0b00 = 1023
7	RW	FORCE_ALL_RINGS: Set to a logical 1 if all rings should be enabled independent of the ring address.
8	RW	FSM_SELFRESET_ON_STATEVEC_PARITYERROR_ENABLE: FSM self reset on STATEVEC parity error enable.
9:11	RW	RESERVED_PSCOM_MODE_LT: Reserved.

Register Name	PSCOMLE Error Register
Mnemonic	TP.TCOB0.OB.EPS.PSC.PSC.PSCOM_STATUS_ERROR_REG
Address	0000000009010001 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) error register.

Bits	SCOM	Field Mnemonic: Description
0	RWX	ACCUMULATED_PCB_WDATA_PARITY_ERROR: Accumulated PCB write data parity error.
1	RWX	ACCUMULATED_PCB_ADDRESS_PARITY_ERROR: Accumulated PCB address parity error.
2	RWX	ACCUMULATED_DL_RETURN_WDATA_PARITY_ERROR: Accumulated DL return write data parity error.
3	RWX	ACCUMULATED_DL_RETURN_P0_ERROR: Accumulated DL return P0 error.
4	RWX	ACCUMULATED_UL_RDATA_PARITY_ERROR: Accumulated UL read data parity error.
5	RWX	ACCUMULATED_UL_P0_ERROR: Accumulated UL P0 error.
6	RWX	ACCUMULATED_PARITY_ERROR_ON_INTERFACE_MACHINE: Accumulated parity error on interface machine.
7	RWX	ACCUMULATED_PARITY_ERROR_ON_P2S_MACHINE: Accumulated parity error on p2s machine.
8	RWX	ACCUMULATED_TIMEOUT_WHILE_WAITING_FOR_ULCCH: Accumulated timeout while waiting for ULCCH.
9	RWX	ACCUMULATED_TIMEOUT_WHILE_WAITING_FOR_DLDCH_RETURN: Accumulated timeout while waiting for DLDCH return.
10	RWX	ACCUMULATED_TIMEOUT_WHILE_WAITING_FOR_ULDCH: Accumulated timeout while waiting for ULDCH.
11	RWX	ACCUMULATED_PSCOM_PARALLEL_WRITE_NVLD: Accumulated PSCOM parallel write NVLD.
12	RWX	ACCUMULATED_PSCOM_PARALLEL_READ_NVLD: Accumulated PSCOM parallel read NVLD.
13	RWX	ACCUMULATED_PSCOM_PARALLEL_ADDR_INVALID: Accumulated PSCOM parallel address invalid.
14	RWX	ACCUMULATED_PCB_COMMAND_PARITY_ERROR: Accumulated PCB command parity error.
15	RWX	ACCUMULATED_GENERAL_TIMEOUT: Accumulated general timeout.
16	RWX	ACCUMULATED_SATELLITE_ACKNOWLEDGE_ACCESS_VIOLATION: Accumulated satellite acknowledge access violation.
17	RWX	ACCUMULATED_SATELLITE_ACKNOWLEDGE_INVALID_REGISTER: Accumulated satellite acknowledge invalid register.
18	RWX	TRAPPED_PCB_WDATA_PARITY_ERROR: Trapped PCB write data parity error.
19	RWX	TRAPPED_PCB_ADDRESS_PARITY_ERROR: Trapped PCB address parity error.
20	RWX	TRAPPED_DL_RETURN_WDATA_PARITY_ERROR: Trapped DL return write data parity error.

Bits	SCOM	Field Mnemonic: Description
21	RWX	TRAPPED_DL_RETURN_P0_ERROR: Trapped DL return P0 error.
22	RWX	TRAPPED_UL_RDATA_PARITY_ERROR: Trapped UL read data parity error.
23	RWX	TRAPPED_UL_P0_ERROR: Trapped UL P0 error.
24	RWX	TRAPPED_PARITY_ERROR_ON_INTERFACE_MACHINE: Trapped parity error on interface machine.
25	RWX	TRAPPED_PARITY_ERROR_ON_P2S_MACHINE: Trapped parity error on p2s machine.
26	RWX	TRAPPED_TIMEOUT_WHILE_WAITING_FOR_ULCCH: Trapped timeout while waiting for ULCCH.
27	RWX	TRAPPED_TIMEOUT_WHILE_WAITING_FOR_DLDCH_RETURN: Trapped timeout while waiting for DLDCH return.
28	RWX	TRAPPED_TIMEOUT_WHILE_WAITING_FOR_ULDCH: Trapped timeout while waiting for ULDCH.
29	RWX	TRAPPED_PSCOM_PARALLEL_WRITE_NVLD: Trapped PSCOM parallel write NVLD.
30	RWX	TRAPPED_PSCOM_PARALLEL_READ_NVLD: Trapped PSCOM parallel read NVLD.
31	RWX	TRAPPED_PSCOM_PARALLEL_ADDR_INVALID: Trapped PSCOM parallel address invalid.
32	RWX	TRAPPED_PCB_COMMAND_PARITY_ERROR: Trapped PCB command parity error.
33	RWX	TRAPPED_GENERAL_TIMEOUT: Trapped general timeout.
34	RWX	TRAPPED_SATELLITE_ACKNOWLEDGE_ACCESS_VIOLATION: Trapped satellite acknowledge access violation.
35	RWX	TRAPPED_SATELLITE_ACKNOWLEDGE_INVALID_REGISTER: Trapped satellite acknowledge invalid register.

Register Name	PSCOMLE Error Mask Register
Mnemonic	TP.TCOB0.OB.EPS.PSC.PSC.PSCOM_ERROR_MASK
Address	0000000009010002 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) error mask register.

Bits	SCOM	Field Mnemonic: Description
0	RW	MASK_PCB_WDATA_PARITY_ERROR: Mask PCB write data parity error.
1	RW	MASK_PCB_ADDRESS_PARITY_ERROR: Mask PCB address parity error.
2	RW	MASK_DL_RETURN_WDATA_PARITY_ERROR: Mask DL return write data parity error.
3	RW	MASK_DL_RETURN_P0_ERROR: Mask DL return P0 error.
4	RW	MASK_UL_RDATA_PARITY_ERROR: Mask UL read data parity error.
5	RW	MASK_UL_P0_ERROR: Mask UL P0 error.
6	RW	MASK_PARITY_ERROR_ON_INTERFACE_MACHINE: Mask parity error on interface machine.
7	RW	MASK_PARITY_ERROR_ON_P2S_MACHINE: Mask parity error on p2s machine.
8	RW	MASK_TIMEOUT_WHILE_WAITING_FOR_ULCCH: Mask timeout while waiting for ULCCH.
9	RW	MASK_TIMEOUT_WHILE_WAITING_FOR_DLDCH_RETURN: Mask timeout while waiting for DLDCH return.
10	RW	MASK_TIMEOUT_WHILE_WAITING_FOR_ULDCH: Mask timeout while waiting for ULDCH.
11	RW	MASK_PSCOM_PARALLEL_WRITE_NVLD: Mask PSCOM parallel write NVLD.
12	RW	MASK_PSCOM_PARALLEL_READ_NVLD: Mask PSCOM parallel read NVLD.
13	RW	MASK_PSCOM_PARALLEL_ADDR_INVALID: Mask PSCOM parallel address invalid.
14	RW	MASK_PCB_COMMAND_PARITY_ERROR: Mask PCB command parity error.

Bits	SCOM	Field Mnemonic: Description
15	RW	MASK_GENERAL_TIMEOUT: Mask general timeout.
16	RW	MASK_SATELLITE_ACKNOWLEDGE_ACCESS_VIOLATION: Mask satellite acknowledge access violation.
17	RW	MASK_SATELLITE_ACKNOWLEDGE_INVALID_REGISTER: Mask satellite acknowledge invalid register.

Register Name	PSCOMLE Address Trap Register
Mnemonic	TP.TCOB0.OB.EPS.PSC.PSC.ADDR_TRAP_REG
Address	0000000009010003 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) address trap register.

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	PCB_ADDRESS_OF_LAST_TRANSACTION_WITH_ERROR: PCB address of the last transaction with an error.
16	ROX	PCB_READ_NOTWRITE_OF_LAST_TRANSACTION_WITH_ERROR: PCB read, not write, of the last transaction with an error.
17	ROX	RESERVED_ADDR_LAST_TRAP_LT: Reserved_0.
18:30	ROX	SERIAL2PARALLEL_STATE_MACHINE_AT_TIME_OF_ERROR: Serial2 parallel state machine at the time of the error.
31	ROX	SATELLITE_ACKNOWLEDGE_BIT_RETURN_PARITY: This bit is set to 1 if no parity error is detected in the satellite number or acknowledgment bits.
32	ROX	SATELLITE_ACKNOWLEDGE_BIT_WRITE_PARITY_ERROR: Set if a write parity error is detected by the satellite.
33	ROX	SATELLITE_ACKNOWLEDGE_BIT_ACCESS_VIOLATION: Set if an invalid read or write access is detected by the satellite.
34	ROX	SATELLITE_ACKNOWLEDGE_BIT_INVALID_REGISTER: Set if an invalid register address is detected by the satellite.

Register Name	Ring Lock Enable Register
Mnemonic	TP.TCOB0.OB.EPS.PSC.PSC.WRITE_PROTECT_ENABLE_REG
Address	0000000009010005 (SCOM)
Description	This register enables the ring lock.

Bits	SCOM	Field Mnemonic: Description
0	RW	ENABLE_RING_LOCKING: General enable of ring locking upon write to a specific ring.
1	RW	RESERVED_RING_LOCKING: Reserved.

Register Name	Write Protect Rings Register
Mnemonic	TP.TCOB0.OB.EPS.PSC.PSC.WRITE_PROTECT_RINGS_REG
Address	0000000009010006 (SCOM)
Description	This register writes ring protect bit maps.

Bits	SCOM	Field Mnemonic: Description
0:15	RW	WRITE_PROTECT_RINGS: Write a protect bit map for each ring.

Register Name	Atomic Lock Mask Register
Mnemonic	TP.TCOB0.OB.EPS.PSC.PSC.ATOMIC_LOCK_MASK_LATCH_REG
Address	0000000009010007 (SCOM)
Description	This register provides a bit mask for atomic locking.

Bits	SCOM	Field Mnemonic: Description
0:15	RW	ATOMIC_LOCK_MASK: A bit mask for atomic locking on a ring-by-ring basis.

Register Name	Ring Fence Enable Mask Register
Mnemonic	TP.TCOB0.OB.EPS.PSC.PSC.RING_FENCE_MASK_LATCH_REG
Address	0000000009010008 (SCOM)
Description	This register provides a bit mask for ring fencing.

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1:15	RW	RING_FENCE_ENABLE_MASK: Enable bit mask for ring fencing on a ring-by-ring basis.

Register Name	Trace Array High Data Register
Mnemonic	TP.TCOB0.OB.TRA0.TR0.TRACE_HI_DATA_REG
Address	0000000009010400 (SCOM)
Description	This register provides the high trace array data.

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	TRACE_HI_DATA: Trace array data 0:63.

Register Name	Trace Array Low Data Register
Mnemonic	TP.TCOB0.OB.TRA0.TR0.TRACE_LO_DATA_REG
Address	0000000009010401 (SCOM)
Description	This register provides the low trace array data.

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	TRACE_LO_DATA: Trace array data 64:95.
32:41	ROX	TRACE_ADDRESS: Trace address.
42:50	ROX	TRACE_LAST_BANK: Trace last bank.
51	ROX	TRACE_LAST_BANK_VALID: Trace last valid bank.
52	ROX	TRACE_WRITE_ON_RUN: Trace write-on-run indicator.
53	ROX	TRACE_RUNNING: Trace run indicator.
54:63	ROX	TRACE_HOLD_ADDRESS: Trace hold address (pointing to last entry).

Register Name	Trace Control Configuration Register
Mnemonic	TP.TCOB0.OB.TRA0.TR0.TRACE_TRCTRL_CONFIG
Address	0000000009010402 (SCOM)
Description	This register contains trace control configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	STORE_ON_TRIG_MODE: Enable store on trigger mode.
1	RW	WRITE_ON_RUN_MODE: Enable unconditional forced write when trace runs.
2:9	RW	EXTEND_TRIG_MODE: Counter value for extended trigger mode.
10	RW	BANK_MODE: Enable bank mode.
11	RW	ENH_TRACE_MODE: Enable enhanced trace mode.
12	RW	LOCAL_CLOCK_GATE_CONTROL: When this bit is set, internal clock gating is disabled. The trace control logic and the trace data pipeline are always clocked.
13	RW	UNUSED_13B: Unused.
14:17	RW	TRACE_SELCT_CONTROL: Selector for two sets of external trace bus multiplexers, tra_mux0_sel(0:1) and tra_mux1_sel(0:1).
18:21	RW	SPARE_CONTROL: Spare control bits.

Register Name	Trace Data Configuration Register 0
Mnemonic	TP.TCOB0.OB.TRA0.TR0.TRACE_TRDATA_CONFIG_0
Address	0000000009010403 (SCOM)
Description	This register contains a trace data compare mask for bits 0 – 63.

Bits	SCOM	Field Mnemonic: Description
0:63	RW	CMP_MSK_LT_B_0_TO_63: Trace data compare mask for bits 0 to 63.

Register Name	Trace Data Configuration Register 1
Mnemonic	TP.TCOB0.OB.TRA0.TR0.TRACE_TRDATA_CONFIG_1
Address	0000000009010404 (SCOM)
Description	This register contains a trace data compare mask for bits 64 – 87.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CMP_MSK_LT_B_64_TO_87: Trace data compare mask for bits 64 to 87.

Register Name	Trace Data Configuration Register 2
Mnemonic	TP.TCOB0.OB.TRA0.TR0.TRACE_TRDATA_CONFIG_2
Address	0000000009010405 (SCOM)
Description	This register contains patterns A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNA: pattern_match_pata_0_to_23.

Bits	SCOM	Field Mnemonic: Description
24:47	RW	PATTERNB: pattern_match_patb_0_to_23.

Register Name	Trace Data Configuration Register 3
Mnemonic	TP.TCOB0.OB.TRA0.TR0.TRACE_TRDATA_CONFIG_3
Address	0000000009010406 (SCOM)
Description	This register contains patterns C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNC: pattern_match_patc_0_to_23.
24:47	RW	PATTERND: pattern_match_patd_0_to_23.

Register Name	Trace Data Configuration Register 4
Mnemonic	TP.TCOB0.OB.TRA0.TR0.TRACE_TRDATA_CONFIG_4
Address	0000000009010407 (SCOM)
Description	This register contains masks A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKA: mska.
24:47	RW	MASKB: mskb.

Register Name	Trace Data Configuration Register 5
Mnemonic	TP.TCOB0.OB.TRA0.TR0.TRACE_TRDATA_CONFIG_5
Address	0000000009010408 (SCOM)
Description	This register contains masks C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKC: mskc.
24:47	RW	MASKD: mskd.

Register Name	Trace Data Configuration Register 9
Mnemonic	TP.TCOB0.OB.TRA0.TR0.TRACE_TRDATA_CONFIG_9
Address	0000000009010409 (SCOM)
Description	This register contains trace data configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	DISABLE_COMPRESSION: Disable trace data compression (store data every cycle).
1	RW	ERROR_BIT_COMPRESSION_CARE_MASK: Take into account changes in the error bit for trace data compression (default = 0).

Bits	SCOM	Field Mnemonic: Description
2:3	RW	MATCHA_MUXSEL: Match PATTERNA against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
4:5	RW	MATCHB_MUXSEL: Match PATTERNB against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
6:7	RW	MATCHC_MUXSEL: Match PATTERNC against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
8:9	RW	MATCHD_MUXSEL: Match PATTERND against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
10:13	RW	TRIG0_OR_MASK: The OR of all selected MATCHes is ORed with result of TRIG0_AND. 0b1xxx selects MATCHA OR 0bx1xx selects MATCHB OR 0bxx1x selects MATCHC OR 0bxxx1 selects MATCHD OR 0b0000 selects to not OR any MATCHes.
14:17	RW	TRIG0_AND_MASK: The AND of following selected MATCHes is ORed with result of TRIG0_OR. 0b1xxx selects MATCHA AND 0bx1xx selects MATCHB AND 0bxx1x selects MATCHC AND 0bxxx1 selects MATCHD AND 0b0000 selects to not AND any MATCHes together to form TRIG0.
18:21	RW	TRIG1_OR_MASK: The OR of all selected MATCHes is ORed with result of TRIG1_AND. 0b1xxx selects MATCHA OR 0bx1xx selects MATCHB OR 0bxx1x selects MATCHC OR 0bxxx1 selects MATCHD OR 0b0000 selects to not OR any MATCHes to form TRIG1.
22:25	RW	TRIG1_AND_MASK: The AND of following selected MATCHes is ORed with result of TRIG1_OR. 0b1xxx selects MATCHA AND 0bx1xx selects MATCHB AND 0bxx1x selects MATCHC AND 0bxxx1 selects MATCHD AND 0b0000 selects to not AND any MATCHes together to form TRIG1.
26	RW	TRIG0_NOT_MODE: Invert TRIG0 before using it.
27	RW	TRIG1_NOT_MODE: Invert TRIG1 before using it.
28:31	RW	MATCH_NOT_MODE: Invert the match polarity before using it to form a trigger. 0b1000 inverts MATCHA. 0b0100 inverts MATCHB. 0b0010 inverts MATCHC. 0b0001 inverts MATCHD.
32:35	RW	Reserved field.
36	RW	DD1_STRETCH_TRIGGER_PULSES: (DD1 workaround.) Stretch trigger output pulses to two clocks. Must be enabled for MCFAST and L2FAST traces.

Bits	SCOM	Field Mnemonic: Description
37	RW	Reserved field.

Register Name	Debug Mode Register
Mnemonic	TP.TCOB0.OB.EPS.DBG.DBG_MODE_REG
Address	00000000090107C0 (SCOM)
Description	This is debug macro configuration register 0 for the configuration component.

Bits	SCOM	Field Mnemonic: Description
0:2	RW	GLB_BRCST_MODE: Global broadcast mode (0 to 2): 100 = dbg_trace_run and dbg_trace_freeze. 101 = pc_tcdbg_trace_run_fncd and dbg_trace_freeze. 110 = dbg_triggers_out(0 to 1). 111 = pc_tcdbg_triggers(0 to 1) (from core).
3:5	RW	TRACE_SEL_MODE: Select source for trace_run and bank. 001 = Core trace run and bank. 010 = TP broadcast run and 0. 011 = tc_dbg_inter_brcst latched. 100 = tc_dbg_dbg_sync_brcst_rcv. else = dbg_trace_run and dbg_trace_bank.
6:7	RW	TRIG_SEL_MODE: Select source for tcdbg_trigger(0). 10 = Global broadcast. 11 = pc_tcdbg_trigger (from core). else = dbg_triggers_out(0:1).
8	RW	STOP_ON_XSTOP_SELECTION: Enable trace stop on checkstop.
9	RW	STOP_ON_RECOV_ERR_SELECTION: Enable trace stop on recoverable error.
10	RW	STOP_ON_SPATTN_SELECTION: Enable trace stop on special attention.
11	RW	FREEZE_SEL_MODE: Select freeze source: 0 = Local debug freeze. 1 = Via broadcast: tp_tcdbg_glb_brcst(1).
12:13	RW	SYNC_BRCST_MODE: Originally used for synchronous broadcast mode, but now obsolete. See trace_sel_mode.
14	RO	constant = 0b0
15	RO	constant = 0b0
16:31	ROX	dbg_status. Debug status.
32:63	RO	constant = 0b00000000000000000000000000000000

Description	This is debug macro configuration register 2 for the front-end 1 component.

Bits	SCOM	Field Mnemonic: Description
0:4	RW	INST2_CROSS_COUPLE_SELECT_1_A: Cross coupling is the same for all selectors: 00000 = Selects inst2_cond1_trig_a. 00001 = Selects inst2_cond1_trig_b. 00010 = Selects inst2_cond2_trig_a. 00011 = Selects inst2_cond2_trig_b. 00100 = Selects inst2_condition1. 00101 = Selects inst2_condition2. 00110 = Selects inst2_condition3. 00111 = Selects inst2_cond2_timeout. 01000 = Selects inst2_cond1_trig_a. 01001 = Selects inst2_cond1_trig_b. 01010 = Selects inst2_cond2_trig_a. 01011 = Selects inst2_cond2_trig_b. 01100 = Selects inst2_condition1. 01101 = Selects inst2_condition2. 01110 = Selects inst2_condition3. 01111 = Selects inst2_cond2_timeout. 10000 = Selects inst3_cond1_trig_a. 10001 = Selects inst3_cond1_trig_b. 10010 = Selects inst3_cond2_trig_a. 10011 = Selects inst3_cond2_trig_b. 10100 = Selects inst3_condition1. 10101 = Selects inst3_condition2. 10110 = Selects inst3_condition3. 10111 = Selects inst3_cond2_timeout. 11000 = Selects inst4_cond1_trig_a. 11001 = Selects inst4_cond1_trig_b. 11010 = Selects inst4_cond2_trig_a. 11011 = Selects inst4_cond2_trig_b. 11100 = Selects inst4_condition1. 11101 = Selects inst4_condition2. 11110 = Selects inst4_condition3. 11111 = Selects inst4_cond2_timeout.
5:9	RW	INST2_CROSS_COUPLE_SELECT_1_B: inst2 cross couple select 1b.
10:14	RW	INST2_CROSS_COUPLE_SELECT_2_A: inst2 cross couple select 2a.
15:19	RW	INST2_CROSS_COUPLE_SELECT_2_B: inst2 cross couple select 2b.
20:43	RW	INST2_TO_CMP_LT: Compare value for special counter LT in debug component 2.
44	RW	INST2_FORCE_TEST_MODE: Force test mode to compare without an actual compare.

Register Name	Debug Instance 2 Condition 3 Register
Mnemonic	TP.TCOB0.OB.EPS.DBG.DBG_INST2_COND_REG_3
Address	00000000090107C6 (SCOM)
Description	This is debug macro configuration register 2 for the front-end 1 component.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	INST2_SP_COUNT_LT: Timeout counter to compare value for dbg_cond_comp_1.

Register Name	Debug Trace 0 Register
Mnemonic	TP.TCOB0.OB.EPS.DBG.DBG_TRACE_REG_0
Address	00000000090107CD (SCOM)
Description	This is debug macro configuration register 0 for the debug back-end component.

Bits	SCOM	Field Mnemonic: Description
0	RW	INST1_COND3_ENABLE: Enable instance 1 condition 3.
1	RW	INST2_COND3_ENABLE: Enable instance 2 condition 3.
2	RW	INST3_COND3_ENABLE: Unused.
3	RW	INST4_COND3_ENABLE: Unused.
4	RW	INST1_SLOW_LFSR_MODE: Enable slow LFSR mode of front end instance 1.
5	RW	INST2_SLOW_LFSR_MODE: Enable slow LFSR mode of front end instance 2.
6	RW	INST3_SLOW_LFSR_MODE: Unused.
7	RW	INST4_SLOW_LFSR_MODE: Unused.
8:9	RW	INST1_CONDITION1_TRIG_SEL: Select inst1 condition1 for output (external) triggers. 00 = Do nothing. 01 = trigger_out(0). 10 = trigger_out(1). 11 = trigger_out(2).
10:11	RW	INST1_CONDITION2_TRIG_SEL: Select inst1 condition2 for output (external) triggers. 00 = Do nothing. 01 = trigger_out(0). 10 = trigger_out(1). 11 = trigger_out(2).
12:13	RW	INST1_C2_TIMEOUT_TRIG_SEL: Select inst1 c2 time-out counter for output (external) triggers. 00 = Do nothing. 01 = trigger_out(0). 10 = trigger_out(1). 11 = trigger_out(2).
14:15	RW	INST2_CONDITION1_TRIG_SEL: Select inst2 condition1 for output (external) triggers. 00 = Do nothing. 01 = trigger_out(0). 10 = trigger_out(1). 11 = trigger_out(2).
16:17	RW	INST2_CONDITION2_TRIG_SEL: Select inst2 condition2 trigger for output (external) triggers. 00 = Do nothing. 01 = trigger_out(0). 10 = trigger_out(1). 11 = trigger_out(2).

Bits	SCOM	Field Mnemonic: Description
18:19	RW	INST2_C2_TIMEOUT_TRIG_SEL: Select inst2 c2 time-out counter for output (external) triggers. 00 = Do nothing. 01 = trigger_out(0). 10 = trigger_out(1). 11 = trigger_out(2).
20:31	RO	constant = 0b000000000000
32	RW	EXT_TRIG_ON_STOP: Enable trigger on stop.
33	RW	EXT_TRIG_ON_FREEZE: Enable trigger on freeze.

Register Name	Debug Trace Mode 2 Register
Mnemonic	TP.TCOB0.OB.EPS.DBG.DBG_TRACE_MODE_REG_2
Address	00000000090107CF (SCOM)
Description	This is debug macro configuration register 2 for the back-end component.

Bits	SCOM	Field Mnemonic: Description
0:15	RW	RUNN_COUNT_COMPARE_VALUE: Compare value for the RUNN counter used in trace modes RUNN and WAITN.
16	RW	IMM_FREEZE_MODE: Immediate freeze mode.
17	RW	STOP_ON_ERR: Stop and freeze on checkstop.
18	RW	BANK_ON_RUNN_MATCH: Bank switch on RUNN match.
19	RW	FORCE_TEST_MODE: Force RUNN condition to be true.
20	RW	ACCUM_HIST_MODE: Accumulate history mode; do not clear history mode when trace_run active.
21	RW	FRZ_COUNT_ON_FRZ: Freeze condition counters on trace freeze.

Register Name	Debug Trace Control Register
Mnemonic	TP.TCOB0.OB.EPS.DBG.DEBUG_TRACE_CONTROL
Address	00000000090107D0 (SCOM)
Description	This is the trace start/stop/rest using SCOM command register. Use write data(0/1/2) = 1. This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0	WOX	Reserved field.
1	WOX	Reserved field.
2	WOX	Reserved field.

Register Name	**Extra Trace Mode Register**
Mnemonic	TP.TCOB0.OB.EPS.DBG.XTRA_TRACE_MODE
Address	00000000090107D1 (SCOM)
Description	This register provides an extra or dedicated trace mode register for core triggers.

Bits	SCOM	Field Mnemonic: Description
0:37	RW	XTRA_TRACE_MODE_DATA: Extra/dedicated trace mode for core triggers.

Register Name	**Power Bus OLL FIR Register**
Mnemonic	PB.IOO.LL0.PB_IOOL_FIR_REG
Address	0000000009010800 (SCOM) 0000000009010801 (SCOM1) 0000000009010802 (SCOM2)
Description	Processor bus OLL FIR register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	WOX_AND	WOX_OR	FIR_LINK0_TRAINED: link0 trained.
1	RWX	WOX_AND	WOX_OR	FIR_LINK1_TRAINED: link1 trained.
2	RWX	WOX_AND	WOX_OR	FIR_LINK0_OP_IRQ: link0 OP IRQ.
3	RWX	WOX_AND	WOX_OR	FIR_LINK1_OP_IRQ: link1 OP IRQ.

29	RWX	WOX_AND	WOX_OR	FIR_LINK1_SW_RETRAIN_MASK: link1 sw retrain mask.
30	RWX	WOX_AND	WOX_OR	FIR_LINK0_ACK_QUEUE_OVERFLOW_MASK: link0 ACK queue overflow mask.
31	RWX	WOX_AND	WOX_OR	FIR_LINK1_ACK_QUEUE_OVERFLOW_MASK: link1 ACK queue overflow mask.
32	RWX	WOX_AND	WOX_OR	FIR_LINK0_ACK_QUEUE_UNDERFLOW_MASK: link0 ACK queue underflow mask.
33	RWX	WOX_AND	WOX_OR	FIR_LINK1_ACK_QUEUE_UNDERFLOW_MASK: link1 ACK queue underflow mask.
34	RWX	WOX_AND	WOX_OR	FIR_LINK0_NUM_REPLAY_MASK: link0 num replay mask.
35	RWX	WOX_AND	WOX_OR	FIR_LINK1_NUM_REPLAY_MASK: link1 num replay mask.
36	RWX	WOX_AND	WOX_OR	FIR_LINK0_TRAINING_SET_RECEIVED_MASK: link0 training set received mask.
37	RWX	WOX_AND	WOX_OR	FIR_LINK1_TRAINING_SET_RECEIVED_MASK: link1 training set received mask.
38	RWX	WOX_AND	WOX_OR	FIR_LINK0_PRBS_SELECT_ERROR_MASK: link0 PRBS select error mask.
39	RWX	WOX_AND	WOX_OR	FIR_LINK1_PRBS_SELECT_ERROR_MASK: link1 PRBS select error mask.
40	RWX	WOX_AND	WOX_OR	FIR_LINK0_TCOMPLETE_BAD_MASK: link0 tcomplete bad mask.
41	RWX	WOX_AND	WOX_OR	FIR_LINK1_TCOMPLETE_BAD_MASK: link1 tcomplete bad mask.
42:43	RWX	WOX_AND	WOX_OR	Reserved.
44	RWX	WOX_AND	WOX_OR	FIR_LINK0_SPARE_DONE_MASK: link0 spare done mask.
45	RWX	WOX_AND	WOX_OR	FIR_LINK1_SPARE_DONE_MASK: link1 spare done mask.
46	RWX	WOX_AND	WOX_OR	FIR_LINK0_TOO_MANY_CRC_ERRORS_MASK: link0 too many CRC errors mask.
47	RWX	WOX_AND	WOX_OR	FIR_LINK1_TOO_MANY_CRC_ERRORS_MASK: link1 too many CRC errors mask.
48	RWX	WOX_AND	WOX_OR	FIR_LINK0_NPU_ERROR_MASK: link0 NPU error mask.
49	RWX	WOX_AND	WOX_OR	FIR_LINK1_NPU_ERROR_MASK: link1 NPU error mask.
50	RWX	WOX_AND	WOX_OR	FIR_LINKX_NPU_ERROR_MASK: linkx NPU error mask.
51	RWX	WOX_AND	WOX_OR	FIR_OSC_SWITCH_MASK: OSC switch mask.
52	RWX	WOX_AND	WOX_OR	FIR_LINK0_CORRECTABLE_ARRAY_ERROR_MASK: link0 correctable array error mask.
53	RWX	WOX_AND	WOX_OR	FIR_LINK1_CORRECTABLE_ARRAY_ERROR_MASK: link1 correctable array error mask.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
54	RWX	WOX_AND	WOX_OR	FIR_LINK0_UNCORRECTABLE_ARRAY_ERROR_MASK: link0 uncorrectable array error mask.
55	RWX	WOX_AND	WOX_OR	FIR_LINK1_UNCORRECTABLE_ARRAY_ERROR_MASK: link1 uncorrectable array error mask.
56	RWX	WOX_AND	WOX_OR	FIR_LINK0_TRAINING_FAILED_MASK: link0 training failed mask.
57	RWX	WOX_AND	WOX_OR	FIR_LINK1_TRAINING_FAILED_MASK: link1 training failed mask.
58	RWX	WOX_AND	WOX_OR	FIR_LINK0_UNRECOVERABLE_ERROR_MASK: link0 unrecoverable error mask.
59	RWX	WOX_AND	WOX_OR	FIR_LINK1_UNRECOVERABLE_ERROR_MASK: link1 unrecoverable error mask.
60	RWX	WOX_AND	WOX_OR	FIR_LINK0_INTERNAL_ERROR_MASK: link0 internal error mask.
61	RWX	WOX_AND	WOX_OR	FIR_LINK1_INTERNAL_ERROR_MASK: link1 internal error mask.
62	RWX	WOX_AND	WOX_OR	FIR_SCOM_ERR_DUP_MASK: FIR SCOM error dup mask.
63	RWX	WOX_AND	WOX_OR	FIR_SCOM_ERR_MASK: FIR SCOM error mask.

Register Name	Power Bus OLL FIR Action 0 Register
Mnemonic	PB.IOO.LL0.PB_IOOL_FIR_ACTION0_REG
Address	0000000009010806 (SCOM)
Description	Processor bus OLL FIR action 0 register

Bits	SCOM	Field Mnemonic: Description
0:63	RW	PB_IOOL_FIR_ACTION0: Processor bus FIR MSB of action select for corresponding bit in FIR. (Action0,Action1) = Action select. (0,0) = Checkstop. (0,1) = Recoverable error to service processor. (1,0) = Special attention to service processor. (1,1) = Invalid.

Register Name	Power Bus OLL FIR Action 1 Register
Mnemonic	PB.IOO.LL0.PB_IOOL_FIR_ACTION1_REG
Address	0000000009010807 (SCOM)
Description	Processor bus OLL FIR action 1 register

Bits	SCOM	Field Mnemonic: Description
0:63	RW	PB_IOOL_FIR_ACTION1: Processor bus FIR LSB of action select for corresponding bit in FIR. (Action0,Action1) = Action select. (0,0) = Checkstop. (0,1) = Recoverable error to service processor. (1,0) = Special attention to service processor. (1,1) = Invalid.

Register Name	Power Bus OLL Configuration Register
Mnemonic	PB.IOO.LL0.IOOL_CONFIG
Address	000000000901080A (SCOM)
Description	Processor bus OLL configuration register

Bits	SCOM	Field Mnemonic: Description
0	RW	CONFIG_LINK_PAIR: When 1, the two links operate as a pair. When 0, only one of the links used or they are independent.
1	RW	CONFIG_DISABLE_SL_ECC: When 1, disable spare lane ECC correction.
2	RW	CONFIG_CRC_LANE_ID: When 1, use lane IDs from CRC for lane sparing.
3	RW	CONFIG_EDPL_LANE_ID: When 1, use lane IDs from EDPL for lane sparing.
4	RW	CONFIG_SL_UE_CRC_ERR: When 1, UEs on SL ECC cause the packet to be treated as a CRC error.
5	RW	CONFIG_REPORT_SL_CHKBIT_ERR: When 1, SL ECC single bit errors on check bits are reported to FIR.
6	RW	CONFIG_BW_SAMPLE_SIZE: When 1, use 256 packets for sample (instead of 64).
7	RW	CONFIG_BW_WINDOW_SIZE: When 1, shorten the sample window.
8:11	RW	CONFIG_UNUSED1: Spare bits.
12:15	RW	CONFIG_PACKET_DELAY_LIMIT: Number of cycles of delay of frame data to be considered delayed/replayed (0 is 16 cycles).
16:19	RW	CONFIG_TDM_DELAY: Adjustment factor of delay for entering/exiting TDM mode.
20	RW	CONFIG_AUTO_TDM_TX: When 1, use TX bandwidth for automatically entering TDM mode.
21	RW	CONFIG_AUTO_TDM_RX: When 1, use RX bandwidth for automatically entering TDM mode.
22	RW	CONFIG_AUTO_TDM_AND_NOT_OR: When 1, both BW and error rate needed (otherwise, either).
23	RW	CONFIG_UNUSED2: Spare bits.
24:27	RW	CONFIG_AUTO_TDM_BW_DIFF: Bandwidth difference for auto entry TDM mode.
28:31	RW	CONFIG_AUTO_TDM_ERROR_RATE: Error rate for auto entry TDM mode.
32:47	RW	CONFIG_UNUSED3: Spare bits.
48:51	RWX	CONFIG_TIMEOUT: Program timeout values, from 1 μs to 65 ms.
52:63	RWX	CONFIG_TIMER_1US: Program number of cycles in 1μs.

Register Name	Power Bus OLL Control Register
Mnemonic	PB.IOO.LL0.IOOL_CONTROL
Address	000000000901080B (SCOM)
Description	Processor bus OLL control register

Bits	SCOM	Field Mnemonic: Description
0	RW	LINK0_PHY_TRAINING: When 1, run PHY training.
1	RW	LINK0_STARTUP: When 1, start initialization/training.
2	RW	LINK0_HOLD_PATT_A: When 1, hold PHY training at sending Pattern A.
3	RW	LINK0_HOLD_PATT_B: When 1, hold PHY training at sending Pattern B.
4	RW	LINK0_RUN_LANE_DISABLE: When 1, hardware control of run_lane is disabled.
5	RW	LINK0_RUN_LANE_OVERRIDE: When 1, the run_lane signal is forced to 1.

Bits	SCOM	Field Mnemonic: Description
6	RW	LINK0_IGNORE_PHY: When 1, all data from PHY is ignored (like fence is 1).
7	RW	LINK0_IGNORE_FENCE: When 1, PHY fence signal is ignored (treated like 0).
8:11	RWX	LINK0_ERR_INJ_COMMAND: Command to do link error injection.
12:23	RWX	LINK0_ERR_INJ_COMMAND_LANES: Lanes for error inject command.
24:27	RWX	CONTROL_UNUSED0: Spare bits.
28:31	RWX	LINK0_COMMAND: Command to do an operation.
32	RW	LINK1_PHY_TRAINING: When 1, run PHY training.
33	RW	LINK1_STARTUP: When 1, start initialization/training.
34	RW	LINK1_HOLD_PATT_A: When 1, hold PHY training at sending Pattern A.
35	RW	LINK1_HOLD_PATT_B: When 1, hold PHY training at sending Pattern B.
36	RW	LINK1_RUN_LANE_DISABLE: When 1, hardware control of run_lane is disabled.
37	RW	LINK1_RUN_LANE_OVERRIDE: When 1, the run_lane signal is forced to 1.
38	RW	LINK1_IGNORE_PHY: When 1, all data from PHY is ignored (like fence is 1).
39	RW	LINK1_IGNORE_FENCE: When 1, PHY fence signal is ignored (treated like 0).
40:43	RWX	LINK1_ERR_INJ_COMMAND: Command to do link error injection.
44:55	RWX	LINK1_ERR_INJ_COMMAND_LANES: Lanes for error inject command.
56:59	RWX	CONTROL_UNUSED1: Spare bits.
60:63	RWX	LINK1_COMMAND: Command to do an operation.

Register Name	**Power Bus OLL PHY Training Configuration Register**
Mnemonic	PB.IOO.LL0.IOOL_PHY_CONFIG
Address	000000000901080C (SCOM)
Description	Processor bus OLL PHY training configuration register

Bits	SCOM	Field Mnemonic: Description
0:1	RW	CONFIG_PHY_TRAIN_A_ADJ: Adjust the number of bits out of 8 for pattern A detection.
2:3	RW	CONFIG_PHY_TRAIN_B_ADJ: Adjust the number of bits out of 16 for pattern B detection.
4:7	RW	CONFIG_PHY_TRAIN_TIME: Time to see Pattern A/B before reporting it.
8:11	RW	CONFIG_PHY_TRAIN_A_HYST: Amount of hysteresis in detecting Pattern A.
12:15	RW	CONFIG_PHY_TRAIN_B_HYST: Amount of hysteresis in detecting Pattern B.
16:39	RW	CONFIG_PRBS_PHASE_SELECT: Select phases for the lanes for PRBS transmit option (exactly 12 bits must be set).
40:49	RW	CONFIG_PRBS_CONFIG: Select PRBS length and tap.
50	RW	CONFIG_PRBS_INVERT: When 1, send the inverted PRBS pattern.
51:63	RW	CONFIG_PHY_UNUSED: Spare bits.

Register Name	Power Bus OLL Secondary Configuration Register
Mnemonic	PB.IOO.LL0.IOOL_SEC_CONFIG
Address	000000000901080D (SCOM)
Description	Processor bus OLL secondary configuration register

Bits	SCOM	Field Mnemonic: Description
0	RW	CONFIG_ENABLE_ERR_INJ: When 1, enable error injection (LFSR runs).
1:15	RW	CONFIG_UNUSED4: Spare bits.
16:17	RW	CONFIG_SBE_ERROR_RATE: Error injection SBE rate.
18:23	RW	CONFIG_RAND_ERROR_RATE: Error injection rate N (from 1 to 38), probability is 2^{-N}.
24:25	RW	CONFIG_INV_SH_ERROR_RATE: Error injection invalid sync header (SBE) rate.
26:31	RW	CONFIG_SYNC_HEADER_ERROR_RATE: Error injection rate N (from 1 to 38), probability is 2^{-N}.
32:47	RW	CONFIG_UNUSED5: Spare bits.
48:63	RW	CONFIG_EDPL_RATE: When 0, disable EDPL. Otherwise, the number of blocks transmitted between EDPL blocks.

Register Name	Power Bus OLL Latency Measure Register
Mnemonic	PB.IOO.LL0.IOOL_LAT_MEASURE
Address	000000000901080E (SCOM)
Description	Processor bus OLL latency measure register

Bits	SCOM	Field Mnemonic: Description
0	ROX	LINK0_ROUND_TRIP_VALID: When 1, the round trip value is valid.
1	RO	constant = 0b0
2:11	ROX	LINK0_ROUND_TRIP: Round trip time in cycles.
12	ROX	LINK1_ROUND_TRIP_VALID: When 1, the round trip value is valid.
13	RO	constant = 0b0
14:23	ROX	LINK1_ROUND_TRIP: Round trip time in cycles.
24	ROX	LOCAL_LATENCY_DIFFERENCE_VALID: When 1, the local latency difference is valid.
25	ROX	LOCAL_LATENCY_LONGER_LINK: When 1, link1 had the longer latency.
26:28	RO	constant = 0b000
29:35	ROX	LOCAL_LATENCY_DIFFERENCE: Received difference in latency between links.
36	ROX	REMOTE_LATENCY_DIFFERENCE_VALID: When 1, the remote latency difference is valid.
37	ROX	REMOTE_LATENCY_LONGER_LINK: When 1, link1 had the longer latency.
38:40	RO	constant = 0b000
41:47	ROX	REMOTE_LATENCY_DIFFERENCE: TX difference in latency between links (as received by other side).
48	RO	constant = 0b0
49:55	RWX	LINK0_TOD_LATENCY: Latency of TOD pulses.
56	RO	constant = 0b0
57:63	RWX	LINK1_TOD_LATENCY: Latency of TOD pulses.

Register Name	Power Bus OLL Optical Configuration Register
Mnemonic	PB.IOO.LL0.IOOL_OPTICAL_CONFIG
Address	000000000901080F (SCOM)
Description	Processor bus OLL optical configuration register

Bits	SCOM	Field Mnemonic: Description
0	RW	CONFIG_DISABLE_BAD_LANE_COUNT: When 1, disable bad lane counter for lane sparing.
1	RW	CONFIG_DISABLE_CLEAR_BAD_LANE_COUNT: When 1, disable clearing bad lane counter when a different error occurs.
2:3	RW	CONFIG_OPT_UNUSED1: Spare bits.
4:7	RW	CONFIG_BAD_LANE_DURATION: Selects time to reset bad lane counter.
8	RW	CONFIG_OPT_UNUSED2: Spare bits.
9:15	RW	CONFIG_BAD_LANE_MAX: Number of errors before marking a lane as bad.
16	RW	CONFIG_DISABLE_LINK_FAIL_COUNT: When 1, disable link fail counter for lane sparing.
17:19	RW	CONFIG_OPT_UNUSED3: Spare bits.
20:23	RW	CONFIG_LINK_FAIL_DURATION: Selects time to cut link fail counter in half.
24	RW	CONFIG_OPT_UNUSED4: Spare bits.
25:31	RW	CONFIG_LINK_FAIL_MAX: Number of errors before making the link fail.
32	RWX	CLEAR_LINK_FAIL_COUNTER: When 1, clear the link fail counter.
33	RWX	CLEAR_BAD_LANE_COUNTER: When 1, clear the bad lane counter.
34:36	RW	CONFIG_OPT_UNUSED5: Spare bits.
37	RW	CONFIG_ELEVEN_LANE_MODE: When 1, link uses 11 lanes (instead of 12).
38	RW	LINK0_ELEVEN_LANE_SHIFT: When 1, in 11-lane mode, use lanes 1-11 (instead of 0-10).
39	RW	LINK1_ELEVEN_LANE_SHIFT: When 1, in 11-lane mode, use lanes 1-11 (instead of 0-10).
40	RW	LINK0_RX_LANE_SWAP: When 1, the lanes are swapped (0 with 10/11, and so on).
41	RW	LINK0_TX_LANE_SWAP: When 1, the lanes are swapped (0 with 10/11, and so on).
42	RW	LINK1_RX_LANE_SWAP: When 1, the lanes are swapped (0 with 10/11, and so on).
43	RW	LINK1_TX_LANE_SWAP: When 1, the lanes are swapped (0 with 10/11, and so on).
44:47	RW	CONFIG_ACK_QUEUE_LOW: Low limit for ACK queue.
48:51	RWX	CONFIG_ACK_QUEUE_START: Start value for ACK queue.
52:55	RWX	CONFIG_ACK_QUEUE_HIGH: High limit for ACK queue.
56:57	RW	CONFIG_REPLAY_BUFFER_SIZE: Size of the replay buffer to use. CAPP mode is largest but cannot be used for fabric traffic.
58	RW	CONFIG_LINK0_OLL_ENABLED: Enable OLL link 0 to use shared PHY and transport buses.
59	RW	CONFIG_LINK1_OLL_ENABLED: Enable OLL link 1 to use shared PHY and transport buses.
60	RW	CONFIG_NPU_TRANSPORT_SWAP:
61	RW	CONFIG_NV0_NPU_ENABLED: Enable NPU NV brick 0 to use shared PHY and transport buses.
62	RW	CONFIG_NV1_NPU_ENABLED: Enable NPU NV brick 1 to use shared PHY and transport buses.
63	RW	CONFIG_NV2_NPU_ENABLED: Enable NPU NV brick 2 to use shared PHY and transport buses.

Register Name	Power Bus OLL Link 0 Transmit Lane Control Register
Mnemonic	PB.IOO.LL0.IOOL_LINK0_TX_LANE_CONTROL
Address	0000000009010810 (SCOM)
Description	Processor bus OLL link0 transmit lane control register

Bits	SCOM	Field Mnemonic: Description
0:3	RW	TX_LINK0_LANE00_CONTROL: Transmit lane control.
4:7	RW	TX_LINK0_LANE01_CONTROL: Transmit lane control.
8:11	RW	TX_LINK0_LANE02_CONTROL: Transmit lane control.
12:15	RW	TX_LINK0_LANE03_CONTROL: Transmit lane control.
16:19	RW	TX_LINK0_LANE04_CONTROL: Transmit lane control.
20:23	RW	TX_LINK0_LANE05_CONTROL: Transmit lane control.
24:27	RW	TX_LINK0_LANE06_CONTROL: Transmit lane control.
28:31	RW	TX_LINK0_LANE07_CONTROL: Transmit lane control.
32:35	RW	TX_LINK0_LANE08_CONTROL: Transmit lane control.
36:39	RW	TX_LINK0_LANE09_CONTROL: Transmit lane control.
40:43	RW	TX_LINK0_LANE10_CONTROL: Transmit lane control.
44:47	RW	TX_LINK0_LANE11_CONTROL: Transmit lane control.
48:59	ROX	TX_LINK0_LANE_FAILED: Bit per lane. When 1, the lane is bad as indicated by the other side.
60:63	RO	constant = 0b0000

Register Name	Power Bus OLL Link 1 Transmit Lane Control Register
Mnemonic	PB.IOO.LL0.IOOL_LINK1_TX_LANE_CONTROL
Address	0000000009010811 (SCOM)
Description	Processor bus OLL link0 transmit lane control register

Bits	SCOM	Field Mnemonic: Description
0:3	RW	TX_LINK1_LANE00_CONTROL: Transmit lane control.
4:7	RW	TX_LINK1_LANE01_CONTROL: Transmit lane control.
8:11	RW	TX_LINK1_LANE02_CONTROL: Transmit lane control.
12:15	RW	TX_LINK1_LANE03_CONTROL: Transmit lane control.
16:19	RW	TX_LINK1_LANE04_CONTROL: Transmit lane control.
20:23	RW	TX_LINK1_LANE05_CONTROL: Transmit lane control.
24:27	RW	TX_LINK1_LANE06_CONTROL: Transmit lane control.
28:31	RW	TX_LINK1_LANE07_CONTROL: Transmit lane control.
32:35	RW	TX_LINK1_LANE08_CONTROL: Transmit lane control.
36:39	RW	TX_LINK1_LANE09_CONTROL: Transmit lane control.
40:43	RW	TX_LINK1_LANE10_CONTROL: Transmit lane control.
44:47	RW	TX_LINK1_LANE11_CONTROL: Transmit lane control.
48:59	ROX	TX_LINK1_LANE_FAILED: Bit per lane. When 1, the lane is bad as indicated by other side.

Bits	SCOM	Field Mnemonic: Description
60:63	RO	constant = 0b0000

Register Name	Power Bus OLL Link 0 Receive Lane Control Register
Mnemonic	PB.IOO.LL0.IOOL_LINK0_RX_LANE_CONTROL
Address	0000000009010812 (SCOM)
Description	Processor bus OLL link0 receive lane control register

Bits	SCOM	Field Mnemonic: Description
0:11	RW	RX_LINK0_LANE_DISABLED: Bit per lane. When 1, the lane is disabled (all data ignored).
12:23	RW	RX_LINK0_LANE_BRINGUP: Bit per lane. When 1, the lane is not used functionally (can lock only).
24:35	RW	RX_LINK0_LANE_SPARED: Bit per lane. When 1, the lane is marked bad.
36:47	ROX	RX_LINK0_LANE_LOCKED: Bit per lane. When 1, the lane is block and scrambling locked.
48:59	ROX	RX_LINK0_LANE_FAILED: Bit per lane. When 1, the lane failed training.
60:63	RO	constant = 0b0000

Register Name	Power Bus OLL Link 1 Receive Lane Control Register
Mnemonic	PB.IOO.LL0.IOOL_LINK1_RX_LANE_CONTROL
Address	0000000009010813 (SCOM)
Description	Processor bus OLL link0 receive lane control register

Bits	SCOM	Field Mnemonic: Description
0:11	RW	RX_LINK1_LANE_DISABLED: Bit per lane. When 1, the lane is disabled (all data ignored).
12:23	RW	RX_LINK1_LANE_BRINGUP: Bit per lane. When 1, the lane is not used functionally (can lock only).
24:35	RW	RX_LINK1_LANE_SPARED: Bit per lane. When 1, the lane is marked bad.
36:47	ROX	RX_LINK1_LANE_LOCKED: Bit per lane. When 1, the lane is block and scrambling locked.
48:59	ROX	RX_LINK1_LANE_FAILED: Bit per lane. When 1, the lane failed training.
60:63	RO	constant = 0b0000

Register Name	Power Bus OLL Link 0 Information Register
Mnemonic	PB.IOO.LL0.IOOL_LINK0_INFO
Address	0000000009010814 (SCOM)
Description	Processor bus OLL link0 information register

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	LINK0_MAX_TIMEOUT: Maximum value reached by timeout counter.
16	ROX	LINK0_FRAME_CAP_VALID: When 1, error capture is valid.
17	ROX	LINK0_FRAME_CAP_INST: Array instance.
18:23	ROX	LINK0_FRAME_CAP_ADDR: Array address of captured error.
24:31	ROX	LINK0_FRAME_CAP_SYN: Syndrome of captured error.

Bits	SCOM	Field Mnemonic: Description
32	ROX	LINK0_REPLAY_CAP_VALID: When 1, error capture is valid.
33:34	ROX	LINK0_REPLAY_CAP_INST: Array instance.
35:43	ROX	LINK0_REPLAY_CAP_ADDR: Array address of captured error.
44:51	ROX	LINK0_REPLAY_CAP_SYN: Syndrome of captured error.
52	ROX	LINK0_ACK_FIFO_CAP_VALID: When 1, error capture is valid.
53:54	RO	constant = 0b00
55:63	ROX	LINK0_ACK_FIFO_CAP_ADDR: Array address of captured error.

Register Name	**Power Bus OLL Link 1 Information Register**
Mnemonic	PB.IOO.LL0.IOOL_LINK1_INFO
Address	0000000009010815 (SCOM)
Description	Processor bus OLL link0 information register

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	LINK1_MAX_TIMEOUT: Maximum value reached by timeout counter.
16	ROX	LINK1_FRAME_CAP_VALID: When 1, error capture is valid.
17	ROX	LINK1_FRAME_CAP_INST: Array instance.
18:23	ROX	LINK1_FRAME_CAP_ADDR: Array address of captured error.
24:31	ROX	LINK1_FRAME_CAP_SYN: Syndrome of captured error.
32	ROX	LINK1_REPLAY_CAP_VALID: When 1, error capture is valid.
33:34	ROX	LINK1_REPLAY_CAP_INST: Array instance.
35:43	ROX	LINK1_REPLAY_CAP_ADDR: Array address of captured error.
44:51	ROX	LINK1_REPLAY_CAP_SYN: Syndrome of captured error.
52	ROX	LINK1_ACK_FIFO_CAP_VALID: When 1, error capture is valid.
53:54	RO	constant = 0b00
55:63	ROX	LINK1_ACK_FIFO_CAP_ADDR: Array address of captured error.

Register Name	**Power Bus OLL Link 0 Error Status Register**
Mnemonic	PB.IOO.LL0.IOOL_LINK0_ERROR_STATUS
Address	0000000009010816 (SCOM)
Description	Processor bus OLL link0 error status register

Bits	SCOM	Field Mnemonic: Description
0	WOX	LINK0_RESET_KEEPER: Reset_keeper for link0 error status register.
1:3	ROX	LINK0_ERROR_STATUS_CE: c_err_rpt for correctable array errors.
4:7	RO	constant = 0b0000
8:9	ROX	LINK0_ERROR_STATUS_UE: c_err_rpt for uncorrectable array errors.
10:11	RO	constant = 0b00
12:13	ROX	LINK0_ERROR_STATUS_OSC: c_err_rpt for oscillator errors.

Bits	SCOM	Field Mnemonic: Description
14:15	RO	constant = 0b00
16:17	ROX	LINK0_ERROR_STATUS_TRAIN: c_err_rpt for training errors.
18:23	RO	constant = 0b000000
24:34	ROX	LINK0_ERROR_STATUS_UNRECOV: c_err_rpt for unrecoverable errors.
35:39	RO	constant = 0b00000
40:55	ROX	LINK0_ERROR_STATUS_INTERNAL: c_err_rpt for internal errors.
56:57	RO	constant = 0b00
58:61	ROX	LINK0_ERROR_STATUS_INTERNAL: c_err_rpt for internal errors.
62:63	RO	constant = 0b00

Register Name	Power Bus OLL Link 1 Error Status Register
Mnemonic	PB.IOO.LL0.IOOL_LINK1_ERROR_STATUS
Address	0000000009010817 (SCOM)
Description	Processor bus OLL link1 error status register

Bits	SCOM	Field Mnemonic: Description
0	WOX	LINK1_RESET_KEEPER: Reset_keeper for link1 error status register.
1:3	ROX	LINK1_ERROR_STATUS_CE: c_err_rpt for correctable array errors.
4:7	RO	constant = 0b0000
8:9	ROX	LINK1_ERROR_STATUS_UE: c_err_rpt for uncorrectable array errors.
10:11	RO	constant = 0b00
12:13	ROX	LINK1_ERROR_STATUS_OSC: c_err_rpt for oscillator errors.
14:15	RO	constant = 0b00
16:17	ROX	LINK1_ERROR_STATUS_TRAIN: c_err_rpt for training errors.
18:23	RO	constant = 0b000000
24:34	ROX	LINK1_ERROR_STATUS_UNRECOV: c_err_rpt for unrecoverable errors.
35:39	RO	constant = 0b00000
40:55	ROX	LINK1_ERROR_STATUS_INTERNAL: c_err_rpt for internal errors.
56:57	RO	constant = 0b00
58:61	ROX	LINK1_ERROR_STATUS_INTERNAL: c_err_rpt for internal errors.
62:63	RO	constant = 0b00

Register Name	Power Bus OLL Replay Threshold Register
Mnemonic	PB.IOO.LL0.IOOL_REPLAY_THRESHOLD
Address	0000000009010818 (SCOM)
Description	Processor bus OLL replay threshold register

Bits	SCOM	Field Mnemonic: Description
0:3	RW	THRESH_REPLAY_TB_SEL: Replay threshold Timebase select.

Bits	SCOM	Field Mnemonic: Description
4:7	RW	THRESH_REPLAY_TAP_SEL: Replay threshold tap select.
8:10	RW	THRESH_REPLAY_ENABLE: Replay threshold error enable.
11:25	RW	THRESH_REPLAY_UNUSED1: Spare bits.
26	RWX	THRESH_REPLAY_LINK0_CLEAR: Replay threshold counter clear.
27	RWX	THRESH_REPLAY_LINK1_CLEAR: Replay threshold counter clear.
28	RW	THRESH_REPLAY_DIS_TB_CLEAR: Threshold disable Timebase clear.
29	RW	THRESH_REPLAY_DIS_TAP_CLEAR: Threshold disable tap clear.
30	RW	THRESH_REPLAY_DIS_TAP_STOP: Threshold disable tap stop.
31	RW	THRESH_REPLAY_UNUSED2: Spare bits.
32:47	ROX	THRESH_REPLAY_LINK0_COUNT: Replay threshold count.
48:63	ROX	THRESH_REPLAY_LINK1_COUNT: Replay threshold count.

Register Name	Power Bus OLL SL ECC Threshold Register
Mnemonic	PB.IOO.LL0.IOOL_SL_ECC_THRESHOLD
Address	0000000009010819 (SCOM)
Description	Processor bus OLL SL ECC Threshold register

Bits	SCOM	Field Mnemonic: Description
0:3	RW	THRESH_SL_ECC_TB_SEL: SL ECC threshold Timebase select.
4:7	RW	THRESH_SL_ECC_TAP_SEL: SL ECC threshold tap select.
8:9	RW	THRESH_SL_ECC_ENABLE: SL ECC threshold error enable.
10:25	RW	THRESH_SL_ECC_UNUSED1: Spare bits.
26	RWX	THRESH_SL_ECC_LINK0_CLEAR: SL ECC threshold counter clear.
27	RWX	THRESH_SL_ECC_LINK1_CLEAR: SL ECC threshold counter clear.
28	RW	THRESH_SL_ECC_DIS_TB_CLEAR: Threshold disable Timebase clear.
29	RW	THRESH_SL_ECC_DIS_TAP_CLEAR: Threshold disable tap clear.
30	RW	THRESH_SL_ECC_DIS_TAP_STOP: Threshold disable tap stop.
31	RW	THRESH_SL_ECC_UNUSED2: Spare bits.
32:47	ROX	THRESH_SL_ECC_LINK0_COUNT: SL ECC threshold count.
48:63	ROX	THRESH_SL_ECC_LINK1_COUNT: SL ECC threshold count.

Register Name	Power Bus OLL Retrain Threshold Register
Mnemonic	PB.IOO.LL0.IOOL_RETRAIN_THRESHOLD
Address	000000000901081A (SCOM)
Description	Processor bus OLL retrain threshold register

Bits	SCOM	Field Mnemonic: Description
0:3	RW	THRESH_RETRAIN_TB_SEL: Retrain threshold Timebase select.
4:7	RW	THRESH_RETRAIN_TAP_SEL: Retrain threshold tap select.

Bits	SCOM	Field Mnemonic: Description
8:16	RW	THRESH_RETRAIN_ENABLE: Retrain threshold error enable.
17:25	RW	THRESH_RETRAIN_UNUSED1: Spare bits.
26	RWX	THRESH_RETRAIN_LINK0_CLEAR: Retrain threshold counter clear.
27	RWX	THRESH_RETRAIN_LINK1_CLEAR: Retrain threshold counter clear.
28	RW	THRESH_RETRAIN_DIS_TB_CLEAR: Threshold disable Timebase clear.
29	RW	THRESH_RETRAIN_DIS_TAP_CLEAR: Threshold disable tap clear.
30	RW	THRESH_RETRAIN_DIS_TAP_STOP: Threshold disable tap stop.
31	RW	THRESH_RETRAIN_UNUSED2: Spare bits.
32:47	ROX	THRESH_RETRAIN_LINK0_COUNT: Retrain threshold count.
48:63	ROX	THRESH_RETRAIN_LINK1_COUNT: Retrain threshold count.

Register Name	**Power Bus OLL Error Injection LFSR Register**
Mnemonic	PB.IOO.LL0.IOOL_ERR_INJ_LFSR
Address	000000000901081B (SCOM)
Description	Processor bus OLL error injection LFSR register

Bits	SCOM	Field Mnemonic: Description
0:60	RWX	ERR_INJ_LFSR: Error injection LFSR.
61:63	RO	constant = 0b000

Register Name	**Power Bus OLL Performance Trace Configuration Register**
Mnemonic	PB.IOO.LL0.IOOL_PERF_TRACE_CONFIG
Address	000000000901081C (SCOM)
Description	Processor bus OLL performance monitor and trace configuration register

Bits	SCOM	Field Mnemonic: Description
0:1	RW	CONFIG_ENABLE_PERF_0: Performance counter enable.
2:3	RW	CONFIG_ENABLE_PERF_1: Performance counter enable.
4:5	RW	CONFIG_ENABLE_PERF_2: Performance counter enable.
6:7	RW	CONFIG_ENABLE_PERF_3: Performance counter enable.
8:9	RW	CONFIG_ENABLE_PERF_4: Performance counter enable.
10:11	RW	CONFIG_ENABLE_PERF_5: Performance counter enable.
12:13	RW	CONFIG_ENABLE_PERF_6: Performance counter enable.
14:15	RW	CONFIG_ENABLE_PERF_7: Performance counter enable.
16:17	RW	CONFIG_PERF_SIZE_0: Performance counter size.
18:19	RW	CONFIG_PERF_SIZE_1: Performance counter size.
20:21	RW	CONFIG_PERF_SIZE_2: Performance counter size.
22:23	RW	CONFIG_PERF_SIZE_3: Performance counter size.
24:25	RW	CONFIG_PERF_SIZE_4: Performance counter size.

Bits	SCOM	Field Mnemonic: Description
26:27	RW	CONFIG_PERF_SIZE_5: Performance counter size.
28:29	RW	CONFIG_PERF_SIZE_6: Performance counter size.
30:31	RW	CONFIG_PERF_SIZE_7: Performance counter size.
32	RW	CONFIG_PMULET_FREEZE_MODE: PMUlet freeze mode: 0 = Freeze-on-full 1 = Free run
33	RW	CONFIG_COMMON_FREEZE_MODE: Common freeze mode: 0 = Independent per PMUlet. 1 = Any counter full freezes all.
34	RW	CONFIG_PERF_RESET_MODE: PMUlet reset mode: 0 = Reset on read. 1 = Reset on write.
35	RW	CONFIG_PERFTRACE_ENABLE: Performance trace enable. Multiplexer performance trace data onto trace bus.
36	RW	CONFIG_PERFTRACE_FIXED_WINDOW: Performance trace fixed window mode. Take a sample every 255 or 255 $\times$ 128 cycles.
37	RW	CONFIG_PERFTRACE_PRESCALE: Performance trace prescale mode. Wide-angle view; performance counts are prescaled by 128.
38:39	RW	CONFIG_PERFTRACE_MODE: Performance trace input selection.
40:51	RW	CONFIG_TRACE_CONFIG_0: Selection for trace bus bits 0:43.
52:63	RW	CONFIG_TRACE_CONFIG_1: Selection for trace bus bits 44:87.

Register Name	**Power Bus OLL Performance Monitor Selection Register**
Mnemonic	PB.IOO.LL0.IOOL_PERF_SEL_CONFIG
Address	000000000901081D (SCOM)
Description	Processor bus OLL performance monitor selection register

Bits	SCOM	Field Mnemonic: Description
0:7	RW	CONFIG_PERF_SELECT_0: Selection performance counter.
8:15	RW	CONFIG_PERF_SELECT_1: Selection performance counter.
16:23	RW	CONFIG_PERF_SELECT_2: Selection performance counter.
24:31	RW	CONFIG_PERF_SELECT_3: Selection performance counter.
32:39	RW	CONFIG_PERF_SELECT_4: Selection performance counter.
40:47	RW	CONFIG_PERF_SELECT_5: Selection performance counter.
48:55	RW	CONFIG_PERF_SELECT_6: Selection performance counter.
56:63	RW	CONFIG_PERF_SELECT_7: Selection performance counter.

Register Name	**Power Bus OLL Performance Monitor Counter 0 Register**
Mnemonic	PB.IOO.LL0.IOOL_PERF_COUNTERS_0
Address	000000000901081E (SCOM)
Description	Processor bus OLL performance monitor counter register 0

Bits	SCOM	Field Mnemonic: Description
0:15	RWX_WCLRREG	PERFMON_COUNTER_0: Performance counter 16 MSB.
16:31	RWX_WCLRREG	PERFMON_COUNTER_1: Performance counter 16 MSB.
32:47	RWX_WCLRREG	PERFMON_COUNTER_2: Performance counter 16 MSB.
48:63	RWX_WCLRREG	PERFMON_COUNTER_3: Performance counter 16 MSB.

Register Name	Power Bus OLL Performance Monitor Counter 1 Register
Mnemonic	PB.IOO.LL0.IOOL_PERF_COUNTERS_1
Address	000000000901081F (SCOM)
Description	Processor bus OLL performance monitor counter register 1

Bits	SCOM	Field Mnemonic: Description
0:15	RWX_WCLRREG	PERFMON_COUNTER_4: Performance counter 16 MSB.
16:31	RWX_WCLRREG	PERFMON_COUNTER_5: Performance counter 16 MSB.
32:47	RWX_WCLRREG	PERFMON_COUNTER_6: Performance counter 16 MSB.
48:63	RWX_WCLRREG	PERFMON_COUNTER_7: Performance counter 16 MSB.

Register Name	Power Bus OLL Performance Monitor Counter LSB 0 Register
Mnemonic	PB.IOO.LL0.IOOL_PERF_COUNT_LSB_0
Address	0000000009010820 (SCOM)
Description	Processor bus OLL performance monitor counter LSB register 0

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Power Bus OLL Performance Monitor Counter LSB 1 Register
Mnemonic	PB.IOO.LL0.IOOL_PERF_COUNT_LSB_1
Address	0000000009010821 (SCOM)
Description	Processor bus OLL Performance Monitor Couter LSB register 1

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Power Bus OLL Link 0 Syndrome Capture Register
Mnemonic	PB.IOO.LL0.IOOL_LINK0_SYN_CAPTURE
Address	0000000009010822 (SCOM)
Description	Processor bus OLL link0 syndrome capture register

Bits	SCOM	Field Mnemonic: Description
0:35	RWX	LINK0_LINK_CAP_CRC_SYN: CRC syndrome for captured link error.

Bits	SCOM	Field Mnemonic: Description
36:43	RWX	LINK0_LINK_CAP_SLECC_SYN0: SL ECC syndrome for captured link error.
44:51	RWX	LINK0_LINK_CAP_SLECC_SYN1: SL ECC syndrome for captured link error.
52:59	RWX	LINK0_LINK_CAP_SLECC_SYN2: SL ECC syndrome for captured link error.
60:63	RWX	LINK0_LINK_CAP_CRC_LANE: CRC lane from syndrome decode.

Register Name	Power Bus OLL Link 1 Syndrome Capture Register
Mnemonic	PB.IOO.LL0.IOOL_LINK1_SYN_CAPTURE
Address	0000000009010823 (SCOM)
Description	Processor bus OLL link1 syndrome capture register

Bits	SCOM	Field Mnemonic: Description
0:35	RWX	LINK1_LINK_CAP_CRC_SYN: CRC syndrome for captured link error.
36:43	RWX	LINK1_LINK_CAP_SLECC_SYN0: SL ECC syndrome for captured link error.
44:51	RWX	LINK1_LINK_CAP_SLECC_SYN1: SL ECC syndrome for captured link error.
52:59	RWX	LINK1_LINK_CAP_SLECC_SYN2: SL ECC syndrome for captured link error.
60:63	RWX	LINK1_LINK_CAP_CRC_LANE: CRC lane from syndrome decode.

Register Name	Power Bus OLL Link 0 EDPL Status Register
Mnemonic	PB.IOO.LL0.IOOL_LINK0_EDPL_STATUS
Address	0000000009010824 (SCOM)
Description	Processor bus OLL link0 EDPL status register

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	LINK0_EDPL_ERROR_COUNT_0: Count of EDPL errors.
4:7	ROX	LINK0_EDPL_ERROR_COUNT_1: Count of EDPL errors.
8:11	ROX	LINK0_EDPL_ERROR_COUNT_2: Count of EDPL errors.
12:15	ROX	LINK0_EDPL_ERROR_COUNT_3: Count of EDPL errors.
16:19	ROX	LINK0_EDPL_ERROR_COUNT_4: Count of EDPL errors.
20:23	ROX	LINK0_EDPL_ERROR_COUNT_5: Count of EDPL errors.
24:27	ROX	LINK0_EDPL_ERROR_COUNT_6: Count of EDPL errors.
28:31	ROX	LINK0_EDPL_ERROR_COUNT_7: Count of EDPL errors.
32:35	ROX	LINK0_EDPL_ERROR_COUNT_8: Count of EDPL errors.
36:39	ROX	LINK0_EDPL_ERROR_COUNT_9: Count of EDPL errors.
40:43	ROX	LINK0_EDPL_ERROR_COUNT_10: Count of EDPL errors.
44:47	ROX	LINK0_EDPL_ERROR_COUNT_11: Count of EDPL errors.
48:63	RO	constant = 0b0000000000000000

Register Name	Power Bus OLL Link 1 EDPL Status Register
Mnemonic	PB.IOO.LL0.IOOL_LINK1_EDPL_STATUS
Address	0000000009010825 (SCOM)
Description	Processor bus OLL link1 EDPL status register

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	LINK1_EDPL_ERROR_COUNT_0: Count of EDPL errors.
4:7	ROX	LINK1_EDPL_ERROR_COUNT_1: Count of EDPL errors.
8:11	ROX	LINK1_EDPL_ERROR_COUNT_2: Count of EDPL errors.
12:15	ROX	LINK1_EDPL_ERROR_COUNT_3: Count of EDPL errors.
16:19	ROX	LINK1_EDPL_ERROR_COUNT_4: Count of EDPL errors.
20:23	ROX	LINK1_EDPL_ERROR_COUNT_5: Count of EDPL errors.
24:27	ROX	LINK1_EDPL_ERROR_COUNT_6: Count of EDPL errors.
28:31	ROX	LINK1_EDPL_ERROR_COUNT_7: Count of EDPL errors.
32:35	ROX	LINK1_EDPL_ERROR_COUNT_8: Count of EDPL errors.
36:39	ROX	LINK1_EDPL_ERROR_COUNT_9: Count of EDPL errors.
40:43	ROX	LINK1_EDPL_ERROR_COUNT_10: Count of EDPL errors.
44:47	ROX	LINK1_EDPL_ERROR_COUNT_11: Count of EDPL errors.
48:63	RO	constant = 0b0000000000000000

Register Name	Power Bus OLL Link 0 Link Quality Status Register
Mnemonic	PB.IOO.LL0.IOOL_LINK0_QUALITY
Address	0000000009010826 (SCOM)
Description	Processor bus OLL link0 link quality status register

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1:11	ROX	LINK0_TX_BW: Measure of transmit bandwidth.
12	RO	constant = 0b0
13:23	ROX	LINK0_RX_BW: Measure of receive bandwidth.
24	RO	constant = 0b0
25:47	ROX	LINK0_ERROR_RATE: Measure of received error rate.
48:63	RO	constant = 0b0000000000000000

Register Name	Power Bus OLL Link 1 Link Quality Status Register
Mnemonic	PB.IOO.LL0.IOOL_LINK1_QUALITY
Address	0000000009010827 (SCOM)
Description	Processor bus OLL link1 link quality status register

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1:11	ROX	LINK1_TX_BW: Measure of transmit bandwidth.
12	RO	constant = 0b0
13:23	ROX	LINK1_RX_BW: Measure of receive bandwidth.
24	RO	constant = 0b0
25:47	ROX	LINK1_ERROR_RATE: Measure of received error rate.
48:63	RO	constant = 0b0000000000000000

Register Name	Power Bus OLL Status Register
Mnemonic	PB.IOO.LL0.IOOL_DLL_STATUS
Address	0000000009010828 (SCOM)
Description	Processor bus OLL status register

Bits	SCOM	Field Mnemonic: Description
0:3	RO	constant = 0b0000
4:7	ROX	LINK0_CURRENT_STATE: Current state of initialization/training state machine.
8:11	RO	constant = 0b0000
12:15	ROX	LINK0_PRIOR_STATE: Prior state of initialization/training state machine.
16	ROX	LINK0_OPTICS_RST_B: Value of driven tp_io_optics_rst_b.
17	ROX	LINK0_OPTICS_IRQ: Value of received io_tp_op_irq.
18	ROX	LINK0_TRAINING: Link is currently training.
19:23	ROX	LINK0_MAX_PKT_TIMER: Maximum value reached by packet delay counter.
24:27	RO	constant = 0b0000
28:31	ROX	LINK1_CURRENT_STATE: Current state of initialization/training state machine.
32:35	RO	constant = 0b0000
36:39	ROX	LINK1_PRIOR_STATE: Prior state of initialization/training state machine.
40	ROX	LINK1_OPTICS_RST_B: Value of driven tp_io_optics_rst_b.
41	ROX	LINK1_OPTICS_IRQ: Value of received io_tp_op_irq.
42	ROX	LINK1_TRAINING: Link is currently training.
43:47	ROX	LINK1_MAX_PKT_TIMER: Maximum value reached by packet delay counter.
48:63	RO	constant = 0b0000000000000000

Register Name	Power Bus OLL Link x Error Status Register
Mnemonic	PB.IOO.LL0.IOOL_LINKX_ERROR_STATUS
Address	0000000009010829 (SCOM)
Description	Processor bus OLL linkx error status register

Bits	SCOM	Field Mnemonic: Description
0	WOX	LINKX_RESET_KEEPER: Reset_keeper for link0 error status register.

Bits	SCOM	Field Mnemonic: Description
1:5	ROX	LINKX_ERROR_STATUS: c_err_rpt for link x NPU errors.
6:63	RO	constant = 0b0000000000000000000000000000000000000000000000000000000000

Register Name	Normal SCOM Mode Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.SCOM.SCOM_MODE_PB
Address	0000000009010C20 (SCOM)
Description	Normal SCOM mode register

Bits	SCOM	Field Mnemonic: Description
0	RWX	GCR_TEST_MODE: GCR test mode. Puts register logic into GCR test mode, which allows all RW registers to be read and written by diagnostic code to verify all register accesses. This mode gates off both logic inputs to the registers as well as the outputs from the logic. The outputs are gated to their scan flush value.
1	RWX	ENABLE_GCR_OFL_BUFF: Enables a second GCR overflow buffer. The default is one.
2	RWX	IORESET_HARD_BUS0: I/O hard reset per-bus and GCR reset.
3	RWX	MMIO_PG_REG_ACCESS: MMIO PG register access is blocked by default. Setting this bit high grants MMIO access to the PG registers.
4:7	RWX	SCOM_MODE_PB_SPARES1: SCOM mode register spares.
8:10	RWX	GCR_HANG_DET_SEL: GCR hang detect threshold select.
11	ROX	GCR_BUFFER_ENABLED_RO_SIGNAL: Flag indicating that the extra GCR buffer is active, if the SCOM GCR enable buffer is off it means the hang threshold was reached.
12	RWX	GCR_HANG_ERROR_MASK: Mask for GCR hang error when a second buffer is enabled.
13	RWX	GCR_HANG_ERROR_INJ: Inject for GCR hang error.
14	RWX	PPE_GCR_MODE: GCR test mode/put register logic into GCR test mode which allows all RW registers to be read and written by diagnostic code to verify all register accesses. This mode gates off both logic inputs to the registers as well as the outputs from the logic. The outputs are gated to their scan flush value.
15:22	RWX	CHAN_FAIL_MASK: Channel fail mask.
23:30	RWX	SCOM_MODE_PB_SPARES2: SCOM mode register spares.
31:63	RO	constant = 0b000000000000000000000000000000000

Register Name	PPE Control Register
Mnemonic	IOO0.IOO_PPE.SCOM_PPE_CNTL
Address	0000000009011060 (SCOM)
Description	PPE Misc Control Register

Bits	SCOM	Field Mnemonic: Description
0	RW	SCOM_PPE_IORESET: Reset I/O-specific logic in the PPE macro. (This does not actually reset the PPE or ARB logic.)
1	RW	SCOM_PPE_PDWN: Power down I/O-specific logic in the PPE macro. (This does not actually reset the PPE or ARB logic.)
2	RW	SCOM_PPE_INTERRUPT: Manually force an external interrupt in the PPE.
3	RW	SCOM_PPE_ARB_ECC_INJECT_ERR: Force an ECC error in the memory arbiter.
4:15	RW	SCOM_PPE_SPARES: PPE Miscellaneous control spares.

Bits	SCOM	Field Mnemonic: Description
16:31	RO	constant = 0b0000000000000000

Register Name	PPE Work 1 Register
Mnemonic	IOO0.IOO_PPE.SCOM_PPE_WORK_REG1
Address	0000000009011061 (SCOM)
Description	PPE Work Register 1

Bits	SCOM	Field Mnemonic: Description
0:31	RWX	SCOM_PPE_WORK1: PPE work register field 1.
32:63	RO	constant = 0b00000000000000000000000000000000

Register Name	PPE Work 2 Register
Mnemonic	IOO0.IOO_PPE.SCOM_PPE_WORK_REG2
Address	0000000009011062 (SCOM)
Description	PPE Work Register 2

Bits	SCOM	Field Mnemonic: Description
0:31	RWX	SCOM_PPE_WORK2: PPE work register field 2.
32:63	RO	constant = 0b00000000000000000000000000000000

Register Name	PPE Flag Register
Mnemonic	IOO0.IOO_PPE.SCOM_PPE_FLAGS
Address	0000000009011063 (SCOM) 0000000009011064 (SCOM1) 0000000009011065 (SCOM2)
Description	PPE Flag Register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:15	RWX	WOX_OR	WOX_CLEAR	SCOM_PPE_FLAGS_FIELD: PPE flags register field.
16:31	RO	RO	RO	constant = 0b0000000000000000

Register Name	Synchronous Configuration Register
Mnemonic	TP.TCOB0.OB.SYNC_CONFIG
Address	0000000009030000 (SCOM)
Description	configuration of CC counters

Bits	SCOM	Field Mnemonic: Description
0:3	RW	SYNC_PULSE_DELAY: Delay incoming synchronous pulse. The default is 8 latches, including asynchronous. 0000 = Delay by 8 latches (default). 0001 = Delay by 2 latches. 0010 = Delay by 3 latches. 0011 = Delay by 4 latches. 0100 = Delay by 5 latches. 0101 = Delay by 6 latches. 0110 = Delay by 7 latches. 0111 = Delay by 8 latches. 1000 = Delay by 9 latches. 1001 = Delay by 10 latches. 1010 = Delay by 11 latches. 1011 = Delay by 12 latches. 1100 = Delay by 13 latches. 1101 = Delay by 14 latches. 1110 = Delay by 15 latches. 1111 = Delay by 16 latches.
4	RW	LISTEN_TO_SYNC_PULSE_DIS: Disable phase counter synchronization by sync_pulse signal (default is enabled). **Note:** When listen_to_sync is enabled, the chiplet becomes corrupted for 200 cycles.
5	RW	SYNC_PULSE_INPUT_SEL: The default is 0. When set to 1, the alternative input of the sync_pulse will be used. **Note:** When toggling the input select, the chiplet becomes corrupted for 200 cycles.
6	RW	USE_SYNC_FOR_SCAN: When set, use OPCG initial alignment for scan requests.
7	RW	CLEAR_CHIPLET_IS_ALIGNED: This bit clears the chiplet_is_aligned bit. See the Chiplet Status Register.
8	RW	UNIT_REGION_CLKCMD_ENABLE: Enable the unit interface to start or stop one dedicated region. Used for POWER9 cache/core.
9	RW	DISABLE_PCB_ITR: Disable interrupt generation within CC. Interrupt sent on each HLD event.
10	RW	ENABLE_VITL_ALIGN_CHECK: Enable the VITL align check to compare alignment of incoming synchronous pulse with 2:1 VITL LCB.
11	RW	SYNC_PULSE_OUT_DIS: Disables sync_pulse output when set to 1. The master chiplet will no longer send synchronous pulses to slave chiplets.
12:19	RW	UNUSED1219: Unused.

Register Name	**OPCG Alignment Register**
Mnemonic	TP.TCOB0.OB.OPCG_ALIGN
Address	0000000009030001 (SCOM)
Description	OPCG ALIGN

Bits	SCOM	Field Mnemonic: Description
0:3	RW	INOP_ALIGN: INOP phase alignment: 0 = None 1 = 2:1 2 = 3:1 3 = 4:1 4 = 6:1 5 = 8:1 6 = 12:1 7 = 16:1 8 = 24:1 9-15 = 48:1
4:7	RW	SNOP_ALIGN: SNOP phase alignment: 0 = None 1 = 2:1 2 = 3:1 3 = 4:1 4 = 6:1 5 = 8:1 6 = 12:1 7 = 16:1 8 = 24:1 9-15 = 48:1
8:11	RW	ENOP_ALIGN: ENOP phase alignment: 0 = None 1 = 2:1 2 = 3:1 3 = 4:1 4 = 6:1 5 = 8:1 6 = 12:1 7 = 16:1 8 = 24:1 9-15 = 48:1
12:19	RW	INOP_WAIT: INOP cycle delay (0-255).
20:31	RW	SNOP_WAIT: SNOP cycle delay (0-4095).
32:39	RW	ENOP_WAIT: ENOP cycle delay (0-255).
40	RW	INOP_FORCE_SG: INOP: Set SG high during INOP.
41	RW	SNOP_FORCE_SG: SNOP: Set SG high during SNOP.
42	RW	ENOP_FORCE_SG: ENOP: Set SG high during ENOP (including LOOP phase).
43	RW	NO_WAIT_ON_CLK_CMD: 0 = A clock change request will first wait the OPCG_WAIT cycles. 1 = A clock change request will not wait, when not in flush.
44:45	RW	ALIGN_SOURCE_SELECT: 0 = Use inopa setting from opcg_reg0. 1 = Use rising edge of synchronous pulse. 2 = Use unit0_sync_lvl to align (for AVP: refresh0). 3 = Use unit1_sync_lvl to align (for AVP: refresh1).
46	RW	UNUSED46: Unused.

Bits	SCOM	Field Mnemonic: Description
47:51	RW	SCAN_RATIO: Scan ratio. The default is 4:1 = 00011. 0 to 15 = (n+1):1 16 = 24:1 17 = 32:1 18 = 48:1 19 = 64:1 20 = 128:1
52:63	RW	OPCG_WAIT_CYCLES: Old PAD value; delay at the beginning and end of the OPCG run, to allow DC signals to be there at the right time (0-4095). The default is 0x020. **Note:** Must be higher than plat depth.

Register Name	OPCG Control 0 Register
Mnemonic	TP.TCOB0.OB.OPCG_REG0
Address	0000000009030002 (SCOM)
Description	OPCG Control Register 0

Bits	SCOM	Field Mnemonic: Description
0	RW	RUNN_MODE: 0 = BIST-mode; used for LBIST. 1 = RUNN-mode; used for ABIST/IOBIST.
1	RWX	OPCG_GO: Start OPCG. The bit is cleared when OPCG completes. Poll for opcg_done in the Chiplet Status Register.
2	RWX	RUN_SCAN0: Run scan0 (overrides all BIST mode settings but the scan_ratio). Starts a scan0 run, and the bit is cleared when OPCG is done. Poll for opcg_done in the Chiplet Status Register.
3	RW	SCAN0_MODE: Sets PRPGs in scan0_mode but does not run the automatic scan0 sequence.
4	RWX	OPCG_IN_SLAVE_MODE: When selected, OPCG waits for the master chiplet to get started. When Keep_MS_Mode is 0, SLAVE_MODE is cleared after the incoming trigger.
5	RWX	OPCG_IN_MASTER_MODE: When selected, OPCG sends out a trigger to all slave chiplets. When Keep_MS_Mode is 0, MASTER_MODE is cleared after sending out one master trigger.
6	RW	KEEP_MS_MODE: When set to 1, OPCG in master and slave mode bits are not cleared after one incoming OPCG trigger. The default is to clear master and slave mode bits.
7	RW	TRIGGER_OPCG_ON_UNIT0_SYNC_LVL: Unit pin used for AVP can trigger OPCG (unit0_sync_lvl).
8	RW	TRIGGER_OPCG_ON_UNIT1_SYNC_LVL: Unit pin used for AVP can trigger OPCG (unit1_sync_lvl).
9	RWX	RUN_CHIPLET_SCAN0: Run scan0 on all regions and types; clears the chiplet at all regions and types.
10	RWX	RUN_CHIPLET_SCAN0_NO_PLL: Run scan0 on all regions and types; clears the chiplet at all exclude-PLL regions. PLL can continue to run.
11	RW	RUN_OPCG_ON_UPDATE_DR: Start the OPCG engine when scan update (update_dr) is received (set pulse) Cronus requires this bit to be set at 1 for a set pulse WRITE.
12	RW	RUN_OPCG_ON_CAPTURE_DR: Start the OPCG engine when scan update (capture_dr) is received (set pulse). Cronus requires this bit to be set at 1 for a set pulse READ.
13	RW	STOP_RUNN_ON_XSTOP: RUNN mode. Stops RUNN on checkstop.
14	RW	OPCG_STARTS_BIST: RUNN mode. The OPCG engine controls start_bist for ABIST or IOBIST (see the BIST Register).
15:20	RW	UNUSED1520: Unused.
21:63	RWX	LOOP_COUNT: Loop counter for LBIST and RUNN. write = Target value. read = Current counter value. Counts from 0 to the target value.

Register Name	OPCG Control 1 Register
Mnemonic	TP.TCOB0.OB.OPCG_REG1
Address	0000000009030003 (SCOM)
Description	OPCG Control Register 1

Bits	SCOM	Field Mnemonic: Description
0:11	RW	SCAN_COUNT: BIST mode: Channel scan count (s = 0-4095) RUNN-mode: start_bist match value (0:11)
12:23	RW	MISR_A_VAL: BIST mode: a value for MISR aperture RUNN-mode: start_bist match value (12:23)
24:35	RW	MISR_B_VAL: BIST mode: b value for MISR aperture RUNN-mode: start_bist match value (24:35)
36:47	RW	MISR_INIT_WAIT: BIST mode: delay MISR aperture; MISRs become active after this number of loops.
48	RW	OPCG_SUPPRESS_EVEN_CLK: OPCG creates only even, and not odd, clocks. Used for RUNN to create only one clock in fast domain. The default is 0.
49	RW	SCAN_CLK_USE_EVEN: Generate scan clock in even cycle instead of odd cycle. The default is 0 (odd cycle).
50:51	RW	UNUSED2: Unused.
52	RW	RTIM_THOLD_FORCE: Force rtim_thold low when not in test_dc mode (must be 0 at all times).
53	RW	DISABLE_ARY_CLK_DURING_FILL: LBIST and SCAN0. Prevent the firing of the ARY HLD bit during NSL fill.
54	RW	SG_HIGH_DURING_FILL: LBIST and SCAN0: Hold SG high during NSL fill.
55:56	RW	LBIST_SKITTER_CTL: BIST mode: 00 = Enable skitter during lbist_ip 01 = Enable skitter when misr_active; see misr_init_wait 10 = Skitter OPCG_GO mode; falling edge = start, rising edge = stop 11 = Unused
57	RW	MISR_MODE: BIST mode. MISR aperture mode (0: a-1 to b-1, 1: start to a and b to end).
58	RW	INFINITE_MODE: Infinite mode. RUNN and LBIST will run indefinitely and ignore the loop count.
59:63	RW	NSL_FILL_COUNT: BIST mode. NSL-fill count (0-31).

Register Name	OPCG Control 2 Register
Mnemonic	TP.TCOB0.OB.OPCG_REG2
Address	0000000009030004 (SCOM)
Description	OPCG Control Register 2

Bits	SCOM	Field Mnemonic: Description
0	RWX	OPCG_GO2: Start OPCG for broadcast sequences (start sequence).
1:3	RW	PRPG_WEIGHTING: prpg_activate: 1/2, 1/4, 1/8, 1/16, 1/2, 3/4, 7/8, 15/16.
4:15	RWX	PRPG_VALUE: Set to 0 to keep PRPG always on, else seed.
16:27	RW	PRPG_A_VAL: a value for PRPG aperture.

Bits	SCOM	Field Mnemonic: Description
28:39	RW	PRPG_B_VAL: b value for PRPG aperture.
40	RW	PRPG_MODE: PRPG aperture mode (0: a-1 to b-1, 1: start to a and b to end).
41:63	RW	UNUSED41_63: Unused.

Register Name	Scan Region and Type Register
Mnemonic	TP.TCOB0.OB.SCAN_REGION_TYPE
Address	0000000009030005 (SCOM)
Description	Scan Region and Type

Bits	SCOM	Field Mnemonic: Description
0	RWX	SYSTEM_FAST_INIT: Default is 0. When set to 1, the MASK bits in the CMSK chain govern which part will be scanned or scan0. MASK = 1: scan0. MASK = 0: Partial or scan chain.
1:2	RO	constant = 0b00
3	NCX	SCAN_REGION_VITL: Scan clock region VITL (Vital = Clock).
4	RWX	SCAN_REGION_PERV: Scan clock region perv (pervasive).
5	RWX	SCAN_REGION_UNIT1: Scan clock region pbiooa0 (PB).
6	RWX	SCAN_REGION_UNIT2: Scan clock region ioo0 (IOO).
7	RWX	SCAN_REGION_UNIT3: Scan clock region unused.
8	RWX	SCAN_REGION_UNIT4: Scan clock region unused.
9	RWX	SCAN_REGION_UNIT5: Scan clock region unused.
10	RWX	SCAN_REGION_UNIT6: Scan clock region unused.
11	RWX	SCAN_REGION_UNIT7: Scan clock region unused.
12	RWX	SCAN_REGION_UNIT8: Scan clock region unused.
13	RWX	SCAN_REGION_UNIT9: Scan clock region unused.
14	RWX	SCAN_REGION_UNIT10: Scan clock region pllioo0 (IOO).
15:47	RO	constant = 0b000000000000000000000000000000000
48	RW	SCAN_TYPE_FUNC: Scan chain is functional.
49	RW	SCAN_TYPE_CFG: Scan chain mode (boot configuration and debug configuration).
50	RW	SCAN_TYPE_CCFG_GPTR: Scan chain ccfg / gptr (pervasive: CC configuration; others: GPTR).
51	RW	SCAN_TYPE_REGF: Scan chain regf (register files).
52	RW	SCAN_TYPE_LBIST: Scan chain lbst (LBIST).
53	RW	SCAN_TYPE_ABIST: Scan chain abst (ABIST).
54	RW	SCAN_TYPE_REPR: Scan chain repr (array repair).
55	RW	SCAN_TYPE_TIME: Scan chain time (array timing).
56	RW	SCAN_TYPE_BNDY: Scan chain bndy (boundary IOs).
57	RW	SCAN_TYPE_FARR: Scan chain farr (fast array unload).
58	RW	SCAN_TYPE_CMSK: Scan chain cmsk (LBIST channel mask).
59	RW	SCAN_TYPE_INEX: Scan chain idex (c14 ASIC).

Bits	SCOM	Field Mnemonic: Description
60:63	RO	constant = 0b0000

Register Name	Clock Region Register
Mnemonic	TP.TCOB0.OB.CLK_REGION
Address	0000000009030006 (SCOM)
Description	start/stop of Clocks

Bits	SCOM	Field Mnemonic: Description
0:1	RWX	CLOCK_CMD: Command for clock control: 00 = NOP 01 = Start 10 = Stop 11 = Pulse (one pulse)
2	RWX	SLAVE_MODE: When selected, the clock command waits for the master chiplet to start. The bit is cleared after the incoming slave trigger and Keep_MS_Mode_after_trigger is set to 0.
3	RWX	MASTER_MODE: When selected, the clock command sends out a trigger to all slave chiplets. The bit is cleared after sending out one master trigger and Keep_MS_Mode_after_trigger is set to 0.
4	RWX	CLOCK_REGION_PERV: For clock region perv (pervasive).
5	RWX	CLOCK_REGION_UNIT1: For clock region pbiooa0 (PB).
6	RWX	CLOCK_REGION_UNIT2: For clock region ioo0 (IOO).
7	RWX	CLOCK_REGION_UNIT3: For clock region unused.
8	RWX	CLOCK_REGION_UNIT4: For clock region unused.
9	RWX	CLOCK_REGION_UNIT5: For clock region unused.
10	RWX	CLOCK_REGION_UNIT6: For clock region unused.
11	RWX	CLOCK_REGION_UNIT7: For clock region unused.
12	RWX	CLOCK_REGION_UNIT8: For clock region unused.
13	RWX	CLOCK_REGION_UNIT9: For clock region unused.
14	RWX	CLOCK_REGION_UNIT10: For clock region pllioo0 (IOO).
15:47	RO	constant = 0b000000000000000000000000000000000
48	RWX	SEL_THOLD_SL: Select SL tholds.
49	RWX	SEL_THOLD_NSL: Select NSL tholds.
50	RWX	SEL_THOLD_ARY: Select array thold.
51	RO	constant = 0b0
52	RW	CLOCK_PULSE_USE_EVEN: For dual mesh support. The default for pulse is ODD phase. When this bit is set, pulse is applied on EVEN phase.
53:63	RO	constant = 0b00000000000

Register Name	Clock Status SL Register
Mnemonic	TP.TCOB0.OB.CLOCK_STAT_SL
Address	0000000009030008 (SCOM)
Description	Clocks running SL

Bits	SCOM	Field Mnemonic: Description

15:47	RO	constant = 0b000000000000000000000000000000000
48:59	RW	XSTOP2_WAIT_CYCLES: Specifies how many cycles checkstop waits (0 - 4095) after dropping flush before tholds are dropped.
60:63	RO	constant = 0b0000

Register Name	Checkstop 3 Register
Mnemonic	TP.TCOB0.OB.XSTOP3
Address	000000000903000E (SCOM)
Description	XSTOP per region

Bits	SCOM	Field Mnemonic: Description
0	RW	XSTOP3_MASK_B: Mask for checkstop to clockstop of select regions. (See xstop_perv, xstop_unit0..n). 0 = Ignore checkstop. 1 = Stop on checkstop.
1	RW	XSTOP3_UNUSED: Unused.

Bits	SCOM	Field Mnemonic: Description
2	RW	TRIGGER_OPCG_ON_XSTOP3: Trigger OPCG on checkstop instead of performing clockstop.
3	RW	XSTOP3_WAIT_ALLWAYS: When set to 1, checkstop waits independently of flush. The default is to not wait when flush is not set.
4	RW	XSTOP3_PERV: Region pervasive: 1 = The region is stopped. 0 = The region continues to run on checkstop.
5	RW	XSTOP3_UNIT1: Region pbiooa0 (PB): 1 = The region is stopped. 0 = The region continues to run on checkstop.
6	RW	XSTOP3_UNIT2: Region ioo0 (IOO): 1 = The region is stopped. 0 = The region continues to run on checkstop.
7	RW	XSTOP3_UNIT3: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
8	RW	XSTOP3_UNIT4: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
9	RW	XSTOP3_UNIT5: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
10	RW	XSTOP3_UNIT6: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
11	RW	XSTOP3_UNIT7: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
12	RW	XSTOP3_UNIT8: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
13	RW	XSTOP3_UNIT9: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
14	RW	XSTOP3_UNIT10: Region pllioo0 (IOO): 1 = The region is stopped. 0 = The region continues to run on checkstop.
15:47	RO	constant = 0b000000000000000000000000000000000
48:59	RW	XSTOP3_WAIT_CYCLES: Specifies how many cycles checkstop waits (0 - 4095) after dropping flush before tholds are dropped.
60:63	RO	constant = 0b0000

Register Name	Error Status Register
Mnemonic	TP.TCOB0.OB.ERROR_STATUS
Address	000000000903000F (SCOM)
Description	Error Status of CC

Bits	SCOM	Field Mnemonic: Description
0	RWX	PCB_WRITE_NOT_ALLOWED_ERR: A write was attempted on a read only register.

Bits	SCOM	Field Mnemonic: Description
1	RWX	PCB_READ_NOT_ALLOWED_ERR: A read is not allowed; the register might be write only.
2	RWX	PCB_PARITY_ON_CMD_ERR: A parity error on the command.
3	RWX	PCB_ADDRESS_NOT_VALID_ERR: Invalid address.
4	RWX	PCB_PARITY_ON_ADDR_ERR: Parity error on the address.
5	RWX	PCB_PARITY_ON_DATA_ERR: Parity error on data.
6	RWX	PCB_PROTECTED_ACCESS_INVALID_ERR: Protection violation.
7	RWX	PCB_PARITY_ON_SPCIF_ERR: Parity error on SPCIF.
8	RWX	PCB_WRITE_AND_OPCG_IP_ERR: A PCB write was attempted while OPCG is running.
9	RWX	SCAN_READ_AND_OPCG_IP_ERR: A scan read was attempted while OPCG is running.
10	RWX	CLOCK_CMD_CONFLICT_ERR: A clock command is in progress.
11	RWX	SCAN_COLLISION_ERR: Scan region was selected on a running region.
12	RWX	PREVENTED_SCAN_COLLISION_ERR: PCB request to set a scan region that is running.
13	RWX	OPCG_TRIGGER_ERR: OPCG was triggered while OPCG is running.
14	RWX	PHASE_CNT_CORRUPTION_ERR: The phase counters inside the chiplet are out of sync.
15	RWX	CLOCK_CMD_PREVENTED_ERR: Security or scan collision prevented a clock start.
16	RWX	PARITY_ON_OPCG_SM_ERR: Parity error on the OPCG state machine.
17	RWX	PARITY_ON_CLOCK_MUX_REG_ERR: Parity error on scan/clock region/type or clock status register.
18	RWX	PARITY_ON_OPCG_REG_ERR: Parity error on OPCG registers.
19	RWX	PARITY_ON_SYNC_CONFIG_REG_ERR: Parity error on sync configuration register.
20	RWX	PARITY_ON_XSTOP_REG_ERR: Parity error on checkstop register.
21	RWX	PARITY_ON_GPIO_REG_ERR: Parity error on GP0,4,5,6 registers.
22	RWX	CLKCMD_REQUEST_ERR: Region clkcmd has one request pending but received a second one.
23	RWX	CBS_PROTOCOL_ERR: CBS protocol error. The REQ / ACK sequence is wrong.
24	RWX	VITL_ALIGN_ERR: VITL alignment is out of sync to the sync pulse.
25	RWX	UNIT_SYNC_LVL_ERR: Unit0 and Unit1 sync lvl pulse are not in sync. AVP is broken.
26	RWX	PARITY_ON_SELFBOOT_CMD_STATE_ERR: Parity error on SELFBOOT command state.
27	RWX	UNUSED_ERROR27: Unused.
28	RWX	UNUSED_ERROR28: Unused.
29	RWX	UNUSED_ERROR29: Unused.
30	RWX	UNUSED_ERROR30: Unused.
31	RWX	UNUSED_ERROR31: Unused.

Register Name	OPCG Control Capture 1 Register
Mnemonic	TP.TCOB0.OB.OPCG_CAPT1
Address	0000000009030010 (SCOM)
Description	OPCG Control Register Capture1

Bits	SCOM	Field Mnemonic: Description
0:3	RW	COUNT: 0000 = 12 cycles 0001 – 1100 = Cycles 1-12 1101-1111 = 24 cycles for normal, slow regions
4:8	RW	SEQ_01: Sequence cycle 1 for normal/slow region (SL, NSL, ARY, SE, FCE).
9:13	RW	SEQ_02: Sequence cycle 2 for normal/slow region (SL, NSL, ARY, SE, FCE).
14:18	RW	SEQ_03: Sequence cycle 3 for normal/slow region (SL, NSL, ARY, SE, FCE).
19:23	RW	SEQ_04: Sequence cycle 4 for normal/slow region (SL, NSL, ARY, SE, FCE).
24:28	RW	SEQ_05: Sequence cycle 5 for normal/slow region (SL, NSL, ARY, SE, FCE).
29:33	RW	SEQ_06: Sequence cycle 6 for normal/slow region (SL, NSL, ARY, SE, FCE).
34:38	RW	SEQ_07: Sequence cycle 7 for normal/slow region (SL, NSL, ARY, SE, FCE).
39:43	RW	SEQ_08: Sequence cycle 8 for normal/slow region (SL, NSL, ARY, SE, FCE).
44:48	RW	SEQ_09: Sequence cycle 9 for normal/slow region (SL, NSL, ARY, SE, FCE).
49:53	RW	SEQ_10: Sequence cycle 10 for normal/slow region (SL, NSL, ARY, SE, FCE).
54:58	RW	SEQ_11: Sequence cycle 11 for normal/slow region (SL, NSL, ARY, SE, FCE).
59:63	RW	SEQ_12: Sequence cycle 12 for normal/slow region (SL, NSL, ARY, SE, FCE).

Register Name	OPCG Control Capture 2 Register
Mnemonic	TP.TCOB0.OB.OPCG_CAPT2
Address	0000000009030011 (SCOM)
Description	OPCG Control Register Capture 2

Bits	SCOM	Field Mnemonic: Description
0:3	RW	UNUSED_CAPT2:
4:8	RW	SEQ_13_01EVEN: Sequence cycle 1 is even for fast region or cycle 13 for normal region (SL, NSL, ARY, SE, FCE).
9:13	RW	SEQ_14_01ODD: Sequence cycle 1 is odd for fast region or cycle 14 for normal region (SL, NSL, ARY, SE, FCE).
14:18	RW	SEQ_15_02EVEN: Sequence cycle 2 is even for fast region or cycle 15 for normal region (SL, NSL, ARY, SE, FCE).
19:23	RW	SEQ_16_02ODD: Sequence cycle 2 is odd for fast region or cycle 16 for normal region (SL, NSL, ARY, SE, FCE).
24:28	RW	SEQ_17_03EVEN: Sequence cycle 3 is even for fast region or cycle 17 for normal region (SL, NSL, ARY, SE, FCE).
29:33	RW	SEQ_18_03ODD: Sequence cycle 3 is odd for fast region or cycle 18 for normal region (SL, NSL, ARY, SE, FCE).
34:38	RW	SEQ_19_04EVEN: Sequence cycle 4 is even for fast region or cycle 19 for normal region (SL, NSL, ARY, SE, FCE).
39:43	RW	SEQ_20_04ODD: Sequence cycle 4 is odd for fast region or cycle 20 for normal region (SL, NSL, ARY, SE, FCE).
44:48	RW	SEQ_21_05EVEN: Sequence cycle 5 is even for fast region or cycle 21 for normal region (SL, NSL, ARY, SE, FCE).
49:53	RW	SEQ_22_05ODD: Sequence cycle 5 is odd for fast region or cycle 22 for normal region (SL, NSL, ARY, SE, FCE).

Bits	SCOM	Field Mnemonic: Description
54:58	RW	SEQ_23_06EVEN: Sequence cycle 6 is even for fast region or cycle 23 for normal region (SL, NSL, ARY, SE, FCE).
59:63	RW	SEQ_24_06ODD: Sequence cycle 6 is odd for fast region or cycle 24 for normal region (SL, NSL, ARY, SE, FCE).

Register Name	OPCG Capture 3 Register
Mnemonic	TP.TCOB0.OB.OPCG_CAPT3
Address	0000000009030012 (SCOM)
Description	OPCG Control Register Capture 3

Bits	SCOM	Field Mnemonic: Description
0:3	RW	UNUSED_CAPT3:
4:8	RW	SEQ_07EVEN: Sequence cycle 7 is even for fast region (SL, NSL, ARY, SE, FCE).
9:13	RW	SEQ_07ODD: Sequence cycle 7 is odd for fast region (SL, NSL, ARY, SE, FCE).
14:18	RW	SEQ_08EVEN: Sequence cycle 8 is even for fast region (SL, NSL, ARY, SE, FCE).
19:23	RW	SEQ_08ODD: Sequence cycle 8 is odd for fast region (SL, NSL, ARY, SE, FCE).
24:28	RW	SEQ_09EVEN: Sequence cycle 9 is even for fast region (SL, NSL, ARY, SE, FCE).
29:33	RW	SEQ_09ODD: Sequence cycle 9 is odd for fast region (SL, NSL, ARY, SE, FCE).
34:38	RW	SEQ_10EVEN: Sequence cycle 10 is even for fast region (SL, NSL, ARY, SE, FCE).
39:43	RW	SEQ_10ODD: Sequence cycle 10 is odd for fast region (SL, NSL, ARY, SE, FCE).
44:48	RW	SEQ_11EVEN: Sequence cycle 11 is even for fast region (SL, NSL, ARY, SE, FCE).
49:53	RW	SEQ_11ODD: Sequence cycle 11 is odd for fast region (SL, NSL, ARY, SE, FCE).
54:58	RW	SEQ_12EVEN: Sequence cycle 12 is even for fast region (SL, NSL, ARY, SE, FCE).
59:63	RW	SEQ_12ODD: Sequence cycle 12 is odd for fast region (SL, NSL, ARY, SE, FCE).

Register Name	Debug CBS CC Register
Mnemonic	TP.TCOB0.OB.DBG_CBS_CC
Address	0000000009030013 (SCOM)
Description	Debug CBS CC Register

Bits	SCOM	Field Mnemonic: Description
0	ROX	DBG_RESET_EP: Reset endpoint.
1	ROX	DBG_OPCG_IP: OPCG in progress, not in idle state.
2	ROX	DBG_VITL_CLKOFF: VITL HLD stopped. When enabled, plat-depth cycles are needed to switch this latch.
3	ROX	DBG_TEST_ENABLE: Test enable.
4	ROX	DBG_CBS_REQ: CBS Interface. Request (latched).
5:7	ROX	DBG_CBS_CMD: CBS Interface. Command (latched).
8:12	ROX	DBG_CBS_STATE: CBS Command State Machine; 00000 = Idle.
13	ROX	DBG_SECURITY_DEBUG_MODE: Status of the security mode bit.

Bits	SCOM	Field Mnemonic: Description
14	ROX	DBG_CBS_PROTOCOL_ERROR: CBS protocol error. Request raised, although state machine is not in idle state. Need reset_ep to clear this bit. No impact on IPL.
15	ROX	DBG_PCB_IDLE: PCB Interface in idle state.
16:19	ROX	DBG_CURRENT_OPCG_MODE: The current (latest) OPCG mode: 0 = NOP 1 = LBIST 2 = ABIST 3 = RUNN 4 = SCAN0 5 = SCAN 6 = SCAN rotate 7 = SCAN with UpdateDR 8 = SCAN with CaptureDR 9 = CLK Change Request 10-15 = Unused
20:23	ROX	DBG_LAST_OPCG_MODE: Previous OPCG mode.
24	ROX	DBG_PCB_ERROR: PCB interface error. Read the CC error register or set CBS_CMD = 001 to switch the FSI CBS debug information to the CC error register.
25	ROX	DBG_PARITY_ERROR: Any parity error, non-PCB parity. Read the CC error register or set CBS_CMD = 001 to switch the FSI CBS debug information to the CC error register.
26	ROX	DBG_CC_ERROR: Any other CC error. Read the CC error register or set CBS_CMD = 001 to switch the FSI CBS debug information to the CC error register.
27	ROX	DBG_CHIPLET_IS_ALIGNED: Set to 1 when a valid align pulse was sent out.
28	ROX	DBG_PCB_REQUEST_SINCE_RESET: Reset clears this bit, and the first PCB request sets it.
29	ROX	DBG_PARANOIA_TEST_ENABLE_CHANGE: Rising or falling edge on test enable, after reset. Need reset_ep to clear. No impact on IPL.
30	ROX	DBG_PARANOIA_VITL_CLKOFF_CHANGE: Rising or falling edge on vitl_clkoff, after reset. Need reset_ep to clear. No impact on IPL.
31	ROX	TP_TPFSI_CBS_ACK: This is the only representation of the CC acknowledge signal that is sent to FSI.

Register Name	CC Protect Mode Register
Mnemonic	TP.TCOB0.OB.CC_PROTECT_MODE_REG
Address	00000000090303FE (SCOM)
Description	Enables read and write protection.

Bits	SCOM	Field Mnemonic: Description
0	RW	CC_READ_PROTECT_ENABLE: Enables read protection.
1	RW	CC_WRITE_PROTECT_ENABLE: Enables write protection.

Register Name	Atomic Lock Register
Mnemonic	TP.TCOB0.OB.CC_ATOMIC_LOCK_REG
Address	00000000090303FF (SCOM)
Description	Enables an atomic lock and an atomic lock counter.

Bits	SCOM	Field Mnemonic: Description
0	RW	CC_ATOMIC_LOCK_ENABLE: Enables atomic lock.
1:4	ROX	CC_ATOMIC_ID: Atomic ID.
5:7	RO	constant = 0b000
8:15	ROX	CC_ATOMIC_ACTIVITY: Atomic lock counter.

Register Name	Global Checkstop FIR Register
Mnemonic	TP.TCOB0.OB.XFIR
Address	0000000009040000 (SCOM)
Description	Global checkstop FIR

Bits	SCOM	Field Mnemonic: Description
0	RWX	XFIR_IN0: Summary bit (any checkstop).
1	RWX	XFIR_IN1: Checkstop broadcast via OOB.
2	RWX	XFIR_IN2: Unused.
3	RWX	XFIR_IN3: Checkstop from pervasive unit.
4	RWX	XFIR_IN4: Checkstop from PBIOOA.
5	RWX	XFIR_IN5: Checkstop from IOO.
6	RWX	XFIR_IN6: Checkstop from IOOPPE.
7:25	RWX	XFIR_IN7: Unused.
26	RWX	XFIR_IN26: Checkstop on debug trigger.

Register Name	Global Recoverable FIR Register
Mnemonic	TP.TCOB0.OB.RFIR
Address	0000000009040001 (SCOM)
Description	Global recoverable FIR

Bits	SCOM	Field Mnemonic: Description
0	ROX	RFIR_IN0: Local checkstop from PBIOX0, PBIOX1, PBIOX2, and IOPPE.
1	ROX	LFIR_RECOV_ERR: Recoverable error from pervasive unit.
2	ROX	RFIR_IN4: Recovery from PBIOOA.
3	ROX	RFIR_IN5: Recovery from IOO.
4	ROX	RFIR_IN6: Recovery from IOOPPE.
5:23	ROX	RFIR_IN7: Unused.

Register Name	FIR Mask Register
Mnemonic	TP.TCOB0.OB.FIR_MASK
Address	0000000009040002 (SCOM)
Description	FIR Mask

Bits	SCOM	Field Mnemonic: Description
0	RW	FIR_MASK_IN0: Mask for XFIR summary bit (any checkstop).
1	RW	FIR_MASK_IN1: Mask for XFIR from other chiplets.
2	RW	FIR_MASK_IN2: Unused.
3	RW	FIR_MASK_IN3: Mask for XFIR from pervasive unit.
4	RW	FIR_MASK_IN4: Mask for PBIOOA, XFIR, and RFIR.
5	RW	FIR_MASK_IN5: Mask for IOO, XFIR, and RFIR.
6	RW	FIR_MASK_IN6: Mask for IOOPPE, XFIR, and RFIR.
7:25	RW	FIR_MASK_IN7: Unused.
26	RW	FIR_MASK_IN26: Mask for debug trigger and local checkstop to recoverable error.

Register Name	Special Attention Register
Mnemonic	TP.TCOB0.OB.SPATTN
Address	0000000009040004 (SCOM) 0000000009040005 (SCOM1) 0000000009040006 (SCOM2)
Description	Special Attention

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	ROX	NCX	NCX	SPATTN_IN0: Special attention from PBIOOA.
1	ROX	NCX	NCX	SPATTN_IN1: Special attention from IOO.
2	ROX	NCX	NCX	SPATTN_IN2: Special attention from IOOPPE.
3	ROX	NCX	NCX	SPATTN_IN3: Unused special attentions.
4	ROX	NCX	NCX	SPATTN_IN4: Unused special attentions.
5	ROX	NCX	NCX	SPATTN_IN5: Unused special attentions.
6	ROX	NCX	NCX	SPATTN_IN6: Unused special attentions.
7	ROX	NCX	NCX	SPATTN_IN7: Unused special attentions.
8	ROX	NCX	NCX	SPATTN_IN8: Unused special attentions.
9	ROX	NCX	NCX	SPATTN_IN9: Unused special attentions.

Register Name	Special Attention Mask Register
Mnemonic	TP.TCOB0.OB.SPA_MASK
Address	0000000009040007 (SCOM)
Description	Special Attention Mask

Bits	SCOM	Field Mnemonic: Description
0:9	RW	SPA_MASK_IN: Special attention mask.

Register Name	FIR Mode Register
Mnemonic	TP.TCOB0.OB.EPS.FIR.MODE_REG
Address	0000000009040008 (SCOM)
Description	Mode Register

Bits	SCOM	Field Mnemonic: Description
0	RW	MODE_IN0: Unused.
1	RW	MODE_IN1: Unused.
2	RW	MODE_IN2: Unused.
3	RW	MODE_IN3: Unused.
4	RW	MODE_IN4: Stop chip TOD on checkstop. (Unused in POWER9).
5	RW	MODE_IN5: Stop chip TOD on recoverable. (Unused in POWER9).
6	RW	MODE_IN6: Disable propagation of checkstop to other chips.
7	RW	MODE_IN7: Unused.
8	RW	MODE_IN8: Enable checkstop on special attention.
9	RW	MODE_IN9: mask_direct/local_error.
10	RW	MODE_IN10: Unused.
11	RW	MODE_IN11: Unused.
12:15	RW	MODE_IN: Unused.

Register Name	Host Attention Register
Mnemonic	TP.TCOB0.OB.HOSTATTN
Address	0000000009040009 (SCOM)
Description	Host Attention

Bits	SCOM	Field Mnemonic: Description
0	ROX	HOSTATTN_IN0: Host attention summary bit.
1	ROX	HOSTATTN_IN1: Unused.
2	ROX	HOSTATTN_IN2: Unused.
3	ROX	HOSTATTN_IN3: Unused.
4	ROX	HOSTATTN_IN4: Unused.
5	ROX	HOSTATTN_IN5: Unused.
6	ROX	HOSTATTN_IN6: Unused.
7	ROX	HOSTATTN_IN7: Unused.
8	ROX	HOSTATTN_IN8: Unused.
9	ROX	HOSTATTN_IN9: Unused.
10	ROX	HOSTATTN_IN10: Unused.
11	ROX	HOSTATTN_IN11: Unused.
12	ROX	HOSTATTN_IN12: Unused.
13	ROX	HOSTATTN_IN13: Unused.

Bits	SCOM	Field Mnemonic: Description
14	ROX	HOSTATTN_IN14: Unused.
15	ROX	HOSTATTN_IN15: Unused.
16	ROX	HOSTATTN_IN16: Unused.
17	ROX	HOSTATTN_IN17: Unused.
18	ROX	HOSTATTN_IN18: Unused.
19	ROX	HOSTATTN_IN19: Unused.
20	ROX	HOSTATTN_IN20: Unused.
21	ROX	HOSTATTN_IN21: Unused.
22	ROX	HOSTATTN_IN22: Unused.

Register Name	Local FIR Register
Mnemonic	TP.TCOB0.OB.LOCAL_FIR
Address	000000000904000A (SCOM) 000000000904000B (SCOM1) 000000000904000C (SCOM2)
Description	Local FIR

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	WOX_AND	WOX_OR	FIR_IN0: CFIR internal parity error.
1	RWX	WOX_AND	WOX_OR	FIR_IN1: Local errors from GPIO (PCB error).
2	RWX	WOX_AND	WOX_OR	FIR_IN2: Local errors from CC (PCB error).
3	RWX	WOX_AND	WOX_OR	FIR_IN3: Local errors from CC (OPCG, parity, scan collision, and so on).
4	RWX	WOX_AND	WOX_OR	FIR_IN4: Local errors from PSC (PCB error).
5	RWX	WOX_AND	WOX_OR	FIR_IN5: Local errors from PSC (parity error).
6	RWX	WOX_AND	WOX_OR	FIR_IN6: Local errors from Thermal (parity error).
7	RWX	WOX_AND	WOX_OR	FIR_IN7: Local errors from Thermal (PCB error).
8	RWX	WOX_AND	WOX_OR	FIR_IN8: Local errors from Thermal (trip error critical).
9	RWX	WOX_AND	WOX_OR	FIR_IN9: Local errors from Thermal (trip error fatal).
10	RWX	WOX_AND	WOX_OR	FIR_IN10: Therm volttrip error.
11	RWX	WOX_AND	WOX_OR	FIR_IN11: Local errors from Debug (error).
12	RWX	WOX_AND	WOX_OR	FIR_IN12: Local errors from Trace Array0 (SCOM error).
13	RWX	WOX_AND	WOX_OR	FIR_IN13: Local errors from Trace Array0.
14	RWX	WOX_AND	WOX_OR	FIR_IN14: Unused.

40	RWX	WOX_AND	WOX_OR	FIR_IN40: Unused.
41	RWX	WOX_AND	WOX_OR	FIR_IN41: Malfunction alert broadcast via OOB.

Register Name	Local FIR Mask Register
Mnemonic	TP.TCOB0.OB.EPS.FIR.LOCAL_FIR_MASK
Address	000000000904000D (SCOM) 000000000904000E (SCOM1) 000000000904000F (SCOM2)
Description	Local FIR Mask

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:41	RW	WO_AND	WO_OR	LFIR_MASK_IN: Mask for LEM error collection vector.

Register Name	Local FIR Action 0 Register
Mnemonic	TP.TCOB0.OB.EPS.FIR.LOCAL_FIR_ACTION0
Address	0000000009040010 (SCOM)
Description	Local FIR Action0

Bits	SCOM	Field Mnemonic: Description
0:41	RW	FIR_ACTION0_IN: action0 mask.

Register Name	Local FIR Action 1 Register
Mnemonic	TP.TCOB0.OB.EPS.FIR.LOCAL_FIR_ACTION1
Address	0000000009040011 (SCOM)
Description	Local FIR Action1

Bits	SCOM	Field Mnemonic: Description
0:41	RW	FIR_ACTION1_IN: action1 mask.

Register Name	Group Checkstop Mask Register
Mnemonic	TP.TCOB0.OB.EPS.FIR.GXSTOP_TRIG_REG
Address	0000000009040013 (SCOM)
Description	Group checkstop Mask Register

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP_TRIG_IN0: Mask bit for system checkstop.
1	RW	GXSTP_TRIG_IN1: Mask bit for recoverable error.
2	RW	GXSTP_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP_TRIG_IN3: Mask bit for local checkstop.
4	RW	GXSTP_TRIG_IN4: Mask bit for type 4 error (host attention).
5	RW	GXSTP_TRIG_IN5: Mask bit for OOB sys_checkstop input (0).
6	RW	GXSTP_TRIG_IN6: Mask bit for OOB sys_checkstop input (1).
7	RW	GXSTP_TRIG_IN7: Mask bit for group checkstop input (0).
8	RW	GXSTP_TRIG_IN8: Mask bit for group checkstop input (1).
9	RW	GXSTP_TRIG_IN9: Mask bit for debug checkstop on trigger.
10	RW	GXSTP_TRIG_IN10: Unused.
11	RW	GXSTP_TRIG_IN11: Unused.

Register Name	Group 0 Checkstop Mask Register
Mnemonic	TP.TCOB0.OB.EPS.FIR.GXSTOP0_MASK_REG
Address	0000000009040014 (SCOM)
Description	Group0 checkstop Mask Register

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP0_TRIG_IN0: Mask bit for system checkstop.
1	RW	GXSTP0_TRIG_IN1: Mask bit for recoverable error.
2	RW	GXSTP0_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP0_TRIG_IN3: Mask bit for local checkstop.
4	RW	GXSTP0_TRIG_IN4: Mask bit for type 4 error (host attention).
5	RW	GXSTP0_TRIG_IN5: Mask bit for OOB sys_checkstop Input (0).
6	RW	GXSTP0_TRIG_IN6: Mask bit for OOB sys_checkstop Input (1).

Bits	SCOM	Field Mnemonic: Description
7	RW	GXSTP0_TRIG_IN7: Mask bit for group checkstop input (0).
8	RW	GXSTP0_TRIG_IN8: Mask bit for group checkstop input (1).
9	RW	GXSTP0_TRIG_IN9: Mask bit for debug checkstop on trigger.
10	RW	GXSTP0_TRIG_IN10: Unused.
11	RW	GXSTP0_TRIG_IN11: Unused.

Register Name	Group1 Checkstop Mask Register
Mnemonic	TP.TCOB0.OB.EPS.FIR.GXSTOP1_MASK_REG
Address	0000000009040015 (SCOM)
Description	Group1 checkstop Mask Register

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP1_TRIG_IN0: Mask bit for system checkstop.
1	RW	GXSTP1_TRIG_IN1: Mask bit for recoverable error.
2	RW	GXSTP1_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP1_TRIG_IN3: Mask bit for local checkstop.
4	RW	GXSTP1_TRIG_IN4: Mask bit for type 4 error (host attention).
5	RW	GXSTP1_TRIG_IN5: Mask bit for OOB sys_checkstop Input (0).
6	RW	GXSTP1_TRIG_IN6: Mask bit for OOB sys_checkstop Input (1).
7	RW	GXSTP1_TRIG_IN7: Mask bit for group checkstop input (0).
8	RW	GXSTP1_TRIG_IN8: Mask bit for group checkstop input (1).
9	RW	GXSTP1_TRIG_IN9: Mask bit for debug checkstop on trigger.
10	RW	GXSTP1_TRIG_IN10: Unused.
11	RW	GXSTP1_TRIG_IN11: Unused.

Register Name	Group 2 Checkstop Mask Register
Mnemonic	TP.TCOB0.OB.EPS.FIR.GXSTOP2_MASK_REG
Address	0000000009040016 (SCOM)
Description	Group2 Xstop Mask Reg

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP2_TRIG_IN0: Mask bit for system checkstop.
1	RW	GXSTP2_TRIG_IN1: Mask bit for recoverable error.
2	RW	GXSTP2_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP2_TRIG_IN3: Mask bit for local checkstop.
4	RW	GXSTP2_TRIG_IN4: Mask bit for type 4 error (host attention).
5	RW	GXSTP2_TRIG_IN5: Mask bit for OOB sys_checkstop Input (0).
6	RW	GXSTP2_TRIG_IN6: Mask bit for OOB sys_checkstop Input (1).
7	RW	GXSTP2_TRIG_IN7: Mask bit for group checkstop input (0).

Bits	SCOM	Field Mnemonic: Description
8	RW	GXSTP2_TRIG_IN8: Mask bit for group checkstop input (1).
9	RW	GXSTP2_TRIG_IN9: Mask bit for debug checkstop on trigger.
10	RW	GXSTP2_TRIG_IN10: Unused.
11	RW	GXSTP2_TRIG_IN11: Unused.

Register Name	Summary Mask Register
Mnemonic	TP.TCOB0.OB.EPS.FIR.SUM_MASK_REG
Address	0000000009040017 (SCOM)
Description	Summary Mask Register

Bits	SCOM	Field Mnemonic: Description
0	RW	SMASK_IN0: System checkstop summary bit.
1	RW	SMASK_IN1: Recoverable summary bit.
2	RW	SMASK_IN2: Special attention summary bit.
3	RW	SMASK_IN3: Local checkstop summary bit.
4	RW	SMASK_IN4: Type4 (host attention) summary bit.

Register Name	Local Checkstop Error Register
Mnemonic	TP.TCOB0.OB.LOCAL_XSTOP_ERR
Address	0000000009040018 (SCOM)
Description	Local Checkstop

Bits	SCOM	Field Mnemonic: Description
0	ROX	LOCAL_XSTOP_IN0: Local checkstop summary bit.
1	ROX	LOCAL_XSTOP_IN1: Local checkstop from IOO, bit 0.
2	ROX	LOCAL_XSTOP_IN2: Local checkstop from IOO PPE, bit 1.
3	ROX	LOCAL_XSTOP_IN3: Unused.
4	ROX	LOCAL_XSTOP_IN4: Unused.
5	ROX	LOCAL_XSTOP_IN5: Unused.
6	ROX	LOCAL_XSTOP_IN6: Unused.
7	ROX	LOCAL_XSTOP_IN7: Unused.
8	ROX	LOCAL_XSTOP_IN8: Unused.
9	ROX	LOCAL_XSTOP_IN9: Unused.
10	ROX	LOCAL_XSTOP_IN10: Unused.
11	ROX	LOCAL_XSTOP_IN11: Unused.
12	ROX	LOCAL_XSTOP_IN12: Unused.
13	ROX	LOCAL_XSTOP_IN13: Unused.
14	ROX	LOCAL_XSTOP_IN14: Unused.
15	ROX	LOCAL_XSTOP_IN15: Unused.

Bits	SCOM	Field Mnemonic: Description
16	ROX	LOCAL_XSTOP_IN16: Unused.
17	ROX	LOCAL_XSTOP_IN17: Unused.
18	ROX	LOCAL_XSTOP_IN18: Unused.
19	ROX	LOCAL_XSTOP_IN19: Unused.
20	ROX	LOCAL_XSTOP_IN20: Unused.
21	ROX	LOCAL_XSTOP_IN21: Unused.
22	ROX	LOCAL_XSTOP_IN22: Unused.

Register Name	Local Checkstop Mask Register
Mnemonic	TP.TCOB0.OB.LOCAL_XSTOP_MASK
Address	0000000009040019 (SCOM)
Description	Local Checkstop Mask

Bits	SCOM	Field Mnemonic: Description
0:21	RW	LOCAL_XSTOP_MASK_IN: Local checkstop mask.

Register Name	Host Attention Mask Register
Mnemonic	TP.TCOB0.OB.HOSTATTN_MASK
Address	000000000904001A (SCOM)
Description	Host Attention Mask

Bits	SCOM	Field Mnemonic: Description
0:21	RW	HOSTATTN_MASK_IN: Host attention mask.

Register Name	DTS Thermal Sensor Result 0 Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.DTS_RESULT0
Address	0000000009050000 (SCOM)
Description	DTS thermal sensor loop1 results

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	DTS_0_RESULT: Calibrated DTS result of sensor with ID 0.
16:31	ROX	DTS_1_RESULT: Calibrated DTS result of sensor with ID 1.
32:63	RO	constant = 0b00000000000000000000000000000000

Register Name	DTS Trace Result Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.DTS_TRC_RESULT
Address	0000000009050003 (SCOM)
Description	DTS Trace Results

Bits	SCOM	Field Mnemonic: Description
0:43	ROX	TIMESTAMP_COUNTER_VALUE: Time stamp counter value during DTS trace mode.
44	ROX	TIMESTAMP_COUNTER_OVERFLOW_ERR: Over flow error bit of the time stamp counter value during DTS trace mode.
45:47	RO	constant = 0b000
48:63	ROX	DTS_1_RESULT: Calibrated DTS result of sensor with ID 1.

Register Name	Thermal Sensor Mode Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.THERM_MODE_REG
Address	000000000905000F (SCOM)
Description	Enables and controls CPM and DTS.

Bits	SCOM	Field Mnemonic: Description
0	RW	THERM_DIS_CPM_BUBBLE_CORR: Critical path result bubble correction active.
1	RW	THERM_FORCE_THRES_ACT: Forces tpc_therm_thres_mac clock gating off and activates clocks.
2:4	RW	THERM_THRES_TRIP_ENA: Enables therm_thres_trip compare. 1xx = trip0, warning. x1x = trip1, critical. xx1 = trip2, fatal.
5	RW	THERM_DTS_SAMPLE_ENA: 0 = No DTS sampling. 1 = DTS sampling is enabled and a below-counter compare match can occur.
6:9	RW	THERM_SAMPLE_PULSE_CNT: A 16 MHz sample pulse is fed into an 18-bit counter. therm_sample_pulse_cnt enables the selection of a high order bit of the counter to enable resolution of sampling DTSs between 2.5 µs and 80 ms. An edge detection circuit detects the rising edge of the selected counter bit and this triggers a DTS sample. 0000 = 16 ms. 0001 = 8 ms. 0010 = 4 ms. 0011 = 2 ms. 0100 = 1 ms. 0101 = 0.5 ms. 0110 = 250 µs. 0111 = 125 µs. 1000 = 62 .5 µs. 1001 = 31.3 µs. 1010 = 15.6 µs. 1011 = 7.8 µs. 1100 = 3.9 µs. 1101 = 2 µs. 1110 = 1 µs. 1111 = 0.5 µs.
10:11	RW	THERM_THRES_MODE_ENA: Forces maximum or minimum mode in the threshold unit: 00 = Off. 11 = Illegal. 10 = Maximum mode. 01 = Minimum mode.
12	RW	DTS_TRIGGER_MODE: Unused.
13	RW	DTS_TRIGGER_SEL: Unused.

Bits	SCOM	Field Mnemonic: Description
14	RW	THERM_THRES_OVERFLOW_MASK: 0 = therm_overflow_err is enabled. 1 = therm_overflow_err is disabled.
15	RW	THERM_MODE_UNUSED: Unused.
16:19	RW	THERM_DTS_READ_SEL: Selects which DTS result will be provided with PCB read addr_v(4): 0000 = DTS 0. 0001 = DTS 1. 0010 = DTS 2. 0100 = DTS 4. 1111 = Worst case sensor.
20:21	RW	THERM_DTS_ENABLE_L1: Loop1 DTS enables: 1x = DTS 0 available. x1 = DTS 1 available.
22:34	RO	constant = 0b0000000000000
35:36	RW	Reserved field.

Register Name	Skitter Control Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.SKITTER_MODE_REG
Address	0000000009050010 (SCOM)
Description	Skitter Control Register

Bits	SCOM	Field Mnemonic: Description
0	RW	SKITTER_HOLD_SAMPLE: Forces skitter to hold the current sample.
1	RW	DISABLE_SKITTER_STICKINESS: A value of '0' specifies accumulation mode. A value of '1' samples a new value on each cycle and resets the sticky value.
2:3	RW	SKITTER_MODE_UNUSED1: Unused.
4:5	RW	SKITTER_HOLD_DBGTRIG_SEL: bit0 = hold_on_trigger0 bit1 = hold_on_trigger1
6:7	RW	SKITTER_RESET_TRIG_SEL: bit0 = reset_sticky_on_trigger0 bit1 = reset_sticky_on_trigger1
8:9	RW	SKITTER_SAMPLE_GUTS: Selects which guts to measure: 00 = guts1. 01 = guts2. 10 = guts3. 11 = guts4.
10:43	RO	constant = 0b0000000000000000000000000000000000
44	ROX	SKITTER_HOLD_SAMPLE_WITH_TRIGGER: Forces skitter to hold the current sample on debug trigger; this has highest priority.
45	ROX	SKITTER_DATA_V_LT: If set to '1', the data requested by a skitter force read register has finished and data is present in the skitter data register in the collector macro. The data be read by any combination of V25/V26/V27 PCB reads.

Register Name	Error Injection Control Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.INJECT_REG
Address	0000000009050011 (SCOM)
Description	Error Injection Control Register

Bits	SCOM	Field Mnemonic: Description
0:1	RW	THERM_INJECT_TRIP: 00 = No injection. 01 = Warning trip level injection. 10 = Critical trip level injection. 11 = Fatal trip level injection.
2:3	RW	THERM_INJECT_MODE: 00 = No injection. 01 = Injection on the next DTS sample. 10 = Solid injection for the next DTS samples until bit setting changes. 11 = Not used.

Register Name	Thermal Control Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.CONTROL_REG
Address	0000000009050012 (SCOM)
Description	Control / Force Reset Register

Bits	SCOM	Field Mnemonic: Description
0	WO_1P	Reserved field.
1	WO_1P	Reserved field.
2	WO_1P	Reserved field.
3	WO_1P	Reserved field.
4	WO_1P	Reserved field.
5	WO_1P	Reserved field.
6	WO_1P	Reserved field.
7	WO_1P	Reserved field.
8	WO_1P	Reserved field.
9	WO_1P	Reserved field.
10	WO_1P	Reserved field.
11	WO_1P	Reserved field.
12	WO_1P	Reserved field.

Register Name	Thermal Error Status Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.ERR_STATUS_REG
Address	0000000009050013 (SCOM)
Description	Thermal Error Status Register

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.
1	ROX	Reserved field.
2	ROX	Reserved field.
3	ROX	Reserved field.
4	ROX	Reserved field.
5	ROX	Reserved field.
6	ROX	Reserved field.

Bits	SCOM	Field Mnemonic: Description
7	ROX	Reserved field.
8	ROX	Reserved field.
9	ROX	Reserved field.
10	ROX	Reserved field.
11	ROX	Reserved field.
12	ROX	Reserved field.
13	ROX	Reserved field.
14	ROX	Reserved field.
15	ROX	Reserved field.
16	ROX	SERIAL_SHIFTCNT_MODEREG_PARITY_ERR_MASK: Serial shift count parity error mask.
17	ROX	THERM_MODEREG_PARITY_ERR_MASK: Thermal Mode Register parity error mask.
18	ROX	SKITTER_MODEREG_PARITY_ERR_MASK: Skitter Mode Register parity error mask.
19	ROX	SKITTER_FORCEREG_PARITY_ERR_MASK: Skitter Force Register parity error mask.
20	ROX	SCAN_INIT_VERSION_REG_PARITY_ERR_MASK: Scan Initial Version Register parity error mask.
21	ROX	VOLT_MODEREG_PARITY_ERR_MASK: Volt Mode Register parity error mask.
22	RO	constant = 0b0
23	ROX	COUNT_STATE_ERR_MASK: Count state machine error mask.
24	ROX	RUN_STATE_ERR_MASK: Run state machine error mask.
25	ROX	THRES_STATE_ERR_MASK: Threshold state machine error mask.
26	ROX	OVERFLOW_ERR_MASK: DTS calibration calculation overflow error mask.
27	ROX	SHIFTER_PARITY_ERR_MASK: Shifter parity error mask.
28	ROX	SHIFTER_VALID_ERR_MASK: Shifter valid error mask.
29	ROX	TIMEOUT_ERR_MASK: Timeout error mask.
30	ROX	F_SKITTER_READ_ERR_MASK: Force skitter read error mask.
31	ROX	PCB_ERR_MASK: Pervasive control bus error mask.
32:39	RO	constant = 0b00000000
40:43	ROX	Reserved field.
44:46	ROX	Reserved field.
47	ROX	Reserved field.
48	ROX	Reserved field.
49:50	ROX	Reserved field.
51:54	ROX	Reserved field.
55	ROX	Reserved field.
56	ROX	Reserved field.
57	ROX	Reserved field.
58	ROX	Reserved field.
59	ROX	Reserved field.
60:63	RO	constant = 0b0000

Register Name	Skitter Force Read Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.SKITTER_FORCE_REG
Address	0000000009050014 (SCOM)
Description	Skitter Force Read Register

Bits	SCOM	Field Mnemonic: Description
0	RW	F_SKITTER_READ: Forces the read of that particular skitter.

Register Name	Skitter Clock Source Control Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.SKITTER_CLKSRC_REG
Address	0000000009050016 (SCOM)
Description	Skitter clock source control register

Bits	SCOM	Field Mnemonic: Description
0:2	RW	SKITTER0_CLKSRC: Selects the clock to measure: 000: Local mesh clock. 001: External pin skitter_c1_1_in. 010: Local d1clk only if d_mode = 1. 011: External pin skitter_c1_2_in. 100: Local lclk only if d_mode = 1. 101: External pin skitter_c1_3_in. 110: Unused. 111: External pin skitter_c1_4_in.
3:35	RO	constant = 0b000000000000000000000000000000000
36:37	RW	SKITTER0_DELAY_SELECT: Selects the delay to be added between the skitter0 clock source multiplexer and the inverter chain. The base line delay is 12.2 psec. 00 = No delay. 01 = 0.6 psec. 10 = 1.8 psec. 11 = 5 psec.

Register Name	Skitter Data 0 Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.SKITTER_DATA0
Address	0000000009050019 (SCOM)
Description	Skitter Data Register Read Bit0:63

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Skitter Data 1 Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.SKITTER_DATA1
Address	000000000905001A (SCOM)
Description	Skitter Data Register Read Bit32:95

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Skitter Data 2 Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.SKITTER_DATA2
Address	000000000905001B (SCOM)
Description	Skitter Data Register Read Bit64:127

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Timestamp Counter Read Register
Mnemonic	TP.TCOB0.OB.EPS.THERM.TIMESTAMP_COUNTER_READ
Address	000000000905001C (SCOM)
Description	Timestamp Counter Read

Bits	SCOM	Field Mnemonic: Description
0:43	ROX	TIMESTAMP_COUNTER_VALUE: Time stamp counter value during DTS trace mode.
44	ROX	TIMESTAMP_COUNTER_OVERFLOW_ERR: Over flow error bit of the time stamp counter value during DTS trace mode.

6. OB 0 Chiplet PCB Slave

The POWER9 processor registers are listed alphabetically by mnemonic in the following address table.

Mnemonic	Address	Page
TP.TPCHIP.NET.PCBSLOB0.ASSIST_INTERRUPT_REG	0x00000000090F0011	1268
TP.TPCHIP.NET.PCBSLOB0.ATOMIC_LOCK_REG	0x00000000090F03FF	1275
TP.TPCHIP.NET.PCBSLOB0.ATTN_INTERRUPT_REG	0x00000000090F001A	1269
TP.TPCHIP.NET.PCBSLOB0.EDRAM_STATUS	0x00000000090F0029	1273
TP.TPCHIP.NET.PCBSLOB0.ERROR_REG	0x00000000090F001F	1270
TP.TPCHIP.NET.PCBSLOB0.HANG_PULSE_0_REG	0x00000000090F0020	1271
TP.TPCHIP.NET.PCBSLOB0.HANG_PULSE_1_REG	0x00000000090F0021	1271
TP.TPCHIP.NET.PCBSLOB0.HANG_PULSE_2_REG	0x00000000090F0022	1271
TP.TPCHIP.NET.PCBSLOB0.HANG_PULSE_3_REG	0x00000000090F0023	1272

TP.TPCHIP.NET.PCBSLOB0.PRIMARY_ADDRESS_REG	0x00000000090F0000	1265
TP.TPCHIP.NET.PCBSLOB0.PROTECT_MODE_REG	0x00000000090F03FE	1275
TP.TPCHIP.NET.PCBSLOB0.RECOV_INTERRUPT_REG	0x00000000090F001B	1269
TP.TPCHIP.NET.PCBSLOB0.SLAVE_CONFIG_REG	0x00000000090F001E	1270
TP.TPCHIP.NET.PCBSLOB0.TIMEOUT_REG	0x00000000090F0010	1268
TP.TPCHIP.NET.PCBSLOB0.VITAL_SCAN_OUT	0x00000000090F0017	1268
TP.TPCHIP.NET.PCBSLOB0.XSTOP_INTERRUPT_REG	0x00000000090F001C	1269

The POWER9 processor registers are listed in the following tables.

Register Name	**Primary PCB Slave Address Register**
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.PRIMARY_ADDRESS_REG
Address	00000000090F0000 (SCOM)
Description	This register contains the PCB slave's primary address.

Bits	SCOM	Field Mnemonic: Description
0:5	RO	Reserved field. This is the primary_address setting.

Register Name	Multicast Group 1 Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.MULTICAST_GROUP_1
Address	00000000090F0001 (SCOM)
Description	Multicast Group Registers 1 – 4 are used to are used to assign chiplets to a specific multicast group within the pervasive connect bus (PCB). Multicast groups make it possible to address more than a single chiplet at a time. They are used to read or write the same resource in multiple chiplets at the same time. **Note:** Multicast groups are initially set up at IPL, but they can be modified at any time by firmware or power management code.

Bits	SCOM	Field Mnemonic: Description
0:2	RO	constant = 0b111
3:5	RW	MULTICAST1_GROUP: Multicast group1 setting. Set this field to a multicast group that this chiplet should be a member of. The chiplet can be assigned to up to four multicast groups by setting this field in the four multicast group registers to the corresponding multicast group numbers. If the chiplet is member of less than four multicast groups, set this field to 0b111 in the multicast group register that is not required. The 0b111 setting indicates multicast group 7; all chiplets are members of multicast group 7 regardless of any multicast register being set to 0b111. 000: Multicast group 0. 001: Multicast group 1. 010: Multicast group 2. 011: Multicast group 3. 100: Multicast group 4 – unused. 101: Multicast group 5 – unused. 110: Multicast group 6 – unused. 111: Multicast group 7.

Register Name	Multicast Group 2 Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.MULTICAST_GROUP_2
Address	00000000090F0002 (SCOM)
Description	Multicast Group Registers 1 – 4 are used to are used to assign chiplets to a specific multicast group within the pervasive connect bus (PCB). Multicast groups make it possible to address more than a single chiplet at a time. They are used to read or write the same resource in multiple chiplets at the same time. **Note:** Multicast groups are initially set up at IPL, but they can be modified at any time by firmware or power management code.

Bits	SCOM	Field Mnemonic: Description
0:2	RO	constant = 0b111

Bits	SCOM	Field Mnemonic: Description
3:5	RW	MULTICAST2_GROUP: Multicast group2 setting. Set this field to a multicast group that this chiplet should be a member of. The chiplet can be assigned to up to four multicast groups by setting this field in the four multicast group registers to the corresponding multicast group numbers. If the chiplet is member of less than four multicast groups, set this field to 0b111 in the multicast group register that is not required. The 0b111 setting indicates multicast group 7; all chiplets are members of multicast group 7 regardless of any multicast register being set to 0b111. 000: Multicast group 0. 001: Multicast group 1. 010: Multicast group 2. 011: Multicast group 3. 100: Multicast group 4 – unused. 101: Multicast group 5 – unused. 110: Multicast group 6 – unused. 111: Multicast group 7.

Register Name	Multicast Group 3 Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.MULTICAST_GROUP_3
Address	00000000090F0003 (SCOM)
Description	Multicast Group Registers 1 – 4 are used to are used to assign chiplets to a specific multicast group within the pervasive connect bus (PCB). Multicast groups make it possible to address more than a single chiplet at a time. They are used to read or write the same resource in multiple chiplets at the same time. **Note:** Multicast groups are initially set up at IPL, but they can be modified at any time by firmware or power management code.

Bits	SCOM	Field Mnemonic: Description
0:2	RO	constant = 0b111
3:5	RW	MULTICAST3_GROUP: Multicast group3 setting. Set this field to a multicast group that this chiplet should be a member of. The chiplet can be assigned to up to four multicast groups by setting this field in the four multicast group registers to the corresponding multicast group numbers. If the chiplet is member of less than four multicast groups, set this field to 0b111 in the multicast group register that is not required. The 0b111 setting indicates multicast group 7; all chiplets are members of multicast group 7 regardless of any multicast register being set to 0b111. 000: Multicast group 0. 001: Multicast group 1. 010: Multicast group 2. 011: Multicast group 3. 100: Multicast group 4 – unused. 101: Multicast group 5 – unused. 110: Multicast group 6 – unused. 111: Multicast group 7.

Register Name	Multicast Group 4 Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.MULTICAST_GROUP_4
Address	00000000090F0004 (SCOM)
Description	Multicast Group Registers 1 – 4 are used to are used to assign chiplets to a specific multicast group within the pervasive connect bus (PCB). Multicast groups make it possible to address more than a single chiplet at a time. They are used to read or write the same resource in multiple chiplets at the same time. **Note:** Multicast groups are initially set up at IPL, but they can be modified at any time by firmware or power management code.

Bits	SCOM	Field Mnemonic: Description
0:2	RO	constant = 0b111
3:5	RW	MULTICAST4_GROUP: Multicast group4 setting. Set this field to a multicast group that this chiplet should be a member of. The chiplet can be assigned to up to four multicast groups by setting this field in the four multicast group registers to the corresponding multicast group numbers. If the chiplet is member of less than four multicast groups, set this field to 0b111 in the multicast group register that is not required. The 0b111 setting indicates multicast group 7; all chiplets are members of multicast group 7 regardless of any multicast register being set to 0b111. 000: Multicast group 0. 001: Multicast group 1. 010: Multicast group 2. 011: Multicast group 3. 100: Multicast group 4 – unused. 101: Multicast group 5 – unused. 110: Multicast group 6 – unused. 111: Multicast group 7.

Register Name	Timeout Select Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.TIMEOUT_REG
Address	00000000090F0010 (SCOM)
Description	This register contains the int_timeout setting.

Bits	SCOM	Field Mnemonic: Description
0:1	RW	Reserved field. This is the int_timeout setting.

Register Name	Assist Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.ASSIST_INTERRUPT_REG
Address	00000000090F0011 (SCOM)
Description	This register contains the attn, recov, and xstop (checkstop) settings.

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field. This is the attn setting.
1	ROX	Reserved field. This is the recov setting.
2	ROX	Reserved field. This is the xstop setting.

Register Name	Vital Scan Out Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.VITAL_SCAN_OUT
Address	00000000090F0017 (SCOM)
Description	This register contains the vital scan out settings.

Bits	SCOM	Field Mnemonic: Description
0	ROX	RESERVED.

Register Name	Chiplet Heartbeat Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.HEARTBEAT_REG
Address	00000000090F0018 (SCOM)
Description	This register indicates whether a chiplet heartbeat is detected.

Bits	SCOM	Field Mnemonic: Description
0	ROX	HEARTBEAT_DEAD: A chiplet heartbeat is not detected.

Register Name	PLL Lock indications Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.PLL_LOCK_REG
Address	00000000090F0019 (SCOM)
Description	This register contains lock indications from the PLLs,

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	Reserved field. This is the lock setting.

Register Name	Attention Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.ATTN_INTERRUPT_REG
Address	00000000090F001A (SCOM)
Description	This register contains the attn setting.

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field. This is the attn setting.

Register Name	Recovery Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.RECOV_INTERRUPT_REG
Address	00000000090F001B (SCOM)
Description	This register contains the recoverable interrupt setting.

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field. This is the recov setting.

Register Name	Checkstop Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.XSTOP_INTERRUPT_REG
Address	00000000090F001C (SCOM)
Description	This register contains the checkstop interrupt setting.

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field. This is the xstop setting.

Register Name	Slave Configuration Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.SLAVE_CONFIG_REG
Address	00000000090F001E (SCOM)
Description	This is the slave configuration register.

Bits	SCOM	Field Mnemonic: Description
0	RW	CFG_DISABLE_PERV_THOLD_CHECK: This bit disables the pervasive threshold check.
1	RW	CFG_DISABLE_MALF_PULSE_GEN: This bit disables pulse generation for a malfunction alert. Switch back to level.
2	RW	CFG_STOP_HANG_CNT_SYS_XSTP: This bit disables the hang counter stop for a system checkstop.
3	RW	CFG_DISABLE_CL_ATOMIC_LOCK: This bit disables the atomic lock for chiplet accesses.
4	RW	CFG_DISABLE_HEARTBEAT: This bit disables the check for voltage and gridclock in the chiplet.
5	RW	CFG_DISABLE_FORCE_TO_ZERO: This bit disables the force to zero for error cases.
6	RW	CFG_PM_DISABLE: This bit disables the power management set/reset interface for net_ctrl registers.
7	RW	CFG_PM_MUX_DISABLE: This bit disables the power-management multiplex request signal.
8:13	RW	ERROR_MASK: These are mask bits for slave error reporting.
14:15	RW	RESERVED.

Register Name	Error Capture Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.ERROR_REG
Address	00000000090F001F (SCOM)
Description	This register is used to capture errors.

Bits	SCOM	Field Mnemonic: Description
0	RWX_WCLEAR	CE_ERROR: Correctable error on the PCB bus.
1:3	RWX_WCLEAR	CHIPLET_ERRORS: Errors reported by the chiplet. 000 = No error. 001 = XSCOM command blocked due to pending errors. 010 = Chiplet offline. 011 = Partial good. 100 = Invalid address, address error, or bad access type. 101 = Clock error. 110 = Parity error, received unexpected packet, or wrong packet number. 111 = Timeout. This register is for debug purposes only. It only holds meaningful data if it is cleared after each error.
4	RWX_WCLEAR	PARITY_ERROR: Parity error on the PCB interface.
5	RWX_WCLEAR	DATA_BUFFER_ERROR: Parity error in the data buffer.
6	RWX_WCLEAR	ADDR_BUFFER_ERROR: Parity error in the address buffer.
7	RWX_WCLEAR	PCB_FSM_ERROR: Invalid state error in the PCB FSM.
8	RWX_WCLEAR	CL_FSM_ERROR: Invalid state error in the chiplet FSM.
9	RWX_WCLEAR	INT_RX_FSM_ERROR: Invalid state error in the interrupt RX FSM.
10	RWX_WCLEAR	INT_TX_FSM_ERROR: Invalid state error in the interrupt TX FSM.
11	RWX_WCLEAR	INT_TYPE_ERROR: Invalid interrupt type.
12	RWX_WCLEAR	CL_DATA_ERROR: Parity error on the chiplet interface.

Bits	SCOM	Field Mnemonic: Description
13	RWX_WCLEAR	INFO_ERROR: Parity error on the chiplet information lines.
14	RWX_WCLEAR	UNUSED_0:
15	RWX_WCLEAR	CHIPLET_ATOMIC_LOCK_ERROR: Chiplet atomic lock error.
16	RWX_WCLEAR	PCB_INTERFACE_ERROR: Error on the PCB interface component for the internal endpoint.
17	RWX_WCLEAR	CHIPLET_OFFLINE: A heartbeat check indicated that the chiplet is offline.
18	RWX_WCLEAR	EDRAM_SEQUENCE_ERR: Error in the eDRAM power-up sequence.
19	RWX_WCLEAR	CTRL_REG_PARITY_ERROR: The control register parity is bad.
20	RWX_WCLEAR	ADDRESS_REG_PARITY_ERROR: The address register parity is bad.
21	RWX_WCLEAR	TIMEOUT_REG_PARITY_ERROR: The timeout select register parity is bad.
22	RWX_WCLEAR	CONFIG_REG_PARITY_ERROR: The slave configuration register parity is bad.
23	RWX_WCLEAR	UNUSED_1:
24	RWX_WCLEAR	DIV_REG_PARITY_ERROR: The divider register parity is bad.
25:28	RWX_WCLEAR	PLL_UNLOCK_ERROR: Unlock from the chiplet PLL.

Register Name	Hang Pulse Generation Register 0
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.HANG_PULSE_0_REG
Address	00000000090F0020 (SCOM)
Description	This register contains hang pulse 0 information.

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_0: This field contains the value of hang pulse 0. The time period equals 2^{value} x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_0: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation Register 1
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.HANG_PULSE_1_REG
Address	00000000090F0021 (SCOM)
Description	This register contains hang pulse 1 information.

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_1: This field contains the value of hang pulse 1. The time period equals 2^{value} x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_1: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation Register 2
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.HANG_PULSE_2_REG
Address	00000000090F0022 (SCOM)
Description	This register contains hang pulse 2 information.

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_2: This field contains the value of hang pulse 2. The time period equals 2^{value} x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_2: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation Register 3
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.HANG_PULSE_3_REG
Address	00000000090F0023 (SCOM)
Description	This register contains hang pulse 3 information.

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_3: This field contains the value of hang pulse 3. The time period equals 2^{value} x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_3: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation Register 4
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.HANG_PULSE_4_REG
Address	00000000090F0024 (SCOM)
Description	This register contains hang pulse 4 information.

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_4: This field contains the value of hang pulse 4. The time period equals 2^{value} x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_4: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation Register 5
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.HANG_PULSE_5_REG
Address	00000000090F0025 (SCOM)
Description	This register contains hang pulse 5 information. This hang counter is exclusively used to generate the malfunction alert pulse.

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_5: This field contains the value of hang pulse 5. The time period equals 2^{value} x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_5: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation Register 6
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.HANG_PULSE_6_REG
Address	00000000090F0026 (SCOM)
Description	This register contains hang pulse 6 information. This hang counter is exclusively used for heartbeat generation.

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_6: This field contains the value of hang pulse 6. The time period equals 2^{value} x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_6: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	**Hang Counter Clock Divider Register**
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.PRE_COUNTER_REG
Address	00000000090F0028 (SCOM)
Description	This register is the divider for the hang counter clock.

Bits	SCOM	Field Mnemonic: Description
0:7	RW	PRE_COUNTER: This field is the divider for the hang counter clock. It divides the clock by n + 1. (The default is n = 0).

Register Name	**eDRAM Control Status Register**
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.EDRAM_STATUS
Address	00000000090F0029 (SCOM)
Description	This register contains the eDRAM control status.

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	EDRAM_STAT: This field contains the eDRAM control status.

Register Name	**NET CTRL0 Register**
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.NET_CTRL0
Address	00000000090F0040 (SCOM) 00000000090F0041 (SCOM1) 00000000090F0042 (SCOM2)
Description	This register contains NET controls. It is not applicable to the pervasive chiplet.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	RWX_WAND	RWX_WOR	CHIPLET_ENABLE: This bit is set if the chiplet is good.
1	RWX	RWX_WAND	RWX_WOR	PCB_EP_RESET: The output is ORed to the global EP reset.
2	RWX	RWX_WAND	RWX_WOR	CLK_ASYNC_RESET: POWER9 cache chiplet: EQ skew adjust reset. POWER9 core chiplet: Core duty cycle adjust reset. POWER9 memory chiplet: Memory glitchless multiplexer asynchronous reset.
3	RWX	RWX_WAND	RWX_WOR	PLL_TEST_EN: Test enable for the chiplet PLL.
4	RWX	RWX_WAND	RWX_WOR	PLL_RESET: Reset for the chiplet PLL.
5	RWX	RWX_WAND	RWX_WOR	PLL_BYPASS: Enable bypass for the chiplet PLL.
6	RWX	RWX_WAND	RWX_WOR	VITAL_SCAN: Scan control for the chiplet vital domain.
7	RWX	RWX_WAND	RWX_WOR	VITAL_SCAN_IN: Scan in for the chiplet vital domain.
8	RWX	RWX_WAND	RWX_WOR	VITAL_PHASE: Phase for the vital domain.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
9	RWX	RWX_WAND	RWX_WOR	FLUSH_ALIGN_OVR: When set to 1, this mechanism overrides automatic control by the clock controller of the flush, flush_nto1, and align signals in the chiplet.
10	RWX	RWX_WAND	RWX_WOR	VITAL_AL: Align for the vital domain.
11	RWX	RWX_WAND	RWX_WOR	ACT_DIS: ACT disable control for LCBs in the vital logic.
12	RWX	RWX_WAND	RWX_WOR	MPW1: Modify pulse width 1 (MPW1) control for LCBs in the vital logic.
13	RWX	RWX_WAND	RWX_WOR	MPW2: Modify pulse width 2 (MPW2) control for LCBs in the vital logic.
14	RWX	RWX_WAND	RWX_WOR	MPW3: Modify pulse width 3 (MPW3) control for LCBs in the vital logic.
15	RWX	RWX_WAND	RWX_WOR	DELAY_LCLKR: LCB control signal for the vital logic.
16	RWX	RWX_WAND	RWX_WOR	VITAL_THOLD: Threshold for the chiplet vital domain.
17	RWX	RWX_WAND	RWX_WOR	FLUSH_SCAN_N: Flush scan control.
18	RWX	RWX_WAND	RWX_WOR	FENCE_EN: Fencing signal for the chiplet.
19	RWX	RWX_WAND	RWX_WOR	CPLT_RCTRL: Chiplet receiver enable.
20	RWX	RWX_WAND	RWX_WOR	CPLT_DCTRL: Chiplet driver enable.
21	RWX	RWX_WAND	RWX_WOR	Reserved field. This is the pm_access setting.
22	RWX	RWX_WAND	RWX_WOR	ADJ_FUNC_CLKSEL: POWER9 cache chiplet: Clock select for the skew adjust/duty cycle adjust logic. POWER9 core chiplet: Skew sense to skew adjust fencing.
23:24	RWX	RWX_WAND	RWX_WOR	Reserved field. This is the pm_access setting.
25	RWX	RWX_WAND	RWX_WOR	TP_FENCE_PCB: Fence the chiplet from the PCB bus. If set, the PCB slave reports “Chiplet Offline.”
26	RWX	RWX_WAND	RWX_WOR	LVLTRANS_FENCE: Fence control for the level translators.
27	RWX	RWX_WAND	RWX_WOR	ARRAY_WRITE_ASSIST_EN: Array write assist.
28	RWX	RWX_WAND	RWX_WOR	HTB_INTEST: HTB intest mode.
29	RWX	RWX_WAND	RWX_WOR	HTB_EXTEST: HTB intest mode.
30	RWX	RWX_WAND	RWX_WOR	Reserved field. This is the pm_access setting.
31	RWX	RWX_WAND	RWX_WOR	PLLFORCE_OUT_EN: PLL force out enable.

Register Name	NET CTRL1 Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.NET_CTRL1
Address	00000000090F0044 (SCOM) 00000000090F0045 (SCOM1) 00000000090F0046 (SCOM2)
Description	This register contains NET controls. It is not applicable to the pervasive chiplet.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	RWX_WAND	RWX_WOR	PLL_CLKIN_SEL: PLL clkin select.
1	RWX	RWX_WAND	RWX_WOR	CLK_DCC_BYPASS_EN: POWER9 cache chiplet: L2-0, L2-1, L3 duty cycle control bypass. POWER9 core chiplet: Core duty cycle control bypass. POWER9 memory chiplet: Memory duty cycle control bypass.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
2	RWX	RWX_WAND	RWX_WOR	CLK_PDLY_BYPASS_EN: POWER9 cache chiplet: L2-0, L2-1, L3 programmable delay bypass. POWER9 core chiplet: Core programmable delay bypass. POWER9 memory chiplet: Memory programmable delay bypass.
3	RWX	RWX_WAND	RWX_WOR	CLK_DIV_BYPASS_EN: Enable clock divider bypass.
4	RWX	RWX_WAND	RWX_WOR	REFCLK_CLKMUX0_SEL: Select for reference clock mux0.
5	RWX	RWX_WAND	RWX_WOR	REFCLK_CLKMUX1_SEL: Select for reference clock mux1.
6	RWX	RWX_WAND	RWX_WOR	PLL_BNDY_BYPASS_EN: Bypass for IOP PLL.
7	RWX	RWX_WAND	RWX_WOR	Reserved field. This is the pcb_access setting.
8:15	RWX	RWX_WAND	RWX_WOR	DPLL_TEST_SEL: DPLL testout multiplexing.
16:19	RWX	RWX_WAND	RWX_WOR	SB_STRENGTH: Sector buffer driver strength.
20	RWX	RWX_WAND	RWX_WOR	ASYNC_TYPE: This is a control signal for testing latches with asynchronous set and reset capabilities.
21	RWX	RWX_WAND	RWX_WOR	ASYNC_OBS: This is a control signal for testing latches with asynchronous set and reset capabilities.
22	RWX	RWX_WAND	RWX_WOR	CPM_CAL_SET: CPM calibrate.
23	RWX	RWX_WAND	RWX_WOR	SENSEADJ_RESET0: POWER9 cache chiplet: L2-0 duty cycle adjust reset.
24	RWX	RWX_WAND	RWX_WOR	SENSEADJ_RESET1: POWER9 cache chiplet: L2-1 duty cycle adjust reset.
25	RWX	RWX_WAND	RWX_WOR	CLK_PULSE_EN: Clock pulse mode enable.
26:27	RWX	RWX_WAND	RWX_WOR	CLK_PULSE_MODE: Clock pulse mode setting.
28:31	RWX	RWX_WAND	RWX_WOR	Reserved field. This is the pcb_access setting.

Register Name	Protect Mode Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.PROTECT_MODE_REG
Address	00000000090F03FE (SCOM)
Description	This register is used to enable read and write protection.

Bits	SCOM	Field Mnemonic: Description
0	RW	READ_PROTECT_ENABLE: Enable read protection.
1	RW	WRITE_PROTECT_ENABLE: Enable write protection.

Register Name	Atomic Lock Register
Mnemonic	TP.TPCHIP.NET.PCBSLOB0.ATOMIC_LOCK_REG
Address	00000000090F03FF (SCOM)
Description	This register contains atomic lock information.

Bits	SCOM	Field Mnemonic: Description
0	RW	ATOMIC_LOCK_ENABLE: This bit enables the atomic lock.
1:4	ROX	ATOMIC_ID: This field contains the atomic ID.
5:7	RO	constant = 0b000

Bits	SCOM	Field Mnemonic: Description
8:15	ROX	ATOMIC_ACTIVITY: This is the atomic lock counter.

7. OB 0 Chiplet Indirect

The POWER9 processor registers are listed alphabetically by mnemonic in the following address table.

Mnemonic	Address	Page
IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.RX_FIR_ERROR_INJECT_PB	0x800F980009010C3F	1848

The POWER9 processor registers are listed in the following tables.

Register Name	**Receive Data DAC Spare Mode Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DATA_DAC_SPARE_MODE_PL
Address	8000000009010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_DAC_SPARE_MODE_0: Per-lane spare mode latch.

Bits	SCOM	Field Mnemonic: Description
49	RWX	RX_PL_DATA_DAC_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_DAC_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_DATA_DAC_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_DAC_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_DATA_DAC_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_DATA_DAC_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_DATA_DAC_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Data DAC Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DATA_DAC_SPARE_MODE_PL
Address	8000000109010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_DAC_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_DATA_DAC_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_DAC_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_DATA_DAC_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_DAC_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_DATA_DAC_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_DATA_DAC_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_DATA_DAC_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Data DAC Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DATA_DAC_SPARE_MODE_PL
Address	8000000209010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_DAC_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_DATA_DAC_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_DAC_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_DATA_DAC_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_DAC_SPARE_MODE_4: Per-lane spare mode latch.

Bits	SCOM	Field Mnemonic: Description
53	RWX	RX_PL_DATA_DAC_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_DATA_DAC_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_DATA_DAC_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Data DAC Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DATA_DAC_SPARE_MODE_PL
Address	8000000309010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_DAC_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_DATA_DAC_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_DAC_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_DATA_DAC_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_DAC_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_DATA_DAC_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_DATA_DAC_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_DATA_DAC_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Data DAC Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DATA_DAC_SPARE_MODE_PL
Address	8000000409010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_DAC_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_DATA_DAC_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_DAC_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_DATA_DAC_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_DAC_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_DATA_DAC_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_DATA_DAC_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_DATA_DAC_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	**Receive Data DAC Spare Mode Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DATA_DAC_SPARE_MODE_PL
Address	8000000509010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_DAC_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_DATA_DAC_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_DAC_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_DATA_DAC_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_DAC_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_DATA_DAC_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_DATA_DAC_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_DATA_DAC_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Address	8000080809010C3F (SCOM)
Description	This register contains the first set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_A_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.
54	RWX	RX_LANE_ANA_PDWN: This bit controls the lane power down of analog and custom circuits.
55:57	RWX	RX_PRBS_TEST_DATA: This field contains PRBS test data.
58:63	RWX	RX_B_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.

Register Name	Receive DAC Control 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_EO_PL
Address	8000080909010C3F (SCOM)
Description	This register contains the first set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_A_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.
54	RWX	RX_LANE_ANA_PDWN: This bit controls the lane power down of analog and custom circuits.
55:57	RWX	RX_PRBS_TEST_DATA: This field contains PRBS test data.
58:63	RWX	RX_B_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.

Register Name	Receive DAC Control 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_EO_PL
Address	8000080A09010C3F (SCOM)
Description	This register contains the first set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_A_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.
54	RWX	RX_LANE_ANA_PDWN: This bit controls the lane power down of analog and custom circuits.
55:57	RWX	RX_PRBS_TEST_DATA: This field contains PRBS test data.
58:63	RWX	RX_B_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.

Register Name	Receive DAC Control 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_EO_PL
Address	8000080B09010C3F (SCOM)
Description	This register contains the first set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_A_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.
54	RWX	RX_LANE_ANA_PDWN: This bit controls the lane power down of analog and custom circuits.
55:57	RWX	RX_PRBS_TEST_DATA: This field contains PRBS test data.
58:63	RWX	RX_B_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.

Register Name	Receive DAC Control 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_EO_PL
Address	8000080C09010C3F (SCOM)
Description	This register contains the first set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_A_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.
54	RWX	RX_LANE_ANA_PDWN: This bit controls the lane power down of analog and custom circuits.
55:57	RWX	RX_PRBS_TEST_DATA: This field contains PRBS test data.
58:63	RWX	RX_B_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.

Register Name	Receive DAC Control 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_EO_PL
Address	8000080D09010C3F (SCOM)
Description	This register contains the first set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_A_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.
54	RWX	RX_LANE_ANA_PDWN: This bit controls the lane power down of analog and custom circuits.
55:57	RWX	RX_PRBS_TEST_DATA: This field contains PRBS test data.
58:63	RWX	RX_B_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.

Register Name	Receive DAC Control 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_EO_PL
Address	8000080E09010C3F (SCOM)
Description	This register contains the first set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_A_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.
54	RWX	RX_LANE_ANA_PDWN: This bit controls the lane power down of analog and custom circuits.
55:57	RWX	RX_PRBS_TEST_DATA: This field contains PRBS test data.
58:63	RWX	RX_B_BANK_CONTROLS: This field controls the power-down pins. Bit 0 = CML2CMOS. Bit 1 = CTLE. Bit 2 = DAC. Bit 3 = Deserializer. Bit 4 = Integrator. Bit 5 = Phase rotator.

Register Name	Receive DAC Control 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_EO_PL
Address	8000080F09010C3F (SCOM)
Description	This register contains the first set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

48:53	RWX	RX_A_CONTROLS: Bit 0 = DFE H1 speculation mux select override enables speculation. Bit 1 = DFE H1 speculation mux select override. Bit 2 = When set, this bit puts this lane's front end into offset cancellation mode. It is also needed for common- mode calibration. Bit 3 = This bit enables the amp DAC for measurements in this bank. Bit 4 = This bit enables the fence for initloff. Bit 5 = When set, this bit disables all the H-DACs. CPG.
54:56	RWX	RX_CM_CNTL: Bit 0 = This bit enables integrator common mode cal, which is used in conjunction with integrator cal enable. Bit 1 = This is the polarity bit. Bit 2 = When 1, this bit enables common mode even. When 0, this bit enables common mode odd. CPG.
57:63	RO	constant = 0b0000000

Register Name	Receive DAC Control 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL3_EO_PL
Address	8000180009010C3F (SCOM)
Description	This register contains the third set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Address	8000200309010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000200409010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000200509010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000200609010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000200709010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000200809010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000200909010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000200A09010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000200B09010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000200C09010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000200D09010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000200E09010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000200F09010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000201009010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000201109010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000201209010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000201309010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000201409010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000201509010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000201609010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_EO_PL
Address	8000201709010C3F (SCOM)
Description	This register contains the fourth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch.
55	RO	constant = 0b0
56:62	RWX	RX_A_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch.
63	RO	constant = 0b0

Register Name	Receive DAC Control 5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280009010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_A_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_A_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_A_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280109010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_A_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_A_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_A_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280209010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_A_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_A_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_A_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280309010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_A_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_A_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.

Bits	SCOM	Field Mnemonic: Description
57:61	RWX	RX_A_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280409010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_A_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_A_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_A_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280509010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_A_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_A_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_A_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280609010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_A_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_A_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_A_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	**Receive DAC Control 5 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280709010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_A_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_A_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_A_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	**Receive DAC Control 5 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280809010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_A_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_A_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_A_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280909010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_A_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_A_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_A_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280A09010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_A_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_A_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_A_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280B09010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_A_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_A_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.

Bits	SCOM	Field Mnemonic: Description
57:61	RWX	RX_A_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_EO_PL
Address	8000280C09010C3F (SCOM)
Description	This register contains the fifth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Address	8000380C09010C3F (SCOM)
Description	This register contains the seventh set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_H1E_VAL: This field contains the DFE H1 value for even samplers.
55	RO	constant = 0b0
56:62	RWX	RX_A_H1O_VAL: This field contains the DFE H1 value for odd samplers.
63	RO	constant = 0b0

Register Name	Receive DAC Control 7 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL7_EO_PL
Address	8000380D09010C3F (SCOM)
Description	This register contains the seventh set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_H1E_VAL: This field contains the DFE H1 value for even samplers.
55	RO	constant = 0b0
56:62	RWX	RX_A_H1O_VAL: This field contains the DFE H1 value for odd samplers.
63	RO	constant = 0b0

Register Name	Receive DAC Control 7 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL7_EO_PL
Address	8000380E09010C3F (SCOM)
Description	This register contains the seventh set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_H1E_VAL: This field contains the DFE H1 value for even samplers.
55	RO	constant = 0b0
56:62	RWX	RX_A_H1O_VAL: This field contains the DFE H1 value for odd samplers.
63	RO	constant = 0b0

Register Name	Receive DAC Control 7 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL7_EO_PL
Address	8000380F09010C3F (SCOM)
Description	This register contains the seventh set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_A_H1E_VAL: This field contains the DFE H1 value for even samplers.
55	RO	constant = 0b0
56:62	RWX	RX_A_H1O_VAL: This field contains the DFE H1 value for odd samplers.
63	RO	constant = 0b0

Register Name	Receive DAC Control 7 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL7_EO_PL
Address	8000381009010C3F (SCOM)
Description	This register contains the seventh set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Description	This register contains the eighth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_AMP_VAL: This field contains the receive AmpDAC value stored as sign magnitude.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 8 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL8_EO_PL
Address	8000401409010C3F (SCOM)
Description	This register contains the eighth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_AMP_VAL: This field contains the receive AmpDAC value stored as sign magnitude.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 8 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL8_EO_PL
Address	8000401509010C3F (SCOM)
Description	This register contains the eighth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_AMP_VAL: This field contains the receive AmpDAC value stored as sign magnitude.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 8 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL8_EO_PL
Address	8000401609010C3F (SCOM)
Description	This register contains the eighth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_AMP_VAL: This field contains the receive AmpDAC value stored as sign magnitude.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 8 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL8_EO_PL
Address	8000401709010C3F (SCOM)
Description	This register contains the eighth set of EO DAC controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_AMP_VAL: This field contains the receive AmpDAC value stored as sign magnitude.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_O_PL
Address	8000800009010C3F (SCOM)
Description	This register contains the first set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_B_CONTROLS: Bit 0 = DFE H1 speculation mux select override enables speculation. Bit 1 = DFE H1 speculation mux select override. Bit 2 = When set, this bit puts this lane's front end into offset cancellation mode. It is also needed for common- mode calibration. Bit 3 = This bit enables the amp DAC for measurements in this bank. Bit 4 = This bit enables the fence for initloff.
53:63	RO	constant = 0b00000000000

Register Name	Receive DAC Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_O_PL
Address	8000800109010C3F (SCOM)
Description	This register contains the first set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_B_CONTROLS: Bit 0 = DFE H1 speculation mux select override enables speculation. Bit 1 = DFE H1 speculation mux select override. Bit 2 = When set, this bit puts this lane's front end into offset cancellation mode. It is also needed for common- mode calibration. Bit 3 = This bit enables the amp DAC for measurements in this bank. Bit 4 = This bit enables the fence for initloff.
53:63	RO	constant = 0b00000000000

Register Name	Receive DAC Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_O_PL
Address	8000800209010C3F (SCOM)
Description	This register contains the first set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_B_CONTROLS: Bit 0 = DFE H1 speculation mux select override enables speculation. Bit 1 = DFE H1 speculation mux select override. Bit 2 = When set, this bit puts this lane's front end into offset cancellation mode. It is also needed for common- mode calibration. Bit 3 = This bit enables the amp DAC for measurements in this bank. Bit 4 = This bit enables the fence for initloff.
53:63	RO	constant = 0b00000000000

Register Name	Receive DAC Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_O_PL
Address	8000800309010C3F (SCOM)
Description	This register contains the first set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_B_CONTROLS: Bit 0 = DFE H1 speculation mux select override enables speculation. Bit 1 = DFE H1 speculation mux select override. Bit 2 = When set, this bit puts this lane's front end into offset cancellation mode. It is also needed for common- mode calibration. Bit 3 = This bit enables the amp DAC for measurements in this bank. Bit 4 = This bit enables the fence for initloff.
53:63	RO	constant = 0b00000000000

Register Name	Receive DAC Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_O_PL
Address	8000800409010C3F (SCOM)
Description	This register contains the first set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:52	RWX	RX_B_CONTROLS: Bit 0 = DFE H1 speculation mux select override enables speculation. Bit 1 = DFE H1 speculation mux select override. Bit 2 = When set, this bit puts this lane's front end into offset cancellation mode. It is also needed for common- mode calibration. Bit 3 = This bit enables the amp DAC for measurements in this bank. Bit 4 = This bit enables the fence for initloff.
53:63	RO	constant = 0b00000000000

Register Name	**Receive DAC Control 1 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_O_PL
Address	8000800509010C3F (SCOM)
Description	This register contains the first set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_B_CONTROLS: Bit 0 = DFE H1 speculation mux select override enables speculation. Bit 1 = DFE H1 speculation mux select override. Bit 2 = When set, this bit puts this lane's front end into offset cancellation mode. It is also needed for common- mode calibration. Bit 3 = This bit enables the amp DAC for measurements in this bank. Bit 4 = This bit enables the fence for initloff.
53:63	RO	constant = 0b00000000000

Register Name	Receive DAC Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_O_PL
Address	8000801609010C3F (SCOM)
Description	This register contains the first set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_B_CONTROLS: Bit 0 = DFE H1 speculation mux select override enables speculation. Bit 1 = DFE H1 speculation mux select override. Bit 2 = When set, this bit puts this lane's front end into offset cancellation mode. It is also needed for common- mode calibration. Bit 3 = This bit enables the amp DAC for measurements in this bank. Bit 4 = This bit enables the fence for initloff.
53:63	RO	constant = 0b00000000000

Register Name	Receive DAC Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL1_O_PL
Address	8000801709010C3F (SCOM)
Description	This register contains the first set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	RX_B_CONTROLS: Bit 0 = DFE H1 speculation mux select override enables speculation. Bit 1 = DFE H1 speculation mux select override. Bit 2 = When set, this bit puts this lane's front end into offset cancellation mode. It is also needed for common- mode calibration. Bit 3 = This bit enables the amp DAC for measurements in this bank. Bit 4 = This bit enables the fence for initloff.
53:63	RO	constant = 0b00000000000

Register Name	Receive DAC Control 2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL2_O_PL
Address	8000880009010C3F (SCOM)
Description	This register contains the second set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_OFFSET_E0: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_E1: This is the vertical offset of the even high-threshold sampling latch. The step size is Vio/256.

Bits	SCOM	Field Mnemonic: Description
63	RO	constant = 0b0

Register Name	Receive DAC Control 2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL2_O_PL
Address	8000880109010C3F (SCOM)
Description	This register contains the second set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_OFFSET_E0: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_E1: This is the vertical offset of the even high-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL2_O_PL
Address	8000880209010C3F (SCOM)
Description	This register contains the second set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_OFFSET_E0: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_E1: This is the vertical offset of the even high-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL2_O_PL
Address	8000880309010C3F (SCOM)
Description	This register contains the second set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_OFFSET_E0: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.

Bits	SCOM	Field Mnemonic: Description
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_E1: This is the vertical offset of the even high-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL2_O_PL
Address	8000880409010C3F (SCOM)
Description	This register contains the second set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_OFFSET_E0: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_E1: This is the vertical offset of the even high-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL2_O_PL
Address	8000880509010C3F (SCOM)
Description	This register contains the second set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_OFFSET_E0: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_E1: This is the vertical offset of the even high-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL2_O_PL
Address	8000880609010C3F (SCOM)
Description	This register contains the second set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_OFFSET_E0: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_E1: This is the vertical offset of the even high-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL2_O_PL
Address	8000880709010C3F (SCOM)
Description	This register contains the second set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_OFFSET_E0: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_E1: This is the vertical offset of the even high-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL2_O_PL
Address	8000880809010C3F (SCOM)
Description	This register contains the second set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_OFFSET_E0: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_E1: This is the vertical offset of the even high-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL2_O_PL
Address	8000880909010C3F (SCOM)
Description	This register contains the second set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

48:54	RWX	RX_B_OFFSET_E0: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_E1: This is the vertical offset of the even high-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 3 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL3_O_PL
Address	8000900009010C3F (SCOM)
Description	This register contains the third set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 3 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL3_O_PL
Address	8000900109010C3F (SCOM)
Description	This register contains the third set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 3 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL3_O_PL
Address	8000900209010C3F (SCOM)
Description	This register contains the third set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_OFFSET_O0: This is the vertical offset of the odd low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_B_OFFSET_O1: This is the vertical offset of the odd high-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 3 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL3_O_PL
Address	8000900309010C3F (SCOM)
Description	This register contains the third set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

62:63	RO	constant = 0b00

Register Name	**Receive DAC Control 4 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_O_PL
Address	8000980209010C3F (SCOM)
Description	This register contains the fourth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_B_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_B_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_O_PL
Address	8000980309010C3F (SCOM)
Description	This register contains the fourth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_B_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_B_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_O_PL
Address	8000980409010C3F (SCOM)
Description	This register contains the fourth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_B_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_B_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_O_PL
Address	8000980509010C3F (SCOM)
Description	This register contains the fourth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_B_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.

Bits	SCOM	Field Mnemonic: Description
57:61	RWX	RX_B_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_O_PL
Address	8000980609010C3F (SCOM)
Description	This register contains the fourth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_B_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_B_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_O_PL
Address	8000980709010C3F (SCOM)
Description	This register contains the fourth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_B_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_B_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_O_PL
Address	8000980809010C3F (SCOM)
Description	This register contains the fourth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_B_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_B_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_O_PL
Address	8000980909010C3F (SCOM)
Description	This register contains the fourth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_B_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_B_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_O_PL
Address	8000980A09010C3F (SCOM)
Description	This register contains the fourth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_B_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_B_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_O_PL
Address	8000980B09010C3F (SCOM)
Description	This register contains the fourth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_B_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_B_ODD_INTEG_FINE_GAIN: This is the odd integrator fine-gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL4_O_PL
Address	8000980C09010C3F (SCOM)
Description	This register contains the fourth set of O controls.

Bits	SCOM	Field Mnemonic: Description

Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00309010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00409010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00509010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00609010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00709010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	**Receive DAC Control 5 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00809010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	**Receive DAC Control 5 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00909010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	**Receive DAC Control 5 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00A09010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00B09010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00C09010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00D09010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00E09010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A00F09010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A01009010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A01109010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A01209010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A01309010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A01409010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A01509010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A01609010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 5 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL5_O_PL
Address	8000A01709010C3F (SCOM)
Description	This register contains the fifth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_B_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_B_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 6 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL6_O_PL
Address	8000A80009010C3F (SCOM)
Description	This register contains the sixth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_H1E_VAL: This field contains the DFE H1 value for the even samplers.
55	RO	constant = 0b0
56:62	RWX	RX_B_H1O_VAL: This field contains the DFE H1 value for the odd samplers.

Bits	SCOM	Field Mnemonic: Description
63	RO	constant = 0b0

Register Name	Receive DAC Control 6 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL6_O_PL
Address	8000A80109010C3F (SCOM)
Description	This register contains the sixth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_H1E_VAL: This field contains the DFE H1 value for the even samplers.
55	RO	constant = 0b0
56:62	RWX	RX_B_H1O_VAL: This field contains the DFE H1 value for the odd samplers.
63	RO	constant = 0b0

Register Name	Receive DAC Control 6 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL6_O_PL
Address	8000A80209010C3F (SCOM)
Description	This register contains the sixth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_B_H1E_VAL: This field contains the DFE H1 value for the even samplers.
55	RO	constant = 0b0
56:62	RWX	RX_B_H1O_VAL: This field contains the DFE H1 value for the odd samplers.
63	RO	constant = 0b0

Register Name	Receive DAC Control 6 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL6_O_PL
Address	8000A80309010C3F (SCOM)
Description	This register contains the sixth set of O controls.

Bits	SCOM	Field Mnemonic: Description

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_E_CONTROLS: Bit 0 = When set, this bit puts this lane's front end into offset cancellation mode. It is also needed for common- mode calibration. Bit 1 = This bit enables the amp DAC for measurements in this bank. Bit 2 = This bit enables the fence for initloff.
51:63	RO	constant = 0b0000000000000

Register Name	Receive DAC Control 7 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL7_O_PL
Address	8000B00D09010C3F (SCOM)
Description	This register contains the seventh set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_E_CONTROLS: Bit 0 = When set, this bit puts this lane's front end into offset cancellation mode. It is also needed for common- mode calibration. Bit 1 = This bit enables the amp DAC for measurements in this bank. Bit 2 = This bit enables the fence for initloff.
51:63	RO	constant = 0b0000000000000

Register Name	Receive DAC Control 7 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL7_O_PL
Address	8000B00E09010C3F (SCOM)
Description	This register contains the seventh set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_E_CONTROLS: Bit 0 = When set, this bit puts this lane's front end into offset cancellation mode. It is also needed for common- mode calibration. Bit 1 = This bit enables the amp DAC for measurements in this bank. Bit 2 = This bit enables the fence for initloff.
51:63	RO	constant = 0b0000000000000

Register Name	Receive DAC Control 7 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL7_O_PL
Address	8000B00F09010C3F (SCOM)
Description	This register contains the seventh set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_E_OFFSET_E: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_E_OFFSET_O: This is the vertical offset of the odd low-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 8 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL8_O_PL
Address	8000B81009010C3F (SCOM)
Description	This register contains the eighth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_E_OFFSET_E: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_E_OFFSET_O: This is the vertical offset of the odd low-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 8 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL8_O_PL
Address	8000B81109010C3F (SCOM)
Description	This register contains the eighth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_E_OFFSET_E: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_E_OFFSET_O: This is the vertical offset of the odd low-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 8 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL8_O_PL
Address	8000B81209010C3F (SCOM)
Description	This register contains the eighth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_E_OFFSET_E: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_E_OFFSET_O: This is the vertical offset of the odd low-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 8 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL8_O_PL
Address	8000B81309010C3F (SCOM)
Description	This register contains the eighth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_E_OFFSET_E: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_E_OFFSET_O: This is the vertical offset of the odd low-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 8 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL8_O_PL
Address	8000B81409010C3F (SCOM)
Description	This register contains the eighth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_E_OFFSET_E: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_E_OFFSET_O: This is the vertical offset of the odd low-threshold sampling latch. The step size is Vio/256.

Bits	SCOM	Field Mnemonic: Description
63	RO	constant = 0b0

Register Name	Receive DAC Control 8 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL8_O_PL
Address	8000B81509010C3F (SCOM)
Description	This register contains the eighth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_E_OFFSET_E: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_E_OFFSET_O: This is the vertical offset of the odd low-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 8 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL8_O_PL
Address	8000B81609010C3F (SCOM)
Description	This register contains the eighth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_E_OFFSET_E: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.
55	RO	constant = 0b0
56:62	RWX	RX_E_OFFSET_O: This is the vertical offset of the odd low-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	Receive DAC Control 8 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL8_O_PL
Address	8000B81709010C3F (SCOM)
Description	This register contains the eighth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	RX_E_OFFSET_E: This is the vertical offset of the even low-threshold sampling latch. The step size is Vio/256.

Bits	SCOM	Field Mnemonic: Description
55	RO	constant = 0b0
56:62	RWX	RX_E_OFFSET_O: This is the vertical offset of the odd low-threshold sampling latch. The step size is Vio/256.
63	RO	constant = 0b0

Register Name	**Receive DAC Control 9 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C00009010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	**Receive DAC Control 9 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C00109010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	**Receive DAC Control 9 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C00209010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 9 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C00309010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 9 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C00409010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 9 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C00509010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 9 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C00609010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 9 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C00709010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 9 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C01109010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 9 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C01209010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 9 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C01309010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 9 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#0.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C01409010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 9 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C01509010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_INTEG_COARSE_GAIN: This is the integrator coarse-gain control used in making common mode adjustments.
52:56	RWX	RX_E_EVEN_INTEG_FINE_GAIN: This is the even integrator fine-gain control used in making common mode adjustments.
57:61	RWX	RX_E_ODD_INTEG_FINE_GAIN: This is the odd integrator fine gain control used in making common mode adjustments.
62:63	RO	constant = 0b00

Register Name	Receive DAC Control 9 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL9_O_PL
Address	8000C01609010C3F (SCOM)
Description	This register contains the ninth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 10 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL10_O_PL
Address	8000C81509010C3F (SCOM)
Description	This register contains the tenth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_E_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 10 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL10_O_PL
Address	8000C81609010C3F (SCOM)
Description	This register contains the tenth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_E_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive DAC Control 10 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RX_DAC_REGS.RX_DAC_REGS.RX_DAC_CNTL10_O_PL
Address	8000C81709010C3F (SCOM)
Description	This register contains the tenth set of O controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_E_CTLE_COARSE: This is the CTLE coarse peak value.
52:55	RWX	RX_E_CTLE_GAIN: This is the CTLE gain setting.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002000009010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002000109010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002000209010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002000309010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002000409010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.

Bits	SCOM	Field Mnemonic: Description
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002000509010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002000609010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002001209010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.

Bits	SCOM	Field Mnemonic: Description
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002001309010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002001409010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002001509010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002001609010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_SPARE_MODE_PL
Address	8002001709010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_FIR_PL
Address	8002080009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	ROX	Reserved field.
51:63	RO	constant = 0b0000000000000

Register Name	Receive FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_FIR_PL
Address	8002080109010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	ROX	Reserved field.
51:63	RO	constant = 0b0000000000000

Register Name	Receive FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_FIR_PL
Address	8002080209010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	ROX	Reserved field.

Bits	SCOM	Field Mnemonic: Description
51:63	RO	constant = 0b0000000000000

Register Name	Receive FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_FIR_PL
Address	8002080309010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	ROX	Reserved field.
51:63	RO	constant = 0b0000000000000

Register Name	Receive FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_FIR_PL
Address	8002080409010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	ROX	Reserved field.
51:63	RO	constant = 0b0000000000000

Register Name	Receive FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_FIR_PL
Address	8002080509010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	ROX	Reserved field.

Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002200909010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002200A09010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.

Bits	SCOM	Field Mnemonic: Description
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002200B09010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002200C09010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.

Bits	SCOM	Field Mnemonic: Description
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002200D09010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002200E09010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002200F09010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002201009010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002201109010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002201209010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002201309010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.

Bits	SCOM	Field Mnemonic: Description
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	**Receive Bit Mode 1 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002201409010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	**Receive Bit Mode 1 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002201509010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.

Bits	SCOM	Field Mnemonic: Description
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002201609010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE1_EO_PL
Address	8002201709010C3F (SCOM)
Description	This register contains the first set of EO mode bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_LANE_DIG_PDWN: This bit is used to power down the digital logic for a lane.
49	RWX	RX_BER_DPIPE_MUX_SEL: Diag BER data pipe mux select. When this bit is set to 1, the XOR of the main and alt data is multiplexed onto the main data path feeding the data pipe.
50	RWX	RX_DECOUPLE_EDGE_A: This bit enables a mode where phase rotator A is decoupled from the edge. Its position is directly equal to the rx_pr_data_a_offset value.
51	RWX	RX_DECOUPLE_EDGE_B: This bit enables a mode where phase rotator B is decoupled from the edge. Its position is directly equal to the rx_pr_data_b_offset value.
52	RWX	RX_PSAVE_DIG_REQ_DIS: This bit disables digital RX slice power gating from link-layer psav_req control.
53	RWX	RX_PSAVE_ANA_REQ_DIS: This bit disables analog RX slice power gating from link-layer psav_req control.
54:63	RO	constant = 0b0000000000

Register Name	Receive Bit Mode 2 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE2_EO_PL
Address	8002280009010C3F (SCOM)
Description	This register contains the second set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:55	RO	constant = 0b00000000000000000000000000000000000000000000000000000000
56	RWX	RX_PR_FW_OFF: Removes the flywheel from the phase-rotator (PR) accumulator. **Note:** This is not the same as setting the inertia amount to zero.
57:59	RWX	RX_PR_FW_INERTIA_AMT: This field contains the amount to be added or subtracted from the flywheel inertia. **Note:** Setting this field to zero might not turn off the flywheel if the flywheel accumulator already has a value (as if it were turned off after having run for some time).
60:63	RWX	RX_PR_PHASE_STEP: This field contains the amount to be added to or subtracted from the phase rotator accumulator on each shift left or right. The value 0000 is decoded as b10000 in logic. Therefore, the PR updates every four shifts. Other values update with every 4 x (16/phase_step) shifts.

Register Name	Receive Bit Mode 2 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE2_EO_PL
Address	8002280109010C3F (SCOM)
Description	This register contains the second set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:55	RO	constant = 0b00000000000000000000000000000000000000000000000000000000
56	RWX	RX_PR_FW_OFF: Removes the flywheel from the PR accumulator. **Note:** This is not the same as setting the inertia amount to zero.
57:59	RWX	RX_PR_FW_INERTIA_AMT: This field contains the amount to be added or subtracted from the flywheel inertia. **Note:** Setting this field to zero might not turn off the flywheel if the flywheel accumulator already has a value (as if it were turned off after having run for some time).
60:63	RWX	RX_PR_PHASE_STEP: This field contains the amount to be added to or subtracted from the phase rotator accumulator on each shift left or right. The value 0000 is decoded as b10000 in logic. Therefore, the PR updates every four shifts. Other values update with every 4 x (16/phase_step) shifts.

Register Name	Receive Bit Mode 2 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE2_EO_PL
Address	8002280209010C3F (SCOM)
Description	This register contains the second set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:55	RO	constant = 0b00000000000000000000000000000000000000000000000000000000
56	RWX	RX_PR_FW_OFF: Removes the flywheel from the PR accumulator. **Note:** This is not the same as setting the inertia amount to zero.

Bits	SCOM	Field Mnemonic: Description
57:59	RWX	RX_PR_FW_INERTIA_AMT: This field contains the amount to be added or subtracted from the flywheel inertia. **Note:** Setting this field to zero might not turn off the flywheel if the flywheel accumulator already has a value (as if it were turned off after having run for some time).
60:63	RWX	RX_PR_PHASE_STEP: This field contains the amount to be added to or subtracted from the phase rotator accumulator on each shift left or right. The value 0000 is decoded as b10000 in logic. Therefore, the PR updates every four shifts. Other values update with every 4 x (16/phase_step) shifts.

Register Name	Receive Bit Mode 2 EO Per-Lane Register

Bits	SCOM	Field Mnemonic: Description
0:55	RO	constant = 0b00000000000000000000000000000000000000000000000000000000
56	RWX	RX_PR_FW_OFF: Removes the flywheel from the PR accumulator. **Note:** This is not the same as setting the inertia amount to zero.
57:59	RWX	RX_PR_FW_INERTIA_AMT: This field contains the amount to be added or subtracted from the flywheel inertia. **Note:** Setting this field to zero might not turn off the flywheel if the flywheel accumulator already has a value (as if it were turned off after having run for some time).
60:63	RWX	RX_PR_PHASE_STEP: This field contains the amount to be added to or subtracted from the phase rotator accumulator on each shift left or right. The value 0000 is decoded as b10000 in logic. Therefore, the PR updates every four shifts. Other values update with every 4 x (16/phase_step) shifts.

Register Name	Receive Bit Mode 2 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE2_EO_PL
Address	8002281609010C3F (SCOM)
Description	This register contains the second set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:55	RO	constant = 0b00000000000000000000000000000000000000000000000000000000
56	RWX	RX_PR_FW_OFF: Removes the flywheel from the PR accumulator. **Note:** This is not the same as setting the inertia amount to zero.

Bits	SCOM	Field Mnemonic: Description
57:59	RWX	RX_PR_FW_INERTIA_AMT: This field contains the amount to be added or subtracted from the flywheel inertia. **Note:** Setting this field to zero might not turn off the flywheel if the flywheel accumulator already has a value (as if it were turned off after having run for some time).
60:63	RWX	RX_PR_PHASE_STEP: This field contains the amount to be added to or subtracted from the phase rotator accumulator on each shift left or right. The value 0000 is decoded as b10000 in logic. Therefore, the PR updates every four shifts. Other values update with every 4 x (16/phase_step) shifts.

Register Name	**Receive Bit Mode 2 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE2_EO_PL
Address	8002281709010C3F (SCOM)
Description	This register contains the second set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:55	RO	constant = 0b00000000000000000000000000000000000000000000000000000000
56	RWX	RX_PR_FW_OFF: Removes the flywheel from the PR accumulator. **Note:** This is not the same as setting the inertia amount to zero.
57:59	RWX	RX_PR_FW_INERTIA_AMT: This field contains the amount to be added or subtracted from the flywheel inertia. **Note:** Setting this field to zero might not turn off the flywheel if the flywheel accumulator already has a value (as if it were turned off after having run for some time).
60:63	RWX	RX_PR_PHASE_STEP: This field contains the amount to be added to or subtracted from the phase rotator accumulator on each shift left or right. The value 0000 is decoded as b10000 in logic. Therefore, the PR updates every four shifts. Other values update with every 4 x (16/phase_step) shifts.

Register Name	**Receive Bit Mode 3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300009010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	**Receive Bit Mode 3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300109010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300209010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300309010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300409010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300509010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300609010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300709010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300809010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300909010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300A09010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300B09010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300C09010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300D09010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300E09010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002300F09010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002301009010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.

51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002301209010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002301309010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002301409010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002301509010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002301609010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE3_EO_PL
Address	8002301709010C3F (SCOM)
Description	This register contains the third set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_BER_CFG: This register controls the bit-error-rate threshold used for DDC.
51:52	RWX	RX_FIFO_DLY_CFG: This register controls how many parallel clock cycles we wait after every change to the phase rotator before we begin using the data again.
53:54	RWX	RX_DDC_CFG: This register controls how many parallel clock cycles we wait while looking for errors as we progress further into the edge.
55:63	RO	constant = 0b000000000

Register Name	Receive Bit Mode 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE4_EO_PL
Address	8002380009010C3F (SCOM)
Description	This register contains the fourth set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_COARSE_MODE_EN: This bit enables the CDR to switch into coarse mode, as needed, on a CDR stop/start or on an invalid lock (if enabled).
49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 s. 01 = ~2.6 μs. 10 = ~5.2 μs. 11 = ~10.5 μs.
59:63	RO	constant = 0b00000

Register Name	Receive Bit Mode 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE4_EO_PL
Address	8002380109010C3F (SCOM)
Description	This register contains the fourth set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_COARSE_MODE_EN: This bit enables the CDR to switch into coarse mode, as needed, on a CDR stop/start or on an invalid lock (if enabled).
49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 µs. 01 = ~2.6 µs. 10 = ~5.2 µs. 11 = ~10.5 µs.
59:63	RO	constant = 0b00000

Register Name	Receive Bit Mode 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE4_EO_PL
Address	8002380209010C3F (SCOM)
Description	This register contains the fourth set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_COARSE_MODE_EN: This bit enables the CDR to switch into coarse mode, as needed, on a CDR stop/start or on an invalid lock (if enabled).
49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 µs. 01 = ~2.6 µs. 10 = ~5.2 µs. 11 = ~10.5 µs.
59:63	RO	constant = 0b00000

Register Name	Receive Bit Mode 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE4_EO_PL
Address	8002380309010C3F (SCOM)
Description	This register contains the fourth set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_COARSE_MODE_EN: This bit enables the CDR to switch into coarse mode, as needed, on a CDR stop/start or on an invalid lock (if enabled).
49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 μs. 01 = ~2.6 μs. 10 = ~5.2 μs. 11 = ~10.5 μs.
59:63	RO	constant = 0b00000

Register Name	Receive Bit Mode 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE4_EO_PL
Address	8002380409010C3F (SCOM)
Description	This register contains the fourth set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_COARSE_MODE_EN: This bit enables the CDR to switch into coarse mode, as needed, on a CDR stop/start or on an invalid lock (if enabled).
49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 μs. 01 = ~2.6 μs. 10 = ~5.2 μs. 11 = ~10.5 μs.
59:63	RO	constant = 0b00000

Register Name	Receive Bit Mode 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE4_EO_PL
Address	8002380509010C3F (SCOM)
Description	This register contains the fourth set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_COARSE_MODE_EN: This bit enables the CDR to switch into coarse mode, as needed, on a CDR stop/start or on an invalid lock (if enabled).
49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 μs. 01 = ~2.6 μs. 10 = ~5.2 μs. 11 = ~10.5 μs.

49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 μs. 01 = ~2.6 μs. 10 = ~5.2 μs. 11 = ~10.5 μs.
59:63	RO	constant = 0b00000

Register Name	Receive Bit Mode 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE4_EO_PL
Address	8002380E09010C3F (SCOM)
Description	This register contains the fourth set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_COARSE_MODE_EN: This bit enables the CDR to switch into coarse mode, as needed, on a CDR stop/start or on an invalid lock (if enabled).
49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 μs. 01 = ~2.6 μs. 10 = ~5.2 μs. 11 = ~10.5 μs.
59:63	RO	constant = 0b00000

Register Name	Receive Bit Mode 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE4_EO_PL
Address	8002380F09010C3F (SCOM)
Description	This register contains the fourth set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_COARSE_MODE_EN: This bit enables the CDR to switch into coarse mode, as needed, on a CDR stop/start or on an invalid lock (if enabled).
49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 μs. 01 = ~2.6 μs. 10 = ~5.2 μs. 11 = ~10.5 μs.
59:63	RO	constant = 0b00000

Register Name	Receive Bit Mode 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_MODE4_EO_PL
Address	8002381009010C3F (SCOM)
Description	This register contains the fourth set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_COARSE_MODE_EN: This bit enables the CDR to switch into coarse mode, as needed, on a CDR stop/start or on an invalid lock (if enabled).
49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 μs. 01 = ~2.6 μs. 10 = ~5.2 μs. 11 = ~10.5 μs.
59:63	RO	constant = 0b00000

Register Name	Receive Bit Mode 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_MODE4_EO_PL
Address	8002381109010C3F (SCOM)
Description	This register contains the fourth set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_COARSE_MODE_EN: This bit enables the CDR to switch into coarse mode, as needed, on a CDR stop/start or on an invalid lock (if enabled).
49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 µs. 01 = ~2.6 µs. 10 = ~5.2 µs. 11 = ~10.5 µs.
59:63	RO	constant = 0b00000

Register Name	Receive Bit Mode 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_MODE4_EO_PL
Address	8002381209010C3F (SCOM)
Description	This register contains the fourth set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_COARSE_MODE_EN: This bit enables the CDR to switch into coarse mode, as needed, on a CDR stop/start or on an invalid lock (if enabled).
49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 µs. 01 = ~2.6 µs. 10 = ~5.2 µs. 11 = ~10.5 µs.
59:63	RO	constant = 0b00000

Register Name	Receive Bit Mode 4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_MODE4_EO_PL
Address	8002381309010C3F (SCOM)
Description	This register contains the fourth set of EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_COARSE_MODE_EN: This bit enables the CDR to switch into coarse mode, as needed, on a CDR stop/start or on an invalid lock (if enabled).
49	RWX	RX_PR_INVALID_LOCK_COARSE_EN: This bit enables the CDR to switch into coarse mode, when enabled, on an invalid lock. It remains in coarse mode until there are no invalid locks, regardless of this bit.
50:52	RWX	RX_PR_FW_INERTIA_AMT_COARSE: This field contains the flywheel inertia in coarse mode. For more information, see the RX_PR_FW_INERTIA_AMT field in the Receive Bit Mode 2 EO Per-Lane Register.
53:56	RWX	RX_PR_PHASE_STEP_COARSE: This field contains the phase step in coarse mode. For more information, see the RX_PR_PHASE_STEP field in the Receive Bit Mode 2 EO Per-Lane Register.
57:58	RWX	RX_PR_COARSE_MODE_TIMER_SEL: This field selects how long to remain in coarse mode. The timer is always reset on an invalid lock. 00 = ~1.3 μs. 01 = ~2.6 μs. 10 = ~5.2 μs. 11 = ~10.5 μs.

Description	This is the receive bit CNTLX1 EO per-lane register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_CAL_LANE_SEL: This bit selects which lane to recalibrate.
49:50	RWX	RX_PIPE_SEL: This bit selects what to multiplex onto the data pipe bus going to the calibration logic.
51	RWX	RX_BANK_SEL_A: This field selects which data bank to select for main data samples and alt data samples. 0b0 = Data bank B is selected for main data, and data bank A is selected for alt data. 0b1 = Data bank A is selected for main data, and data bank B is selected for alt data.
52	RWX	RX_PIPE_MARGIN: This field adds extra cycles of padding on the asynchronous data pipe handshake.
53:54	RWX	RX_SCOPE_MODE: This field adds extra cycles in the asynchronous crossing for scope mode.
55:56	RO	constant = 0b00
57	RWX	RX_BIST_PIPE_DATA_SHIFT: This field selects what to mux onto the data pipe bus going to the rx_bist engine to get the upper-order lanes on the edge and alt only.
58:63	RO	constant = 0b000000

Register Name	Receive Bit CNTLX1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_CNTLX1_EO_PL
Address	8002401709010C3F (SCOM)
Description	This is the receive bit CNTLX1 EO per-lane register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_CAL_LANE_SEL: This bit selects which lane to recalibrate.
49:50	RWX	RX_PIPE_SEL: This bit selects what to multiplex onto the data pipe bus going to the calibration logic.
51	RWX	RX_BANK_SEL_A: This field selects which data bank to select for main data samples and alt data samples. 0b0 = Data bank B is selected for main data, and data bank A is selected for alt data. 0b1 = Data bank A is selected for main data, and data bank B is selected for alt data.
52	RWX	RX_PIPE_MARGIN: This field adds extra cycles of padding on the asynchronous data pipe handshake.
53:54	RWX	RX_SCOPE_MODE: This field adds extra cycles in the asynchronous crossing for scope mode.
55:56	RO	constant = 0b00
57	RWX	RX_BIST_PIPE_DATA_SHIFT: This field selects what to mux onto the data pipe bus going to the rx_bist engine to get the upper-order lanes on the edge and alt only.
58:63	RO	constant = 0b000000

Register Name	Receive Bit CNTL2 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL2_EO_PL
Address	8002480009010C3F (SCOM)
Description	This register contains the second set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_PR_EDGE_TRACK_CNTL: This field runs edge tracking on the selected bank. 00 = No edge tracking. 01 = Tracks against A data. 10 = Tracks against B data. 11 = Unused.
50	RWX	RX_PR_WOBBLE_A: This bit wobbles the PR position for PR A for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
51	RWX	RX_PR_WOBBLE_B: This bit wobbles the PR position for PR B for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
52	RWX	RX_PR_WOBBLE_EDGE: This bit wobbles the PR position for the PR edge for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
53	RWX	RX_PR_DDC_A: This bit enables the DDC state machine to go through its DDC routine on PR A. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.
54	RWX	RX_PR_DDC_B: This bit enables the DDC state machine to go through its DDC routine on PR B. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.

Bits	SCOM	Field Mnemonic: Description
55	RWX	RX_PR_BUMP_TO_EDGE_A: This bit bumps PR A position to the edge => +(16 - clkadj).
56	RWX	RX_PR_BUMP_TO_EDGE_B: This bit bumps PR B position to the edge. (Not supported).
57	RWX	RX_PR_BUMP_SL_1UI: This bit bumps the PR position of all PRs to the next eye by shifting 32 steps. (Not supported).
58	RWX	RX_PR_BUMP_SR_1UI: This bit bumps the PR position to the previous eye by shifting 32 steps. (Not supported).
59:60	RO	constant = 0b00
61	RWX	RX_PR_USE_DFE_CLOCK_A: RX Use the A-bank DFE (h1/Ap-adjusted clock). RJRDMB.
62	RWX	RX_PR_USE_DFE_CLOCK_B: RX Use the B-bank DFE (h1/Ap-adjusted clock). RJRDMB.
63	RO	constant = 0b0

Register Name	Receive Bit CNTL2 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL2_EO_PL
Address	8002480109010C3F (SCOM)
Description	This register contains the second set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_PR_EDGE_TRACK_CNTL: This field runs edge tracking on the selected bank. 00 = No edge tracking. 01 = Tracks against A data. 10 = Tracks against B data. 11 = Unused.
50	RWX	RX_PR_WOBBLE_A: This bit wobbles the PR position for PR A for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
51	RWX	RX_PR_WOBBLE_B: This bit wobbles the PR position for PR B for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
52	RWX	RX_PR_WOBBLE_EDGE: This bit wobbles the PR position for the PR edge for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
53	RWX	RX_PR_DDC_A: This bit enables the DDC state machine to go through its DDC routine on PR A. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.
54	RWX	RX_PR_DDC_B: This bit enables the DDC state machine to go through its DDC routine on PR B. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.
55	RWX	RX_PR_BUMP_TO_EDGE_A: This bit bumps PR A position to the edge => +(16 - clkadj).
56	RWX	RX_PR_BUMP_TO_EDGE_B: This bit bumps PR B position to the edge. (Not supported.)
57	RWX	RX_PR_BUMP_SL_1UI: This bit bumps the PR position of all PRs to the next eye by shifting 32 steps. (Not supported.)
58	RWX	RX_PR_BUMP_SR_1UI: This bit bumps the PR position to the previous eye by shifting 32 steps. (Not supported.)
59:60	RO	constant = 0b00
61	RWX	RX_PR_USE_DFE_CLOCK_A: RX Use the A-bank DFE (h1/Ap-adjusted clock). RJRDMB.

Bits	SCOM	Field Mnemonic: Description
62	RWX	RX_PR_USE_DFE_CLOCK_B: RX Use the B-bank DFE (h1/Ap-adjusted clock). RJRDMB.
63	RO	constant = 0b0

Register Name	Receive Bit CNTL2 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL2_EO_PL
Address	8002480209010C3F (SCOM)
Description	This register contains the second set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_PR_EDGE_TRACK_CNTL: This field runs edge tracking on the selected bank. 00 = No edge tracking. 01 = Tracks against A data. 10 = Tracks against B data. 11 = Unused.
50	RWX	RX_PR_WOBBLE_A: This bit wobbles the PR position for PR A for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
51	RWX	RX_PR_WOBBLE_B: This bit wobbles the PR position for PR B for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
52	RWX	RX_PR_WOBBLE_EDGE: This bit wobbles the PR position for the PR edge for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
53	RWX	RX_PR_DDC_A: This bit enables the DDC state machine to go through its DDC routine on PR A. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.
54	RWX	RX_PR_DDC_B: This bit enables the DDC state machine to go through its DDC routine on PR B. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.
55	RWX	RX_PR_BUMP_TO_EDGE_A: This bit bumps PR A position to the edge => +(16 - clkadj).
56	RWX	RX_PR_BUMP_TO_EDGE_B: This bit bumps PR B position to the edge. (Not supported.)
57	RWX	RX_PR_BUMP_SL_1UI: This bit bumps the PR position of all PRs to the next eye by shifting 32 steps. (Not supported.)
58	RWX	RX_PR_BUMP_SR_1UI: This bit bumps the PR position to the previous eye by shifting 32 steps. (Not supported.)
59:60	RO	constant = 0b00

62	RWX	RX_PR_USE_DFE_CLOCK_B: RX Use the B-bank DFE (h1/Ap-adjusted clock). RJRDMB.
63	RO	constant = 0b0

Register Name	Receive Bit CNTL2 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL2_EO_PL
Address	8002480809010C3F (SCOM)
Description	This register contains the second set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_PR_EDGE_TRACK_CNTL: This field runs edge tracking on the selected bank. 00 = No edge tracking. 01 = Tracks against A data. 10 = Tracks against B data. 11 = Unused.
50	RWX	RX_PR_WOBBLE_A: This bit wobbles the PR position for PR A for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
51	RWX	RX_PR_WOBBLE_B: This bit wobbles the PR position for PR B for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
52	RWX	RX_PR_WOBBLE_EDGE: This bit wobbles the PR position for the PR edge for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
53	RWX	RX_PR_DDC_A: This bit enables the DDC state machine to go through its DDC routine on PR A. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.
54	RWX	RX_PR_DDC_B: This bit enables the DDC state machine to go through its DDC routine on PR B. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.
55	RWX	RX_PR_BUMP_TO_EDGE_A: This bit bumps PR A position to the edge => +(16 - clkadj).
56	RWX	RX_PR_BUMP_TO_EDGE_B: This bit bumps PR B position to the edge. (Not supported.)
57	RWX	RX_PR_BUMP_SL_1UI: This bit bumps the PR position of all PRs to the next eye by shifting 32 steps. (Not supported.)
58	RWX	RX_PR_BUMP_SR_1UI: This bit bumps the PR position to the previous eye by shifting 32 steps. (Not supported.)
59:60	RO	constant = 0b00
61	RWX	RX_PR_USE_DFE_CLOCK_A: RX Use the A-bank DFE (h1/Ap-adjusted clock). RJRDMB.
62	RWX	RX_PR_USE_DFE_CLOCK_B: RX Use the B-bank DFE (h1/Ap-adjusted clock). RJRDMB.
63	RO	constant = 0b0

Register Name	Receive Bit CNTL2 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL2_EO_PL
Address	8002480909010C3F (SCOM)
Description	This register contains the second set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_PR_EDGE_TRACK_CNTL: This field runs edge tracking on the selected bank. 00 = No edge tracking. 01 = Tracks against A data. 10 = Tracks against B data. 11 = Unused.
50	RWX	RX_PR_WOBBLE_A: This bit wobbles the PR position for PR A for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
51	RWX	RX_PR_WOBBLE_B: This bit wobbles the PR position for PR B for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
52	RWX	RX_PR_WOBBLE_EDGE: This bit wobbles the PR position for the PR edge for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
53	RWX	RX_PR_DDC_A: This bit enables the DDC state machine to go through its DDC routine on PR A. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.
54	RWX	RX_PR_DDC_B: This bit enables the DDC state machine to go through its DDC routine on PR B. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.
55	RWX	RX_PR_BUMP_TO_EDGE_A: This bit bumps PR A position to the edge => +(16 - clkadj).
56	RWX	RX_PR_BUMP_TO_EDGE_B: This bit bumps PR B position to the edge. (Not supported.)
57	RWX	RX_PR_BUMP_SL_1UI: This bit bumps the PR position of all PRs to the next eye by shifting 32 steps. (Not supported.)
58	RWX	RX_PR_BUMP_SR_1UI: This bit bumps the PR position to the previous eye by shifting 32 steps. (Not supported.)

58	RWX	RX_PR_BUMP_SR_1UI: This bit bumps the PR position to the previous eye by shifting 32 steps. (Not supported.)
59:60	RO	constant = 0b00
61	RWX	RX_PR_USE_DFE_CLOCK_A: RX Use the A-bank DFE (h1/Ap-adjusted clock). RJRDMB.
62	RWX	RX_PR_USE_DFE_CLOCK_B: RX Use the B-bank DFE (h1/Ap-adjusted clock). RJRDMB.
63	RO	constant = 0b0

Register Name	Receive Bit CNTL2 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL2_EO_PL
Address	8002481109010C3F (SCOM)
Description	This register contains the second set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_PR_EDGE_TRACK_CNTL: This field runs edge tracking on the selected bank. 00 = No edge tracking. 01 = Tracks against A data. 10 = Tracks against B data. 11 = Unused.
50	RWX	RX_PR_WOBBLE_A: This bit wobbles the PR position for PR A for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.

Bits	SCOM	Field Mnemonic: Description
51	RWX	RX_PR_WOBBLE_B: This bit wobbles the PR position for PR B for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
52	RWX	RX_PR_WOBBLE_EDGE: This bit wobbles the PR position for the PR edge for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
53	RWX	RX_PR_DDC_A: This bit enables the DDC state machine to go through its DDC routine on PR A. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.
54	RWX	RX_PR_DDC_B: This bit enables the DDC state machine to go through its DDC routine on PR B. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.
55	RWX	RX_PR_BUMP_TO_EDGE_A: This bit bumps PR A position to the edge => +(16 - clkadj).
56	RWX	RX_PR_BUMP_TO_EDGE_B: This bit bumps PR B position to the edge. (Not supported.)
57	RWX	RX_PR_BUMP_SL_1UI: This bit bumps the PR position of all PRs to the next eye by shifting 32 steps. (Not supported.)
58	RWX	RX_PR_BUMP_SR_1UI: This bit bumps the PR position to the previous eye by shifting 32 steps. (Not supported.)
59:60	RO	constant = 0b00
61	RWX	RX_PR_USE_DFE_CLOCK_A: RX Use the A-bank DFE (h1/Ap-adjusted clock). RJRDMB.
62	RWX	RX_PR_USE_DFE_CLOCK_B: RX Use the B-bank DFE (h1/Ap-adjusted clock). RJRDMB.
63	RO	constant = 0b0

Register Name	Receive Bit CNTL2 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL2_EO_PL
Address	8002481209010C3F (SCOM)
Description	This register contains the second set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_PR_EDGE_TRACK_CNTL: This field runs edge tracking on the selected bank. 00 = No edge tracking. 01 = Tracks against A data. 10 = Tracks against B data. 11 = Unused.
50	RWX	RX_PR_WOBBLE_A: This bit wobbles the PR position for PR A for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
51	RWX	RX_PR_WOBBLE_B: This bit wobbles the PR position for PR B for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
52	RWX	RX_PR_WOBBLE_EDGE: This bit wobbles the PR position for the PR edge for the offset function. This is done by first shifting 1 UI away in one direction, and then back and forth 2 UIs to cover the entire range of PR values. When de-asserted, the PR returns to the original value.
53	RWX	RX_PR_DDC_A: This bit enables the DDC state machine to go through its DDC routine on PR A. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.

Bits	SCOM	Field Mnemonic: Description
54	RWX	RX_PR_DDC_B: This bit enables the DDC state machine to go through its DDC routine on PR B. It works by shifting to the left and right looking for errors to find the edges. Then, it adds an offset that centers the data between the two edges.
55	RWX	RX_PR_BUMP_TO_EDGE_A: This bit bumps PR A position to the edge => +(16 - clkadj).
56	RWX	RX_PR_BUMP_TO_EDGE_B: This bit bumps PR B position to the edge. (Not supported.)
57	RWX	RX_PR_BUMP_SL_1UI: This bit bumps the PR position of all PRs to the next eye by shifting 32 steps. (Not supported.)
58	RWX	RX_PR_BUMP_SR_1UI: This bit bumps the PR position to the previous eye by shifting 32 steps. (Not supported.)

Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002500509010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002500609010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.

Bits	SCOM	Field Mnemonic: Description
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002500709010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002500809010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002500909010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.

Bits	SCOM	Field Mnemonic: Description
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002500A09010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002500B09010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002500C09010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002500D09010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002500E09010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002500F09010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002501009010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002501109010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.

Bits	SCOM	Field Mnemonic: Description
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002501209010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002501309010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002501409010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.

Bits	SCOM	Field Mnemonic: Description
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002501509010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002501609010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	Receive Bit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_CNTL3_EO_PL
Address	8002501709010C3F (SCOM)
Description	This register contains the third set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_PR_DATA_A_OFFSET: This field contains the offset value applied to PR A.
54:59	RWX	RX_PR_DATA_B_OFFSET: This field contains the offset value applied to PR B.
60	RWX	RX_PR_BIT_LOCK_DONE: This bit indicates that the bit lock is done. It is used to gate the invalid lock in the CDR logic.
61	RWX	RX_PR_INVALID_LOCK_FILTER_EN: This bit enables the filtered invalid-lock, phase-rotator shift right. The default is ON.
62:63	RWX	RX_PR_INVALID_LOCK_BUMP_SIZE: This field sets the size of the invalid_lock_bump.

Register Name	**Receive Bit CNTL4 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580009010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	**Receive Bit CNTL4 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580109010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580209010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580309010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580409010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.

Bits	SCOM	Field Mnemonic: Description
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580509010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580609010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580709010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580809010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580909010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.

Bits	SCOM	Field Mnemonic: Description
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580A09010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580B09010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580C09010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580D09010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580E09010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.

Bits	SCOM	Field Mnemonic: Description
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002580F09010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002581009010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002581109010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002581209010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002581309010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.

Bits	SCOM	Field Mnemonic: Description
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002581409010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002581509010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002581609010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_CNTL4_EO_PL
Address	8002581709010C3F (SCOM)
Description	This register contains the fourth set of EO control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PR_TRACE_DDC_STOP: This bit enables the trace debug DDC state to stop the state machines.
49:53	RWX	RX_PR_TRACE_DDC_SM: This bit determines when to stop the state machine for trace debug.
54	RWX	RX_PR_TRACE_WOBBLE_STOP: This bit enables the trace debug wobble state to stop the state machines.
55:57	RWX	RX_PR_TRACE_WOBBLE_SM: This field determines when to stop the state machine for trace debug.
58:61	RO	constant = 0b0000
62	RWX	RX_PR_RESET: Set this bit to reset the CDR logic. Power and clocks must be enabled in the slice.
63	RWX	RX_IORESET: This bit resets the given RX lane (except the CDR logic).

Register Name	Receive Bit CNTL5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_CNTL5_EO_PL
Address	8002600009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49	NCX	Reserved field.

Bits	SCOM	Field Mnemonic: Description
50	NCX	Reserved field.
51:63	RO	constant = 0b0000000000000

Register Name	Receive Bit CNTL5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_CNTL5_EO_PL
Address	8002600109010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49	NCX	Reserved field.
50	NCX	Reserved field.
51:63	RO	constant = 0b0000000000000

Register Name	Receive Bit CNTL5 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_CNTL5_EO_PL
Address	8002600209010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49	NCX	Reserved field.
50	NCX	Reserved field.

56	ROX	Reserved field.
57	ROX	Reserved field.
58	ROX	Reserved field.
59:63	RO	constant = 0b00000

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780009010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780109010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780209010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780309010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	**Receive Bit STAT3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780409010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	**SCOM**	**Field Mnemonic: Description**
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	**Receive Bit STAT3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780509010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	**SCOM**	**Field Mnemonic: Description**
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	**Receive Bit STAT3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780609010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	**SCOM**	**Field Mnemonic: Description**
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	**Receive Bit STAT3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780709010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780809010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780909010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780A09010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	**Receive Bit STAT3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780B09010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	**Receive Bit STAT3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780C09010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	**Receive Bit STAT3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780D09010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	**Receive Bit STAT3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002780E09010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002781209010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002781309010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002781409010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002781509010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002781609010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT3_EO_PL
Address	8002781709010C3F (SCOM)
Description	This register contains the third set of EO status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_A_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank A clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT4_EO_PL
Address	8002800009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50:56	ROX	Reserved field.

Bits	SCOM	Field Mnemonic: Description
57:63	RO	constant = 0b0000000

Register Name	Receive Bit STAT4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT4_EO_PL
Address	8002800109010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50:56	ROX	Reserved field.
57:63	RO	constant = 0b0000000

Register Name	Receive Bit STAT4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT4_EO_PL
Address	8002800209010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50:56	ROX	Reserved field.
57:63	RO	constant = 0b0000000

Register Name	Receive Bit STAT4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT4_EO_PL
Address	8002800309010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50:56	ROX	Reserved field.
57:63	RO	constant = 0b0000000

Register Name	Receive Bit STAT4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT4_EO_PL
Address	8002800409010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50:56	ROX	Reserved field.
57:63	RO	constant = 0b0000000

Register Name	Receive Bit STAT4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT4_EO_PL
Address	8002800509010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50:56	ROX	Reserved field.
57:63	RO	constant = 0b0000000

Register Name	Receive Bit STAT4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT4_EO_PL
Address	8002800609010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50:56	ROX	Reserved field.
57:63	RO	constant = 0b0000000

Register Name	Receive Bit STAT4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT4_EO_PL
Address	8002800709010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50:56	ROX	Reserved field.
57:63	RO	constant = 0b0000000

Register Name	Receive Bit STAT4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT4_EO_PL
Address	8002800809010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50:56	ROX	Reserved field.
57:63	RO	constant = 0b0000000

Register Name	Receive Bit STAT4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT4_EO_PL
Address	8002800909010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.

49	ROX	Reserved field.
50:56	ROX	Reserved field.
57:63	RO	constant = 0b0000000

Register Name	Receive Bit STAT4 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT4_EO_PL
Address	8002801709010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50:56	ROX	Reserved field.
57:63	RO	constant = 0b0000000

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180009010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180109010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180209010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#0.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180309010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180409010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180509010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180609010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	**Receive Bit STAT1 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#1.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180709010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	**Receive Bit STAT1 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180809010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	**Receive Bit STAT1 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180909010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	**Receive Bit STAT1 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180A09010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#2.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180B09010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180C09010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180D09010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180E09010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#3.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003180F09010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003181009010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003181109010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003181209010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#4.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003181309010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#0.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003181409010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#1.RD.RX_BIT_REGS.
Address	8003181509010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#2.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003181609010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive Bit STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXPACKS#5.RXPACK.RD.SLICE#3.RD.RX_BIT_REGS.RX_BIT_STAT1_O_PL
Address	8003181709010C3F (SCOM)
Description	This register contains the first set of O status fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	ROX	Reserved field.
54:59	ROX	Reserved field.
60:63	RWX	RX_B_PR_DFE_CLKADJ: This field contains the tweak value, in phase rotator steps, for the bank B clock offset when performing a DFE calibration.

Register Name	Receive GLBSM Per-Lane CNTL1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#0.PLREGS.RX_GLBSM_PL_CNTL1_O_PL
Address	8003200009010C3F (SCOM)
Description	Receive GLBSM Per-Lane CNTL1 O Per-Lane Register

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_RUN_LANE: This bit runs training and subsequent recalibration on the given lane.
49	RWX	RX_RUN_DCCAL: This bit runs on-die DC training on the given lane.
50	RWX	RX_RECAL_REQ: This bit requests recalibration on the given lane.
51	RWX	RX_RECAL_ABORT: This bit stops recalibration on the given lane.
52	RWX	RX_LANE_DISABLED: This bit is used to set the given lane to be ignored by the training logic. This bit does not affect power down.
53:63	RO	constant = 0b00000000000

Register Name	**Receive GLBSM Per-Lane CNTL1 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#1.PLREGS.RX_GLBSM_PL_CNTL1_O_PL
Address	8003200109010C3F (SCOM)
Description	Receive GLBSM Per-Lane CNTL1 O Per-Lane Register

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_RUN_LANE: This bit runs training and subsequent recalibration on the given lane.
49	RWX	RX_RUN_DCCAL: This bit runs on-die DC training on the given lane.
50	RWX	RX_RECAL_REQ: This bit requests recalibration on the given lane.
51	RWX	RX_RECAL_ABORT: This bit stops recalibration on the given lane.
52	RWX	RX_LANE_DISABLED: This bit is used to set the given lane to be ignored by the training logic. This bit does not affect power down.
53:63	RO	constant = 0b00000000000

Register Name	**Receive GLBSM Per-Lane CNTL1 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#2.PLREGS.RX_GLBSM_PL_CNTL1_O_PL
Address	8003200209010C3F (SCOM)
Description	Receive GLBSM Per-Lane CNTL1 O Per-Lane Register

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_RUN_LANE: This bit runs training and subsequent recalibration on the given lane.
49	RWX	RX_RUN_DCCAL: This bit runs on-die DC training on the given lane.
50	RWX	RX_RECAL_REQ: This bit requests recalibration on the given lane.
51	RWX	RX_RECAL_ABORT: This bit stops recalibration on the given lane.
52	RWX	RX_LANE_DISABLED: This bit is used to set the given lane to be ignored by the training logic. This bit does not affect power down.
53:63	RO	constant = 0b00000000000

Register Name	Receive GLBSM Per-Lane CNTL1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#3.PLREGS.RX_GLBSM_PL_CNTL1_O_PL
Address	8003200309010C3F (SCOM)
Description	Receive GLBSM Per-Lane CNTL1 O Per-Lane Register

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_RUN_LANE: This bit runs training and subsequent recalibration on the given lane.
49	RWX	RX_RUN_DCCAL: This bit runs on-die DC training on the given lane.
50	RWX	RX_RECAL_REQ: This bit requests recalibration on the given lane.
51	RWX	RX_RECAL_ABORT: This bit stops recalibration on the given lane.
52	RWX	RX_LANE_DISABLED: This bit is used to set the given lane to be ignored by the training logic. This bit does not affect power down.
53:63	RO	constant = 0b00000000000

Register Name	Receive GLBSM Per-Lane CNTL1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#4.PLREGS.RX_GLBSM_PL_CNTL1_O_PL
Address	8003200409010C3F (SCOM)
Description	Receive GLBSM Per-Lane CNTL1 O Per-Lane Register

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_RUN_LANE: This bit runs training and subsequent recalibration on the given lane.
49	RWX	RX_RUN_DCCAL: This bit runs on-die DC training on the given lane.

Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	**Receive GLBSM Per-Lane STAT1 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#9.PLREGS.RX_GLBSM_PL_STAT1_O_PL
Address	8003280909010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#10.PLREGS.RX_GLBSM_PL_STAT1_O_PL
Address	8003280A09010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#11.PLREGS.RX_GLBSM_PL_STAT1_O_PL
Address	8003280B09010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#12.PLREGS.RX_GLBSM_PL_STAT1_O_PL
Address	8003280C09010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#13.PLREGS.RX_GLBSM_PL_STAT1_O_PL
Address	8003280D09010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#14.PLREGS.RX_GLBSM_PL_STAT1_O_PL
Address	8003280E09010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#15.PLREGS.RX_GLBSM_PL_STAT1_O_PL
Address	8003280F09010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#16.PLREGS.RX_GLBSM_PL_STAT1_O_PL
Address	8003281009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#17.PLREGS.RX_GLBSM_PL_STAT1_O_PL
Address	8003281109010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane STAT1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#18.PLREGS.RX_GLBSM_PL_STAT1_O_PL
Address	8003281209010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49	NCX	Reserved field.
50	NCX	Reserved field.
51	NCX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane CNTL1X O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#17.PLREGS.RX_GLBSM_PL_CNTL1X_O_PL
Address	8003301109010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49	NCX	Reserved field.
50	NCX	Reserved field.
51	NCX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane CNTL1X O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#18.PLREGS.RX_GLBSM_PL_CNTL1X_O_PL
Address	8003301209010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49	NCX	Reserved field.
50	NCX	Reserved field.
51	NCX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane CNTL1X O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#19.PLREGS.RX_GLBSM_PL_CNTL1X_O_PL
Address	8003301309010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49	NCX	Reserved field.
50	NCX	Reserved field.
51	NCX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane CNTL1X O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#20.PLREGS.RX_GLBSM_PL_CNTL1X_O_PL
Address	8003301409010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49	NCX	Reserved field.
50	NCX	Reserved field.
51	NCX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive GLBSM Per-Lane CNTL1X O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#21.PLREGS.RX_GLBSM_PL_CNTL1X_O_PL
Address	8003301509010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49	NCX	Reserved field.
50	NCX	Reserved field.
51	NCX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	**Receive GLBSM Per-Lane CNTL1X O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#22.PLREGS.RX_GLBSM_PL_CNTL1X_O_PL
Address	8003301609010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49	NCX	Reserved field.
50	NCX	Reserved field.
51	NCX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	**Receive GLBSM Per-Lane CNTL1X O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.SLICE#23.PLREGS.RX_GLBSM_PL_CNTL1X_O_PL
Address	8003301709010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.
49	NCX	Reserved field.
50	NCX	Reserved field.
51	NCX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	**Receive Data Work Spare Mode Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#0.RX_WORK_REGS.RX_DATA_WORK_SPARE_MODE_PL
Address	8003800009010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_WORK_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_DATA_WORK_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_WORK_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_DATA_WORK_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_WORK_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_DATA_WORK_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_DATA_WORK_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_DATA_WORK_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Data Work Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#1.RX_WORK_REGS.RX_DATA_WORK_SPARE_MODE_PL
Address	8003800109010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_WORK_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_DATA_WORK_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_WORK_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_DATA_WORK_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_WORK_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_DATA_WORK_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_DATA_WORK_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_DATA_WORK_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Data Work Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#2.RX_WORK_REGS.RX_DATA_WORK_SPARE_MODE_PL
Address	8003800209010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_WORK_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_DATA_WORK_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_WORK_SPARE_MODE_2: Per-lane spare mode latch.

Bits	SCOM	Field Mnemonic: Description
51	RWX	RX_PL_DATA_WORK_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_WORK_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_DATA_WORK_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_DATA_WORK_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_DATA_WORK_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Data Work Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#3.RX_WORK_REGS.RX_DATA_WORK_SPARE_MODE_PL
Address	8003800309010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_WORK_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_DATA_WORK_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_WORK_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_DATA_WORK_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_WORK_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_DATA_WORK_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_DATA_WORK_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_DATA_WORK_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Data Work Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#4.RX_WORK_REGS.RX_DATA_WORK_SPARE_MODE_PL
Address	8003800409010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_WORK_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_DATA_WORK_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_WORK_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_DATA_WORK_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_WORK_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_DATA_WORK_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_DATA_WORK_SPARE_MODE_6: Per-lane spare mode latch.

Bits	SCOM	Field Mnemonic: Description
55	RWX	RX_PL_DATA_WORK_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Data Work Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#5.RX_WORK_REGS.RX_DATA_WORK_SPARE_MODE_PL
Address	8003800509010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_WORK_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_DATA_WORK_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_WORK_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_DATA_WORK_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_WORK_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_DATA_WORK_SPARE_MODE_5: Per-lane spare mode latch.
54	RWX	RX_PL_DATA_WORK_SPARE_MODE_6: Per-lane spare mode latch.
55	RWX	RX_PL_DATA_WORK_SPARE_MODE_7: Per-lane spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive Data Work Spare Mode Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#6.RX_WORK_REGS.RX_DATA_WORK_SPARE_MODE_PL
Address	8003800609010C3F (SCOM)
Description	This register contains per-lane spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PL_DATA_WORK_SPARE_MODE_0: Per-lane spare mode latch.
49	RWX	RX_PL_DATA_WORK_SPARE_MODE_1: Per-lane spare mode latch.
50	RWX	RX_PL_DATA_WORK_SPARE_MODE_2: Per-lane spare mode latch.
51	RWX	RX_PL_DATA_WORK_SPARE_MODE_3: Per-lane spare mode latch.
52	RWX	RX_PL_DATA_WORK_SPARE_MODE_4: Per-lane spare mode latch.
53	RWX	RX_PL_DATA_WORK_SPARE_MODE_5: Per-lane spare mode latch.

63	RWX	RX_BIST_ERR_E: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank E. 0b0 = No error. 0b1 = An error occurred during RXBIST.

Register Name	Receive Work STAT1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#9.RX_WORK_REGS.RX_WORK_STAT1_EO_PL
Address	8003880909010C3F (SCOM)
Description	This register contains the RX BIST error status.

Bits	SCOM	Field Mnemonic: Description
0:60	RO	constant = 0b0000000000000000000000000000000000000000000000000000000000000
61	RWX	RX_BIST_ERR_A: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank A. 0b0 = No error. 0b1 = An error occurred during RXBIST.
62	RWX	RX_BIST_ERR_B: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank B. 0b0 = No error. 0b1 = An error occurred during RXBIST.
63	RWX	RX_BIST_ERR_E: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank E. 0b0 = No error. 0b1 = An error occurred during RXBIST.

Register Name	Receive Work STAT1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#10.RX_WORK_REGS.RX_WORK_STAT1_EO_PL
Address	8003880A09010C3F (SCOM)
Description	This register contains the RX BIST error status.

Bits	SCOM	Field Mnemonic: Description
0:60	RO	constant = 0b0000000000000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
61	RWX	RX_BIST_ERR_A: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank A. 0b0 = No error. 0b1 = An error occurred during RXBIST.
62	RWX	RX_BIST_ERR_B: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank B. 0b0 = No error. 0b1 = An error occurred during RXBIST.
63	RWX	RX_BIST_ERR_E: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank E. 0b0 = No error. 0b1 = An error occurred during RXBIST.

Register Name	**Receive Work STAT1 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#11.RX_WORK_REGS.RX_WORK_STAT1_EO_PL
Address	8003880B09010C3F (SCOM)
Description	This register contains the RX BIST error status.

Bits	SCOM	Field Mnemonic: Description
0:60	RO	constant = 0b0000000000000000000000000000000000000000000000000000000000000
61	RWX	RX_BIST_ERR_A: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank A. 0b0 = No error. 0b1 = An error occurred during RXBIST.
62	RWX	RX_BIST_ERR_B: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank B. 0b0 = No error. 0b1 = An error occurred during RXBIST.
63	RWX	RX_BIST_ERR_E: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank E. 0b0 = No error. 0b1 = An error occurred during RXBIST.

Register Name	**Receive Work STAT1 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#12.RX_WORK_REGS.RX_WORK_STAT1_EO_PL
Address	8003880C09010C3F (SCOM)
Description	This register contains the RX BIST error status.

Bits	SCOM	Field Mnemonic: Description
0:60	RO	constant = 0b0000000000000000000000000000000000000000000000000000000000000
61	RWX	RX_BIST_ERR_A: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank A. 0b0 = No error. 0b1 = An error occurred during RXBIST.
62	RWX	RX_BIST_ERR_B: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank B. 0b0 = No error. 0b1 = An error occurred during RXBIST.

Bits	SCOM	Field Mnemonic: Description
63	RWX	RX_BIST_ERR_E: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank E. 0b0 = No error. 0b1 = An error occurred during RXBIST.

Register Name	Receive Work STAT1 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#13.RX_WORK_REGS.RX_WORK_STAT1_EO_PL
Address	8003880D09010C3F (SCOM)
Description	This register contains the RX BIST error status.

Bits	SCOM	Field Mnemonic: Description
0:60	RO	constant = 0b0000000000000000000000000000000000000000000000000000000000000
61	RWX	RX_BIST_ERR_A: This bit indicates that the RXBIST did not find two data eyes of sufficient width while testing bank A. 0b0 = No error. 0b1 = An error occurred during RXBIST.

48:53	RWX	RX_A_PATH_OFF_EVEN: This field contains the eye-optimization A bank even path offset.
54:59	RWX	RX_A_PATH_OFF_ODD: This field contains the eye-optimization A bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#1.RX_WORK_REGS.RX_WORK_STAT3_EO_PL
Address	8003980109010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_A_PATH_OFF_EVEN: This field contains the eye-optimization A bank even path offset.
54:59	RWX	RX_A_PATH_OFF_ODD: This field contains the eye-optimization A bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#2.RX_WORK_REGS.RX_WORK_STAT3_EO_PL
Address	8003980209010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_A_PATH_OFF_EVEN: This field contains the eye-optimization A bank even path offset.
54:59	RWX	RX_A_PATH_OFF_ODD: This field contains the eye-optimization A bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#3.RX_WORK_REGS.RX_WORK_STAT3_EO_PL
Address	8003980309010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_A_PATH_OFF_EVEN: This field contains the eye-optimization A bank even path offset.
54:59	RWX	RX_A_PATH_OFF_ODD: This field contains the eye-optimization A bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#4.RX_WORK_REGS.RX_WORK_STAT3_EO_PL
Address	8003980409010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_A_PATH_OFF_EVEN: This field contains the eye-optimization A bank even path offset.
54:59	RWX	RX_A_PATH_OFF_ODD: This field contains the eye-optimization A bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#5.RX_WORK_REGS.RX_WORK_STAT3_EO_PL
Address	8003980509010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_A_PATH_OFF_EVEN: This field contains the eye-optimization A bank even path offset.
54:59	RWX	RX_A_PATH_OFF_ODD: This field contains the eye-optimization A bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#6.RX_WORK_REGS.RX_WORK_STAT3_EO_PL
Address	8003980609010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:53	RWX	RX_A_PATH_OFF_EVEN: This field contains the eye-optimization A bank even path offset.
54:59	RWX	RX_A_PATH_OFF_ODD: This field contains the eye-optimization A bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#7.RX_WORK_REGS.RX_WORK_STAT3_EO_PL
Address	8003980709010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description

60:63	RO	constant = 0b0000

Register Name	Receive Work STAT4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#7.RX_WORK_REGS.RX_WORK_STAT4_O_PL
Address	8003A00709010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_B_PATH_OFF_EVEN: This field contains the eye-optimization B bank even path offset.
54:59	RWX	RX_B_PATH_OFF_ODD: This field contains the eye-optimization B bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#8.RX_WORK_REGS.RX_WORK_STAT4_O_PL
Address	8003A00809010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_B_PATH_OFF_EVEN: This field contains the eye-optimization B bank even path offset.
54:59	RWX	RX_B_PATH_OFF_ODD: This field contains the eye-optimization B bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#9.RX_WORK_REGS.RX_WORK_STAT4_O_PL
Address	8003A00909010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_B_PATH_OFF_EVEN: This field contains the eye-optimization B bank even path offset.
54:59	RWX	RX_B_PATH_OFF_ODD: This field contains the eye-optimization B bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#10.RX_WORK_REGS.RX_WORK_STAT4_O_PL
Address	8003A00A09010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:53	RWX	RX_B_PATH_OFF_EVEN: This field contains the eye-optimization B bank even path offset.
54:59	RWX	RX_B_PATH_OFF_ODD: This field contains the eye-optimization B bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#11.RX_WORK_REGS.RX_WORK_STAT4_O_PL
Address	8003A00B09010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_B_PATH_OFF_EVEN: This field contains the eye-optimization B bank even path offset.
54:59	RWX	RX_B_PATH_OFF_ODD: This field contains the eye-optimization B bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#12.RX_WORK_REGS.RX_WORK_STAT4_O_PL
Address	8003A00C09010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_B_PATH_OFF_EVEN: This field contains the eye-optimization B bank even path offset.
54:59	RWX	RX_B_PATH_OFF_ODD: This field contains the eye-optimization B bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#13.RX_WORK_REGS.RX_WORK_STAT4_O_PL
Address	8003A00D09010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_B_PATH_OFF_EVEN: This field contains the eye-optimization B bank even path offset.
54:59	RWX	RX_B_PATH_OFF_ODD: This field contains the eye-optimization B bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	**Receive Work STAT4 O Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#14.RX_WORK_REGS.RX_WORK_STAT4_O_PL
Address	8003A00E09010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	**SCOM**	**Field Mnemonic: Description**
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

54:59	RWX	RX_B_PATH_OFF_ODD: This field contains the eye-optimization B bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#22.RX_WORK_REGS.RX_WORK_STAT4_O_PL
Address	8003A01609010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_B_PATH_OFF_EVEN: This field contains the eye-optimization B bank even path offset.
54:59	RWX	RX_B_PATH_OFF_ODD: This field contains the eye-optimization B bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work STAT4 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#23.RX_WORK_REGS.RX_WORK_STAT4_O_PL
Address	8003A01709010C3F (SCOM)
Description	This register contains eye-optimization information.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_B_PATH_OFF_EVEN: This field contains the eye-optimization B bank even path offset.
54:59	RWX	RX_B_PATH_OFF_ODD: This field contains the eye-optimization B bank odd path offset.
60:63	RO	constant = 0b0000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#0.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A80009010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#1.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A80109010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#2.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A80209010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#3.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A80309010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#4.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A80409010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#5.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A80509010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#6.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A80609010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#7.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A80709010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#8.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A80809010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description

Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#14.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A80E09010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#15.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A80F09010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#16.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A81009010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#17.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A81109010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#18.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A81209010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#19.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A81309010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#20.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A81409010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#21.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A81509010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#22.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A81609010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Receive Work Control 1 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.RX0.RX_WORK_REGS_MAC.SLICE#23.RX_WORK_REGS.RX_WORK_CNTL1_O_PL
Address	8003A81709010C3F (SCOM)
Description	This register is used to reset the work registers of a single slice.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_WORK_REGS_IORESET: Set this bit to reset the work registers of a single slice.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit Mode 1 Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_MODE1_PL
Address	8004040009010C3F (SCOM)
Description	This register contains the first set of transmit mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_LANE_PDWN: This bit is used to drive inhibit (tristate) and fully power down a lane independent of the logical lane disable. 0b0 = Lane powered up. 0b1 = Lane drive inhibited (tristated) and powered down (default).
49	RWX	TX_LANE_INVERT: This bit is used to invert the polarity of a lane. 0b0 = Normal lane polarity (default). 0b1 = Lane inverted.
50:51	RWX	TX_LANE_QUIESCE: This field is This field is used to force the output of a lane to a particular logical value. 0b00 = Functional data (default). 0b01 = Quiesce lane to a static 0 value. 0b10 = Quiesce lane to a static 1 value. 0b11 = Tri-state lane output.
52:53	RO	constant = 0b00
54	RWX	TX_PSAVE_REQ_DIS: This bit disables TX slice power gating from link-layer psav_req control.
55	RWX	TX_ERR_INJ_A_ENABLE: This bit enables the random bit error-injection pattern A for this lane (default). 0b0 = Pattern A error injection is masked for this lane. 0b1 = Pattern A error injection is enabled for this lane.
56	RWX	TX_ERR_INJ_B_ENABLE: This bit enables the random bit error-injection pattern B for this lane (default). 0b0 = Pattern B error injection is masked for this lane. 0b1 = Pattern B error injection is enabled for this lane.
57:59	RO	constant = 0b000
60	RWX	TX_PL_SPARE_MODE_0: Per-lane spare mode latch.
61	RWX	TX_PL_SPARE_MODE_1: Per-lane spare mode latch.
62	RWX	TX_PL_SPARE_MODE_2: Per-lane spare mode latch.
63	RWX	TX_PL_SPARE_MODE_3: Per-lane spare mode latch.

Register Name	**Transmit Mode 1 Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_MODE1_PL
Address	8004040109010C3F (SCOM)
Description	This register contains the first set of transmit mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_LANE_PDWN: This bit is used to drive inhibit (tristate) and fully power down a lane independent of the logical lane disable. 0b0 = Lane powered up. 0b1 = Lane drive inhibited (tristated) and powered down (default).
49	RWX	TX_LANE_INVERT: This bit is used to invert the polarity of a lane. 0b0 = Normal lane polarity (default). 0b1 = Lane inverted.
50:51	RWX	TX_LANE_QUIESCE: This field is used to force the output of a lane to a particular logical value. 0b00 = Functional data (default). 0b01 = Quiesce lane to a static 0 value. 0b10 = Quiesce lane to a static 1 value. 0b11 = Tri-state lane output.

Bits	SCOM	Field Mnemonic: Description
52:53	RO	constant = 0b00
54	RWX	TX_PSAVE_REQ_DIS: This bit disables TX slice power gating from link-layer psav_req control.
55	RWX	TX_ERR_INJ_A_ENABLE: This bit enables the random bit error-injection pattern A for this lane (default). 0b0 = Pattern A error injection is masked for this lane. 0b1 = Pattern A error injection is enabled for this lane.
56	RWX	TX_ERR_INJ_B_ENABLE: This bit enables the random bit error-injection pattern B for this lane (default). 0b0 = Pattern B error injection is masked for this lane. 0b1 = Pattern B error injection is enabled for this lane.
57:59	RO	constant = 0b000
60	RWX	TX_PL_SPARE_MODE_0: Per-lane spare mode latch.
61	RWX	TX_PL_SPARE_MODE_1: Per-lane spare mode latch.
62	RWX	TX_PL_SPARE_MODE_2: Per-lane spare mode latch.
63	RWX	TX_PL_SPARE_MODE_3: Per-lane spare mode latch.

Register Name	Transmit Mode 1 Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_MODE1_PL
Address	8004040209010C3F (SCOM)
Description	This register contains the first set of transmit mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Description	This register contains the first set of transmit mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_LANE_PDWN: This bit is used to drive inhibit (tristate) and fully power down a lane independent of the logical lane disable. 0b0 = Lane powered up. 0b1 = Lane drive inhibited (tristated) and powered down (default).
49	RWX	TX_LANE_INVERT: This bit is used to invert the polarity of a lane. 0b0 = Normal lane polarity (default). 0b1 = Lane inverted.

Bits	SCOM	Field Mnemonic: Description
50:51	RWX	TX_LANE_QUIESCE: This field is used to force the output of a lane to a particular logical value. 0b00 = Functional data (default). 0b01 = Quiesce lane to a static 0 value. 0b10 = Quiesce lane to a static 1 value. 0b11 = Tri-state lane output.
52:53	RO	constant = 0b00
54	RWX	TX_PSAVE_REQ_DIS: This bit disables TX slice power gating from link-layer psav_req control.
55	RWX	TX_ERR_INJ_A_ENABLE: This bit enables the random bit error-injection pattern A for this lane (default). 0b0 = Pattern A error injection is masked for this lane. 0b1 = Pattern A error injection is enabled for this lane.
56	RWX	TX_ERR_INJ_B_ENABLE: This bit enables the random bit error-injection pattern B for this lane (default). 0b0 = Pattern B error injection is masked for this lane. 0b1 = Pattern B error injection is enabled for this lane.
57:59	RO	constant = 0b000
60	RWX	TX_PL_SPARE_MODE_0: Per-lane spare mode latch.
61	RWX	TX_PL_SPARE_MODE_1: Per-lane spare mode latch.
62	RWX	TX_PL_SPARE_MODE_2: Per-lane spare mode latch.
63	RWX	TX_PL_SPARE_MODE_3: Per-lane spare mode latch.

Register Name	Transmit Mode 1 Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_MODE1_PL
Address	8004040909010C3F (SCOM)
Description	This register contains the first set of transmit mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_LANE_PDWN: This bit is used to drive inhibit (tristate) and fully power down a lane independent of the logical lane disable. 0b0 = Lane powered up. 0b1 = Lane drive inhibited (tristated) and powered down (default).
49	RWX	TX_LANE_INVERT: This bit is used to invert the polarity of a lane. 0b0 = Normal lane polarity (default). 0b1 = Lane inverted.
50:51	RWX	TX_LANE_QUIESCE: This field is used to force the output of a lane to a particular logical value. 0b00 = Functional data (default). 0b01 = Quiesce lane to a static 0 value. 0b10 = Quiesce lane to a static 1 value. 0b11 = Tri-state lane output.
52:53	RO	constant = 0b00
54	RWX	TX_PSAVE_REQ_DIS: This bit disables TX slice power gating from link-layer psav_req control.
55	RWX	TX_ERR_INJ_A_ENABLE: This bit enables the random bit error-injection pattern A for this lane (default). 0b0 = Pattern A error injection is masked for this lane. 0b1 = Pattern A error injection is enabled for this lane.
56	RWX	TX_ERR_INJ_B_ENABLE: This bit enables the random bit error-injection pattern B for this lane (default). 0b0 = Pattern B error injection is masked for this lane. 0b1 = Pattern B error injection is enabled for this lane.
57:59	RO	constant = 0b000

Bits	SCOM	Field Mnemonic: Description
60	RWX	TX_PL_SPARE_MODE_0: Per-lane spare mode latch.
61	RWX	TX_PL_SPARE_MODE_1: Per-lane spare mode latch.
62	RWX	TX_PL_SPARE_MODE_2: Per-lane spare mode latch.
63	RWX	TX_PL_SPARE_MODE_3: Per-lane spare mode latch.

54	RWX	TX_PSAVE_REQ_DIS: This bit disables TX slice power gating from link-layer psav_req control.
55	RWX	TX_ERR_INJ_A_ENABLE: This bit enables the random bit error-injection pattern A for this lane (default). 0b0 = Pattern A error injection is masked for this lane. 0b1 = Pattern A error injection is enabled for this lane.
56	RWX	TX_ERR_INJ_B_ENABLE: This bit enables the random bit error-injection pattern B for this lane (default). 0b0 = Pattern B error injection is masked for this lane. 0b1 = Pattern B error injection is enabled for this lane.
57:59	RO	constant = 0b000
60	RWX	TX_PL_SPARE_MODE_0: Per-lane spare mode latch.
61	RWX	TX_PL_SPARE_MODE_1: Per-lane spare mode latch.
62	RWX	TX_PL_SPARE_MODE_2: Per-lane spare mode latch.
63	RWX	TX_PL_SPARE_MODE_3: Per-lane spare mode latch.

Register Name	Transmit Mode 1 Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_MODE1_PL
Address	8004041409010C3F (SCOM)
Description	This register contains the first set of transmit mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_LANE_PDWN: This bit is used to drive inhibit (tristate) and fully power down a lane independent of the logical lane disable. 0b0 = Lane powered up. 0b1 = Lane drive inhibited (tristated) and powered down (default).
49	RWX	TX_LANE_INVERT: This bit is used to invert the polarity of a lane. 0b0 = Normal lane polarity (default). 0b1 = Lane inverted.
50:51	RWX	TX_LANE_QUIESCE: This field is used to force the output of a lane to a particular logical value. 0b00 = Functional data (default). 0b01 = Quiesce lane to a static 0 value. 0b10 = Quiesce lane to a static 1 value. 0b11 = Tri-state lane output.
52:53	RO	constant = 0b00
54	RWX	TX_PSAVE_REQ_DIS: This bit disables TX slice power gating from link-layer psav_req control.
55	RWX	TX_ERR_INJ_A_ENABLE: This bit enables the random bit error-injection pattern A for this lane (default). 0b0 = Pattern A error injection is masked for this lane. 0b1 = Pattern A error injection is enabled for this lane.
56	RWX	TX_ERR_INJ_B_ENABLE: This bit enables the random bit error-injection pattern B for this lane (default). 0b0 = Pattern B error injection is masked for this lane. 0b1 = Pattern B error injection is enabled for this lane.
57:59	RO	constant = 0b000

Bits	SCOM	Field Mnemonic: Description
60	RWX	TX_PL_SPARE_MODE_0: Per-lane spare mode latch.
61	RWX	TX_PL_SPARE_MODE_1: Per-lane spare mode latch.
62	RWX	TX_PL_SPARE_MODE_2: Per-lane spare mode latch.
63	RWX	TX_PL_SPARE_MODE_3: Per-lane spare mode latch.

Register Name	Transmit Mode 1 Per-Lane Register

Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004240A09010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004240B09010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004240C09010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004240D09010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004240E09010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004240F09010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004241009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004241109010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004241209010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004241309010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004241409010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004241509010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004241609010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_PL
Address	8004241709010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0009010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0109010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0209010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0309010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0409010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.

Bits	SCOM	Field Mnemonic: Description
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0509010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0609010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0709010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0809010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0909010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0A09010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0B09010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0C09010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0D09010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0E09010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C0F09010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.

Bits	SCOM	Field Mnemonic: Description
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C1009010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C1109010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C1209010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C1409010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C1509010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C1609010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Mask Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_MASK_PL
Address	80042C1709010C3F (SCOM)
Description	This register masks transmit FIR per-lane errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERRS_MASK: IOTK ALIAS: This bit is a FIR mask for all per-lane register, or per-lane state machine, parity errors.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340009010C3F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340109010C3F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340209010C3F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.

Bits	SCOM	Field Mnemonic: Description
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340309010C3F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340409010C3F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340509010C3F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340609010C3F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340709010C3F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340809010C3F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PL_FIR_ERR_INJ: IOTK ALIAS: This bit is used for the tx_fir_error_inject_pl register.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit FIR Error Inject Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_FIR_ERROR_INJECT_PL
Address	8004340909010C3F (SCOM)
Description	This register is used to inject errors into the per-lane FIR Transmit Registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register	
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL2_O_PL	
Address	80044C0009010C3F (SCOM)	
Description	This register is used to reset the given transmit lane.	
Bits	**SCOM**	**Field Mnemonic: Description**
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0109010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0209010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0309010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0409010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0509010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0609010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0709010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0809010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0909010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0A09010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0B09010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0C09010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0D09010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0E09010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C0F09010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C1009010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C1109010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C1209010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C1309010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C1409010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C1509010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C1609010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL2 O Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL2_O_PL
Address	80044C1709010C3F (SCOM)
Description	This register is used to reset the given transmit lane.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_IORESET: This bit resets the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540009010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540109010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540209010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#0.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540309010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540409010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540509010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540609010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#1.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540709010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540809010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540909010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540A09010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#2.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540B09010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540C09010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540D09010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540E09010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#3.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004540F09010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004541009010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004541109010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004541209010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#4.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004541309010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	Transmit CNTL3 EO Per-Lane Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#0.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004541409010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit CNTL3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#1.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004541509010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit CNTL3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#2.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004541609010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	**Transmit CNTL3 EO Per-Lane Register**
Mnemonic	IOO0.IOO_CPLT.TX0.TXPACKS#5.TXPACK.DD.SLICE#3.DD.TX_BIT_REGS.TX_CNTL3_EO_PL
Address	8004541709010C3F (SCOM)
Description	This register is used to enable TDR.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_TDR_ENABLE: This bit enables TDR on the given transmit lane.
49:63	RO	constant = 0b000000000000000

Register Name	**Receive Spare Mode Per-Group Register**
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_SPARE_MODE_PG
Address	8008000009010C3F (SCOM)
Description	This register contains per-group spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PG_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	RX_PG_SPARE_MODE_1: Per-group spare mode latch.

Bits	SCOM	Field Mnemonic: Description
50	RWX	RX_PG_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	RX_PG_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	RX_PG_SPARE_MODE_4: This debug switch prevents the rx_sls_hndshk_state state machine and the rx_dyn_recal_hndshk_state state machine from ever being allowed to run at the same time. Setting this bit turns this feature off.
53:63	RO	constant = 0b00000000000

Register Name	Receive ID1 Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_ID1_PG
Address	8008080009010C3F (SCOM)
Description	This register is used to set the bus number of a clock group.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	RX_BUS_ID: This field is used to programmatically set the bus number that a clock group belongs to.
54:63	RO	constant = 0b0000000000

Register Name	Receive CTL Mode 1 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE1_EO_PG
Address	8008100009010C3F (SCOM)
Description	This register contains the first set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_CLKDIST_PDWN: This field is used to disable the receive group clocks and put them into a low-power state. Bit 0 disables slices 0 - 7. Bit 1 disables slices 8 - 15. Bit 2 disables slices 16 - 23.
51:56	RWX	RX_BIST_MIN_EYE_WIDTH: Receive BIST minimum eye width. This field sets the minimum eye width value, in phase-rotator steps, that is considered acceptable in order to pass.
57	RWX	RX_A_BIST_EN: BIST enable pin.
58	RWX	RX_B_BIST_EN: BIST enable pin.
59	RWX	RX_E_BIST_EN: BIST enable pin.
60:61	RWX	RX_BISTCLK_EN: BIST clock enable pins.
62	RWX	RX_DISABLE_BANK_PDWN: This bit is used to disable power down of an unused (functionally) bank.
63	RO	constant = 0b0

Register Name	Receive CTL Mode 2 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE2_EO_PG
Address	8008180009010C3F (SCOM)
Description	This register contains the second set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_DFE_CA_CFG: Receive DFE clock adjustment settings. This 2-bit field contains an encoded value for K as follows: \n00 = 8 \n01 = 10 \n10 = 12 \n11 = 14 Lab testing is required to determine the proper value of K.
50:53	RWX	RX_SCOPE_CONTROL: This 4-bit value indicates which scope bit is being captured. Valid values are 0 - 9.
54	RO	constant = 0b0
55	RWX	RX_RECAL_REQ_DL_MASK: This bit masks rx_recal_req_dl primary inputs from the data layer.
56	RWX	RX_RECAL_DONE_DL_MASK: This bit masks rx_recal_done_dl primary inputs from the data layer.
57	RWX	RX_RUN_LANE_DL_MASK: This bit masks rx_run_lane_dl primary inputs from the data layer.
58	RWX	RX_RECAL_ABORT_DL_MASK: This bit masks rx_recal_abort_dl primary inputs from the data layer.
59	RWX	RX_INIT_DONE_DL_MASK: This bit masks rx_init_done_dl primary outputs to the data layer.
60	RWX	RX_DATA_PIPE_CLR_ON_READ_MODE: This bit sets the data pipe capture on read mode. When set, reading rx_data_pipe_16_31 automatically captures new data. Otherwise, rx_data_pipe_capture must be written.
61	RO	constant = 0b0
62:63	RWX	RX_CFG_LTE_MC:

Register Name	Receive CTL Mode 5 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE5_EO_PG
Address	8008300009010C3F (SCOM)
Description	This register contains the fifth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:55	RO	constant = 0b00000000000000000000000000000000000000000000000000000000
56:59	RWX	RX_TRACKING_TIMEOUT_SEL: This field contains the time to wait for phase tracking to lock on the edge before proceeding in the state machine.
60:63	RO	constant = 0b0000

Register Name	Receive CTL Mode 6 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE6_EO_PG
Address	8008380009010C3F (SCOM)
Description	This register contains the sixth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_EO_CONVERGED_END_COUNT: This field contains the end value of the receive eye-optimization convergence counter. This value represents the number of times through the vga + CTLE peaking substeps before giving up.
52:53	RWX	RX_HIST_MIN_EYE_WIDTH_MODE: This field indicates the receive historic eye width and height minimum measurement mode.
54:55	RWX	RX_HIST_MIN_EYE_HEIGHT_MODE: Receive historic eye-height minimum measurement mode. This field is inoperative on POWER8 processor with NVLink technology hardware. Use the rx_hist_min_eye_width_mode control instead. Set both the width and height_mode controls to the same value in test routines to maintain compatibility.
56:59	RWX	RX_AMP_GAIN_CNT_MAX: This field indicates the maximum number of attempts to adjust VGA gain before doing a peaking operation.
60:63	RO	constant = 0b0000

Register Name	Receive CTL Mode 7 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE7_EO_PG
Address	8008400009010C3F (SCOM)
Description	This register contains the seventh set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_ABORT_CHECK_TIMEOUT_SEL: This field selects the abort check timeout value.
52:55	RWX	RX_POLLING_TIMEOUT_SEL: This field selects the polling read timeout value.
56:63	RO	constant = 0b00000000

Register Name	Receive CTL Mode 9 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE9_EO_PG
Address	8008500009010C3F (SCOM)
Description	This register contains the ninth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	constant = 0b00000000000000000000000000000000000000000000000000
50:55	RWX	RX_MIN_EYE_WIDTH: This field indicates the minimum acceptable eye width used during initial or recalibration results checking. (EDI or EI4).
56:63	RWX	RX_MIN_EYE_HEIGHT: This field indicates the minimum acceptable eye height used during initial or recalibration results checking. (EDI only).

Register Name	Receive CTL Mode 10 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE10_EO_PG
Address	8008580009010C3F (SCOM)
Description	This register contains the tenth set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_AMP_INIT_CFG: This register controls the servo filter for amplitude measurements during initialization.
51:53	RWX	RX_AMP_RECAL_CFG: This register controls the servo filter for amplitude measurements during recalibration.
54:56	RWX	RX_PEAK_INIT_CFG: This register controls the servo filter for peaking during initialization.
57:59	RWX	RX_PEAK_RECAL_CFG: This register controls the servo filter for peaking during recalibration.
60:63	RWX	RX_AMP_CFG: This register controls the servo filter for rx_amp_0 and rx_amp_1 servo ops.

Register Name	Receive CTL Mode 11 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE11_EO_PG
Address	8008600009010C3F (SCOM)
Description	This register contains the 11th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_OFF_INIT_CFG: This register controls the servo filter for offset measurements during initialization.
51:53	RWX	RX_OFF_RECAL_CFG: This register controls the servo filter for offset measurements during recalibration.
54:56	RWX	RX_CM_CFG: This register controls the servo during common-mode measurement.
57:59	RWX	RX_AMIN_CFG: This register controls the servo filtering used for amin measurements.
60:63	RWX	RX_USERDEF_CFG: This register controls the servo filtering when running the user-defined servo operations.

Register Name	Receive CTL Mode 12 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE12_EO_PG
Address	8008680009010C3F (SCOM)
Description	This register contains the 12th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_SERVO_CHG_CFG: This register controls the minimum acceptable changes of the accumulator for a valid servo operation. It is used to assure that we have reached a stable point.
52:54	RWX	RX_DAC_BO_CFG: This register controls the time of the DAC black out time.
55:56	RWX	RX_FILTER_MODE: Servo filter mode. 00 = Normal filter during the entire operation. 01 = Use the 1/4 - 1/2 mode. 10 = 1/8 - 1/4 mode. 11 = Automatic convergence detect mode.
57:58	RWX	RX_MISC_CFG: These are per-group receive miscellaneous configuration bits. Bit 0 is used to re-enable the progressive filter mode for peaking. Bit 1, when 1, enables the clearing of H1 during the amp0, amp1, and user-defined servo operations.
59	RWX	RX_DISABLE_H1_CLEAR: Per group. When set, this bit disables the clearing when running servo operations that typically clear and restore the H1 registers.

Bits	SCOM	Field Mnemonic: Description
60:62	RWX	RX_VOFF_CFG: This is a per-group configuration register that is used for setting the filter value when running the VREF version of offset on edge latches.
63	RWX	RX_LOFF_AMP_EN: When set to 1, the amp DAC is enabled during the loff versions of local latch offset cancellation.

Register Name	Receive CTL Mode 13 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE13_EO_PG
Address	8008700009010C3F (SCOM)
Description	This register contains the 13^{th} set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49:55	RWX	RX_CM_OFFSET_VAL: This field contains the value used to offset the amp DAC when running common mode.
56:59	RWX	RX_SERVO_THRESH1: This field contains the value used as a threshold of when to switch to normal filtering mode.
60:63	RWX	RX_SERVO_THRESH2: This field contains the value used as a threshold of when we think the servo has converged.

Register Name	Receive CTL Mode 14 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE14_EO_PG
Address	8008780009010C3F (SCOM)
Description	This register contains the 14^{th} set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_AMP_INIT_TIMEOUT: This field is used for amplitude measurements during initialization.
52:55	RWX	RX_AMP_RECAL_TIMEOUT: This field is used for amplitude measurements during recalibration.
56:59	RWX	RX_PEAK_INIT_TIMEOUT: This field is used for peaking measurements during initialization.
60:63	RWX	RX_PEAK_RECAL_TIMEOUT: This field is used for peaking measurements during recalibration

Register Name	Receive CTL Mode 15 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE15_EO_PG
Address	8008800009010C3F (SCOM)
Description	This register contains the 15^{th} set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_OFF_INIT_TIMEOUT: This field is used for offset measurements during initialization.
52:55	RWX	RX_OFF_RECAL_TIMEOUT: This field is used for offset measurements during recalibration.
56:59	RWX	RX_CM_TIMEOUT: This field is used for common-mode measurements.

Bits	SCOM	Field Mnemonic: Description
60:63	RWX	RX_AMIN_TIMEOUT: This field is used for Amin measurements.

Register Name	Receive CTL Mode 16 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE16_EO_PG
Address	8008880009010C3F (SCOM)
Description	This register contains the 16th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_AMP_TIMEOUT: This timeout is used when running the generic amplitude servo operations.
52:55	RWX	RX_USERDEF_TIMEOUT: This timeout is used when using the user-defined servo operations.
56:59	RWX	RX_BER_TIMEOUT: This timeout is used when making bit error measurements with a servo operation.
60:63	RWX	RX_SPARE4_TIMEOUT: This timeout is currently a spare.

Register Name	Receive CTL Mode 17 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE17_EO_PG
Address	8008900009010C3F (SCOM)
Description	This register contains the 17th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_AMAX_HIGH: This field contains the receive Amax high target in amplitude DAC steps (as measured by the 2Ap-Amin method). The default is d120.
56:63	RWX	RX_AMAX_LOW: This field contains the receive Amax low target in amplitude DAC steps (as measured by the 2Ap-Amin method). The default is d80.

Register Name	Receive CTL Mode 18 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE18_EO_PG
Address	8008980009010C3F (SCOM)
Description	This register contains the 18th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_AMP0_FILTER_MASK: This register controls the filter and mask for the Amp_0 servo operations.
56:63	RWX	RX_AMP1_FILTER_MASK: This register controls the filter and mask for the Amp_1 servo operations.

Register Name	Receive CTL Mode 19 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE19_EO_PG
Address	8008A00009010C3F (SCOM)
Description	This register contains the 19th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_CTLE_GAIN_MAX: This field contains the receive CTLE (VGA) gain maximum allowable gain value.
52:55	RO	constant = 0b0000
56:63	RWX	RX_AMP_START_VAL: This field contains the receive amp start value, used when making amplitude measurements as the starting point.

Register Name	Receive CTL Mode 20 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE20_EO_PG
Address	8008A80009010C3F (SCOM)
Description	This register contains the 20th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_DFE_CONVERGED_CNT_MAX: This field contains the number of iterations through DFE H1 and kH1Ap adjustment before ending DFE, unless it is ended by the rx_ap110ap010_delta criteria being met.
52:55	RWX	RX_AP110_AP010_DELTA_MAX: This field contains the maximum delta between Apx110 and Apx010 measurements to end DFE H1 and kH1Ap adjustment, unless ended by dfe_converged_cnt_max.
56:63	RO	constant = 0b00000000

Register Name	Receive CTL Mode 21 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE21_EO_PG
Address	8008B00009010C3F (SCOM)
Description	This register contains the 21st set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_EO_ENABLE_INTEG_LATCH_OFFSET_CAL: This bit is the receive eye-optimization latch offset adjustment enable with an integrator-based disable.
49	RWX	RX_EO_ENABLE_CTLE_COARSE_CAL: This bit is the receive eye-optimization coarse CTLE/Peakin enable.
50	RWX	RX_EO_ENABLE_DAC_H1_CAL: This bit is the receive eye-optimization H! DAC calibration to reference.
51	RWX	RX_EO_ENABLE_VGA_CAL: This bit is the receive eye-optimization VGA gain and offset adjustment enable.
52	RWX	RX_EO_ENABLE_DFE_H1_CAL: This bit is the receive eye-optimization DFE H1 adjustment enable.
53	RWX	RX_EO_ENABLE_H1AP_TWEAK: This bit is the receive eye-optimization H1/AN PR adjust enable.
54	RWX	RX_EO_ENABLE_DDC: This bit is the receive eye-optimization dynamic data centering enable.

Bits	SCOM	Field Mnemonic: Description
55	RWX	RX_EO_ENABLE_CM_COARSE_CAL: This bit is the receive eye-optimization common-mode coarse calibration enable.
56	RWX	RX_EO_ENABLE_CM_FINE_CAL: This bit is the receive eye-optimization common-mode fine calibration enable.
57	RWX	RX_EO_ENABLE_VGA_EDGE_OFFSET_CAL: This bit is the receive eye-optimization edge-offset calibration enable during VGA calibration.
58	RWX	RX_EO_ENABLE_CTLE_EDGE_OFFSET_CAL: This bit is the receive eye-optimization edge-offset calibration enable during CTLE calibration.
59:63	RO	constant = 0b00000

Register Name	Receive CTL Mode 22 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE22_EO_PG
Address	8008B80009010C3F (SCOM)
Description	This register contains the 22nd set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_RC_ENABLE_INTEG_LATCH_OFFSET_CAL: This bit is the receive recalibration latch offset adjustment enable with integrator-based disable.
49	RWX	RX_RC_ENABLE_CTLE_COARSE_CAL: This bit is the receive recalibration coarse CTLE/Peakin enable.
50	RWX	RX_RC_ENABLE_DAC_H1_CAL: This bit is the receive recalibration H! DAC calibration to reference.
51	RWX	RX_RC_ENABLE_VGA_CAL: This bit is the receive recalibration VGA gain and offset adjustment enable.
52	RWX	RX_RC_ENABLE_DFE_H1_CAL: This bit is the receive recalibration DFE H1 adjustment enable.
53	RWX	RX_RC_ENABLE_H1AP_TWEAK: This bit is the receive recalibration H1/AN PR adjustment enable.
54	RWX	RX_RC_ENABLE_DDC: This bit is the receive recalibration dynamic data-centering enable.
55	RWX	RX_RC_ENABLE_CM_COARSE_CAL: This bit is the receive recalibration common-mode coarse calibration enable.
56	RWX	RX_RC_ENABLE_CM_FINE_CAL: This bit is the receive recalibration common-mode fine calibration enable.
57	RWX	RX_RC_ENABLE_VGA_EDGE_OFFSET_CAL: This bit is the receive recalibration edge-offset calibration enable during VGA calibration.
58	RWX	RX_RC_ENABLE_CTLE_EDGE_OFFSET_CAL: This bit is the receive recalibration edge-offset calibration enable during CTLE calibration.
59:63	RO	constant = 0b00000

Register Name	Receive CTL Mode 23 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE23_EO_PG
Address	8008C00009010C3F (SCOM)
Description	This register contains the 23rd set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	constant = 0b00000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
50:52	RWX	RX_IREF_RES_DAC: This field contains the twos complement control vector for setting the magnitude of the output current of res outputs.
53	RWX	RX_IREF_BYPASS: This bit is used to bypass the closed loop controller for an open loop bias.
54	RWX	RX_IREF_PDWN_B: This bit provides Iref power down control (active low).
55:63	RO	constant = 0b000000000

Register Name	Receive CTL Mode 24 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE24_EO_PG
Address	8008C80009010C3F (SCOM)
Description	This register contains the 24th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:49	RWX	RX_H1AP_CFG: This register controls the maximum allowed ration of H1 and Ap. This is not a servo setting, but rather the setting of a ration between H1 and the value of Ap.
50	RWX	RX_CTLE_UPDATE_MODE: This bit controls updating of the CTLE_COARSE (peaking) values.
51:55	RO	constant = 0b00000
56:63	RWX	RX_USER_FILTER_MASK: This register controls the filter and mask for user-defined servo operations.

Register Name	Receive CTL Mode 29 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE29_EO_PG
Address	8008D00009010C3F (SCOM)
Description	This register contains the 29th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_APX111_HIGH: This field contains the receive Amax high target, in amplitude DAC steps (as measured by ap_x111 and an_x000). The default is d102.
56:63	RWX	RX_APX111_LOW: This field contains the receive Amax low target, in amplitude DAC steps (as measured by ap_x111 and an_x000). The default is d68.

Register Name	Receive CTL CNTL1 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL1_EO_PG
Address	8008D80009010C3F (SCOM)
Description	This register contains the first set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RWX	RX_BER_EN: Diagnostic bit-error-rate (BER) error checking enable control. When 1, this bit enables error checking. When 0, the error checking is disabled. This control enables the BER timer. It also enables the error checker and BER counters. The assumption is that the drivers are currently driving PRBS23, and the link was trained before enabling BER checking.
49	RWX	RX_BER_TIMER_FREEZE_EN: Diagnostic bit-error-rate (BER) timer freeze enable. When set to 1, the timer is frozen when any lane error count saturates in that pack.
50	RWX	RX_BER_COUNT_FREEZE_EN: Diagnostic BER lane error counter freeze enable. When set to 1, the per-lane error counters are frozen when the timer saturates in that pack.
51:54	RWX	RX_BER_COUNT_SEL: Diagnostic BER lane error counter saturation select. This field selects the number of errors that saturates the counter and causes a freeze event. The default value is used during initialization and must only be changed post initialization. 0b0000 = 1. 0b0001 = 2. 0b0010 = 4. 0b0011 = 8. 0b0100 = 16. 0b0101 = 32. 0b0110 = 64. 0b0111 = 128. 0b1000 = 256. 0b1001 = 512. 0b1010 = 1024. 0b1011 = unused1. 0b1100 = unused2. 0b1101 = unused3. 0b1110 = unused4. 0b1111 = unused5.
55	RO	constant = 0b0
56:58	RWX	RX_BER_TIMER_SEL: Diagnostic BER timer saturation select. This field selects the timer value that saturates the timer and causes a freeze event. The default value is used during initialization and must only be changed post initialization. 0b000 = 2^{31}. 0b001 = 2^{27}. 0b010 = 2^{23}. 0b011 = 2^{19}. 0b100 = 2^{17}. 0b101 = 2^{13}. 0b110 = 2^{9}. 0b111 = 2^{5}.
59	RWX	RX_BER_CLR_COUNT_ON_READ_EN: Diagnostic BER lane error counter clear on read. When set to 1, this bit enables clearing a lane's error counter when it is read.
60	RWX	RX_BER_CLR_TIMER_ON_READ_EN: Diagnostic BER timer clear on read. When set to 1, this bit enables clearing a lane's timer when it is read from any lane in the pack.
61:63	RO	constant = 0b000

Register Name	Receive CTL CNTL2 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL2_EO_PG
Address	8008E00009010C3F (SCOM)
Description	This register contains the second set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_TRC_MODE: Receive trace mode. 0b0000 = Training state machines. 0b0001 = Dynamic repair state machines. 0b0010 = SLS handshake state machines with recovery. 0b0011 = Dynamic recalibration state machines. 0b0100 = Recalibration handshake state machine with recovery. 0b0101 = CRC or ECC tallying logic. 0b0110 = Receive SLS commands. 0b0111 = Receive bad lanes. 0b1000 = Receive SLS lanes. 0b1001 = GCR. 0b1010 = Per lane/per pack trace (see rx_pp_trc_mode for details). 0b1011 = TBD. 0b1100 = TBD. 0b1101 = TBD. 0b1110 = TBD. 0b1111 = TBD.
52:63	RO	constant = 0b000000000000

Register Name	Receive CTL CNTL3 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL3_EO_PG
Address	8008E80009010C3F (SCOM)
Description	This register contains the third set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_INT_MODE: This field contains the receive interrupt mode setting.
52:63	RWX	RX_INT_CURRENT_STATE: This field contains the receive interrupt current state to stop on.

Register Name	Receive CTL CNTL4 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL4_EO_PG
Address	8008F00009010C3F (SCOM)
Description	This register contains the fourth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_INT_ENABLE_ENC: This field contains the receive interrupt encoded enable.
52:63	RWX	RX_INT_NEXT_STATE: This field contains the receive interrupt next state to stop on.

Register Name	Receive CTL CNTL5 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL5_EO_PG
Address	8008F80009010C3F (SCOM)
Description	This register contains the fifth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:51	RO	constant = 0b0000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
52:63	RWX	RX_INT_GOTO_STATE: This field contains the receive interrupt state to go to upon an interrupt trigger.

Register Name	Receive CTL CNTL6 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL6_EO_PG
Address	8009000009010C3F (SCOM)
Description	This register contains the sixth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:51	RO	constant = 0b0000000000000000000000000000000000000000000000000000
52:63	RWX	RX_INT_RETURN_STATE: This field contains the receive interrupt state to go to upon return from an interrupt code.

Register Name	Receive CTL CNTL7 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTLX7_EO_PG
Address	8009080009010C3F (SCOM)
Description	This register contains the seventh set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:55	RO	constant = 0b00000000000000000000000000000000000000000000000000000000
56:60	RWX	RX_CAL_LANE_PG_PHY_GCRMSG: This field contains the encoded calibration lane in relation to the local, physical group.
61:63	RO	constant = 0b000

Register Name	Receive CTL CNTL8 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL8_EO_PG
Address	8009100009010C3F (SCOM)
Description	This register contains the eighth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:62	RWX	RX_SERVO_OP: This field contains the servo operation code. It is written by the global training state machine.
63	RWX	RX_SERVO_DONE: This bit indicates that the servo operation completed. It is read by the global training state machine.

Register Name	Receive CTL CNTL9 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL9_EO_PG
Address	8009180009010C3F (SCOM)
Description	This register contains the ninth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_BIST_EN: This bit enables the receive BIST state machine to begin testing. It is set by the BIST helper sequencer through a GCR message. To properly initialize and run the receive BIST, set the rx_start_bist register bit.
49	RWX	RX_BIST_EXT_START_MODE: This bit enables the receive BIST state machine to begin testing. It is set by the BIST helper sequencer through a GCR message. To properly initialize and run the receive BIST, set the rx_start_bist register bit.
50:52	RWX	RX_BIST_INIT_DISABLE: Each bit disables an individual step of the receive BIST initialization state machine when raised. Bit 0 disables the CU PLL lock. Bit 1 disables the receive FIFO initialization. Bit 2 disables eye optimization/training.
53	RWX	RX_BIST_CUPLL_LOCK_CHECK_EN: This bit enables the CU PLL lock check mode of the receive BIST initialization state machine. When set high, the test checks for the PLL lock signal and sets an error if it is not present.
54:59	RWX	RX_BIST_STORE_EYES_LANE_SEL: This register selects which lane to store receive BIST eye-width data from. The data is stored in the rx_bist_eye_a_width and rx_bist_eye_b_width registers.
60:61	RWX	RX_BIST_STORE_EYES_BANK_SEL: This register selects which bank to store receive BIST eye-width data from. 0b00 = Store bank A widths. 0b01 = Store bank B widths. 0b10 = Store bank E widths. 0b11 = EDI+ bank A.
62	RWX	RX_PERVASIVE_CAPT: This bit latches glb_ctl and jtag_bndy pervasive signals in iocrc_pervasive_capt when set high. RO register bit rx_prvcpt_change_det goes high when latched values differ from pervasive inputs.
63	RWX	RX_BIST_LL_TEST_EN: This bit enables the link test portion of RX BIST.

Register Name	Receive CTL CNTL10 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL10_EO_PG
Address	8009200009010C3F (SCOM)
Description	This register contains the tenth set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	RWX	RX_BIST_PRBS_TEST_TIME: This field controls how long the receive BIST tests the PRBS7 data for errors.
52	RWX	RX_BIST_BUS_DATA_MODE: This bit enables a mode where the receive BIST tests data from the bus.
53:56	RWX	RX_BIST_PRBS_PROP_TIME: This field controls how long the receive BIST waits between incrementing a phase rotator and beginning to test the PRBS data.
57:63	RO	constant = 0b0000000

Register Name	Receive CTL CNTL11 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL11_EO_PG
Address	8009280009010C3F (SCOM)
Description	This register contains the 11th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:56	RWX	RX_DACTEST_LLMT: This control register is used to lower the threshold limit.
57	RWX	RX_DACTEST_RESET: This control register is used to reset the DACTEST.
58	RWX	RX_DACTEST_START: This control register is used to start the DACTEST.
59:63	RO	constant = 0b00000

Register Name	Receive CTL CNTL12 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL12_EO_PG
Address	8009300009010C3F (SCOM)
Description	This register contains the 12th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:56	RWX	RX_DACTEST_HLMT: This control register is used to set a higher threshold limit.
57:63	RO	constant = 0b0000000

Register Name	Receive CTL CNTL13 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL13_EO_PG
Address	8009380009010C3F (SCOM)
Description	This register contains the 13th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_HIST_MIN_EYE_WIDTH_VALID: This bit indicates that the receive historic eye width minimum value and lane are valid.
49:53	RWX	RX_HIST_MIN_EYE_WIDTH_LANE: This field contains the receive historic eye width lane number.
54:61	RWX	RX_HIST_MIN_EYE_WIDTH: This field contains the receive historic eye width and height minimum measurement mode.
62:63	RO	constant = 0b00

Register Name	Receive CTL CNTL14 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_CNTL14_EO_PG
Address	8009400009010C3F (SCOM)
Description	This register contains the 14th set of CTL CNTL EO fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_HIST_MIN_EYE_HEIGHT_VALID: This bit indicates that the receive historic eye height minimum value and lane are valid.
49:53	RWX	RX_HIST_MIN_EYE_HEIGHT_LANE: This field contains the receive historic eye height lane number.

Bits	SCOM	Field Mnemonic: Description
54:61	RWX	RX_HIST_MIN_EYE_HEIGHT: This field contains the receive historic eye height minimum measurement mode. It is inoperative on POWER8 processor with NVLink technology hardware. Use the rx_hist_min_eye_width_mode control instead. Set both the width and height_mode controls to the same value in test routines to maintain compatibility.
62:63	RO	constant = 0b00

Register Name	Receive CTL STAT1 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT1_EO_PG
Address	8009500009010C3F (SCOM)
Description	This register contains the servo operation result.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	RX_SERVO_RESULT: This field contains the servo operation result. It is read by the global training state machine.
56:63	RO	constant = 0b00000000

Register Name	Receive CTL STAT2 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_STAT2_EO_PG
Address	8009580009010C3F (SCOM)
Description	This register contains the status of the receive BIST.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_BIST_INIT_DONE: This bit signals completion of the receive BIST initialization state machine.
49	RWX	RX_BIST_DONE: This bit signals completion of the entire receive BIST procedure.
50	RWX	RX_BIST_LL_ERR: This bit indicates an error was detected during the link layer test portion of the receive BIST.
51	RWX	RX_BIST_NO_EDGE_DET: This bit indicates that one eye was counted to be significantly large (over 60 phase rotator steps).
52:57	RWX	RX_BIST_EYE_A_WIDTH: This register holds the counted eye A width of one particular lane.
58:63	RWX	RX_BIST_EYE_B_WIDTH: This register holds the counted eye B width of one particular lane.

Register Name	Receive CTL Mode 26 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE26_EO_PG
Address	8009680009010C3F (SCOM)
Description	This register contains the 26th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_EO_ENABLE_CTLE_1ST_LATCH_OFFSET_CAL: Receive eye-optimization; first latch offset adjustment enable with CTLE-based disable.

Bits	SCOM	Field Mnemonic: Description
49	RWX	RX_EO_ENABLE_CTLE_2ND_LATCH_OFFSET_CAL: Receive eye-optimization; second latch offset adjustment enable with CTLE-based disable.
50	RWX	RX_EO_ENABLE_VGA_AMAX_MODE: Receive eye-optimization; VGA Ap measurement mode.
51:63	RO	constant = 0b0000000000000

Register Name	Receive CTL Mode 27 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE27_EO_PG
Address	8009700009010C3F (SCOM)
Description	This register contains the 27th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_RC_ENABLE_CTLE_1ST_LATCH_OFFSET_CAL: Receive recalibration; first latch offset adjustment enable with CTLE-based disable.
49	RWX	RX_RC_ENABLE_CTLE_2ND_LATCH_OFFSET_CAL: Receive recalibration; second latch offset adjustment enable with CTLE-based disable.
50	RWX	RX_RC_ENABLE_VGA_AMAX_MODE: Receive recalibration; VGA Ap measurement mode.
51	RWX	RX_RC_ENABLE_AUTO_RECAL: Receive recalibration; VGA Ap measurement mode.
52:63	RO	constant = 0b000000000000

Register Name	Receive CTL Mode 28 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE28_EO_PG
Address	8009780009010C3F (SCOM)
Description	This register contains the 28th set of receive CTL EO mode fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_DC_ENABLE_CM_COARSE_CAL: This bit enables receive DC calibration eye-optimization common-mode coarse calibration.
49	RWX	RX_DC_ENABLE_CM_FINE_CAL: This bit enables receive DC calibration eye-optimization common-mode fine calibration.
50	RWX	RX_DC_ENABLE_CTLE_1ST_LATCH_OFFSET_CAL: Receive DC calibration eye-optimization latch offset adjustment enable done prior to CTLE.
51	RWX	RX_DC_ENABLE_CTLE_2ND_LATCH_OFFSET_CAL: Receive DC calibration eye-optimization latch offset adjustment enable done after CTLE.
52	RWX	RX_DC_ENABLE_INTEG_LATCH_OFFSET_CAL: Receive DC calibration eye-optimization latch offset adjustment enable done prior to integrator.
53:63	RO	constant = 0b00000000000

Register Name	Receive CTL Mode 2 O Per-Group
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE2_O_PG
Address	8009880009010C3F (SCOM)
Description	This is a per-group receive CTL mode O register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	RX_OCTANT_SELECT: This field selects which c16 clock is used on IOO.
51:52	RWX	RX_SPEED_SELECT: This field selects the IOO speed control.
53	RWX	RX_AC_COUPLED: This bit selects the IOO AC coupled mode in the receiver.
54:63	RO	constant = 0b0000000000

Register Name	Receive CTL Mode 1 O Per-Group
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.CTL_REGS.RX_CTL_REGS.RX_CTL_MODE1_O_PG
Address	8009B00009010C3F (SCOM)
Description	This register contains minikerf control bits.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	RWX	RX_MINIKERF: This field contains receive minikerf control bits. Bits 3:13 are only used when bits 0:2 = 001. Bits 14:15 are spare. Bits 0:2 are level 1 steering: 000 = Reserved. 001 = Use bits 3:5. 010= impedance control termref_mk_probe_ana(0:1) only for the POWER8 memory buffer. All other buses use the tx_minikerf_pb. 011 = Receive cleanup PLL atst on pad_io_p. Pad_io_n = 0. 100 = Reserved. 101 = Reserved. 110 = Receive cleanup PLL clock on C4 pads. 111= Reserved. Bits 3:5 are level 2 steering. Bits 6:13 are DAC controls. Bits 14:15 are spare.

Register Name	Receive GLBSM Spare Mode Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_SPARE_MODE_PG
Address	800A800009010C3F (SCOM)
Description	This register contains per-group spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PG_GLBSM_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	RX_PG_GLBSM_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	RX_PG_GLBSM_SPARE_MODE_2: Per-group spare mode latch.

Bits	SCOM	Field Mnemonic: Description
51	RWX	RX_PG_GLBSM_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	RX_PG_GLBSM_SPARE_MODE_4: Per-group spare mode latch.
53	RWX	RX_PG_GLBSM_SPARE_MODE_5: Per-group spare mode latch.
54	RWX	RX_PG_GLBSM_SPARE_MODE_6: Per-group spare mode latch.
55	RWX	RX_PG_GLBSM_SPARE_MODE_7: Per-group spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Receive FIR1 Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_FIR1_PG
Address	800A880009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52	ROX	Reserved field.
53	ROX	Reserved field.
54	ROX	Reserved field.
55	ROX	Reserved field.
56	ROX	Reserved field.
57	ROX	Reserved field.
58	ROX	Reserved field.
59	ROX	Reserved field.
60	ROX	Reserved field.
61	RO	constant = 0b0
62	ROX	Reserved field.
63	RO	constant = 0b0

Register Name	Receive FIR1 Mask Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_FIR1_MASK_PG
Address	800A900009010C3F (SCOM)
Description	This register masks receive FIR per-group errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:62	RWX	RX_Per Group_FIR1_ERRS_MASK: This field provides a FIR mask for register or state-machine parity checkers in the per-group receive logic. A value of 1 masks the error from generating a FIR error. Bit 0 = (mask_pg_regs) RXCTL Register parity error mask. Bit 1 = Reserved. Bit 2 = Reserved. Bit 3 = (mask_gcrs_ld_sm) RXCTL GCR load state machine parity error mask. Bit 4 = (mask_gcrs_unld_sm) RXCTL GCR unload state machine parity error mask. Bit 5 = (mask_snd_msg_sm) RXCTL Send message parity error mask. Bit 6 = (mask_main_init_sm) RXCTL main init state machine parity error mask. Bit 7 = (mask_wtm_sm) RXCTL wire-test main state machine parity error mask.
63	RO	constant = 0b0

Register Name	Receive FIR1 Error Inject Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_FIR1_ERROR_INJECT_PG
Address	800A980009010C3F (SCOM)
Description	This register is used to inject parity errors into the per-group receive registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:62	RWX	RX_PG_FIR1_ERR_INJ: IOTK ALIAS: Receive per-group parity error injection. This field enables the injection of non-destructive parity errors in either register or state-machine latch banks. The register or state value is not affected.
63	RO	constant = 0b0

Register Name	Receive GLBSM CNTLX1 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_CNTLX1_EO_PG
Address	800AB00009010C3F (SCOM)
Description	This register controls per-group latches.

Bits	SCOM	Field Mnemonic: Description
0:61	RO	constant = 0b00000000000000000000000000000000000000000000000000000000000000
62	RWX	RX_CLR_PAR_ERRS: Clear all receive parity error latches. Toggle this field 0→1-→0 to clear all receive parity error latches.
63	RWX	RX_FIR_RESET: FIR reset. Toggle this field 0→1→0 to reset all the receive FIR-related latches including the isolation and parity error latches.

Register Name	Receive GLBSM STAT1 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_STAT1_EO_PG
Address	800AB80009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:59	ROX	Reserved field.

Bits	SCOM	Field Mnemonic: Description
60:63	RO	constant = 0b0000

Register Name	Receive GLBSM STAT2 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_STAT2_EO_PG
Address	800AC00009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	ROX	Reserved field.

Register Name	Receive GLBSM STAT3 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_STAT3_EO_PG
Address	800AC80009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51:59	ROX	Reserved field.
60:63	RO	constant = 0b0000

Register Name	Receive GLBSM STAT4 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_STAT4_EO_PG
Address	800AD00009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	ROX	Reserved field.

Register Name	Receive GLBSM STAT5 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_STAT5_EO_PG
Address	800AD80009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50:54	ROX	Reserved field.
55	ROX	Reserved field.
56:63	RO	constant = 0b00000000

Register Name	Receive GLBSM CNTL2 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_CNTL2_EO_PG
Address	800AE00009010C3F (SCOM)
Description	This register controls the single-lane recalibration monitor mode.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49	RWX	RX_CNT_SINGLE_LANE_RECAL: This bit selects single-lane recalibration monitor mode.
50:54	RWX	RX_RECAL_LANE_TO_MONITOR: This field designates the lane to monitor when rx_cnt_single_lane_recal is 1.
55:63	RO	constant = 0b000000000

Register Name	Receive GLBSM CNTL3 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_CNTL3_EO_PG
Address	800AE80009010C3F (SCOM)
Description	This register controls manual recalibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_MANUAL_RECAL_REQUEST: This bit indicates a recalibration request from the microcontroller.
49:50	RO	constant = 0b00
51:55	RWX	RX_MANUAL_RECAL_LANE: This field specifies the recalibration lane from the microcontroller.
56:63	RO	constant = 0b00000000

Register Name	Receive GLBSM CNTL4 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.GLBSM.REGS.RX_GLBSM_CNTL4_EO_PG
Address	800AF00009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	NCX	Reserved field.

Bits	SCOM	Field Mnemonic: Description
49	NCX	Reserved field.
50	NCX	Reserved field.
51	NCX	Reserved field.
52:63	RO	constant = 0b000000000000

Register Name	Receive DATASM Spare Mode Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_SPARE_MODE_PG
Address	800B800009010C3F (SCOM)
Description	This register contains per-group spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	RX_PG_DATASM_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	RX_PG_DATASM_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	RX_PG_DATASM_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	RX_PG_DATASM_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	RX_PG_DATASM_SPARE_MODE_4: Per-group spare mode latch.
53	RWX	RX_PG_DATASM_SPARE_MODE_5: Per-group spare mode latch.
54	RWX	RX_PG_DATASM_SPARE_MODE_6: Per-group spare mode latch.
55	RWX	RX_PG_DATASM_SPARE_MODE_7: Per-group spare mode latch.
56:59	RWX	RX_SERVO_CONFIG: Per-group servo configuration bits.
60	RWX	RX_CTL_DATASM_CLKDIST_PDWN: This bit is used to put additional rx_ctl_datasm_mac logic into clock off mode.
61:63	RO	constant = 0b000

Register Name	Receive DATASM CNTLX1 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_CNTLX1_EO_PG
Address	800B880009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49	NCX	Reserved field.
50	NCX	Reserved field.
51	NCX	Reserved field.
52	NCX	Reserved field.
53	NCX	Reserved field.
54	NCX	Reserved field.
55:63	RO	constant = 0b000000000

Register Name	Receive DATASM STAT1 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT1_EO_PG
Address	800B900009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:58	ROX	Reserved field.
59	ROX	Reserved field.
60	ROX	Reserved field.
61	ROX	Reserved field.
62	ROX	Reserved field.
63	RO	constant = 0b0

Register Name	Receive DATASM STAT2 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT2_EO_PG
Address	800B980009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	ROX	Reserved field.

Register Name	Receive DATASM STAT3 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT3_EO_PG
Address	800BA00009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	ROX	Reserved field.

Register Name	Receive DATASM STAT4 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT4_EO_PG
Address	800BA80009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	ROX	Reserved field.

Register Name	Receive DATASM STAT5 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT5_EO_PG
Address	800BB00009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	ROX	Reserved field.

Register Name	Receive DATASM STAT6 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT6_EO_PG
Address	800BB80009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	ROX	Reserved field.

Register Name	Receive DATASM STAT7 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT7_EO_PG
Address	800BC00009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:51	ROX	Reserved field.
52:58	RO	constant = 0b0000000
59:62	ROX	Reserved field.
63	ROX	Reserved field.

Register Name	Receive DATASM STAT8 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT8_EO_PG
Address	800BC80009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	ROX	Reserved field.

Register Name	Receive DATASM STAT9 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT9_EO_PG
Address	800BD00009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:56	ROX	Reserved field.
57:63	RO	constant = 0b0000000

Register Name	Receive DATASM STAT10 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT10_EO_PG
Address	800BD80009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:55	RO	constant = 0b00000000000000000000000000000000000000000000000000000000
56:63	ROX	Reserved field.

Register Name	Receive DATASM STAT11 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.RX0.RXCTL.DATASM.DATASM_REGS.RX_DATASM_STAT11_EO_PG
Address	800BE00009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:63	ROX	Reserved field.

Register Name	Transmit Spare Mode Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_SPARE_MODE_PG
Address	800C040009010C3F (SCOM)
Description	This register contains per-group spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_PG_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	TX_PG_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	TX_PG_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	TX_PG_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	TX_PG_SPARE_MODE_4: Per-group spare mode latch.

Bits	SCOM	Field Mnemonic: Description
53	RWX	TX_PG_SPARE_MODE_5: Per-group spare mode latch.
54	RWX	TX_PG_SPARE_MODE_6: Per-group spare mode latch.
55	RWX	TX_PG_SPARE_MODE_7: Per-group spare mode latch.
56:57	RWX	TX_PG_SPARE_MODE_8_9: Per-group spare mode latch.
58:63	RO	constant = 0b000000

Register Name	Transmit ID1 Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_ID1_PG
Address	800C0C0009010C3F (SCOM)
Description	This register is used to programmatically set the bus number that a group belongs to.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:53	RWX	TX_BUS_ID: This field is used to programmatically set the bus number that a group belongs to.
54:63	RO	constant = 0b0000000000

Register Name	Transmit CTL Mode 1 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_MODE1_EO_PG
Address	800C140009010C3F (SCOM)
Description	This register contains transmit control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	TX_CLKDIST_PDWN: This field is used to disable the transmit group clocks and put them into a low-power state. It does not control per-lane circuits or logic. Bit 0 disables slices 16 - 23. Bit 1 disables slices 8 - 15. Bit 2 disables slices 0 - 7.
51	RW	TX_BIST_EN: This bit enables the transmit BIST state machine to begin testing.
52	RW	TX_EXBIST_MODE: This bit is used to disable the BIST enable through external I/O.
53:63	RO	constant = 0b00000000000

Register Name	Transmit CTL CNTLG1 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTLG1_EO_PG
Address	800C240009010C3F (SCOM)
Description	This register contains the transmit drive patterns.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	constant = 0b00000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
50:53	RWX	TX_DRV_DATA_PATTERN_GCRMSG: Transmit drive patterns. 0b0000 = Drive all 0s pattern. 0b0001 = Drive wire-test pattern. 0b0010 = Drive all 1s pattern. 0b0011 = Drive deskew pattern A. 0b0100 = Drive deskew pattern B. 0b0101 = PRBS full-speed scramble pattern (see tx_prbs_tap_id). 0b0110 = Alternate PRBS7 pattern for RX BIST. 0b0111 = PRBS calibration or 9th pattern. 0b1000 = PRBS7 pattern. 0b1001 = PRBS11 pattern. 0b1010 = Drives TDR pulse-square waves. 0b1011 = PRBS15 pattern. 0b1100 = Alternate PRBS23 for NVBUS. 0b1101 = PRBS31 pattern. 0b1110 = 1-to-1 clock pattern. 0b1111 = Unused.
54:63	RO	constant = 0b0000000000

Register Name	Transmit CTL CNTL2 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL2_EO_PG
Address	800C2C0009010C3F (SCOM)
Description	This register contains per-group transmit control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	TX_ERR_INJ_A_FINE_SEL: This field contains the random LSB/fine-grained cycle offset variation control for pattern A, where cycles are deserialized domain cycles. 0b000 = Random offset in the range of 1 - 32 cycles(default). 0b001 = Random offset in the range of 1 - 16 cycles. 0b010 = Random offset in the range of 1 - 8 cycles. 0b011 = Random offset in the range of 1 - 4 cycles. 0b100 = Random offset in the range of 1 - 2 cycles. 0b101 = Fixed offset of 1 cycle. 0b110 = Fixed offset of 3 cycles. 0b111 = Fixed offset of 7 cycles.
51:54	RWX	TX_ERR_INJ_A_COARSE_SEL: This field contains the random MSB/coarse-grained multiplier for the base error rate counter, which controls bit-error-rate variation for pattern A. There are also a number of nonrandom settings that are specifically chosen to avoid powers of two.
55:60	RWX	TX_ERR_INJ_A_BER_SEL: This field is used to set the random bit-error injection rate for pattern A. When set to a binary value of N, the average bit error rate is 1/(2^N x beats x mean(MSB)).
61	RWX	TX_ERR_INJ_ENABLE: This bit is the overall error injection enable. When set to 0, all other injection is gated.
62	RWX	TX_ERR_INJ_CLOCK_ENABLE: This bit enables clocks to larger counter and PRBS logic. Use this to stagger start times and effectively seed the injection mechanism randomly.
63	RO	constant = 0b0

Register Name	Transmit CTL CNTL3 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL3_EO_PG
Address	800C340009010C3F (SCOM)
Description	This register contains per-group transmit control fields.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:50	RWX	TX_ERR_INJ_B_FINE_SEL: This field contains the random LSB/fine-grained cycle offset variation control for pattern B, where cycles are deserialized domain cycles. 0b000 = Random offset in range of 1 - 32 cycles(default). 0b001 = Random offset in range of 1 - 16 cycles. 0b010 = Random offset in range of 1 - 8 cycles. 0b011 = Random offset in range of 1 - 4 cycles. 0b100 = Random offset in range of 1 - 2 cycles. 0b101 = Fixed offset of 1 cycle. 0b110 = Fixed offset of 3 cycles. 0b111 = Fixed offset of 7 cycles.
51:54	RWX	TX_ERR_INJ_B_COARSE_SEL: This field contains the random MSB/coarse-grained multiplier for the base error-rate counter, which controls the bit-error-rate variation for pattern B. There are also a number of nonrandom settings that are specifically chosen to avoid powers of two.
55:60	RWX	TX_ERR_INJ_B_BER_SEL: This field is used to set the random bit-error injection rate for pattern B. When set to a binary value of N, the average bit error rate is 1/(2^N x beats x mean(MSB)).
61:63	RO	constant = 0b000

Register Name	Transmit CTL CNTL8 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL8_EO_PG
Address	800CCC0009010C3F (SCOM)
Description	This register is used to control the TDR function.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	TX_TDR_DAC_CNTL: This field controls the variable threshold receiver for the TDR function.
56	RO	constant = 0b0
57	RWX	TX_TDR_PHASE_SEL: This field controls phase select for the TDR function. 0 = _n leg. 1 = _p leg.
58:63	RO	constant = 0b000000

Register Name	Transmit CTL CNTL9 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL9_EO_PG
Address	800CD40009010C3F (SCOM)
Description	This register is used to control the TDR function.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:61	RWX	TX_TDR_PULSE_OFFSET: This field contains the offset value for the TDR pulse.
62:63	RO	constant = 0b00

Register Name	Transmit CTL CNTL10 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.CTL_REGS.TX_CTL_REGS.TX_CTL_CNTL10_EO_PG
Address	800CDC0009010C3F (SCOM)
Description	This register is used to control the TDR function.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	TX_TDR_PULSE_WIDTH: The field controls the width of the TDR pulse.
56:63	RO	constant = 0b00000000

Register Name	Transmit Group FIR Error Source
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_FIR_Per Group
Address	800D040009010C3F (SCOM)
Description	This is an isolation register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	Reserved field.
49	ROX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52	ROX	Reserved field.
53:62	RO	constant = 0b0000000000
63	ROX	Reserved field.

Register Name	Transmit Group FIR Error Mask Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_FIR_MASK_PG
Address	800D0C0009010C3F (SCOM)
Description	This register masks transmit FIR per-group errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:52	RWX	TX_Per Group_FIR_ERRS_MASK: This field contains the FIR mask for register or state-machine parity checkers in the per-group TXCTL logic. A value of 1 masks the error from generating a FIR error. Bit 0 = par_err_mask_txctl_regs. Bit 1 = par_err_mask_gcr_buff. Bit 2 = Reserved. Bit 3 = par_err_mask_tx_stt_rpr_snd_msg_state. Bit 4 = par_err_mask_gcrs_ld_state. Bit 5 = par_err_mask_gcrs_unld_state. Bit 6 = Reserved. Bit 7 = Reserved.
53:62	RO	constant = 0b0000000000
63	RWX	TX_PL_FIR_ERR_MASK: IOTK ALIAS: This bit is a FIR mask for the per-lane transmit register checker.

Register Name	Transmit Reset Control Action Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_FIR_RESET_PG
Address	800D140009010C3F (SCOM)
Description	This register controls per-group transmit latches.

Bits	SCOM	Field Mnemonic: Description
0:61	RO	constant = 0b00000000000000000000000000000000000000000000000000000000000000
62	RWX	TX_CLR_PAR_ERRS: Clear all transmit parity error latches. Toggle this field 0→1→0 to clear all transmit parity error latches.
63	RWX	TX_FIR_RESET: FIR reset. Toggle this field 0→1→0 to reset all transmit FIR-related latches including parity error latches.

Register Name	Transmit Per-Group FIR Error Injection Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_FIR_ERROR_INJECT_PG
Address	800D1C0009010C3F (SCOM)
Description	This register is used to inject errors into per-group transmit registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	TX_PG_FIR_ERR_INJ: IOTK ALIAS: While 1, inverts the parity check bit to force an error on the per-group TXCTL register or the state-machine parity checkers.
53:63	RO	constant = 0b00000000000

Register Name	Transmit CTLSM Spare Mode Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_SPARE_MODE_PG
Address	800D240009010C3F (SCOM)
Description	This register contains per-group spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RWX	TX_PG_CTL_SM_SPARE_MODE_0: Per-group spare mode latch.
49	RWX	TX_PG_CTL_SM_SPARE_MODE_1: Per-group spare mode latch.
50	RWX	TX_PG_CTL_SM_SPARE_MODE_2: Per-group spare mode latch.
51	RWX	TX_PG_CTL_SM_SPARE_MODE_3: Per-group spare mode latch.
52	RWX	TX_PG_CTL_SM_SPARE_MODE_4: Per-group spare mode latch.
53	RWX	TX_PG_CTL_SM_SPARE_MODE_5: Per-group spare mode latch.
54	RWX	TX_PG_CTL_SM_SPARE_MODE_6: Per-group spare mode latch.
55	RWX	TX_PG_CTL_SM_SPARE_MODE_7: Per-group spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	**Transmit CTLSM Mode 1 EO Per-Group Register**
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_MODE1_EO_PG
Address	800D2C0009010C3F (SCOM)
Description	This register controls the driver segment test.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	constant = 0b00000000000000000000000000000000000000000000000000
50:57	RWX	TX_SEG_TEST_MODE: Driver segment test mode. When this field is all 0s, it means normal function mode. When this field is not all 0s, the segment test begins.
58	RO	constant = 0b0
59	RWX	TX_FFE_BOOST_EN: Driver segment test. This bit enables the boost function of the NVLink transmit.
60	RO	constant = 0b0
61	RWX	TX_SEG_TEST_LEAKAGE_CTRL: This bit controls txr_txc_sst_ctl_dc in every transmit slice. 1 = Run the segment test in low-leakage mode.
62:63	RO	constant = 0b00

Register Name	**Transmit CTLSM CNTL1 EO Per-Group Register**
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL1_EO_PG
Address	800D340009010C3F (SCOM)
Description	This register contains transmit pseg controls.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000
51:55	RWX	TX_PSEG_PRE_EN: This field is used for pre-bank pseg enable.
56:60	RWX	TX_PSEG_PRE_SEL: This field is used for pre-bank pseg mode selection.
61:63	RO	constant = 0b000

Register Name	Transmit CTLSM CNTL2 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL2_EO_PG
Address	800D3C0009010C3F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000
51:55	RWX	TX_NSEG_PRE_EN: This field is used for pre-bank nseg enable.
56:60	RWX	TX_NSEG_PRE_SEL: This field is used for pre-bank nseg mode selection.
61:63	RO	constant = 0b000

Register Name	Transmit CTLSM CNTL3 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL3_EO_PG
Address	800D440009010C3F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	TX_PSEG_MARGINPU_EN: This field is used for margin pull-up bank pseg enable.
56:63	RWX	TX_PSEG_MARGINPD_EN: This field is used for margin pull-down bank pseg enable.

Register Name	Transmit CTLSM CNTL4 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL4_EO_PG
Address	800D4C0009010C3F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	TX_NSEG_MARGINPU_EN: This field is used for margin pull-up bank nseg enable.
56:63	RWX	TX_NSEG_MARGINPD_EN: This field is used for margin pull-down bank nseg enable.

Register Name	Transmit CTLSM CNTL5 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL5_EO_PG
Address	800D540009010C3F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:55	RWX	TX_MARGINPU_SEL: This field is used for margin pull-up bank mode selection.
56:63	RWX	TX_MARGINPD_SEL: This field is used for margin pull-down bank mode selection.

Register Name	Transmit CTLSM CNTL6 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL6_EO_PG
Address	800D5C0009010C3F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000
51:57	RWX	TX_PSEG_MAIN_EN: This field is used for main bank pseg enable.
58:63	RO	constant = 0b000000

Register Name	Transmit CTLSM CNTL7 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL7_EO_PG
Address	800D640009010C3F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:50	RO	constant = 0b000000000000000000000000000000000000000000000000000
51:57	RWX	TX_NSEG_MAIN_EN: This field is used for main bank nseg enable.
58:63	RO	constant = 0b000000

Register Name	Transmit CTLSM STAT1 EO Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_STAT1_EO_PG
Address	800D6C0009010C3F (SCOM)
Description	This is a reserved field.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	constant = 0b00000000000000000000000000000000000000000000000000
50	ROX	Reserved field.
51:63	RO	constant = 0b0000000000000

Register Name	Transmit CTLSM CNTL1 O Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL1_O_PG
Address	800D840009010C3F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49:55	RWX	TX_PSEG_POST_EN: This field is used for post bank pseg enable.
56:62	RWX	TX_PSEG_POST_SEL: This field is used for post bank pseg mode selection.
63	RO	constant = 0b0

Register Name	Transmit CTLSM CNTL2 O Per-Group Register
Mnemonic	IOO0.IOO_CPLT.TX0.TXCTL.TX_CTL_SM.REGS.TX_CTLSM_CNTL2_O_PG
Address	800D8C0009010C3F (SCOM)
Description	This register contains transmit per-group controls.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49:55	RWX	TX_NSEG_POST_EN: This field is used for post bank nseg enable.
56:62	RWX	TX_NSEG_POST_SEL: This field is used for post bank nseg mode selection.
63	RO	constant = 0b0

Register Name	Transmit Impedance Calibration Per-Bus Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL_PB
Address	800F040009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49	NCX	Reserved field.
50	ROX	Reserved field.
51	ROX	Reserved field.
52	ROX	Reserved field.
53	NCX	Reserved field.
54	ROX	Reserved field.
55:63	ROX	Reserved field.

Register Name	Transmit Impedance Calibration NVAL Per-Bus Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL_NVAL_PB
Address	800F0C0009010C3F (SCOM)
Description	This register is used for impedance calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:56	RWX	TX_ZCAL_N: Calibration circuit NSeg enable value. This field holds the current value of the enabled segments. It is a 4x multiple of the actual segment count. It can be read for the current calibration result set during the calibration sequence. It can be written to immediately update circuit enables on each write. It is used with tx_zcal_swo_* for manual calibration. Do not write to this field when tx_zcal_req = 1. (binary code - 0x00 is zero slices, and 0xA1 is maximum slices).
57:63	RO	constant = 0b0000000

Register Name	Transmit Impedance Calibration PVAL Per-Bus Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL_PVAL_PB
Address	800F140009010C3F (SCOM)
Description	This register is used for impedance calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:56	RWX	TX_ZCAL_P: Calibration circuit PSeg enable value. This field holds the current value of the enabled segments. It is a 4x multiple of the actual segment count. It can be read for the current calibration result set during the calibration sequence. It can be written to immediately update circuit enables on each write. It is used with tx_zcal_swo_* for manual calibration. Do not write this field when tx_zcal_req = 1. (binary code - 0x00 is zero slices, and 0xA1 is maximum slices).
57:63	RO	constant = 0b0000000

Register Name	Transmit Impedance Calibration P 4X Per-Bus Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL_P_4X_PB
Address	800F1C0009010C3F (SCOM)
Description	This register is used for impedance calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:52	RWX	TX_ZCAL_P_4X: Calibration circuit PSeg-4X enable value. This field holds the current value of the enabled segments. It is a 2x multiple of the actual segment count. It can be read for the current calibration result set during the calibration sequence. It can be written to immediately update circuit enables on each write. It is used with tx_zcal_swo_* for manual calibration. Do not write this field when tx_zcal_req = 1. (binary code - 0x00 is zero slices and 0x15 is maximum slices).
53:63	RO	constant = 0b00000000000

Register Name	Transmit Impedance Calibration SWO1 Per-Bus Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL_SWO1_PB
Address	800F240009010C3F (SCOM)
Description	This register is used for impedance calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	TX_ZCAL_SWO_EN: Impedance calibration software override. This bit steers all calibration controls directly from these register fields. It effectively disables the state-machine logic (default). 0b0 = Inactive. 0b1 = Enable.
49	RWX	TX_ZCAL_SWO_CAL_SEGS: Impedance calibration software bank select. This bit enables PSeg calibration (default). 0b0 = Select NSeg bank comparison. 0b1 = Select PSeg bank comparison.

Bits	SCOM	Field Mnemonic: Description
50	RWX	TX_ZCAL_SWO_CMP_INV: Impedance calibration software compare invert. This bit swaps calibration circuit comparator inputs (default). 0b0 = Select NSeg bank comparison. 0b1 = Select PSeg bank comparison.
51	RWX	TX_ZCAL_SWO_CMP_OFFSET: Impedance calibration software offset flush. This bit equalizes the comparator offset in the calibration circuit (default). 0b0 = Disable offset. 0b1 = Enable offset.
52	RWX	TX_ZCAL_SWO_CMP_RESET: Impedance calibration software comparator reset. This bit resets the comparator in the calibration circuit (default). 0b0 = Disable reset. 0b1 = Enable reset.
53	RWX	TX_ZCAL_SWO_POWERDOWN: Impedance calibration software circuit power down. This bit enables the power-down calibration circuit (default). 0b0 = Disable power down. 0b1 = Enable power down.
54	RWX	TX_ZCAL_SWO_TCOIL: Impedance calibration software circuit TCoil.
55	RWX	TX_ZCAL_RANGE_CHECK: This bit controls the usage of tx_zcal_sm_min/max_val. 0 = These two registers are used to define the range of zcal. 1 = The calibration range is 1 - 80, and the minimum/maximum registers are only used to check whether the result is in range.
56	RWX	TX_ZCAL_CYA_DATA_INV: Impedance calibration CYA sample inversion. This bit selects inverted comparator values in case of a hardware error (default). 0b0 = No sample inversion. 0b1 = Invert samples.
57	RWX	TX_ZCAL_TEST_OVR_2R: Impedance calibration test-only 2R segment override.
58	RWX	TX_ZCAL_TEST_OVR_1R: Impedance calibration test-only 1R segment override.
59	RWX	TX_ZCAL_TEST_OVR_4X_SEG: Impedance calibration test-only 4x segment override.
60	RWX	TX_ZCAL_TEST_CLK_DIV: This register controls the clock for impedance BIST. 1 = The clock is divided by 32. 0 = PLL bypass mode is needed.
61:63	RO	constant = 0b000

Register Name	Transmit Impedance Calibration SWO2 Per-Bus Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL_SWO2_PB
Address	800F2C0009010C3F (SCOM)
Description	This register is used for impedance calibration.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:54	RWX	TX_ZCAL_SM_MIN_VAL: Impedance calibration minimum search threshold. This low-side segment count limit is used in the calibration process. (binary code - 0x00 is zero slices, and 0x50 is maximum slices).
55:61	RWX	TX_ZCAL_SM_MAX_VAL: Impedance calibration maximum search threshold. This high-side segment count limit is used in the calibration process. (binary code - 0x00 is zero slices and 0x50 is maximum slices).
62:63	RO	constant = 0b00

Register Name	Spare Mode Per-Bus Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.SPARE_MODE_PB
Address	800F340009010C3F (SCOM)
Description	This register contains per-bus spare mode latches.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	RWX	PB_SPARE_MODE_0: Per-bus spare mode latch.
49	RWX	PB_SPARE_MODE_1: Per-bus spare mode latch.
50	RWX	PB_SPARE_MODE_2: Per-bus spare mode latch.
51	RWX	PB_SPARE_MODE_3: Per-bus spare mode latch.
52	RWX	PB_SPARE_MODE_4: Per-bus spare mode latch.
53	RWX	PB_SPARE_MODE_5: Per-bus spare mode latch.
54	RWX	PB_SPARE_MODE_6: Per-bus spare mode latch.
55	RWX	PB_SPARE_MODE_7: Per-bus spare mode latch.
56:63	RO	constant = 0b00000000

Register Name	Transmit IMPCAL2 Per-Bus Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.TX_IMPCAL2_PB
Address	800F3C0009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant = 0b0000000000000000000000000000000000000000000000000
49	ROX	Reserved field.
50	ROX	Reserved field.
51:52	RO	constant = 0b00
53	NCX	Reserved field.
54	ROX	Reserved field.
55	ROX	Reserved field.
56:63	RO	constant = 0b00000000

Register Name	Receive FIR Reset Per-Bus Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.RX_FIR_RESET_PB
Address	800F800009010C3F (SCOM)
Description	This register controls per-bus transmit latches.

Bits	SCOM	Field Mnemonic: Description
0:61	RO	constant = 0b00000000000000000000000000000000000000000000000000000000000000
62	RWX	RX_PB_CLR_PAR_ERRS: Clear all receive parity error latches. Toggle this field 0→1→0 to clear parity-error latches in the BUSCTL logic.

Bits	SCOM	Field Mnemonic: Description
63	RWX	RX_PB_FIR_RESET: FIR reset. Toggle this field 0→1→0 to reset the BUSCTL logic FIR-related latches, including the isolation and parity-error latches.

Register Name	Receive FIR Per-Bus Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.RX_FIR_PB
Address	800F880009010C3F (SCOM)
Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:57	ROX	Reserved field.
58:63	RO	constant = 0b000000

Register Name	Receive FIR Mask Per-Bus Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.RX_FIR_MASK_PB
Address	800F900009010C3F (SCOM)
Description	This register masks receive FIR per-bus errors.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:57	RWX	RX_PB_FIR_ERRS_MASK: IOTK ALIAS: This field is a FIR mask for rx_fir_pb errors.
58:63	RO	constant = 0b000000

Register Name	Receive FIR Error Inject Per-Bus Register
Mnemonic	IOO0.IOO_CPLT.BUSCTL.BUS_REG_IF.BUS_CTL_REGS.RX_FIR_ERROR_INJECT_PB
Address	800F980009010C3F (SCOM)
Description	This register is used to inject errors into the per-bus receive registers.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48:57	RWX	RX_PB_FIR_ERRS_INJ: IOTK ALIAS: Receive per-bus parity error injection. This field allows injection of non-destructive parity errors in either register or state-machine latch banks. The register or state value is not affected.
58:63	RO	constant = 0b000000

8. PCI 0 Chiplet

The POWER9 processor registers are listed alphabetically by mnemonic in the following address table.

Mnemonic	Address	Page
IOP0.IOP_X844.IOP_SCOM.FIR_ACTION0_REG	0x000000000D010C06	1907

The POWER9 processor registers are listed in the following tables.

Register Name	Chiplet Control Register 0		
Mnemonic	TP.TCPCI0.PCI0.CPLT_CTRL0		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
	000000000D000000 (SCOM) 000000000D000010 (SCOM1) 000000000D000020 (SCOM2)	000000000E000000 (SCOM) 000000000E000010 (SCOM1) 000000000E000020 (SCOM2)	000000000F000000 (SCOM) 000000000F000010 (SCOM1) 000000000F000020 (SCOM2)
Description	This register contains the first set of vital chiplet controls.		

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_OR	WO_CLEAR	CTRL_CC_ABSTCLK_MUXSEL_DC: Select ABIST clock source for the arrays on the chiplet boundary. When this bit is set to 1, clocks are used from from the chiplet with ABIST.
1	RW	WO_OR	WO_CLEAR	TC_UNIT_SYNCCLK_MUXSEL_DC: Select the sync clock for asynchronous latches (initialization value = 1).
2	RW	WO_OR	WO_CLEAR	CTRL_CC_FLUSHMODE_INH_DC: Prevent pipeline latches from going into flush mode (initialization value = 1).
3	RW	WO_OR	WO_CLEAR	CTRL_CC_FORCE_ALIGN_DC: Force the align signal to be sent (initialization value = 1, drop before dropping flushmode_inh).
4	RW	WO_OR	WO_CLEAR	TC_UNIT_ARY_WRT_THRU_DC: Set array into write-through mode, used for LBIST.
5	RW	WO_OR	WO_CLEAR	TC_UNIT_AVP_MODE: AVP mode. Switches the refresh pulse to phase counter.
6	RW	WO_OR	WO_CLEAR	FREE_USAGE_6A: Free usage.
7	RW	WO_OR	WO_CLEAR	FREE_USAGE_7A: Free usage.
8	RW	WO_OR	WO_CLEAR	CTRL_CC_ABIST_RECOV_DISABLE_DC: New signal to disable recovery.
9	RW	WO_OR	WO_CLEAR	FREE_USAGE_9A: Free usage.
10	RW	WO_OR	WO_CLEAR	TC_UNIT_IOBIST_TX_WRAP_ENABLE_DC:
11	RW	WO_OR	WO_CLEAR	RESERVED_11A: Reserved.
12	RW	WO_OR	WO_CLEAR	TC_SKIT_MODE_BIST_DC:
13	RW	WO_OR	WO_CLEAR	TC_UNIT_DETERMINISTIC_TEST_ENABLE_DC: Forces login into deterministic test mode; for example, for LBIST.
14	RW	WO_OR	WO_CLEAR	TC_UNIT_CONSTRAIN_SAFESCAN_DC: Safe scan of N1L latches. Prevent a lock when switching SE.
15	RW	WO_OR	WO_CLEAR	TC_UNIT_RRFA_TEST_ENABLE_DC:
16	RW	WO_OR	WO_CLEAR	TC_NBTI_HDR_ENABLE_OVR_DC: NBTI.
17	RW	WO_OR	WO_CLEAR	TC_NBTI_PROBE_GATE_DC: NBTI.
18	RW	WO_OR	WO_CLEAR	RESERVED_18A: Reserved.
19	RW	WO_OR	WO_CLEAR	RESERVED_19A: Reserved.
20:27	RW	WO_OR	WO_CLEAR	TC_PSRO_SEL_DC: PSRO select.
28	RW	WO_OR	WO_CLEAR	TC_BSC_WRAPSEL_DC: Wrap select for BSC.
29	RW	WO_OR	WO_CLEAR	TC_BSC_INTMODE_DC: INT Mode for BSC.
30	RW	WO_OR	WO_CLEAR	TC_BSC_INV_DC: INV for BSC mode.
31	RW	WO_OR	WO_CLEAR	TC_BSC_EXTMODE_DC: EXT mode for BSC.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
32	RW	WO_OR	WO_CLEAR	TC_REFCLK_DRVR_EN_DC: Reference clock driver enable.
33	RW	WO_OR	WO_CLEAR	RESERVED_33A: Reserved.
34	RW	WO_OR	WO_CLEAR	RESERVED_34A: Reserved.
35	RW	WO_OR	WO_CLEAR	RESERVED_35A: Reserved.
36	RW	WO_OR	WO_CLEAR	TC_OELCC_EDGE_DELAYED_DC: Allows to delay the align by one fast cycle. Only used in dual-mesh chiplets.
37	RW	WO_OR	WO_CLEAR	TC_OELCC_ALIGN_FLUSH_DC: Forces the alignment and odd/even toggling latch into flush state. For DFT only.
38	RW	WO_OR	WO_CLEAR	RESERVED_38A: Reserved.
39	RW	WO_OR	WO_CLEAR	RESERVED_39A: Reserved.
40:41	RW	WO_OR	WO_CLEAR	CTRL_MISC_CLKDIV_SEL_DC: Clock divider select 00 = 1024:1 01 = 64:1 10 = 16:1 11 = 4:1
42	RW	WO_OR	WO_CLEAR	RESERVED_42A: Reserved.
43	RW	WO_OR	WO_CLEAR	RESERVED_43A: Reserved.
44	RW	WO_OR	WO_CLEAR	CTRL_CC_DCTEST_DC: TE = 1 only; enable DCTEST.
45	RW	WO_OR	WO_CLEAR	CTRL_CC_OTP_PRGMODE_DC: TE = 1 only; OTP ROM program mode.
46	RW	WO_OR	WO_CLEAR	CTRL_CC_SSS_CALIBRATE_DC: TE = 1 only; sensors calibration.
47	RW	WO_OR	WO_CLEAR	CTRL_CC_PIN_LBIST_DC: TE = 1 only; PIN LBIST mode. LBIST is controlled via PIN, not by OPCG.
48	RW	WO_OR	WO_CLEAR	FREE_USAGE_48A: Free usage.
49	RW	WO_OR	WO_CLEAR	FREE_USAGE_49A: Free usage.
50	RW	WO_OR	WO_CLEAR	FREE_USAGE_50A: Free usage.
51	RW	WO_OR	WO_CLEAR	FREE_USAGE_51A: Free usage.
52	RW	WO_OR	WO_CLEAR	FREE_USAGE_52A: Free usage.
53	RW	WO_OR	WO_CLEAR	FREE_USAGE_53A: Free usage.
54	RW	WO_OR	WO_CLEAR	FREE_USAGE_54A: Free usage.
55	RW	WO_OR	WO_CLEAR	FREE_USAGE_55A: Free usage.
56	RW	WO_OR	WO_CLEAR	FREE_USAGE_56A: Free usage.
57	RW	WO_OR	WO_CLEAR	FREE_USAGE_57A: Free usage.
58	RW	WO_OR	WO_CLEAR	FREE_USAGE_58A: Free usage.
59	RW	WO_OR	WO_CLEAR	FREE_USAGE_59A: Free usage.
60	RW	WO_OR	WO_CLEAR	FREE_USAGE_60A: Free usage.
61	RW	WO_OR	WO_CLEAR	FREE_USAGE_61A: Free usage.
62	RW	WO_OR	WO_CLEAR	FREE_USAGE_62A: Free usage.
63	RW	WO_OR	WO_CLEAR	FREE_USAGE_63A: Free usage.

Register Name	Chiplet Control Register 1
Mnemonic	TP.TCPCI0.PCI0.CPLT_CTRL1
Address	
Description	This register contains the second set of vital chiplet controls.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D000001 (SCOM) 000000000D000011 (SCOM1) 000000000D000021 (SCOM2)	000000000E000001 (SCOM) 000000000E000011 (SCOM1) 000000000E000021 (SCOM2)	000000000F000001 (SCOM) 000000000F000011 (SCOM1) 000000000F000021 (SCOM2)

31	RW	WO_OR	WO_CLEAR	UNUSED_31B: Unused.

Register Name	Chiplet Configuration Register 0
Mnemonic	TP.TCPCI0.PCI0.CPLT_CONF0
Address	
Description	This register contains the first set of vital chiplet configuration functions.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D000008 (SCOM) 000000000D000018 (SCOM1) 000000000D000028 (SCOM2)	000000000E000008 (SCOM) 000000000E000018 (SCOM1) 000000000E000028 (SCOM2)	000000000F000008 (SCOM) 000000000F000018 (SCOM1) 000000000F000028 (SCOM2)

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:5	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE0_SEL_DC: Probe 0 select.
6	RW	WO_OR	WO_CLEAR	RESERVED_6C: Reserved.
7	RW	WO_OR	WO_CLEAR	RESERVED_7C: Reserved.
8:13	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE1_SEL_DC: Probe 1 select.
14	RW	WO_OR	WO_CLEAR	RESERVED_14C: Reserved.
15	RW	WO_OR	WO_CLEAR	RESERVED_15C: Reserved.
16:21	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE2_SEL_DC: Probe 2 select.
22	RW	WO_OR	WO_CLEAR	RESERVED_22C: Reserved.
23	RW	WO_OR	WO_CLEAR	RESERVED_23C: Reserved.
24:29	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE3_SEL_DC: Probe 3 select.
30	RW	WO_OR	WO_CLEAR	RESERVED_30C: Reserved.
31	RW	WO_OR	WO_CLEAR	RESERVED_31C: Reserved.
32	RW	WO_OR	WO_CLEAR	CTRL_CC_OFLOW_FEH_SEL_DC: Selects an ABIST overflow or failure indication.
33	RW	WO_OR	WO_CLEAR	CTRL_CC_SCAN_PROTECT_DC: Enables scan protection;enables the scan collision error mechanism.
34	RW	WO_OR	WO_CLEAR	CTRL_CC_SDIS_DC_N: Disables the scan diagnostic scan path.
35	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_35C: Reserved for test control.
36	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_36C: Reserved for test control.
37	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_37C: Reserved for test control.
38	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_38C: Reserved for test control.
39	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_39C: Reserved for test control.
40	RW	WO_OR	WO_CLEAR	CTRL_EPS_MASK_VITL_PCB_ERR_DC: Mask VITL PCB errors from the CC or CPLT_CTRL.
41	RW	WO_OR	WO_CLEAR	CTRL_CC_MASK_VITL_SCAN_OPCG_ERR_DC: Mask VITL errors in the CC that are not PCB related.
42	RW	WO_OR	WO_CLEAR	RESERVED_42C: Reserved.
43	RW	WO_OR	WO_CLEAR	RESERVED_43C: Reserved.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
44	RW	WO_OR	WO_CLEAR	FREE_USAGE_44C: Free usage.

21	RW	WO_OR	WO_CLEAR	FREE_USAGE_21D: Free usage.
22	RW	WO_OR	WO_CLEAR	FREE_USAGE_22D: Free usage.
23	RW	WO_OR	WO_CLEAR	FREE_USAGE_23D: Free usage.
24	RW	WO_OR	WO_CLEAR	FREE_USAGE_24D: Free usage.
25	RW	WO_OR	WO_CLEAR	FREE_USAGE_25D: Free usage.
26	RW	WO_OR	WO_CLEAR	FREE_USAGE_26D: Free usage.
27	RW	WO_OR	WO_CLEAR	FREE_USAGE_27D: Free usage.
28	RW	WO_OR	WO_CLEAR	TC_IOP_SYS_RESET_PCS: For chiplets with NBTI.
29	RW	WO_OR	WO_CLEAR	TC_IOP_SYS_RESET_PMA: For chiplets with NBTI.
30	RW	WO_OR	WO_CLEAR	TC_IOP_HSSPORWREN: For chiplets with NBTI.
31	RW	WO_OR	WO_CLEAR	FREE_USAGE_31D: Free usage.

Register Name	**Chiplet Status Register**
Mnemonic	TP.TCPCI0.PCI0.CPLT_STAT0
Address	**PCI0 (PE0)**: 000000000D000100 (SCOM) **PCI1 (PE1)**: 000000000E000100 (SCOM) **PCI2 (PE2)**: 000000000F000100 (SCOM)
Description	An interrupt is sent out on a bit change if not masked by the Chiplet Mask Register. A mask only masks the interrupt, not the status register.

Bits	SCOM	Field Mnemonic: Description
0	ROX	SRAM_ABIST_DONE_DC: SRAM and eDRAM ABIST done.
1	ROX	DRAM_ABIST_DONE_DC: Unused in POWER9 DD1.
2	ROX	RESERVED_2E: Reserved.
3	ROX	RESERVED_3E: Reserved.
4	ROX	TC_DIAG_PORT0_OUT: Diagnostic output port.
5	ROX	TC_DIAG_PORT1_OUT: Diagnostic output port.
6	ROX	RESERVED_6E: Reserved.
7	ROX	PLL_DESTOUT: Reserved.
8	ROX	CC_CTRL_OPCG_DONE_DC: OPCG done. Used for LBIST, ABIST, or other OPCG runs.
9	ROX	CC_CTRL_CHIPLET_IS_ALIGNED_DC: Indicates that chiplet is aligned.
10	ROX	FREE_USAGE_10E: Free usage.
11	ROX	FREE_USAGE_11E: Free usage.
12	ROX	FREE_USAGE_12E: Free usage.
13	ROX	FREE_USAGE_13E: Free usage.
14	ROX	FREE_USAGE_14E: Free usage.
15	ROX	FREE_USAGE_15E: Free usage.
16	ROX	FREE_USAGE_16E: Free usage.

Bits	SCOM	Field Mnemonic: Description
17	ROX	FREE_USAGE_17E: Free usage.
18	ROX	FREE_USAGE_18E: Free usage.
19	ROX	FREE_USAGE_19E: Free usage.
20	ROX	FREE_USAGE_20E: Free usage.

23	ROX	FREE_USAGE_23E: Free usage.

Register Name	**Chiplet Mask Register**
Mnemonic	TP.TCPCI0.PCI0.CPLT_MASK0
Address	
Description	This register masks an interrupt when a bit changes in the Chiplet Status Register. It does not mask the status itself.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D000101 (SCOM)	000000000E000101 (SCOM)	000000000F000101 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CPLTMASK0: This field provides bitwise masking of the Chiplet Status Register.

Register Name	**Control Protect Mode Register**
Mnemonic	TP.TCPCI0.PCI0.CTRL_PROTECT_MODE_REG
Address	
Description	This register enables read and write protection.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D0003FE (SCOM)	000000000E0003FE (SCOM)	000000000F0003FE (SCOM)

Bits	SCOM	Field Mnemonic: Description
0	RW	CTRL_READ_PROTECT_ENABLE: This bit enables read protection.
1	RW	CTRL_WRITE_PROTECT_ENABLE: This bit enables write protection.

Register Name	**Atomic Lock Register**
Mnemonic	TP.TCPCI0.PCI0.CTRL_ATOMIC_LOCK_REG
Address	
Description	This register enables an atomic lock and an atomic lock counter.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D0003FF (SCOM)	000000000E0003FF (SCOM)	000000000F0003FF (SCOM)

Bits	SCOM	Field Mnemonic: Description
0	RW	CTRL_ATOMIC_LOCK_ENABLE: This bit enables an atomic lock.
1:4	ROX	CTRL_ATOMIC_ID: This field contains the atomic ID.
5:7	RO	Constant = 0b000
8:15	ROX	CTRL_ATOMIC_ACTIVITY: This field is an atomic lock counter.

Register Name	PSCOMLE Mode Register
Mnemonic	TP.TCPCI0.PCI0.EPS.PSC.PSC.PSCOM_MODE_REG
Address	<table><tr><th>PCI0 (PE0)</th><th>PCI1 (PE1)</th><th>PCI2 (PE2)</th></tr><tr><td>000000000D010000 (SCOM)</td><td>000000000E010000 (SCOM)</td><td>000000000F010000 (SCOM)</td></tr></table>
Description	This is the parallel-to-serial communication light edition (PSCOMLE) mode register.

Bits	SCOM	Field Mnemonic: Description
0	RW	ABORT_ON_PCB_ADDR_PARITY_ERROR: Abort on a PCB address parity error.
1	RW	ABORT_ON_PCB_WDATA_PARITY_ERROR: Abort on a PCB write data parity error.
2	RW	ABORT_ON_DL_RETURN_P0_ERROR: Abort on a DL return P0 error.
3	RW	ABORT_ON_DL_RETURN_WDATA_PARITY_ERROR: Abort on a DL return write data parity error.
4	RW	WATCHDOG_ENABLE: Watchdog enable.
5:6	RW	SCOM_HANG_LIMIT: 11 = 256 10 = 512 01 = 768 00 = 1023
7	RW	FORCE_ALL_RINGS: This bit is set to a logical '1' if all rings must be enable independent of the ring address.
8	RW	FSM_SELFRESET_ON_STATEVEC_PARITYERROR_ENABLE: FSM self-reset on statevec parity error enable.
9:11	RW	RESERVED_PSCOM_MODE_LT: Reserved.

Register Name	PSCOMLE Error Register
Mnemonic	TP.TCPCI0.PCI0.EPS.PSC.PSC.PSCOM_STATUS_ERROR_REG
Address	<table><tr><th>PCI0 (PE0)</th><th>PCI1 (PE1)</th><th>PCI2 (PE2)</th></tr><tr><td>000000000D010001 (SCOM)</td><td>000000000E010001 (SCOM)</td><td>000000000F010001 (SCOM)</td></tr></table>
Description	This is the parallel-to-serial communication light edition (PSCOMLE) error register.

Bits	SCOM	Field Mnemonic: Description
0	RWX	ACCUMULATED_PCB_WDATA_PARITY_ERROR: Accumulated PCB write data parity error.
1	RWX	ACCUMULATED_PCB_ADDRESS_PARITY_ERROR: Accumulated PCB address parity error.
2	RWX	ACCUMULATED_DL_RETURN_WDATA_PARITY_ERROR: Accumulated DL return write data parity error.

Bits	SCOM	Field Mnemonic: Description
3	RWX	ACCUMULATED_DL_RETURN_P0_ERROR: Accumulated DL return P0 error.
4	RWX	ACCUMULATED_UL_RDATA_PARITY_ERROR: Accumulated UL read data parity error.
5	RWX	ACCUMULATED_UL_P0_ERROR: Accumulated UL P0 error.
6	RWX	ACCUMULATED_PARITY_ERROR_ON_INTERFACE_MACHINE: Accumulated parity error on the interface machine.
7	RWX	ACCUMULATED_PARITY_ERROR_ON_P2S_MACHINE: Accumulated parity error on the parallel-to-serial (p2s) machine.
8	RWX	ACCUMULATED_TIMEOUT_WHILE_WAITING_FOR_ULCCH: Accumulated timeout while waiting for ULCCH.
9	RWX	ACCUMULATED_TIMEOUT_WHILE_WAITING_FOR_DLDCH_RETURN: Accumulated timeout while waiting for DLDCH return.
10	RWX	ACCUMULATED_TIMEOUT_WHILE_WAITING_FOR_ULDCH: Accumulated timeout while waiting for ULDCH.
11	RWX	ACCUMULATED_PSCOM_PARALLEL_WRITE_NVLD: Accumulated PSCOM parallel write NVLD.
12	RWX	ACCUMULATED_PSCOM_PARALLEL_READ_NVLD: Accumulated PSCOM parallel read NVLD.
13	RWX	ACCUMULATED_PSCOM_PARALLEL_ADDR_INVALID: Accumulated PSCOM parallel address invalid.
14	RWX	ACCUMULATED_PCB_COMMAND_PARITY_ERROR: Accumulated PCB command parity error.
15	RWX	ACCUMULATED_GENERAL_TIMEOUT: Accumulated general timeout.
16	RWX	ACCUMULATED_SATELLITE_ACKNOWLEDGE_ACCESS_VIOLATION: Accumulated satellite acknowledge access violation.
17	RWX	ACCUMULATED_SATELLITE_ACKNOWLEDGE_INVALID_REGISTER: Accumulated satellite acknowledge invalid register.
18	RWX	TRAPPED_PCB_WDATA_PARITY_ERROR: Trapped PCB write data parity error.
19	RWX	TRAPPED_PCB_ADDRESS_PARITY_ERROR: Trapped PCB address parity error.
20	RWX	TRAPPED_DL_RETURN_WDATA_PARITY_ERROR: Trapped DL return write data parity error.
21	RWX	TRAPPED_DL_RETURN_P0_ERROR: Trapped DL return P0 error.
22	RWX	TRAPPED_UL_RDATA_PARITY_ERROR: Trapped UL read data parity error.
23	RWX	TRAPPED_UL_P0_ERROR: Trapped UL P0 error.
24	RWX	TRAPPED_PARITY_ERROR_ON_INTERFACE_MACHINE: Trapped parity error on the interface machine.
25	RWX	TRAPPED_PARITY_ERROR_ON_P2S_MACHINE: Trapped parity error on the parallel-to-serial (p2s) machine.
26	RWX	TRAPPED_TIMEOUT_WHILE_WAITING_FOR_ULCCH: Trapped timeout while waiting for ULCCH.
27	RWX	TRAPPED_TIMEOUT_WHILE_WAITING_FOR_DLDCH_RETURN: Trapped timeout while waiting for DLDCH return.
28	RWX	TRAPPED_TIMEOUT_WHILE_WAITING_FOR_ULDCH: Trapped timeout while waiting for ULDCH.
29	RWX	TRAPPED_PSCOM_PARALLEL_WRITE_NVLD: Trapped PSCOM parallel write NVLD.
30	RWX	TRAPPED_PSCOM_PARALLEL_READ_NVLD: Trapped PSCOM parallel read NVLD.
31	RWX	TRAPPED_PSCOM_PARALLEL_ADDR_INVALID: Trapped PSCOM parallel address invalid.
32	RWX	TRAPPED_PCB_COMMAND_PARITY_ERROR: Trapped PCB command parity error.
33	RWX	TRAPPED_GENERAL_TIMEOUT: Trapped general timeout.
34	RWX	TRAPPED_SATELLITE_ACKNOWLEDGE_ACCESS_VIOLATION: Trapped satellite acknowledge access violation.

Bits	SCOM	Field Mnemonic: Description
35	RWX	TRAPPED_SATELLITE_ACKNOWLEDGE_INVALID_REGISTER: Trapped satellite acknowledge invalid register.

Register Name	PSCOMLE Error Mask Register
Mnemonic	TP.TCPCI0.PCI0.EPS.PSC.PSC.PSCOM_ERROR_MASK
Address	PCI0 (PE0): 000000000D010002 (SCOM) PCI1 (PE1): 000000000E010002 (SCOM) PCI2 (PE2): 000000000F010002 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) error mask register.

Bits	SCOM	Field Mnemonic: Description
0	RW	MASK_PCB_WDATA_PARITY_ERROR: Mask PCB write data parity error.
1	RW	MASK_PCB_ADDRESS_PARITY_ERROR: Mask PCB address parity error.
2	RW	MASK_DL_RETURN_WDATA_PARITY_ERROR: Mask DL return write data parity error.
3	RW	MASK_DL_RETURN_P0_ERROR: Mask DL return P0 error.
4	RW	MASK_UL_RDATA_PARITY_ERROR: Mask UL read data parity error.
5	RW	MASK_UL_P0_ERROR: Mask UL P0 error.
6	RW	MASK_PARITY_ERROR_ON_INTERFACE_MACHINE: Mask parity error on interface machine.
7	RW	MASK_PARITY_ERROR_ON_P2S_MACHINE: Mask parity error on the parallel-to-serial (p2s) machine.
8	RW	MASK_TIMEOUT_WHILE_WAITING_FOR_ULCCH: Mask timeout while waiting for ULCCH.
9	RW	MASK_TIMEOUT_WHILE_WAITING_FOR_DLDCH_RETURN: Mask timeout while waiting for DLDCH return.
10	RW	MASK_TIMEOUT_WHILE_WAITING_FOR_ULDCH: Mask timeout while waiting for ULDCH.
11	RW	MASK_PSCOM_PARALLEL_WRITE_NVLD: Mask PSCOM parallel write NVLD.
12	RW	MASK_PSCOM_PARALLEL_READ_NVLD: Mask PSCOM parallel read NVLD.
13	RW	MASK_PSCOM_PARALLEL_ADDR_INVALID: Mask PSCOM parallel address invalid.
14	RW	MASK_PCB_COMMAND_PARITY_ERROR: Mask PCB command parity error.
15	RW	MASK_GENERAL_TIMEOUT: Mask general timeout.
16	RW	MASK_SATELLITE_ACKNOWLEDGE_ACCESS_VIOLATION: Mask satellite acknowledge access violation.
17	RW	MASK_SATELLITE_ACKNOWLEDGE_INVALID_REGISTER: Mask satellite acknowledge invalid register.

Register Name	PSCOMLE Address Trap Register
Mnemonic	TP.TCPCI0.PCI0.EPS.PSC.PSC.ADDR_TRAP_REG
Address	PCI0 (PE0): 000000000D010003 (SCOM) PCI1 (PE1): 000000000E010003 (SCOM) PCI2 (PE2): 000000000F010003 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) address trap register.

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	PCB_ADDRESS_OF_LAST_TRANSACTION_WITH_ERROR: This field contains the PCB address of the last transaction with an error.
16	ROX	PCB_READ_NOTWRITE_OF_LAST_TRANSACTION_WITH_ERROR: PCB read, not write, of the last transaction with an error.
17	ROX	RESERVED_ADDR_LAST_TRAP_LT: Reserved 0.
18:30	ROX	SERIAL2PARALLEL_STATE_MACHINE_AT_TIME_OF_ERROR: Serial-to-parallel state machine at the time of the error.
31	ROX	SATELLITE_ACKNOWLEDGE_BIT_RETURN_PARITY: Satellite acknowledge bit. This bit is set to 1 if no parity error is detected in the satellite number or acknowledgment bits.
32	ROX	SATELLITE_ACKNOWLEDGE_BIT_WRITE_PARITY_ERROR: This bit is set if a write parity error is detected by the satellite.
33	ROX	SATELLITE_ACKNOWLEDGE_BIT_ACCESS_VIOLATION: This bit is set if an invalid read or write access is detected by the satellite.
34	ROX	SATELLITE_ACKNOWLEDGE_BIT_INVALID_REGISTER: This bit is set if an invalid register address is detected by the satellite.

Register Name	**Ring Lock Enable Register**
Mnemonic	TP.TCPCI0.PCI0.EPS.PSC.PSC.WRITE_PROTECT_ENABLE_REG
Address	
Description	This register enables the ring lock.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D010005 (SCOM)	000000000E010005 (SCOM)	000000000F010005 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0	RW	ENABLE_RING_LOCKING: General enable of ring locking upon a write to a specific ring.
1	RW	RESERVED_RING_LOCKING: Reserved.

Register Name	**Write Protect Rings Register**
Mnemonic	TP.TCPCI0.PCI0.EPS.PSC.PSC.WRITE_PROTECT_RINGS_REG
Address	
Description	This register writes ring-protect bit maps.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D010006 (SCOM)	000000000E010006 (SCOM)	000000000F010006 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:15	RW	WRITE_PROTECT_RINGS: Writes a protect bit map for each ring.

Register Name	Atomic Lock Mask Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.PSC.PSC.ATOMIC_LOCK_MASK_LATCH_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D010007 (SCOM)	000000000E010007 (SCOM)	000000000F010007 (SCOM)
Description	This register provides a bit mask for atomic locking.		

Bits	SCOM	Field Mnemonic: Description
0:15	RW	ATOMIC_LOCK_MASK: This field provides a bit mask for atomic locking on a ring-by-ring basis.

Register Name	Ring Fence Enable Mask Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.PSC.PSC.RING_FENCE_MASK_LATCH_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D010008 (SCOM)	000000000E010008 (SCOM)	000000000F010008 (SCOM)
Description	This register provides a bit mask for ring fencing.		

Bits	SCOM	Field Mnemonic: Description
0	RO	Constant = 0b0
1:15	RW	RING_FENCE_ENABLE_MASK: This field provides a bit mask for ring fencing on a ring-by-ring basis.

Register Name	Trace Array High Data Register		
Mnemonic	TP.TCPCI0.PCI0.TRA0.TR0.TRACE_HI_DATA_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D010400 (SCOM)	000000000E010400 (SCOM)	000000000F010400 (SCOM)
Description	This register provides the high trace array data.		

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	TRACE_HI_DATA: This field contains trace array data 0:63.

Register Name	Trace Array Low Data Register		
Mnemonic	TP.TCPCI0.PCI0.TRA0.TR0.TRACE_LO_DATA_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D010401 (SCOM)	000000000E010401 (SCOM)	000000000F010401 (SCOM)
Description	This register provides the low trace array data.		

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	TRACE_LO_DATA: These are the bits for the trace array data bits 64:95.
32:41	ROX	TRACE_ADDRESS: Trace address.
42:50	ROX	TRACE_LAST_BANK: Trace last bank.
51	ROX	TRACE_LAST_BANK_VALID: Trace last bank valid.
52	ROX	TRACE_WRITE_ON_RUN: Trace write-on-run indicator.
53	ROX	TRACE_RUNNING: Trace run indicator.
54:63	ROX	TRACE_HOLD_ADDRESS: Trace hold address (pointing to last entry).

Register Name	Trace Control Configuration Register
Mnemonic	TP.TCPCI0.PCI0.TRA0.TR0.TRACE_TRCTRL_CONFIG
Address	PCI0 (PE0): 000000000D010402 (SCOM) PCI1 (PE1): 000000000E010402 (SCOM) PCI2 (PE2): 000000000F010402 (SCOM)
Description	This register contains trace control configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	STORE_ON_TRIG_MODE: This bit enables store-on-trigger mode.
1	RW	WRITE_ON_RUN_MODE: Not implemented. Use bit 0 of TRACE_TRDATA_CONFIG_9 instead. Force an unconditional write when trace_run.
2:9	RW	EXTEND_TRIG_MODE: This field contains the counter value for extended trigger mode.
10	RW	BANK_MODE: This bit enables bank mode.
11	RW	ENH_TRACE_MODE: This bit suppresses writing timestamps in store-on-trigger mode.
12:13	RW	LOCAL_CLOCK_GATE_CONTROL: Local clock gate control selection. x0 = Normal clock gating. x1 = rd_act to trace array turned off.
14:17	RW	TRACE_SELECT_CONTROL: This field is a selector for two sets of external trace bus multiplexers: tra_mux0_sel(0:1) and tra_mux1_sel(0:1).
18:21	RW	SPARE_CONTROL: This field contains spare control bits.

Register Name	Trace Data Configuration Register 0
Mnemonic	TP.TCPCI0.PCI0.TRA0.TR0.TRACE_TRDATA_CONFIG_0
Address	PCI0 (PE0): 000000000D010403 (SCOM) PCI1 (PE1): 000000000E010403 (SCOM) PCI2 (PE2): 000000000F010403 (SCOM)
Description	This register contains a trace data compare mask for bits 0 - 63.

Bits	SCOM	Field Mnemonic: Description
0:63	RW	CMP_MSK_LT_B_0_TO_63: This field contains a trace data compression mask for trace bus bits 0 - 63. 1 = Record an entry when this bit changes, 0 = Ignore this bit. Setting the mask to all zeros results in no trace entries being recorded just from bit changes.

Register Name	**Trace Data Configuration Register 1**
Mnemonic	TP.TCPCI0.PCI0.TRA0.TR0.TRACE_TRDATA_CONFIG_1
Address	
Description	This register contains a trace data compare mask for bits 64 - 87.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D010404 (SCOM)	000000000E010404 (SCOM)	000000000F010404 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CMP_MSK_LT_B_64_TO_87: This field contains a trace data compression mask for bits 64 - 87. 1 = Record an entry when this bit changes, 0 = Ignore this bit. Setting the mask to all zeros results in no trace entries being recorded just from bit changes.

Register Name	**Trace Data Configuration Register 2**
Mnemonic	TP.TCPCI0.PCI0.TRA0.TR0.TRACE_TRDATA_CONFIG_2
Address	
Description	This register contains patterns A and B.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D010405 (SCOM)	000000000E010405 (SCOM)	000000000F010405 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNA: Pattern match pattern a 0 - 23.
24:47	RW	PATTERNB: Pattern_match_pattern b 0 - 23.

Register Name	**Trace Data Configuration Register 3**
Mnemonic	TP.TCPCI0.PCI0.TRA0.TR0.TRACE_TRDATA_CONFIG_3
Address	
Description	This register contains patterns C and D.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D010406 (SCOM)	000000000E010406 (SCOM)	000000000F010406 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNC: Pattern match pattern C 0 - 23.
24:47	RW	PATTERND: Pattern match pattern D 0 - 23.

Register Name	Trace Data Configuration Register 4		
Mnemonic	TP.TCPCI0.PCI0.TRA0.TR0.TRACE_TRDATA_CONFIG_4		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D010407 (SCOM)	000000000E010407 (SCOM)	000000000F010407 (SCOM)
Description	This register contains masks A and B.		

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKA: Mask A. These are the mask bits for the pattern A trace data compare function. They are set to 1 to mask off individual bits.
24:47	RW	MASKB: Mask B. These are the mask bits for the pattern B trace data compare function. They are set to 1 to mask off individual bits.

Register Name	Trace Data Configuration Register 5		
Mnemonic	TP.TCPCI0.PCI0.TRA0.TR0.TRACE_TRDATA_CONFIG_5		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D010408 (SCOM)	000000000E010408 (SCOM)	000000000F010408 (SCOM)
Description	This register contains masks C and D.		

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKC: Mask C.
24:47	RW	MASKD: Mask D.

Register Name	Trace Data Configuration Register 9		
Mnemonic	TP.TCPCI0.PCI0.TRA0.TR0.TRACE_TRDATA_CONFIG_9		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D010409 (SCOM)	000000000E010409 (SCOM)	000000000F010409 (SCOM)
Description	This register contains trace data configuration fields.		

Bits	SCOM	Field Mnemonic: Description
0	RW	DISABLE_COMPRESSION: Disable trace data compression (store data every cycle).
1	RW	ERROR_BIT_COMPRESSION_CARE_MASK: Take into account (care about) changes in the error bit for trace data compression (default = 0).
2:3	RW	MATCHA_MUXSEL: Match PATTERNA against: 00 = Trace bus bits (00:23). 01 = Trace bus bits (24:47). 10 = Trace bus bits (48:71). 11 = Trace bus bits (72:87) | 8 zeros.

Bits	SCOM	Field Mnemonic: Description
4:5	RW	MATCHB_MUXSEL: Match PATTERNB against: 00 = Trace bus bits (00:23). 01 = Trace bus bits (24:47). 10 = Trace bus bits (48:71). 11 = Trace bus bits (72:87) | 8 zeros.
6:7	RW	MATCHC_MUXSEL: Match PATTERNC against: 00 = Trace bus bits (00:23). 01 = Trace bus bits (24:47). 10 = Trace bus bits (48:71). 11 = Trace bus bits (72:87) | 8 zeros.
8:9	RW	MATCHD_MUXSEL: Match PATTERND against: 00 = Trace bus bits (00:23). 01 = Trace bus bits (24:47). 10 = Trace bus bits (48:71). 11 = Trace bus bits (72:87) | 8 zeros.
10:13	RW	TRIG0_OR_MASK: Note: The OR of all selected MATCHes is ORd with result of TRIG0_AND. 0b1XXX selects MATCHA OR. 0bX1XX selects MATCHB OR. 0bXX1X selects MATCHC OR. 0bXXX1 selects MATCHD OR. 0b0000 selects to not OR any MATCHes.
14:17	RW	TRIG0_AND_MASK: Note: The AND of following selected MATCHes is ORd with result of TRIG0_OR. 0b1XXX selects MATCHA AND. 0bX1XX selects MATCHB AND. 0bXX1X selects MATCHC AND. 0bXXX1 selects MATCHD AND. 0b0000 selects to not AND any MATCHes together to form TRIG0.
18:21	RW	TRIG1_OR_MASK: Note: The OR of all selected MATCHes is ORd with result of TRIG1_AND. 0b1XXX selects MATCHA OR. 0bX1XX selects MATCHB OR. 0bXX1X selects MATCHC OR. 0bXXX1 selects MATCHD OR. 0b0000 selects to not OR any MATCHes to form TRIG1.
22:25	RW	TRIG1_AND_MASK: Note: The AND of following selected MATCHes is ORd with result of TRIG1_OR. 0b1XXX selects MATCHA AND. 0bX1XX selects MATCHB AND. 0bXX1X selects MATCHC AND. 0bXXX1 selects MATCHD AND. 0b0000 selects to not AND any MATCHes together to form TRIG1.
26	RW	TRIG0_NOT_MODE: Invert TRIG0 before using it.
27	RW	TRIG1_NOT_MODE: Invert TRIG1 before using it.
28:31	RW	MATCH_NOT_MODE: Invert the match polarity before using it to form a TRIGger. 0b1000 inverts MATCHA. 0b0100 inverts MATCHB. 0b0010 inverts MATCHC. 0b0001 inverts MATCHD.
32	RW	ERROR_CMP_MASK: Leave this at 0. It is a trap. (DD1 bug).
33	RW	ERROR_CMP_PATTERN: Value to a compare trace error against.
34	RW	TRIG0_ERR_CMP: Include (via OR) the error comparison result into trig0.

Bits	SCOM	Field Mnemonic: Description
35	RW	TRIG1_ERR_CMP: Include (via OR) the error comparison result into trig1.
36	RW	DD1_STRETCH_TRIGGER_PULSES: (DD1 workaround) Stretches the trigger output pulses to two clocks. This bit must be enabled for MCFAST and L2FAST traces.
37	RW	Spare lt.

Register Name	**Debug Mode Register**
Mnemonic	TP.TCPCI0.PCI0.EPS.DBG.DBG_MODE_REG
Address	
Description	This is debug macro configuration register 0 for the configuration component.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D0107C0 (SCOM)	000000000E0107C0 (SCOM)	000000000F0107C0 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:2	RW	GLB_BRCST_MODE: Global broadcast mode (0 - 2): 100 = Debug trace run and debug trace freeze. 101 = Pc tcdbg trace run fncd and debug trace freeze. 110 = Debug triggers out(0 - 1). 111 = Pc tcdbg triggers(0 - 1) (from core).
3:5	RW	TRACE_SEL_MODE: Selects the source for trace_run and bank. 001 = core trace run and bank. 010 = tp broadcast run and 0. 011 = tc_dbg_inter_brcst latched. 100 = tc_dbg_dbg_sync_brcst_rcv. Else = dbg_trace_run and dbg_trace_bank.
6:7	RW	TRIG_SEL_MODE: Selects the source for tcdbg_trigger(0). 10 = global broadcast. 11 = pc_tcdbg_trigger (from core). Else = dbg_triggers_out(0:1).
8	RW	STOP_ON_XSTOP_SELECTION: This bit enables a trace stop on a checkstop.
9	RW	STOP_ON_RECOV_ERR_SELECTION: This bit enables a trace stop on a recoverable error.
10	RW	STOP_ON_SPATTN_SELECTION: This bit enables a trace stop on special attention.
11	RW	FREEZE_SEL_MODE: Select freeze source: 0 = Local debug freeze. 1 = Via broadcast: tp_tcdbg_glb_brcst(1).
12:13	RW	SYNC_BRCST_MODE: Originally used for synchronous broadcast mode; currently unused because obsolete. See trace_sel_mode.
14	RO	Constant = 0b0 sync_brcst_mode.

Register Name	**Debug Trace Mode 2 Register**
Mnemonic	TP.TCPCI0.PCI0.EPS.DBG.DBG_TRACE_MODE_REG_2
Address	
Description	This is debug macro configuration register 2 for the back-end component.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D0107CF (SCOM)	000000000E0107CF (SCOM)	000000000F0107CF (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:15	RW	RUNN_COUNT_COMPARE_VALUE: Compare value for the run-N counter used in trace modes run-N and wait-N.
16	RW	IMM_FREEZE_MODE: Immediate freeze mode.
17	RW	STOP_ON_ERR: Stop and freeze on a checkstop.
18	RW	BANK_ON_RUNN_MATCH: Bank switch on run-N match.
19	RW	FORCE_TEST_MODE: Force run-N condition to be true.
20	RW	ACCUM_HIST_MODE: Accumulate history mode; do not clear history mode when trace_run active.
21	RW	FRZ_COUNT_ON_FRZ: Freeze condition counters on trace freeze.

Register Name	Debug Trace Control Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.DBG.DEBUG_TRACE_CONTROL		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0107D0 (SCOM)	000000000E0107D0 (SCOM)	000000000F0107D0 (SCOM)
Description	This is the trace start/stop/reset using SCOM command register. Use write data(0/1/2) = 1.		

Bits	SCOM	Field Mnemonic: Description
0	WOX	scom_trace_start. Set to 1 to start a SCOM trace.
1	WOX	scom_trace_stop. Set to 1 to stop a SCOM trace.
2	WOX	scom_trace_reset. Set to 1 to reset a SCOM trace.

Register Name	Extra Trace Mode Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.DBG.XTRA_TRACE_MODE		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0107D1 (SCOM)	000000000E0107D1 (SCOM)	000000000F0107D1 (SCOM)
Description	This register provides an extra or dedicated trace mode register for core triggers.		

Bits	SCOM	Field Mnemonic: Description
0:37	RW	XTRA_TRACE_MODE_DATA: Extra or dedicated trace mode register for core triggers.

Register Name	PE Bus AIB Mode Bits Register		
Mnemonic	PE0.PB0.PBAIB.REGS.PBAIBHWCFG_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D010800 (SCOM)	000000000E010800 (SCOM)	000000000F010800 (SCOM)
Description	PE Bus AIB Mode Bits		

Bits	SCOM	Field Mnemonic: Description
0:15	RW	Reserved0.
16:18	RW	PE_OSMB_DATASTART_MODE: Mode bits for allowing overcommit of the outbound speed-matching buffer. StartAfterFourBeats (000): Start next packet after 4 data beats. StartAfterFiveBeats (100): Start next packet after 5 data beats. StartAfterSixBeats (101): Start next packet after 6 data beats. StartAfterSevenBeats (110): Start next packet after 7 data beats. StartAfterEightBeats (111): Start next packet after 8 data beats. All others are reserved.
19	RW	Reserved1.

Bits	SCOM	Field Mnemonic: Description
20:23	RW	PE_TX_RESP_HWM: Mode bits for the high water mark for stalling outbound commands. The default is 10.
24:27	RW	PE_TX_RESP_LWM: Mode bits for the low water mark for stalling outbound commands. The default is 0x02.
28:29	RW	PE_OSMB_EARLYEMPTY_MODE: Mode bits for allowing sending outbound SMB empty early. NoEarlyOSMBEmpty (00): Do not send empty toggle early. ThreeEarlyOSMBEmpty (01): Send empty toggle 3 cycles early. FourEarlyOSMBEmpty (10): Send empty toggle 4 cycles early. FiveEarlyOSMBEmpty (11: Send empty toggle 5 cycles early.
30	RW	PE_PCIE_CLK_TRACE_EN: Enable debug tracing of PCI clock signals.
31	RW	PE_SELECT_ETU_TRACE: Choose the debug bus controlled by the ETU register.
32:35	RW	PE_PCI_CLK_TRACE_SEL: Mode bits for selecting what PCI clock domain trace function. Tx_AIB (01): Trace outbound AIB information. Rx_AIB (10): Trace inbound AIB information. ASB (11): Trace ASB transactions.
36:38	RW	PE_ISMB_ERROR_INJECT: Mode bits for injecting inbound SMB errors. NoInject_iSMB (000): No Inject on the inbound the iSMB. Inject_iSMB_parity_error(111): Inject a parity error into the iSMB(control). Inject_iSMB_ECC_ce (100): Inject a correctable ECC error into the iSMB(data). Inject_iSMB_ECC_ue (101): Inject an uncorrectable ECC error into the iSMB(data). Inject_iSMB_ECC_sue (110): Inject a special uncorrectable ECC error into the iSMB(data).
39	RW	Reserved2.
40:42	RW	PE_OSMB_HOL_BLK_CNT: Mode bits for allowing the outbound speed-matching buffer to the head-of-line (HOL) block for a programmable number of cycles. Disabled (000): Disabled. No HOL blocking; if no AIB credit is available, reject the command. Wait04Clocks(100): Enabled. Wait 4 PCI clocks for a credit to become available, then reject. Wait08Clocks(101): Enabled. Wait 8 PCI clocks for a credit to become available, then reject. Wait16Clocks(110): Enabled. Wait 16 PCI clocks for a credit to become available, then reject. Wait32Clocks(111): Enabled. Wait 32 PCI clocks for a credit to become available, then reject.

Description	The Who is on first register indicates which error occurred first		

Bits	SCOM	Field Mnemonic: Description
0:36	RWX_WCLRREG	FIR_WOF_REG_WOF: The WOF Register locks on the first error.
37:63	RO	Constant = 0b000000000000000000000000000

Register Name	Configuration of CC Counters Register		
Mnemonic	TP.TCPCI0.PCI0.SYNC_CONFIG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D030000 (SCOM)	000000000E030000 (SCOM)	000000000F030000 (SCOM)
Description	Configuration of CC counters		

Bits	SCOM	Field Mnemonic: Description
0:3	RW	SYNC_PULSE_DELAY: Delay the incoming sync pulse. The default is 8 latches including asynchronous. 0000 = 8 0001 = 2 0010 = 3 0011 = 4 0100 = 5 0101 = 6 0110 = 7 0111 = 8 cycles 1000 = 9 1001 = 10 1010 = 11 1011 = 12 1100 = 13 1101 = 14 1110 = 15 1111 = 16 delay of the reset of the phase counter.
4	RW	LISTEN_TO_SYNC_PULSE_DIS: Disable phase counter synchronization by the sync_pulse signal. (The default is enabled.) Attention: When you enable listen_to_sync, the chiplet gets corrupted for 200 cycles.
5	RW	SYNC_PULSE_INPUT_SEL: The default is 0. When set to 1, the alternative input of the sync_pulse is used. Attention: When you toggle the input select, the chiplet gets corrupted for 200 cycles.
6	RW	USE_SYNC_FOR_SCAN: If set, use OPCG initial alignment for scan requests.
7	RW	CLEAR_CHIPLET_IS_ALIGNED: This bit clears the chiplet_is_aligned bit. See the cplt_stat register.
8	RW	UNIT_REGION_CLKCMD_ENABLE: Enable the unit interface to start or stop one dedicate region. Used for the POWER9 cache or core.
9	RW	DISABLE_PCB_ITR: Disable interrupt generation within the CC. An interrupt is sent on each HLD event.
10	RW	ENABLE_VITL_ALIGN_CHECK: Enable the VITL align check to compare alignment of an incoming sync pulse with 2:1 VITL LCB.
11	RW	SYNC_PULSE_OUT_DIS: Disable sync_pulse output. When set to 1, the master chiplet does not send sync pulses to slave chiplets anymore.
12:19	RW	UNUSED1219: Unused.

Register Name	OPCG Alignment Register		
Mnemonic	TP.TCPCI0.PCI0.OPCG_ALIGN		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
	000000000D030001 (SCOM)	000000000E030001 (SCOM)	000000000F030001 (SCOM)
Description	OPCG ALIGN		

Bits	SCOM	Field Mnemonic: Description
0:3	RW	INOP_ALIGN: INOP phase alignment (0: none, 1: 2:1, 2: 3:1, 3: 4:1, 4: 6:1, 5: 8:1, 6: 12:1, 7: 16:1, 8: 24:1, 9-15: 48:1).
4:7	RW	SNOP_ALIGN: SNOP phase alignment (0: none, 1: 2:1, 2: 3:1, 3: 4:1, 4: 6:1, 5: 8:1, 6: 12:1, 7: 16:1, 8: 24:1, 9-15: 48:1).
8:11	RW	ENOP_ALIGN: ENOP phase alignment (0: none, 1: 2:1, 2: 3:1, 3: 4:1, 4: 6:1, 5: 8:1, 6: 12:1, 7: 16:1, 8: 24:1, 9-15: 48:1).
12:19	RW	INOP_WAIT: INOP cycle delay (0 - 255).
20:31	RW	SNOP_WAIT: SNOP cycle delay (0 - 4095).
32:39	RW	ENOP_WAIT: ENOP cycle delay (0 - 255).
40	RW	INOP_FORCE_SG: INOP: Set SG high during INOP.
41	RW	SNOP_FORCE_SG: SNOP: Set SG high during SNOP.
42	RW	ENOP_FORCE_SG: ENOP: Set SG high during ENOP (including LOOP phase).
43	RW	NO_WAIT_ON_CLK_CMD: 0 = A clock change request first waits the OPCG_WAIT cycles. 1 = A clock change request does not wait when not in flush.
44:45	RW	ALIGN_SOURCE_SELECT: 0: Use the inopa setting from opcg_reg0. 1: Use the rising edge of the sync pulse. 2: Use unit0_sync_lvl to align (for AVP - refresh0). 3: Use unit1_sync_lvl to align (for AVP - refresh1).
46	RW	UNUSED46: Unused.
47:51	RW	SCAN_RATIO: scan_ratio (n = 0 - 15: (n+1):1, 16: 24:1, 17: 32:1, 18: 48:1, 19: 64:1, 20: 128:1). The default is 4:1 = 00011.
52:63	RW	OPCG_WAIT_CYCLES: Old PAD value. Delay at the beginning and end of the OPCG run to enable DC signals to be there at the correct time (0 = 4095). Must be higher than the pipeline-latch depth. The default is 0x020.

Register Name	OPCG Control Register 0		
Mnemonic	TP.TCPCI0.PCI0.OPCG_REG0		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
	000000000D030002 (SCOM)	000000000E030002 (SCOM)	000000000F030002 (SCOM)
Description	OPCG Control Register 0		

Bits	SCOM	Field Mnemonic: Description
0	RW	RUNN_MODE: 0 = BIST mode used for LBIST. 1 = Run-N mode used for ABIST/IOBIST.
1	RWX	OPCG_GO: OPCG go (start OPCG). This bit is cleared when the OPCG is done. Poll for opcg_done in the cplt_start register
2	RWX	RUN_SCAN0: Run scan0 (overrides all BIST mode settings but the scan_ratio). Starts a scan0 run. The bit gets cleared when OPCG is done. Poll for opcg_done in the cplt_start register.
3	RW	SCAN0_MODE: Set PRPGs in scan0_mode but do not run the automatic scan0 sequence.
4	RWX	OPCG_IN_SLAVE_MODE: When selected, the OPCG waits for the master chiplet to get started. When Keep_MS_Mode is 0, SLAVE_MODE is cleared after the incoming trigger.
5	RWX	OPCG_IN_MASTER_MODE: When selected, the OPCG sends out a trigger to all slave chiplets. When Keep_MS_MODE = 0, MASTER_MODE is cleared after sending out one master trigger.
6	RW	KEEP_MS_MODE: When set to 1, the OPCG in M/S mode bits are not cleared after one incoming OPCG trigger. The default is clear the M/S mode bits.
7	RW	TRIGGER_OPCG_ON_UNIT0_SYNC_LVL: The unit pin used for AVP can trigger OPCG (unit0_sync_lvl).
8	RW	TRIGGER_OPCG_ON_UNIT1_SYNC_LVL: The unit pin used for AVP can trigger OPCG (unit1_sync_lvl).
9	RWX	RUN_CHIPLET_SCAN0: Run scan0 on all regions and types. The clears the chiplet.
10	RWX	RUN_CHIPLET_SCAN0_NO_PLL: Run scan0 on all regions and types. This clears the chiplet excluding the PLL region. The PLL can keep running.
11	RW	RUN_OPCG_ON_UPDATE_DR: Start the OPCG engine when scan updated (update_dr) is received (set pulse). Cronus requires this bit = 1 for a setpulse WRITE.
12	RW	RUN_OPCG_ON_CAPTURE_DR: Start the OPCG engine when scan updated (capture_dr) is received (set pulse). Cronus requires this bit = 1 for a setpulse READ.
13	RW	STOP_RUNN_ON_XSTOP: Run-N mode: Stop run-n on a checkstop.
14	RW	OPCG_STARTS_BIST: Run-N mode: The OPCG engine controls start_bist for ABIST or IOBIST (see BIST register).
15:20	RW	UNUSED1520: Unused.
21:63	RWX	LOOP_COUNT: Loop counter for LBIST and RUN-N. Write: Target value. Read: Current counter value. Counts from 0 to the target value.

Register Name	OPCG Control Register 1
Mnemonic	TP.TCPCI0.PCI0.OPCG_REG1
Address	
Description	OPCG Control Register 1

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D030003 (SCOM)	000000000E030003 (SCOM)	000000000F030003 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:11	RW	SCAN_COUNT: BIST mode: Channel scan count (s = 0 - 4095) Run-N mode: The start_bist match value (0:11).

Bits	SCOM	Field Mnemonic: Description
12:23	RW	MISR_A_VAL: BIST mode: The a value for the MISR aperture. Run-N mode: The start_bist match value (12:23).
24:35	RW	MISR_B_VAL: BIST mode: The b value for the MISR aperture. Run-N mode: The start_bist match value (24:35).
36:47	RW	MISR_INIT_WAIT: BIST mode: Delay MISR aperture. MISRs get active after this number of loops.
48	RW	OPCG_SUPPRESS_LAST_RUNN_CLK: OPCG suppresses the last RUNN clock. Normal slow mesh sees N cycles instead of N+1. Fast mesh sees 2 ´ (N +1) -1 cycles.
49	RW	SCAN_CLK_USE_EVEN: Generate a scan clock in an even cycle instead of an odd. The default is 0 = odd for scan.
50:51	RW	UNUSED2: Unused.
52	RW	RTIM_THOLD_FORCE: Force rtim_thold low when not in test_dc mode (must be 0 at all time).
53	RW	DISABLE_ARY_CLK_DURING_FILL: LBIST and SCAN0: Prevent the fire of ARY HLD during an NSL fill.
54	RW	SG_HIGH_DURING_FILL: LBIST and SCAN0: Hold SG high during an NSL fill.
55:56	RW	LBIST_SKITTER_CTL: BIST mode: 00 = Enable skitter during lbist_ip. 01 = Enable skitter when misr_active. See misr_init_wait. 10 = Skitter OPCG_GO mode. The falling edge equals start; the rising edge equals stop. 11 = Unused.
57	RW	MISR_MODE: BIST mode: MISR aperture mode 0 = a-1 to b-1. 1 = Start to a and b to end.
58	RW	INFINITE_MODE: Infinite mode. RUN-N and LBIST run forever and ignore the loop count.
59:63	RW	NSL_FILL_COUNT: BIST mode: NSL-fill count (0 - 31).

Register Name	**OPCG Control Register 2**
Mnemonic	TP.TCPCI0.PCI0.OPCG_REG2
Address	
Description	OPCG Control Register 2

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D030004 (SCOM)	000000000E030004 (SCOM)	000000000F030004 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0	RWX	OPCG_GO2: OPCG go for broadcast sequences (start sequence).
1:3	RW	PRPG_WEIGHTING: prpg_activate: 1/2, 1/4, 1/8, 1/16, 1/2, 3/4, 7/8, 15/16.
4:15	RWX	PRPG_VALUE: Set to 0 for PRPG always on; else seed.
16:27	RW	PRPG_A_VAL: The a value for the PRPG aperture.
28:39	RW	PRPG_B_VAL: The b value for the PRPG aperture.
40	RW	PRPG_MODE: PRPG aperture mode: 0 = a-1 to b-1. 1 = Start to a and b to end.
41:63	RW	UNUSED41_63: Unused.

Register Name	Scan Region and Type Register
Mnemonic	TP.TCPCI0.PCI0.SCAN_REGION_TYPE
Address	PCI0 (PE0): 000000000D030005 (SCOM) PCI1 (PE1): 000000000E030005 (SCOM) PCI2 (PE2): 000000000F030005 (SCOM)
Description	Scan Region and Type

Bits	SCOM	Field Mnemonic: Description
0	RWX	SYSTEM_FAST_INIT: The default is 0. When it is set to 1, the MASK bits in the CMSK chain decide which part will be scanned or scan0. MASK = 1 = scan0. MASK = 0 = part or scan chain.
1:2	RO	Constant = 0b00
3	NCX	SCAN_REGION_VITL: Scan clock region VITL (Vital = Clock).
4	RWX	SCAN_REGION_PERV: Scan clock region perv (Pervasive).
5	RWX	SCAN_REGION_UNIT1: Scan clock region pci00 - PCI.
6	RWX	SCAN_REGION_UNIT2: Scan clock region iopci0 - IOP.
7	RWX	SCAN_REGION_UNIT3: Scan clock region unused.
8	RWX	SCAN_REGION_UNIT4: Scan clock region unused.
9	RWX	SCAN_REGION_UNIT5: Scan clock region unused.
10	RWX	SCAN_REGION_UNIT6: Scan clock region unused.
11	RWX	SCAN_REGION_UNIT7: Scan clock region unused.
12	RWX	SCAN_REGION_UNIT8: Scan clock region unused.
13	RWX	SCAN_REGION_UNIT9: Scan clock region unused.
14	RWX	SCAN_REGION_UNIT10: Scan clock region PLL.
15:47	RO	Constant = 0b000000000000000000000000000000000
48	RW	SCAN_TYPE_FUNC: Scan chain functional.
49	RW	SCAN_TYPE_CFG: Scan chain mode (boot configuration and debug configuration).
50	RW	SCAN_TYPE_CCFG_GPTR: Scan chain CCFG / GPTR (Pervasive: CC configuration, Others: GPTR).
51	RW	SCAN_TYPE_REGF: Scan chain register files.
52	RW	SCAN_TYPE_LBIST: Scan chain lbst (LBIST).
53	RW	SCAN_TYPE_ABIST: Scan chain abst (ABIST).
54	RW	SCAN_TYPE_REPR: Scan chain repr (Array Repair).
55	RW	SCAN_TYPE_TIME: Scan chain time (Array Timing).
56	RW	SCAN_TYPE_BNDY: Scan chain bndy (Boundary I/Os).
57	RW	SCAN_TYPE_FARR: Scan chain FARR (fast array unload).
58	RW	SCAN_TYPE_CMSK: Scan chain CMSK (LBIST channel mask).
59	RW	SCAN_TYPE_INEX: Scan chain index (c14 ASIC).
60:63	RO	Constant = 0b0000

Register Name	Start/Stop Clocks Register
Mnemonic	TP.TCPCI0.PCI0.CLK_REGION
Address	PCI0 (PE0): 000000000D030006 (SCOM) PCI1 (PE1): 000000000E030006 (SCOM) PCI2 (PE2): 000000000F030006 (SCOM)
Description	Start/stop of clocks

Bits	SCOM	Field Mnemonic: Description
0:1	RWX	CLOCK_CMD: Command for clock control: 00 = NOP 01 = Start 10 = Stop 11 = Pulse (one pulse)
2	RWX	SLAVE_MODE: When selected, the clock command waits for the master chiplet to get started. The bit gets cleared after the incoming slave trigger, and Keep_MS_Mode_after_trigger is set to 0.
3	RWX	MASTER_MODE: When selected, the clock command sends out a trigger to all the slave chiplets. The bit gets cleared after sending out one master trigger, and Keep_MS_Mode_after_trigger is set to 0.
4	RWX	CLOCK_REGION_PERV: For clock region perv (Pervasive).
5	RWX	CLOCK_REGION_UNIT1: For clock region pci00 - PCI.
6	RWX	CLOCK_REGION_UNIT2: For clock region iopci0 - IOP.
7	RWX	CLOCK_REGION_UNIT3: For clock region unused.
8	RWX	CLOCK_REGION_UNIT4: For clock region unused.
9	RWX	CLOCK_REGION_UNIT5: For clock region unused.
10	RWX	CLOCK_REGION_UNIT6: For clock region unused.
11	RWX	CLOCK_REGION_UNIT7: For clock region unused.
12	RWX	CLOCK_REGION_UNIT8: For clock region unused.
13	RWX	CLOCK_REGION_UNIT9: For clock region unused.
14	RWX	CLOCK_REGION_UNIT10: For clock region PLL.
15:47	RO	Constant = 0b000000000000000000000000000000000
48	RWX	SEL_THOLD_SL: Select sl tholds.
49	RWX	SEL_THOLD_NSL: Select nsl tholds.
50	RWX	SEL_THOLD_ARY: Select array thold.
51	RO	Constant = 0b0
52	RW	CLOCK_PULSE_USE_EVEN: For dual mesh support. The default for pulse is an odd phase. When this bit is set, the pulse is applied on an even phase.
53:63	RO	Constant = 0b00000000000

Register Name	ABIST and IOBIST per Region Register		
Mnemonic	TP.TCPCI0.PCI0.BIST		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
	000000000D03000B (SCOM)	000000000E03000B (SCOM)	000000000F03000B (SCOM)
Description	ABIST and IOBIST per region register.		

Bits	SCOM	Field Mnemonic: Description
0	RW	TC_BIST_START_TEST_DC: Keep this bit 0 during ABIST/IOBIST. It can be used to bypass the Run-N start. When this bit is set, the BIST_START_TEST goes high immediately without waiting for Run-N. BIST starts with the first hld clock cycle.
1	RW	TC_SRAM_ABIST_MODE_DC: Select the ABIST engines for SRAMs.
2	RW	TC_EDRAM_ABIST_MODE_DC: Select the ABIST engines for eDRAMs.
3	RW	TC_IOBIST_MODE_DC: Select the IOBIST engines.
4	RW	BIST_PERV: Region perv: 1 = BIST_START_TEST for this region is triggered. 0 = Region take not part of the ABIST/IOBIST run.
5	RW	BIST_UNIT1: Region pci00 - pci: 1 = BIST_START_TEST for this region is triggered. 0 = Region take not part of the ABIST/IOBIST run.
6	RW	BIST_UNIT2: Region iopci0 - iop: 1 = BIST_START_TEST for this region is triggered. 0 = Region take not part of the ABIST/IOBIST run.
7	RW	BIST_UNIT3: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = Region take not part of the ABIST/IOBIST run.
8	RW	BIST_UNIT4: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = Region take not part of the ABIST/IOBIST run.
9	RW	BIST_UNIT5: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = Region take not part of the ABIST/IOBIST run.
10	RW	BIST_UNIT6: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = region take not part of the ABIST/IOBIST run.
11	RW	BIST_UNIT7: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = Region take not part of the ABIST/IOBIST run.
12	RW	BIST_UNIT8: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = Region take not part of the ABIST/IOBIST run.
13	RW	BIST_UNIT9: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = Region take not part of the ABIST/IOBIST run.
14	RW	BIST_UNIT10: Region PLL: 1 = BIST_START_TEST for this region is triggered. 0 = Region take not part of the ABIST/IOBIST run.
15:47	RO	Constant = 0b000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RW	BIST_STROBE_WINDOW_EN: Enable Strobe window only in TE = 1 mode OPCGGO tester pin is enabling ABIST compare, once ABIST has been started. Special setup in ABIST engine is required. default is 0. System mode can not enable this feature.
49:63	RO	Constant = 0b000000000000000

Register Name	Checkstop per Region Register		
Mnemonic	TP.TCPCI0.PCI0.XSTOP1		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D03000C (SCOM)	000000000E03000C (SCOM)	000000000F03000C (SCOM)
Description	Checkstop per region register.		

Bits	SCOM	Field Mnemonic: Description
0	RW	XSTOP1_MASK_B: Mask for a checkstop to a clockstop of select regions (see xstop_perv,xstop_unit0..n). 0 = Ignore checkstop. 1 = Stop on checkstop.
1	RW	XSTOP1_UNUSED: Unused.
2	RW	TRIGGER_OPCG_ON_XSTOP1: Trigger an OPCG on a checkstop instead of performing a clockstop.
3	RW	XSTOP1_WAIT_ALLWAYS: When set to 1, a checkstop waits independent from the flush. The default is no wait, when flush in not set.
4	RW	XSTOP1_PERV: Region pervasive: 1 = Region is stopped. 0 = Region keeps running on a checkstop.
5	RW	XSTOP1_UNIT1: Region pci00 - pci: 1 = Region is stopped. 0 = Region keeps running on a checkstop.
6	RW	XSTOP1_UNIT2: Region iopci0 - iop: 1 = Region is stopped. 0 = Region keeps running on a checkstop.

Register Name	**Error Status of CC Register**
Mnemonic	TP.TCPCI0.PCI0.ERROR_STATUS
Address	**PCI0 (PE0)**: 000000000D03000F (SCOM) **PCI1 (PE1)**: 000000000E03000F (SCOM) **PCI2 (PE2)**: 000000000F03000F (SCOM)
Description	Error Status of CC register.

Bits	SCOM	Field Mnemonic: Description
0	RWX	PCB_WRITE_NOT_ALLOWED_ERR: Write on a read-only register.
1	RWX	PCB_READ_NOT_ALLOWED_ERR: Read not allowed; might be a write-only register.
2	RWX	PCB_PARITY_ON_CMD_ERR: Parity error on a command.
3	RWX	PCB_ADDRESS_NOT_VALID_ERR: Invalid address.
4	RWX	PCB_PARITY_ON_ADDR_ERR: Parity error on an address.
5	RWX	PCB_PARITY_ON_DATA_ERR: Parity error on data.
6	RWX	PCB_PROTECTED_ACCESS_INVALID_ERR: Protection violation.
7	RWX	PCB_PARITY_ON_SPCIF_ERR: Parity error on SPCIF.

Bits	SCOM	Field Mnemonic: Description
8	RWX	PCB_WRITE_AND_OPCG_IP_ERR: PCB write while the OPCG is running.
9	RWX	SCAN_READ_AND_OPCG_IP_ERR: Scan read when the OPCG is running.
10	RWX	CLOCK_CMD_CONFLICT_ERR: Clock command in progress.
11	RWX	SCAN_COLLISION_ERR: Scan region selected of running region.
12	RWX	PREVENTED_SCAN_COLLISION_ERR: PCB request to set the scan region that is running.
13	RWX	OPCG_TRIGGER_ERR: OPCG gets triggered while the OPCG is running.
14	RWX	PHASE_CNT_CORRUPTION_ERR: Phase counters inside the chiplet are out of sync.
15	RWX	CLOCK_CMD_PREVENTED_ERR: Security or scan collision prevented a clock start.
16	RWX	PARITY_ON_OPCG_SM_ERR: Parity error on an OPCG state machine.
17	RWX	PARITY_ON_CLOCK_MUX_REG_ERR: Parity error on a scan, clock region, or type or the clock status register.
18	RWX	PARITY_ON_OPCG_REG_ERR: Parity error on OPCG registers.
19	RWX	PARITY_ON_SYNC_CONFIG_REG_ERR: Parity error on the sync configuration register.
20	RWX	PARITY_ON_XSTOP_REG_ERR: Parity error on a checkstop register.
21	RWX	PARITY_ON_GPIO_REG_ERR: Parity error on GP0, 4, 5, 6 registers.
22	RWX	CLKCMD_REQUEST_ERR: Region clkcmd has one request pending but get a second one.
23	RWX	CBS_PROTOCOL_ERR: CBS protocol error. The REQ/ACK sequence is wrong.
24	RWX	VITL_ALIGN_ERR: VITL alignment is out of sync to the sync pulse.
25	RWX	UNIT_SYNC_LVL_ERR: Unit0 and Unit1 sync lvl pulses are not in sync. The AVP is broken.
26	RWX	PARITY_ON_SELFBOOT_CMD_STATE_ERR: Parity error on the selfboot command state.
27	RWX	UNUSED_ERROR27: Unused.
28	RWX	UNUSED_ERROR28: Unused.
29	RWX	UNUSED_ERROR29: Unused.
30	RWX	UNUSED_ERROR30: Unused.
31	RWX	UNUSED_ERROR31: Unused.

Register Name	OPCG Control Register Capture1		
Mnemonic	TP.TCPCI0.PCI0.OPCG_CAPT1		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
	000000000D030010 (SCOM)	000000000E030010 (SCOM)	000000000F030010 (SCOM)
Description	OPCG Control Register Capture1 Register		

Bits	SCOM	Field Mnemonic: Description
0:3	RW	COUNT: 0000 = 12 cycles 0001 - 1100 = Cycles 1 - 12 1101 - 1111 = 24 normal, no fast.
4:8	RW	SEQ_01: Sequence cycle 1 for normal/slow region (sl, nsl, ary, se, fce).
9:13	RW	SEQ_02: Sequence cycle 2 for normal/slow region (sl, nsl, ary, se, fce).

Bits	SCOM	Field Mnemonic: Description
14:18	RW	SEQ_03: Sequence cycle 3 for normal/slow region (sl, nsl, ary, se, fce).
19:23	RW	SEQ_04: Sequence cycle 4 for normal/slow region (sl, nsl, ary, se, fce).
24:28	RW	SEQ_05: Sequence cycle 5 for normal/slow region (sl, nsl, ary, se, fce).

59:63	RW	SEQ_12ODD: Sequence cycle 12: Odd for fast region (sl, nsl, ary, se, fce).

Register Name	Debug CBS CC Register		
Mnemonic	TP.TCPCI0.PCI0.DBG_CBS_CC		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D030013 (SCOM)	000000000E030013 (SCOM)	000000000F030013 (SCOM)
Description	Debug CBS CC Register		

Bits	SCOM	Field Mnemonic: Description
0	ROX	DBG_RESET_EP: Reset endpoint. Are the CC and CTRL in a reset state?
1	ROX	DBG_OPCG_IP: OPCG in progress, not in idle.
2	ROX	DBG_VITL_CLKOFF: VITL HLD stopped when enabled. Need pipeline-latch-depth cycles to switch this latch.
3	ROX	DBG_TEST_ENABLE: Test enable.
4	ROX	DBG_CBS_REQ: CBS interface: request (latched).
5:7	ROX	DBG_CBS_CMD: CBS interface: command (latched).
8:12	ROX	DBG_CBS_STATE: CBS command state machine. 00000 = Idle.
13	ROX	DBG_SECURITY_DEBUG_MODE: Status of the security mode bit.

Bits	SCOM	Field Mnemonic: Description
14	ROX	DBG_CBS_PROTOCOL_ERROR: CBS protocol error. REQ raised, although the state machine is not in IDLE. Need reset_ep to clear this bit. There is no impact on IPL.
15	ROX	DBG_PCB_IDLE: The PCB interface is in the IDLE state.
16:19	ROX	DBG_CURRENT_OPCG_MODE: Current or latest OPCG MODE: 0 = NOP 1 = LBIST 2 = ABIST 3 = Run-N 4 = SCAN0 5 = SCAN 6 = SCAN rotate 7 = SCAN with UpdateDR 8 = SCAN with CaptureDR 9 = CLK change request 10 - 15 = Unused.
20:23	ROX	DBG_LAST_OPCG_MODE: Previous OPCG MODE.
24	ROX	DBG_PCB_ERROR: PCB interface error. Read the CC Error Register or set CBS_CMD = 001 to switch FSI CBS debug information to the CC Error Register.
25	ROX	DBG_PARITY_ERROR: Any parity error or non-PCB parity. Read the CC Error Register or set CBS_CMD = 001 to switch FSI CBS Debug Information to the CC Error Register.
26	ROX	DBG_CC_ERROR: Any other CC error. Read the CC Error Register or set CBS_CMD = 001 to switch FSI CBS Debug Information to the CC Error Register.
27	ROX	DBG_CHIPLET_IS_ALIGNED: This bit is 1 when a valid align pulse was send out.
28	ROX	DBG_PCB_REQUEST_SINCE_RESET: Reset clears this bit; the first PCB request sets it.
29	ROX	DBG_PARANOIA_TEST_ENABLE_CHANGE: The rising or falling edge on test enable, after reset - need reset_ep to clear, no impact on IPL.
30	ROX	DBG_PARANOIA_VITL_CLKOFF_CHANGE: Rising or falling edge on vitl_clkoff, after reset. Need reset_ep to clear. There is no impact on IPL.
31	ROX	TP_TPFSI_CBS_ACK: Only representation of CC ACK signal going to the FSI.

Register Name	CC Protect Mode Register
Mnemonic	TP.TCPCI0.PCI0.CC_PROTECT_MODE_REG
Address	<table><tr><th>PCI0 (PE0)</th><th>PCI1 (PE1)</th><th>PCI2 (PE2)</th></tr><tr><td>000000000D0303FE (SCOM)</td><td>000000000E0303FE (SCOM)</td><td>000000000F0303FE (SCOM)</td></tr></table>
Description	This register enables read and write protection.

Bits	SCOM	Field Mnemonic: Description
0	RW	CC_READ_PROTECT_ENABLE: Enable read protection.
1	RW	CC_WRITE_PROTECT_ENABLE: Enable write protection.

Register Name	Atomic Lock Register
Mnemonic	TP.TCPCI0.PCI0.CC_ATOMIC_LOCK_REG
Address	

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D0303FF (SCOM)	000000000E0303FF (SCOM)	000000000F0303FF (SCOM)

Description	This register enables an atomic lock.

Bits	SCOM	Field Mnemonic: Description
0	RW	CC_ATOMIC_LOCK_ENABLE: This bit enables an atomic lock.
1:4	ROX	CC_ATOMIC_ID: This field contains the atomic ID.
5:7	RO	Constant = 0b000
8:15	ROX	CC_ATOMIC_ACTIVITY: This field is the atomic lock counter.

Register Name	Global Checkstop FIR
Mnemonic	TP.TCPCI0.PCI0.XFIR
Address	

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D040000 (SCOM)	000000000E040000 (SCOM)	000000000F040000 (SCOM)

Description	This is a fault-isolation register for global FIRs.

Bits	SCOM	Field Mnemonic: Description
0	RWX	XFIR_IN0: Summary bit (any checkstop).
1	RWX	XFIR_IN1: Checkstop broadcast via OOB.
2	RWX	XFIR_IN2: Unused.
3	RWX	XFIR_IN3: Checkstop from the pervasive unit.
4	RWX	XFIR_IN4: Checkstop from ETU FIR in PCI0.
5	RWX	XFIR_IN5: Checkstop from IOPCI0.
6	RWX	XFIR_IN6: Checkstop from PBPCI0.
7:25	RWX	XFIR_IN7: Unused.
26	RWX	XFIR_IN26: Checkstop on debug trigger.

Register Name	Global Recoverable FIR
Mnemonic	TP.TCPCI0.PCI0.RFIR
Address	

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D040001 (SCOM)	000000000E040001 (SCOM)	000000000F040001 (SCOM)

Description	This is a fault-isolation register for global recoverable errors.

Bits	SCOM	Field Mnemonic: Description
0	ROX	RFIR_IN0: Local checkstop summary bit.
1	ROX	LFIR_RECOV_ERR: Recoverable error from the pervasive unit.
2	ROX	RFIR_IN4: Recover from the ETU FIR Register.
3	ROX	RFIR_IN5: Recover from the IOPCI0.
4	ROX	RFIR_IN6: Recover from the PBPCI0.
5:23	ROX	RFIR_IN7: Unused.

Register Name	**FIR Mask Register**
Mnemonic	TP.TCPCI0.PCI0.FIR_MASK
Address	
Description	FIR Mask

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D040002 (SCOM)	000000000E040002 (SCOM)	000000000F040002 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0	RW	FIR_MASK_IN0: Mask for the XFIR summary bit (any checkstop).
1	RW	FIR_MASK_IN1: Mask for XFIR from other chiplets.
2	RW	FIR_MASK_IN2: Unused.
3	RW	FIR_MASK_IN3: Mask for XFIR/RFIR from the pervasive unit.
4	RW	FIR_MASK_IN4: Mask for PCI0 XFIR and RFIR.
5	RW	FIR_MASK_IN5: Mask for IOPCI0 XFIR and RFIR.
6	RW	FIR_MASK_IN6: Mask for IOPCI0 XFIR and RFIR.
7:25	RW	FIR_MASK_IN7: Unused.
26	RW	FIR_MASK_IN26: Mask for the debug trigger.

Register Name	**Special Attention Register**
Mnemonic	TP.TCPCI0.PCI0.SPATTN
Address	
Description	This register contains special attention fields.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D040004 (SCOM) 000000000D040005 (SCOM1) 000000000D040006 (SCOM2)	000000000E040004 (SCOM) 000000000E040005 (SCOM1) 000000000E040006 (SCOM2)	000000000F040004 (SCOM) 000000000F040005 (SCOM1) 000000000F040006 (SCOM2)

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:9	ROX	NCX	NCX	SPATTN_IN: Unused special attentions.

Register Name	Special Attention Mask Register		
Mnemonic	TP.TCPCI0.PCI0.SPA_MASK		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D040007 (SCOM)	000000000E040007 (SCOM)	000000000F040007 (SCOM)
Description	This register provides a special attention mask.		

Bits	SCOM	Field Mnemonic: Description
0:9	RW	SPA_MASK_IN: Special attention mask.

Register Name	Mode Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.FIR.MODE_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D040008 (SCOM)	000000000E040008 (SCOM)	000000000F040008 (SCOM)
Description	This register contains mode bits.		

Bits	SCOM	Field Mnemonic: Description
0	RW	MODE_IN0: Unused.
1	RW	MODE_IN1: Unused.
2	RW	MODE_IN2: Unused.
3	RW	MODE_IN3: Unused.
4	RW	MODE_IN4: Stop chip TOD on checkstop. (Unused in POWER9.)
5	RW	MODE_IN5: Stop chip TOD on recoverable. (Unused in POWER9.)
6	RW	MODE_IN6: Disable propagation of the checkstop to other chips.
7	RW	MODE_IN7: Unused.
8	RW	MODE_IN8: Enable a checkstop on special attention.
9	RW	MODE_IN9: Mask direct or local error.
10	RW	MODE_IN10: Unused.
11	RW	MODE_IN11: Unused.
12:15	RW	MODE_IN: Unused.

Register Name	Host Attention Register		
Mnemonic	TP.TCPCI0.PCI0.HOSTATTN		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D040009 (SCOM)	000000000E040009 (SCOM)	000000000F040009 (SCOM)
Description	This register contains host attention bits.		

Bits	SCOM	Field Mnemonic: Description
0	ROX	HOSTATTN_IN0: Host attention summary bit.
1	ROX	HOSTATTN_IN1: Unused.
2	ROX	HOSTATTN_IN2: Unused.
3	ROX	HOSTATTN_IN3: Unused.
4	ROX	HOSTATTN_IN4: Unused.
5	ROX	HOSTATTN_IN5: Unused.
6	ROX	HOSTATTN_IN6: Unused.
7	ROX	HOSTATTN_IN7: Unused.
8	ROX	HOSTATTN_IN8: Unused.
9	ROX	HOSTATTN_IN9: Unused.
10	ROX	HOSTATTN_IN10: Unused.
11	ROX	HOSTATTN_IN11: Unused.
12	ROX	HOSTATTN_IN12: Unused.
13	ROX	HOSTATTN_IN13: Unused.
14	ROX	HOSTATTN_IN14: Unused.
15	ROX	HOSTATTN_IN15: Unused.
16	ROX	HOSTATTN_IN16: Unused.
17	ROX	HOSTATTN_IN17: Unused.
18	ROX	HOSTATTN_IN18: Unused.
19	ROX	HOSTATTN_IN19: Unused.
20	ROX	HOSTATTN_IN20: Unused.
21	ROX	HOSTATTN_IN21: Unused.
22	ROX	HOSTATTN_IN22: Unused.

Register Name	**Local FIR**
Mnemonic	TP.TCPCI0.PCI0.LOCAL_FIR
Address	<table><tr><th>PCI0 (PE0)</th><th>PCI1 (PE1)</th><th>PCI2 (PE2)</th></tr><tr><td>000000000D04000A (SCOM) 000000000D04000B (SCOM1) 000000000D04000C (SCOM2)</td><td>000000000E04000A (SCOM) 000000000E04000B (SCOM1) 000000000E04000C (SCOM2)</td><td>000000000F04000A (SCOM) 000000000F04000B (SCOM1) 000000000F04000C (SCOM2)</td></tr></table>
Description	This is a fault-isolation register for local errors.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	WOX_AND	WOX_OR	FIR_IN0: CFIR internal parity error.
1	RWX	WOX_AND	WOX_OR	FIR_IN1: Chiplet Control Register: PCB access error.
2	RWX	WOX_AND	WOX_OR	FIR_IN2: Clock controller: PCB access error.
3	RWX	WOX_AND	WOX_OR	FIR_IN3: Clock controller: Summarized error. Read the ERROR_STATUS Register with SCOM address nn3000F for details.
4	RWX	WOX_AND	WOX_OR	FIR_IN4: PSCOM logic: PCB access error.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
5	RWX	WOX_AND	WOX_OR	FIR_IN5: PSCOM logic: Summarized internal errors.
6	RWX	WOX_AND	WOX_OR	FIR_IN6: Thermal logic: Summarized internal errors.
7	RWX	WOX_AND	WOX_OR	FIR_IN7: Thermal logic: PCB access error.
8	RWX	WOX_AND	WOX_OR	FIR_IN8: Thermal logic: Temperature critical trip error.
9	RWX	WOX_AND	WOX_OR	FIR_IN9: Thermal logic: Temperature fatal trip error.
10	RWX	WOX_AND	WOX_OR	FIR_IN10: Thermal logic: Voltage trip error. Unused in the POWER9 processor.
11	RWX	WOX_AND	WOX_OR	FIR_IN11: Debug logic: SCOM satellite error.
12	RWX	WOX_AND	WOX_OR	FIR_IN12: Trace logic: SCOM satellite error: Trace0.
13	RWX	WOX_AND	WOX_OR	FIR_IN13: Trace logic: SCOM satellite error: Trace0.
14	RWX	WOX_AND	WOX_OR	FIR_IN14: Unused.
15	RWX	WOX_AND	WOX_OR	FIR_IN15: Unused.
16	RWX	WOX_AND	WOX_OR	FIR_IN16: Unused.
17	RWX	WOX_AND	WOX_OR	FIR_IN17: Unused.
18	RWX	WOX_AND	WOX_OR	FIR_IN18: Unused.
19	RWX	WOX_AND	WOX_OR	FIR_IN19: Unused.
20	RWX	WOX_AND	WOX_OR	FIR_IN20: Unused.
21	RWX	WOX_AND	WOX_OR	FIR_IN21: Unused.
22	RWX	WOX_AND	WOX_OR	FIR_IN22: Unused.
23	RWX	WOX_AND	WOX_OR	FIR_IN23: Unused.
24	RWX	WOX_AND	WOX_OR	FIR_IN24: Unused.
25	RWX	WOX_AND	WOX_OR	FIR_IN25: Unused.
26	RWX	WOX_AND	WOX_OR	FIR_IN26: Unused.
27	RWX	WOX_AND	WOX_OR	FIR_IN27: Unused.
28	RWX	WOX_AND	WOX_OR	FIR_IN28: Unused.
29	RWX	WOX_AND	WOX_OR	FIR_IN29: Unused.
30	RWX	WOX_AND	WOX_OR	FIR_IN30: Unused.
31	RWX	WOX_AND	WOX_OR	FIR_IN31: Unused.
32	RWX	WOX_AND	WOX_OR	FIR_IN32: Unused.
33	RWX	WOX_AND	WOX_OR	FIR_IN33: Unused.
34	RWX	WOX_AND	WOX_OR	FIR_IN34: Unused.
35	RWX	WOX_AND	WOX_OR	FIR_IN35: Unused.
36	RWX	WOX_AND	WOX_OR	FIR_IN36: Unused.
37	RWX	WOX_AND	WOX_OR	FIR_IN37: Unused.
38	RWX	WOX_AND	WOX_OR	FIR_IN38: Unused.
39	RWX	WOX_AND	WOX_OR	FIR_IN39: Unused.
40	RWX	WOX_AND	WOX_OR	FIR_IN40: Unused.
41	RWX	WOX_AND	WOX_OR	FIR_IN41: Malfunction alert broadcast via the OOB.

Register Name	Local FIR Mask Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.FIR.LOCAL_FIR_MASK		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D04000D (SCOM) 000000000D04000E (SCOM1) 000000000D04000F (SCOM2)	000000000E04000D (SCOM) 000000000E04000E (SCOM1) 000000000E04000F (SCOM2)	000000000F04000D (SCOM) 000000000F04000E (SCOM1) 000000000F04000F (SCOM2)
Description	This register masks the local FIR bits.		

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:41	RW	WO_AND	WO_OR	LFIR_MASK_IN: Mask for the LEM error collection vector.

Register Name	Local FIR Action0 Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.FIR.LOCAL_FIR_ACTION0		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D040010 (SCOM)	000000000E040010 (SCOM)	000000000F040010 (SCOM)
Description	Local FIR Action0		

Bits	SCOM	Field Mnemonic: Description
0:41	RW	FIR_ACTION0_IN: Action0 mask.

Register Name	Local FIR Action1 Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.FIR.LOCAL_FIR_ACTION1		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D040011 (SCOM)	000000000E040011 (SCOM)	000000000F040011 (SCOM)
Description	Local FIR Action1		

Bits	SCOM	Field Mnemonic: Description
0:41	RW	FIR_ACTION1_IN: Action1 mask.

Register Name	Group Checkstop Mask Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.FIR.GXSTOP_TRIG_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D040013 (SCOM)	000000000E040013 (SCOM)	000000000F040013 (SCOM)
Description	This register masks group checkstops.		

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP_TRIG_IN0: Mask bit for a system checkstop.
1	RW	GXSTP_TRIG_IN1: Mask bit for a recoverable error.
2	RW	GXSTP_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP_TRIG_IN3: Mask bit for a local checkstop.
4	RW	GXSTP_TRIG_IN4: Mask bit for a type 4 error (host attention).
5	RW	GXSTP_TRIG_IN5: Mask bit for an OOB sys_checkstop input (0).
6	RW	GXSTP_TRIG_IN6: Mask bit for an OOB sys_checkstop input (1).
7	RW	GXSTP_TRIG_IN7: Mask bit for a group checkstop input (0).
8	RW	GXSTP_TRIG_IN8: Mask bit for a group checkstop input (1).
9	RW	GXSTP_TRIG_IN9: Mask bit for a debug checkstop on a trigger.
10	RW	GXSTP_TRIG_IN10: Unused.
11	RW	GXSTP_TRIG_IN11: Unused.

Register Name	**Group0 Checkstop Mask Register**		
Mnemonic	TP.TCPCI0.PCI0.EPS.FIR.GXSTOP0_MASK_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D040014 (SCOM)	000000000E040014 (SCOM)	000000000F040014 (SCOM)
Description	This register masks group 0 checkstops.		

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP0_TRIG_IN0: Mask bit for a system checkstop.
1	RW	GXSTP0_TRIG_IN1: Mask bit for a recoverable error.
2	RW	GXSTP0_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP0_TRIG_IN3: Mask bit for a local checkstop.
4	RW	GXSTP0_TRIG_IN4: Mask bit for a type 4 error (host attention).
5	RW	GXSTP0_TRIG_IN5: Mask bit for an OOB sys_checkstop input (0).
6	RW	GXSTP0_TRIG_IN6: Mask bit for an OOB sys_checkstop input (1).
7	RW	GXSTP0_TRIG_IN7: Mask bit for a group checkstop input (0).
8	RW	GXSTP0_TRIG_IN8: Mask bit for a group checkstop input (1).
9	RW	GXSTP0_TRIG_IN9: Mask bit for a debug checkstop on a trigger.
10	RW	GXSTP0_TRIG_IN10: Unused.
11	RW	GXSTP0_TRIG_IN11: Unused.

Register Name	Group1 Checkstop Mask Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.FIR.GXSTOP1_MASK_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D040015 (SCOM)	000000000E040015 (SCOM)	000000000F040015 (SCOM)
Description	This register masks group 1 checkstops.		

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP1_TRIG_IN0: Mask bit for a system checkstop.
1	RW	GXSTP1_TRIG_IN1: Mask bit for a recoverable error.
2	RW	GXSTP1_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP1_TRIG_IN3: Mask bit for a local checkstop.
4	RW	GXSTP1_TRIG_IN4: Mask bit for a type 4 error (host attention).
5	RW	GXSTP1_TRIG_IN5: Mask bit for an OOB sys_checkstop input (0).
6	RW	GXSTP1_TRIG_IN6: Mask bit for an OOB sys_checkstop input (1).
7	RW	GXSTP1_TRIG_IN7: Mask bit for a group checkstop input (0).
8	RW	GXSTP1_TRIG_IN8: Mask bit for a group checkstop input (1).
9	RW	GXSTP1_TRIG_IN9: Mask bit for a debug checkstop on a trigger.
10	RW	GXSTP1_TRIG_IN10: Unused.
11	RW	GXSTP1_TRIG_IN11: Unused.

Register Name	Group2 Checkstop Mask Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.FIR.GXSTOP2_MASK_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D040016 (SCOM)	000000000E040016 (SCOM)	000000000F040016 (SCOM)
Description	This register masks group 2 checkstops.		

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP2_TRIG_IN0: Mask bit for a system checkstop.
1	RW	GXSTP2_TRIG_IN1: Mask bit for a recoverable error.
2	RW	GXSTP2_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP2_TRIG_IN3: Mask bit for a local checkstop.
4	RW	GXSTP2_TRIG_IN4: Mask bit for a type 4 error (host attention).
5	RW	GXSTP2_TRIG_IN5: Mask bit for an OOB sys_checkstop input (0).
6	RW	GXSTP2_TRIG_IN6: Mask bit for an OOB sys_checkstop input (1).
7	RW	GXSTP2_TRIG_IN7: Mask bit for a group checkstop input (0).
8	RW	GXSTP2_TRIG_IN8: Mask bit for a group checkstop input (1).
9	RW	GXSTP2_TRIG_IN9: Mask bit for a debug checkstop on a trigger.

Bits	SCOM	Field Mnemonic: Description
10	RW	GXSTP2_TRIG_IN10: Unused.
11	RW	GXSTP2_TRIG_IN11: Unused.

Register Name	Summary Mask Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.FIR.SUM_MASK_REG		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
	000000000D040017 (SCOM)	000000000E040017 (SCOM)	000000000F040017 (SCOM)
Description	This register contains summary bits.		

Bits	SCOM	Field Mnemonic: Description
0	RW	SMASK_IN0: System checkstop summary bit.
1	RW	SMASK_IN1: Recoverable summary bit.
2	RW	SMASK_IN2: Special attention summary bit.
3	RW	SMASK_IN3: Local checkstop summary bit.
4	RW	SMASK_IN4: Type4 (host attention summary bit.

Register Name	Local Checkstop Register		
Mnemonic	TP.TCPCI0.PCI0.LOCAL_XSTOP_ERR		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
	000000000D040018 (SCOM)	000000000E040018 (SCOM)	000000000F040018 (SCOM)
Description	This register contains local checkstop bits.		

Bits	SCOM	Field Mnemonic: Description
0	ROX	LOCAL_XSTOP_IN0: Local checkstop summary bit.
1	ROX	LOCAL_XSTOP_IN1: Unused.
2	ROX	LOCAL_XSTOP_IN2: Unused.
3	ROX	LOCAL_XSTOP_IN3: Unused.
4	ROX	LOCAL_XSTOP_IN4: Unused.
5	ROX	LOCAL_XSTOP_IN5: Unused.
6	ROX	LOCAL_XSTOP_IN6: Unused.
7	ROX	LOCAL_XSTOP_IN7: Unused.
8	ROX	LOCAL_XSTOP_IN8: Unused.
9	ROX	LOCAL_XSTOP_IN9: Unused.
10	ROX	LOCAL_XSTOP_IN10: Unused.
11	ROX	LOCAL_XSTOP_IN11: Unused.
12	ROX	LOCAL_XSTOP_IN12: Unused.

Bits	SCOM	Field Mnemonic: Description
13	ROX	LOCAL_XSTOP_IN13: Unused.
14	ROX	LOCAL_XSTOP_IN14: Unused.
15	ROX	LOCAL_XSTOP_IN15: Unused.
16	ROX	LOCAL_XSTOP_IN16: Unused.
17	ROX	LOCAL_XSTOP_IN17: Unused.
18	ROX	LOCAL_XSTOP_IN18: Unused.
19	ROX	LOCAL_XSTOP_IN19: Unused.
20	ROX	LOCAL_XSTOP_IN20: Unused.
21	ROX	LOCAL_XSTOP_IN21: Unused.
22	ROX	LOCAL_XSTOP_IN22: Unused.

Register Name	**Local Checkstop Mask Register**
Mnemonic	TP.TCPCI0.PCI0.LOCAL_XSTOP_MASK
Address	
Description	This register masks local checkstops.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D040019 (SCOM)	000000000E040019 (SCOM)	000000000F040019 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:21	RW	LOCAL_XSTOP_MASK_IN: Local checkstop mask.

Register Name	**Host Attention Mask Register**
Mnemonic	TP.TCPCI0.PCI0.HOSTATTN_MASK
Address	
Description	This register masks host attention.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D04001A (SCOM)	000000000E04001A (SCOM)	000000000F04001A (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:21	RW	HOSTATTN_MASK_IN: Host attention mask.

Register Name	**DTS Thermal Sensor Loop1 Results Register**
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.DTS_RESULT0
Address	
Description	This register contains the DTS thermal sensor loop1 results.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D050000 (SCOM)	000000000E050000 (SCOM)	000000000F050000 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	DTS_0_RESULT: Calibrated DTS result of the sensor with ID 0.
16:31	ROX	DTS_1_RESULT: Calibrated DTS result of the sensor with ID 1.
32:63	RO	Constant = 0b00000000000000000000000000000000

Register Name	DTS Trace Results Register
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.DTS_TRC_RESULT
Address	**PCI0 (PE0)**: 000000000D050003 (SCOM) **PCI1 (PE1)**: 000000000E050003 (SCOM) **PCI2 (PE2)**: 000000000F050003 (SCOM)
Description	This register contains DTS trace results.

Bits	SCOM	Field Mnemonic: Description
0:43	ROX	TIMESTAMP_COUNTER_VALUE: Time stamp counter value during DTS trace mode.
44	ROX	TIMESTAMP_COUNTER_OVERFLOW_ERR: Overflow error bit of the time stamp counter value during DTS trace mode.
45:47	RO	Constant = 0b000
48:63	ROX	DTS_1_RESULT: Calibrated DTS result of the sensor with ID 1.

Register Name	CPM and DTS Enables and Controls Register
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.THERM_MODE_REG
Address	**PCI0 (PE0)**: 000000000D05000F (SCOM) **PCI1 (PE1)**: 000000000E05000F (SCOM) **PCI2 (PE2)**: 000000000F05000F (SCOM)
Description	This register is used to enable and control the critical path monitor (CPM) and digital thermal sensor (DTS).

Bits	SCOM	Field Mnemonic: Description
0	RW	THERM_DIS_CPM_BUBBLE_CORR: Critical path result bubble correction active.
1	RW	THERM_FORCE_THRES_ACT: This bit forces tpc_therm_thres_mac clock gating off and activates the clocks.
2:4	RW	THERM_THRES_TRIP_ENA: Enables therm_thres_trip compare. 1xx = trip0 - warning. x1x = trip1 - critical. xx1 = trip2 - fatal.
5	RW	THERM_DTS_SAMPLE_ENA: 0 = No DTS sampling. 1 = DTS sampling is enabled and a below-counter compare match can occur.

Bits	SCOM	Field Mnemonic: Description
6:9	RW	THERM_SAMPLE_PULSE_CNT: A 16 MHz sample pulse is fed into an 18-bit counter. With the therm_sample_pulse_cnt , it is possible to select a high-order bit of the counter to enable resolutions of sampling DTSs between 2.5 µs and 80 ms. An edge-detection circuit detects the rising edge of the selected counter bit, and this triggers a DTS sample. 0000 = 16 ms. 0001 = 8 ms. 0010 = 4 ms. 0011 = 2 ms. 0100 = 1 ms. 0101 = 0.5 ms. 0110 = 250 µs. 0111 = 125 µs. 1000 = 62.5 µs. 1001 = 31.3 µs. 1010 = 15.6 µs. 1011 = 7.8 µs. 1100 = 3.9 µs. 1101 = 2 µs. 1110 = 1 µs. 1111 = 0.5 µs.
10:11	RW	THERM_THRES_MODE_ENA: Forces maximum or minimum mode in the threshold unit: 00 = Off. 11 = Illegal. 10 = Maximum mode. 01 = Minimum mode.
12	RW	DTS_TRIGGER_MODE: Unused.
13	RW	DTS_TRIGGER_SEL: Unused.
14	RW	THERM_THRES_OVERFLOW_MASK: 0 = therm_overflow_err is enabled. 1 = therm_overflow_err is disabled.
15	RW	THERM_MODE_UNUSED: Unused.
16:19	RW	THERM_DTS_READ_SEL: Selects which DTS result is provided with PCB read addr_v(4): 0000 = DTS 0. 0001 = DTS 1. 0010 = DTS 2. 0100 = DTS 4. 1111 = Worst-case sensor.
20:21	RW	THERM_DTS_ENABLE_L1: Loop1 DTS enables: 1x = DTS 0 available. x1 = DTS 1 available.
22:34	RO	Constant = 0b0000000000000
35:36	RW	therm_cpm_enable_l1.

Register Name	Skitter Control Register
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.SKITTER_MODE_REG
Address	

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D050010 (SCOM)	000000000E050010 (SCOM)	000000000F050010 (SCOM)

Description	This register controls skitter.

Bits	SCOM	Field Mnemonic: Description
0	RW	SKITTER_HOLD_SAMPLE: Forces skitter to hold the current sample.
1	RW	DISABLE_SKITTER_STICKINESS: A value of '0' specifies accumulation mode. A value of '1' samples a new value on each cycle and resets the sticky value.
2:3	RW	SKITTER_MODE_UNUSED1: Unused.
4:5	RW	SKITTER_HOLD_DBGTRIG_SEL: bit0 = hold_on_trigger0 bit1 = hold_on_trigger1
6:7	RW	SKITTER_RESET_TRIG_SEL: bit0 = reset_sticky_on_trigger0 bit1 = reset_sticky_on_trigger1
8:9	RW	SKITTER_SAMPLE_GUTS: Selects which guts to measure: 00 = guts1. 01 = guts2. 10 = guts3. 11 = guts4.
10:43	RO	Constant = 0b0000000000000000000000000000000000
44	ROX	SKITTER_HOLD_SAMPLE_WITH_TRIGGER: Forces skitter to hold the current sample on the DBG trigger. This has the highest priority.
45	ROX	SKITTER_DATA_V_LT: If set to '1', the data requested by a skitter force read register has finished and data is present in skitter data register in the collector macro. The data be read by any combination of V25, V26, or V27 PCB reads.

Register Name	**Error Injection Control Register**
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.INJECT_REG
Address	
Description	This register controls error injection.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D050011 (SCOM)	000000000E050011 (SCOM)	000000000F050011 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:1	RW	THERM_INJECT_TRIP: 00 = No injection. 01 = Warning trip-level injection. 10 = Critical trip-level injection. 11 = Fatal trip-level injection.
2:3	RW	THERM_INJECT_MODE: 00 = No injection. 01 = Injection on the next DTS sample. 10 = Solid injection for the next DTS samples until the bit setting changes. 11 = Not used.

Register Name	Control/Force Reset Register
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.CONTROL_REG
Address	
Description	Control/Force Reset Register

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D050012 (SCOM)	000000000E050012 (SCOM)	000000000F050012 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0	WO_1P	reset_trip_history.
1	WO_1P	reset_sample_pulse_cnt.
2	WO_1P	f_reset_cpm_rd.
3	WO_1P	f_reset_cpm_wr.
4	WO_1P	reset_sample_dts.
5	WO_1P	force_sample_dts.
6	WO_1P	force_sample_dts_interruptible.
7	WO_1P	force_reset_thres_l1results.
8	WO_1P	force_reset_thres_l2results.
9	WO_1P	force_reset_thres_l3results.
10	WO_1P	force_measure_volt_interruptible.
11	WO_1P	force_reset_measure_volt.
12	WO_1P	force_shift_sensor.

Register Name	Thermal Error Status Register
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.ERR_STATUS_REG
Address	
Description	This register contains error status information.

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D050013 (SCOM)	000000000E050013 (SCOM)	000000000F050013 (SCOM)

Bits	SCOM	Field Mnemonic: Description
0	ROX	serial_shiftcnt_modereg_parity_err_hold.
1	ROX	therm_modereg_parity_err_hold.
2	ROX	skitter_modereg_parity_err_hold.
3	ROX	skitter_forcereg_parity_err_hold.
4	ROX	scan_init_version_reg_parity_err_hold.
5	ROX	volt_modereg_parity_err_hold.
6	ROX	skitter_clksrcreg_parity_err_hold.
7	ROX	count_state_err_hold.
8	ROX	run_state_err_hold.

Bits	SCOM	Field Mnemonic: Description
9	ROX	thres_therm_state_err_hold.
10	ROX	thres_therm_overflow_err_hold.
11	ROX	shifter_parity_err_hold.
12	ROX	shifter_valid_err_hold.
13	ROX	timeout_err_hold.
14	ROX	f_skitter_err_hold.
15	ROX	pcb_err_hold_out.
16	ROX	SERIAL_SHIFTCNT_MODEREG_PARITY_ERR_MASK: Serial shift count parity error mask.
17	ROX	THERM_MODEREG_PARITY_ERR_MASK: Thermal Mode Register parity error mask.
18	ROX	SKITTER_MODEREG_PARITY_ERR_MASK: Skitter Mode Register parity error mask.
19	ROX	SKITTER_FORCEREG_PARITY_ERR_MASK: Skitter Force Register parity error mask.
20	ROX	SCAN_INIT_VERSION_REG_PARITY_ERR_MASK: Scan Initial Version Register parity error mask.
21	ROX	VOLT_MODEREG_PARITY_ERR_MASK: Volt Mode Register parity error mask.
22	RO	Constant = 0b0
23	ROX	COUNT_STATE_ERR_MASK: Count state machine error mask.
24	ROX	RUN_STATE_ERR_MASK: Run state machine error mask.
25	ROX	THRES_STATE_ERR_MASK: Threshold state machine error mask.
26	ROX	OVERFLOW_ERR_MASK: DTS calibration calculation overflow error mask.
27	ROX	SHIFTER_PARITY_ERR_MASK: Shifter parity error mask.
28	ROX	SHIFTER_VALID_ERR_MASK: Shifter valid error mask.
29	ROX	TIMEOUT_ERR_MASK: Timeout error mask.
30	ROX	F_SKITTER_READ_ERR_MASK: Force skitter read error mask.
31	ROX	PCB_ERR_MASK: Pervasive control bus error mask.
32:39	RO	Constant = 0b00000000
40:43	ROX	count_state_lt.
44:46	ROX	run_state_lt.
47	ROX	shift_dts_lt.
48	ROX	shift_volt_lt.
49:50	ROX	read_state_lt.
51:54	ROX	write_state_lt.
55	ROX	sample_dts_lt.
56	ROX	measure_volt_lt.
57	ROX	read_cpm_lt.
58	ROX	write_cpm_lt.
59	ROX	Unused.
60:63	RO	Constant = 0b0000

Register Name	Skitter Force Read Register
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.SKITTER_FORCE_REG
Address	

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D050014 (SCOM)	000000000E050014 (SCOM)	000000000F050014 (SCOM)

Description	This register forces a skitter read.

Bits	SCOM	Field Mnemonic: Description
0	RW	F_SKITTER_READ: Forces the read of that particular skitter.

Register Name	Skitter Clock Source Control Register
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.SKITTER_CLKSRC_REG
Address	

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D050016 (SCOM)	000000000E050016 (SCOM)	000000000F050016 (SCOM)

Description	This register contains skitter controls.

Bits	SCOM	Field Mnemonic: Description
0:2	RW	SKITTER0_CLKSRC: Selects the clock to measure: 000 = Local mesh clock. 001 = External pin skitter_c1_1_in. 010 = Local d1clk only if d_mode = 1. 011 = External pin skitter_c1_2_in. 100 = Local lclk only if d_mode = 1. 101 = External pin skitter_c1_3_in. 110 = Unused. 111 = External pin skitter_c1_4_in.
3:35	RO	Constant = 0b000000000000000000000000000000000
36:37	RW	SKITTER0_DELAY_SELECT: Selects the delay to be added between the skitter0 clock source multiplexer and the inverter chain. The base line delay is 12.2 psec. 00 = No delay. 01 = 0.6 psec. 10 = 1.8 psec. 11 = 5 psec.

Register Name	Skitter Data Register Read Bits 0:63
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.SKITTER_DATA0
Address	

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D050019 (SCOM)	000000000E050019 (SCOM)	000000000F050019 (SCOM)

Description	This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Skitter Data Register Read Bits 32:95		
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.SKITTER_DATA1		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D05001A (SCOM)	000000000E05001A (SCOM)	000000000F05001A (SCOM)
Description	This is a reserved register.		

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Skitter Data Register Read Bits 64:127		
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.SKITTER_DATA2		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D05001B (SCOM)	000000000E05001B (SCOM)	000000000F05001B (SCOM)
Description	This is a reserved register.		

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Timestamp Counter Read Register		
Mnemonic	TP.TCPCI0.PCI0.EPS.THERM.TIMESTAMP_COUNTER_READ		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D05001C (SCOM)	000000000E05001C (SCOM)	000000000F05001C (SCOM)
Description	This register contains the time-stamp counter value during DTS trace mode and an overflow error bit.		

Bits	SCOM	Field Mnemonic: Description
0:43	ROX	TIMESTAMP_COUNTER_VALUE: Time stamp counter value during DTS trace mode.
44	ROX	TIMESTAMP_COUNTER_OVERFLOW_ERR: Overflow error bit of the time-stamp counter value during DTS trace mode.

9. PCI 0 Chiplet PCB Slave

The POWER9 processor registers are listed alphabetically by mnemonic in the following address table.

Mnemonic	Address	Page
TP.TPCHIP.NET.PCBSLPCI0.ASSIST_INTERRUPT_REG	0x000000000D0F0011	1947
TP.TPCHIP.NET.PCBSLPCI0.ATOMIC_LOCK_REG	0x000000000D0F03FF	1957

The POWER9 processor registers are listed in the following tables.

Register Name	Primary PCB Slave Address Register		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.PRIMARY_ADDRESS_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F0000 (SCOM)	000000000E0F0000 (SCOM)	000000000F0F0000 (SCOM)
Description	This register contains the slave's primary address.		

Bits	SCOM	Field Mnemonic: Description
0:5	RO	Reserved. This is the primary_address setting.

Register Name	Multicast Group 1 Register		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.MULTICAST_GROUP_1		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F0001 (SCOM)	000000000E0F0001 (SCOM)	000000000F0F0001 (SCOM)
Description	Multicast Group Registers 1 – 4 are used to are used to assign chiplets to a specific multicast group within the pervasive connect bus (PCB). Multicast groups make it possible to address more than a single chiplet at a time. They are used to read or write the same resource in multiple chiplets at the same time. Note: Multicast groups are initially set up at IPL, but they can be modified at any time by firmware or power management code.		

Bits	SCOM	Field Mnemonic: Description
0:2	RO	Constant = 111
3:5	RW	MULTICAST1_GROUP: Multicast group1 setting. Set this field to a multicast group that this chiplet should be a member of. The chiplet can be assigned to up to four multicast groups by setting this field in the four multicast group registers to the corresponding multicast group numbers. If the chiplet is member of less than four multicast groups, set this field to 0b111 in the multicast group register that is not required. The 0b111 setting indicates multicast group 7; all chiplets are members of multicast group 7 regardless of any multicast register being set to 0b111. 000: Multicast group 0. 001: Multicast group 1. 010: Multicast group 2. 011: Multicast group 3. 100: Multicast group 4 – unused. 101: Multicast group 5 – unused. 110: Multicast group 6 – unused. 111: Multicast group 7.

Register Name	Multicast Group 2 Register
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.MULTICAST_GROUP_2

Address

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D0F0002 (SCOM)	000000000E0F0002 (SCOM)	000000000F0F0002 (SCOM)

Description

Multicast Group Registers 1 – 4 are used to are used to assign chiplets to a specific multicast group within the pervasive connect bus (PCB). Multicast groups make it possible to address more than a single chiplet at a time. They are used to read or write the same resource in multiple chiplets at the same time.
Note: Multicast groups are initially set up at IPL, but they can be modified at any time by firmware or power management code.

Bits	SCOM	Field Mnemonic: Description
0:2	RO	Constant = 111
3:5	RW	MULTICAST2_GROUP: Multicast group2 setting. Set this field to a multicast group that this chiplet should be a member of. The chiplet can be assigned to up to four multicast groups by setting this field in the four multicast group registers to the corresponding multicast group numbers. If the chiplet is member of less than four multicast groups, set this field to 0b111 in the multicast group register that is not required. The 0b111 setting indicates multicast group 7; all chiplets are members of multicast group 7 regardless of any multicast register being set to 0b111. 000: Multicast group 0. 001: Multicast group 1. 010: Multicast group 2. 011: Multicast group 3. 100: Multicast group 4 – unused. 101: Multicast group 5 – unused. 110: Multicast group 6 – unused. 111: Multicast group 7.

Register Name	Multicast Group 3
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.MULTICAST_GROUP_3

Address

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D0F0003 (SCOM)	000000000E0F0003 (SCOM)	000000000F0F0003 (SCOM)

Description

Multicast Group Registers 1 – 4 are used to are used to assign chiplets to a specific multicast group within the pervasive connect bus (PCB). Multicast groups make it possible to address more than a single chiplet at a time. They are used to read or write the same resource in multiple chiplets at the same time.
Note: Multicast groups are initially set up at IPL, but they can be modified at any time by firmware or power management code.

Bits	SCOM	Field Mnemonic: Description
0:2	RO	Constant = 111

Bits	SCOM	Field Mnemonic: Description
3:5	RW	MULTICAST3_GROUP: Multicast group3 setting. Set this field to a multicast group that this chiplet should be a member of. The chiplet can be assigned to up to four multicast groups by setting this field in the four multicast group registers to the corresponding multicast group numbers. If the chiplet is member of less than four multicast groups, set this field to 0b111 in the multicast group register that is not required. The 0b111 setting indicates multicast group 7; all chiplets are members of multicast group 7 regardless of any multicast register being set to 0b111. 000: Multicast group 0. 001: Multicast group 1. 010: Multicast group 2. 011: Multicast group 3. 100: Multicast group 4 – unused. 101: Multicast group 5 – unused. 110: Multicast group 6 – unused. 111: Multicast group 7.

Register Name	Multicast Group 4 Register
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.MULTICAST_GROUP_4
Address	PCI0 (PE0): 000000000D0F0004 (SCOM) PCI1 (PE1): 000000000E0F0004 (SCOM) PCI2 (PE2): 000000000F0F0004 (SCOM)
Description	Multicast Group Registers 1 – 4 are used to are used to assign chiplets to a specific multicast group within the pervasive connect bus (PCB). Multicast groups make it possible to address more than a single chiplet at a time. They are used to read or write the same resource in multiple chiplets at the same time. Note: Multicast groups are initially set up at IPL, but they can be modified at any time by firmware or power management code.

Bits	SCOM	Field Mnemonic: Description
0:2	RO	Constant = 111
3:5	RW	MULTICAST4_GROUP: Multicast group4 setting. Set this field to a multicast group that this chiplet should be a member of. The chiplet can be assigned to up to four multicast groups by setting this field in the four multicast group registers to the corresponding multicast group numbers. If the chiplet is member of less than four multicast groups, set this field to 0b111 in the multicast group register that is not required. The 0b111 setting indicates multicast group 7; all chiplets are members of multicast group 7 regardless of any multicast register being set to 0b111. 000: Multicast group 0. 001: Multicast group 1. 010: Multicast group 2. 011: Multicast group 3. 100: Multicast group 4 – unused. 101: Multicast group 5 – unused. 110: Multicast group 6 – unused. 111: Multicast group 7.

Register Name	Timeout Select Register		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.TIMEOUT_REG		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
	000000000D0F0010 (SCOM)	000000000E0F0010 (SCOM)	000000000F0F0010 (SCOM)
Description	This register contains the int_timeout setting.		

Bits	SCOM	Field Mnemonic: Description
0:1	RW	Reserved. This is the int_timeout setting.

Register Name	Assist Interrupt Register		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.ASSIST_INTERRUPT_REG		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
	000000000D0F0011 (SCOM)	000000000E0F0011 (SCOM)	000000000F0F0011 (SCOM)
Description	This register contains the attn, recov, and xstop (checkstop) settings.		

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved. This is the attn setting.
1	ROX	Reserved. This is the recov setting.
2	ROX	Reserved. This is the xstop setting.

Register Name	Vital Scan Out Register		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.VITAL_SCAN_OUT		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
	000000000D0F0017 (SCOM)	000000000E0F0017 (SCOM)	000000000F0F0017 (SCOM)
Description	This register contains the vital scan out settings.		

Bits	SCOM	Field Mnemonic: Description
0	ROX	RESERVED.

Register Name	Chiplet Heartbeat Register
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.HEARTBEAT_REG
Address	

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D0F0018 (SCOM)	000000000E0F0018 (SCOM)	000000000F0F0018 (SCOM)

Description	This register indicates whether a chiplet heartbeat is detected.

Bits	SCOM	Field Mnemonic: Description
0	ROX	HEARTBEAT_DEAD: A chiplet heartbeat is not detected.

Register Name	PLL Lock indications Register
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.PLL_LOCK_REG
Address	

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D0F0019 (SCOM)	000000000E0F0019 (SCOM)	000000000F0F0019 (SCOM)

Description	This register contains lock indications from the PLLs,

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	Reserved field.. This is the lock setting.

Register Name	Attention Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.ATTN_INTERRUPT_REG
Address	

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D0F001A (SCOM)	000000000E0F001A (SCOM)	000000000F0F001A (SCOM)

Description	This register contains the attn setting.

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved. This is the attn setting.

Register Name	Recovery Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.RECOV_INTERRUPT_REG
Address	

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D0F001B (SCOM)	000000000E0F001B (SCOM)	000000000F0F001B (SCOM)

Description	This register contains the recoverable interrupt setting.

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field. This is the recov setting.

Register Name	Checkstop Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.XSTOP_INTERRUPT_REG
Address	PCI0 (PE0): 000000000D0F001C (SCOM) PCI1 (PE1): 000000000E0F001C (SCOM) PCI2 (PE2): 000000000F0F001C (SCOM)
Description	This register contains the checkstop interrupt setting.

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field. This is the checkstop setting.

Register Name	Slave Configuration Register
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.SLAVE_CONFIG_REG
Address	PCI0 (PE0): 000000000D0F001E (SCOM) PCI1 (PE1): 000000000E0F001E (SCOM) PCI2 (PE2): 000000000F0F001E (SCOM)
Description	This is the slave configuration register.

Bits	SCOM	Field Mnemonic: Description
0	RW	CFG_DISABLE_PERV_THOLD_CHECK: This bit disables the pervasive threshold check.
1	RW	CFG_DISABLE_MALF_PULSE_GEN: This bit disables pulse generation for a malfunction alert. Switch back to level.
2	RW	CFG_STOP_HANG_CNT_SYS_XSTP: This bit disables the hang counter stop for a system checkstop.
3	RW	CFG_DISABLE_CL_ATOMIC_LOCK: This bit disables the atomic lock for chiplet accesses.
4	RW	CFG_DISABLE_HEARTBEAT: This bit disables the check for voltage and gridclock in the chiplet.
5	RW	CFG_DISABLE_FORCE_TO_ZERO: This bit disables the force to zero for error cases.
6	RW	CFG_PM_DISABLE: This bit disables the power management set/reset interface for net_ctrl registers.
7	RW	CFG_PM_MUX_DISABLE: This bit disables the power-management multiplex request signal.
8:13	RW	ERROR_MASK: These are mask bits for slave error reporting.
14:15	RW	RESERVED.

Register Name	**Error Capture Register**
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.ERROR_REG
Address	**PCI0 (PE0)**: 000000000D0F001F (SCOM) **PCI1 (PE1)**: 000000000E0F001F (SCOM) **PCI2 (PE2)**: 000000000F0F001F (SCOM)
Description	This register is used to capture errors.

Bits	SCOM	Field Mnemonic: Description
0	RWX_WCLEAR	CE_ERROR: Correctable error on the PCB bus.
1:3	RWX_WCLEAR	CHIPLET_ERRORS: Errors reported by the chiplet. 000 = No error. 001 = XSCOM command blocked due to pending errors. 010 = Chiplet offline. 011 = Partial good. 100 = Invalid address, address error, or bad access type. 101 = Clock error. 110 = Parity error, received unexpected packet, or wrong packet number. 111 = Timeout. This register is for debug purposes only. It only holds meaningful data if it is cleared after each error.
4	RWX_WCLEAR	PARITY_ERROR: Parity error on the PCB interface.
5	RWX_WCLEAR	DATA_BUFFER_ERROR: Parity error in the data buffer.
6	RWX_WCLEAR	ADDR_BUFFER_ERROR: Parity error in the address buffer.
7	RWX_WCLEAR	PCB_FSM_ERROR: Invalid state error in the PCB FSM.
8	RWX_WCLEAR	CL_FSM_ERROR: Invalid state error in the chiplet FSM.
9	RWX_WCLEAR	INT_RX_FSM_ERROR: Invalid state error in the interrupt RX FSM.
10	RWX_WCLEAR	INT_TX_FSM_ERROR: Invalid state error in the interrupt TX FSM.
11	RWX_WCLEAR	INT_TYPE_ERROR: Invalid interrupt type.
12	RWX_WCLEAR	CL_DATA_ERROR: Parity error on the chiplet interface.
13	RWX_WCLEAR	INFO_ERROR: Parity error on the chiplet information lines.
14	RWX_WCLEAR	UNUSED_0:
15	RWX_WCLEAR	CHIPLET_ATOMIC_LOCK_ERROR: Chiplet atomic lock error.
16	RWX_WCLEAR	PCB_INTERFACE_ERROR: Error on the PCB interface component for the internal endpoint.
17	RWX_WCLEAR	CHIPLET_OFFLINE: A heartbeat check indicated that the chiplet is offline.
18	RWX_WCLEAR	EDRAM_SEQUENCE_ERR: Error in the eDRAM power-up sequence.
19	RWX_WCLEAR	CTRL_REG_PARITY_ERROR: The control register parity is bad.
20	RWX_WCLEAR	ADDRESS_REG_PARITY_ERROR: The address register parity is bad.
21	RWX_WCLEAR	TIMEOUT_REG_PARITY_ERROR: The timeout select register parity is bad.
22	RWX_WCLEAR	CONFIG_REG_PARITY_ERROR: The slave configuration register parity is bad.
23	RWX_WCLEAR	UNUSED_1:
24	RWX_WCLEAR	DIV_REG_PARITY_ERROR: The divider register parity is bad.
25:28	RWX_WCLEAR	PLL_UNLOCK_ERROR: Unlock from the chiplet PLL.

Register Name	Hang Pulse Generation Register 0		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.HANG_PULSE_0_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F0020 (SCOM)	000000000E0F0020 (SCOM)	000000000F0F0020 (SCOM)
Description	This register contains hang pulse 0 information.		

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_0: This field contains the value of hang pulse 0. The time period equals 2value x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_0: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation Register 1		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.HANG_PULSE_1_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F0021 (SCOM)	000000000E0F0021 (SCOM)	000000000F0F0021 (SCOM)
Description	This register contains hang pulse 1 information.		

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_1: This field contains the value of hang pulse 1. The time period equals 2value x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_1: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation Register 2		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.HANG_PULSE_2_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F0022 (SCOM)	000000000E0F0022 (SCOM)	000000000F0F0022 (SCOM)
Description	This register contains hang pulse 2 information.		

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_2: This field contains the value of hang pulse 2. The time period equals 2value x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_2: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation Register 3		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.HANG_PULSE_3_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F0023 (SCOM)	000000000E0F0023 (SCOM)	000000000F0F0023 (SCOM)
Description	This register contains hang pulse 3 information.		

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_3: This field contains the value of hang pulse 3. The time period equals 2value x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_3: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation Register 4		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.HANG_PULSE_4_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F0024 (SCOM)	000000000E0F0024 (SCOM)	000000000F0F0024 (SCOM)
Description	This register contains hang pulse 4 information.		

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_4: This field contains the value of hang pulse 4. The time period equals 2value x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_4: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation Register 5		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.HANG_PULSE_5_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F0025 (SCOM)	000000000E0F0025 (SCOM)	000000000F0F0025 (SCOM)
Description	This register contains hang pulse 5 information. This hang counter is exclusively used to generate the malfunction alert pulse.		

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_5: This field contains the value of hang pulse 5. The time period equals 2value x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_5: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation Register 6		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.HANG_PULSE_6_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F0026 (SCOM)	000000000E0F0026 (SCOM)	000000000F0F0026 (SCOM)
Description	This register contains hang pulse 6 information. This hang counter is exclusively used for heartbeat generation.		

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_6: This field contains the value of hang pulse 6. The time period equals 2value x (precounter_reg + 1) / pcb_freq. The range of valid values is 34 – 0.
6	RW	SUPPRESS_HANG_6: If set to '1', hang pulses are suppressed in case of a checkstop.

Register Name	Hang Counter Clock Divider Register		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.PRE_COUNTER_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F0028 (SCOM)	000000000E0F0028 (SCOM)	000000000F0F0028 (SCOM)
Description	This register is the divider for the hang counter clock.		

Bits	SCOM	Field Mnemonic: Description
0:7	RW	PRE_COUNTER: This field is the divider for the hang counter clock. It divides the clock by n + 1. (The default is n = 0).

Register Name	eDRAM Control Status Register		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.EDRAM_STATUS		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F0029 (SCOM)	000000000E0F0029 (SCOM)	000000000F0F0029 (SCOM)
Description	This register contains the eDRAM control status.		

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	EDRAM_STAT: This field contains the eDRAM control status.

Register Name	NET CTRL0 Register (NA in PERV CPLT)
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.NET_CTRL0
Address	

PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
000000000D0F0040 (SCOM) 000000000D0F0041 (SCOM1) 000000000D0F0042 (SCOM2)	000000000E0F0040 (SCOM) 000000000E0F0041 (SCOM1) 000000000E0F0042 (SCOM2)	000000000F0F0040 (SCOM) 000000000F0F0041 (SCOM1) 000000000F0F0042 (SCOM2)

Description	NET CTRL0 Register (NA in PERV CPLT)

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	RWX_WAND	RWX_WOR	CHIPLET_ENABLE: This bit is set if the chiplet is good.
1	RWX	RWX_WAND	RWX_WOR	PCB_EP_RESET: The output is ORed to the global EP reset.
2	RWX	RWX_WAND	RWX_WOR	CLK_ASYNC_RESET: POWER9 cache chiplet: EQ skew adjust reset. POWER9 core chiplet: Core duty cycle adjust reset. POWER9 memory chiplet: Memory glitchless multiplexer asynchronous reset.
3	RWX	RWX_WAND	RWX_WOR	PLL_TEST_EN: Test enable for the chiplet PLL.
4	RWX	RWX_WAND	RWX_WOR	PLL_RESET: Reset for the chiplet PLL.
5	RWX	RWX_WAND	RWX_WOR	PLL_BYPASS: Enable bypass for chiplet PLL.
6	RWX	RWX_WAND	RWX_WOR	VITAL_SCAN: Scan control for chiplet vital domain.
7	RWX	RWX_WAND	RWX_WOR	VITAL_SCAN_IN: Scan in for the chiplet vital domain.
8	RWX	RWX_WAND	RWX_WOR	VITAL_PHASE: Phase for vital domain.
9	RWX	RWX_WAND	RWX_WOR	FLUSH_ALIGN_OVR: When set to 1, this mechanism overrides automatic control by the clock controller of the flush, flush_nto1, and align signals in the chiplet.
10	RWX	RWX_WAND	RWX_WOR	VITAL_AL: Align for vital domain.
11	RWX	RWX_WAND	RWX_WOR	ACT_DIS: ACT disable control for LCBs in the vital logic.
12	RWX	RWX_WAND	RWX_WOR	MPW1: Modify pulse width 1 (MPW1) control for LCBs in the vital logic.
13	RWX	RWX_WAND	RWX_WOR	MPW2: Modify pulse width 2 (MPW2) control for LCBs in the vital logic.
14	RWX	RWX_WAND	RWX_WOR	MPW3: Modify pulse width 3 (MPW3) control for LCBs in the vital logic.
15	RWX	RWX_WAND	RWX_WOR	DELAY_LCLKR: LCB control signal for the vital logic.
16	RWX	RWX_WAND	RWX_WOR	VITAL_THOLD: Threshold for the chiplet vital domain.
17	RWX	RWX_WAND	RWX_WOR	FLUSH_SCAN_N: Flush scan control.
18	RWX	RWX_WAND	RWX_WOR	FENCE_EN: Fencing signal for the chiplet.
19	RWX	RWX_WAND	RWX_WOR	CPLT_RCTRL: Chiplet receiver enable.
20	RWX	RWX_WAND	RWX_WOR	CPLT_DCTRL: Chiplet driver enable.
21	RWX	RWX_WAND	RWX_WOR	Reserved. This is the pm_access setting.
22	RWX	RWX_WAND	RWX_WOR	ADJ_FUNC_CLKSEL: POWER9 cache chiplet: Clock select for the skew adjust/duty cycle adjust logic. POWER9 core chiplet: Skew sense to skew adjust fencing.
23:24	RWX	RWX_WAND	RWX_WOR	Reserved. This is the pm_access setting.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
25	RWX	RWX_WAND	RWX_WOR	TP_FENCE_PCB: Fence the chiplet from the PCB bus. If set, the PCB slave reports “Chiplet Offline.”
26	RWX	RWX_WAND	RWX_WOR	LVLTRANS_FENCE: Fence control for the level translators.
27	RWX	RWX_WAND	RWX_WOR	ARRAY_WRITE_ASSIST_EN: Array write assist.
28	RWX	RWX_WAND	RWX_WOR	HTB_INTEST: HTB intest mode.
29	RWX	RWX_WAND	RWX_WOR	HTB_EXTEST: HTB intest mode.
30	RWX	RWX_WAND	RWX_WOR	Reserved. This is the pm_access setting.
31	RWX	RWX_WAND	RWX_WOR	PLLFORCE_OUT_EN: PLL force out enable.

Register Name	NET CTRL1 Register (NA in PERV CPLT)
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.NET_CTRL1
Address	<table><tr><th>PCI0 (PE0)</th><th>PCI1 (PE1)</th><th>PCI2 (PE2)</th></tr><tr><td>000000000D0F0044 (SCOM) 000000000D0F0045 (SCOM1) 000000000D0F0046 (SCOM2)</td><td>000000000E0F0044 (SCOM) 000000000E0F0045 (SCOM1) 000000000E0F0046 (SCOM2)</td><td>000000000F0F0044 (SCOM) 000000000F0F0045 (SCOM1) 000000000F0F0046 (SCOM2)</td></tr></table>
Description	NET CTRL1 Register (NA in PERV CPLT)

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	RWX_WAND	RWX_WOR	PLL_CLKIN_SEL: PLL clkin select. POWER9 Memory chiplet (mux3): Selects the reference clock source for the DDR reference clock. 0 = SSCG enabled, 1 = SSCG disabled. POWER9 XBus chiplet (mux8): Selects the reference clock source for the Xbus PLLs. 0 = SSCG enabled. 1 = SSCG disabled. POWER9 PCIe chiplet (PCI0 = mux5, PCI2 = mux4): Selects the reference clock source for the PCIe PHY E2 (PCI2), PCIe PHY E0 and E2 (PCI0). 0 = SSCG enabled. 1 = SSCG disabled. POWER9 OBus chiplet (OB0 = mux6, OB3 = mux7): Selects the reference clock source for the combo PHY 0 (OB0) and PHY 3 (OB3). 0 = NVLink. 1 = Optics.
1	RWX	RWX_WAND	RWX_WOR	CLK_DCC_BYPASS_EN: POWER9 cache chiplet: L2-0, L2-1, L3 duty cycle control bypass. POWER9 core chiplet: Core duty cycle control bypass. POWER9 memory chiplet: Memory duty cycle control bypass.
2	RWX	RWX_WAND	RWX_WOR	CLK_PDLY_BYPASS_EN: POWER9 cache chiplet: L2-0, L2-1, L3 programmable delay bypass. POWER9 core chiplet: Core programmable delay bypass. POWER9 memory chiplet: Memory programmable delay bypass.
3	RWX	RWX_WAND	RWX_WOR	CLK_DIV_BYPASS_EN: Enable clock divider bypass.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
4	RWX	RWX_WAND	RWX_WOR	REFCLK_CLKMUX0_SEL: Selects the reference clock input. POWER9 OB0 chiplet (mux13): Selects the reference clock source for the Optics 156.25 MHz reference clock. 0 = SSCG enabled. 1 = SSCG disabled, POWER9 OB3 chiplet (mux9): Selects the reference clock source for the NVLink 133 1/3 MHz reference clock. 0 = SSCG enabled. 1 = SSCG disabled. POWER9 PCI0 chiplet (mux10): Selects the 100 MHz SSCG reference clock source for the PCIe PHYs. 0 = CP Filter PLL 2. 1 = SSCG PLL 1.
5	RWX	RWX_WAND	RWX_WOR	REFCLK_CLKMUX1_SEL: Selects the reference clock input. POWER9 OB0 chiplet (mux15): Selects the reference clock source for the NVLink reference clock. 0 = 133 1/3 MHz. 1 = 156.25 MHz. POWER9 OB3 chiplet (mux14): Selects the reference clock source for NVLink 156.25 MHz reference clock. 0 = SSCG enabled. 1 = SSCG disabled. POWER9 PCI0 chiplet (mux11): Selects 100 MHz non-SSCG reference clock source for PCIe PHYs. 0 = I/O filter PLL 3. 1 = Unfiltered.
6	RWX	RWX_WAND	RWX_WOR	PLL_BNDY_BYPASS_EN: Bypass for IOP PLL.
7	RWX	RWX_WAND	RWX_WOR	Reserved. This is the pcb_access setting.
8:15	RWX	RWX_WAND	RWX_WOR	DPLL_TEST_SEL: DPLL testout multiplexing.
16:19	RWX	RWX_WAND	RWX_WOR	SB_STRENGTH: Sector buffer driver strength.
20	RWX	RWX_WAND	RWX_WOR	ASYNC_TYPE: This is a control signal for testing latches with asynchronous set and reset capabilities.
21	RWX	RWX_WAND	RWX_WOR	ASYNC_OBS: This is a control signal for testing latches with asynchronous set and reset capabilities.
22	RWX	RWX_WAND	RWX_WOR	CPM_CAL_SET: CPM calibrate.
23	RWX	RWX_WAND	RWX_WOR	SENSEADJ_RESET0: POWER9 cache chiplet: L2-0 duty cycle adjust reset.
24	RWX	RWX_WAND	RWX_WOR	SENSEADJ_RESET1: POWER9 cache chiplet: L2-1 duty cycle adjust reset.
25	RWX	RWX_WAND	RWX_WOR	CLK_PULSE_EN: Clock pulse mode enable.
26:27	RWX	RWX_WAND	RWX_WOR	CLK_PULSE_MODE: Clock pulse mode setting.
28:31	RWX	RWX_WAND	RWX_WOR	Reserved. This is the pcb_access setting.

Register Name	Protect Mode Register		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.PROTECT_MODE_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F03FE (SCOM)	000000000E0F03FE (SCOM)	000000000F0F03FE (SCOM)
Description	This register is used to enable read and write protection.		

Bits	SCOM	Field Mnemonic: Description
0	RW	READ_PROTECT_ENABLE: Enable read protection.
1	RW	WRITE_PROTECT_ENABLE: Enable write protection.

Register Name	Atomic Lock Register		
Mnemonic	TP.TPCHIP.NET.PCBSLPCI0.ATOMIC_LOCK_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
	000000000D0F03FF (SCOM)	000000000E0F03FF (SCOM)	000000000F0F03FF (SCOM)
Description	This register contains atomic lock information.		

Bits	SCOM	Field Mnemonic: Description
0	RW	ATOMIC_LOCK_ENABLE: Enable the atomic lock.
1:4	ROX	ATOMIC_ID: This field contains the atomic ID.
5:7	RO	constant = 0b000
8:15	ROX	ATOMIC_ACTIVITY: This is the atomic lock counter.

10. PCI 1 and PCI 2 Chiplet

The POWER9 processor registers are listed alphabetically by mnemonic in the following address table.

Mnemonic	Address	Page
PE1.PHB2.ETUX08.RSB.RSB.REGS.ACT0_REG	0x000000000E01094E	1965
PE1.PHB2.ETUX08.RSB.RSB.REGS.ACTION1_REG	0x000000000E01094F	1967
PE1.PHB2.ETUX08.RSB.RSB.REGS.FIR_REG	0x000000000E010948	1960
PE1.PHB2.ETUX08.RSB.RSB.REGS.MASK_REG	0x000000000E01094B	1963
PE1.PHB2.ETUX08.RSB.RSB.REGS.PERF_CFG_REG	0x000000000E010957	1971

Register Name	**PHB4 SCOM HV Indirect Address Register**		
Mnemonic	PE1.PHB2.ETUX08.RSB.RSB.SCOM.SSR.PHB4_SCOM_HVIAR		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
		000000000E010940 (SCOM)	000000000F010940 (SCOM)
Description	This register contains the PHB4 SCOM HV request indirect address value.		

Bits	SCOM	Field Mnemonic: Description
0	RW	HV_REQ_ADDR_VLD: SCOM HV request valid.
1	RW	HV_REQ_4B: SCOM HV request 4B access.
2	RW	HV_AUTO_INC: SCOM HV request address auto increment.
3:50	RO	Constant = 0b000000000000000000000000000000000000000000000000
51:61	RW	HV_REQ_ADDR_VALUE: SCOM HV request indirect address value.
62:63	RO	Constant = 0b00

Register Name	PHB4 SCOM HV Indirect Address Register Read Port		
Mnemonic	PE1.PHB2.ETUX08.RSB.RSB.SCOM.SSR.PHB4_SCOM_HVIDR		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
		000000000E010941 (SCOM)	000000000F010941 (SCOM)
Description	PHB4 SCOM HV Indirect Address Register Read Port		

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	scom_hv_req_read_data.

Register Name	PHB4 SCOM HV Indirect Address Register Write Port		
Mnemonic	PE1.PHB2.ETUX08.RSB.RSB.SCOM.SSR.PHB4_SCOM_HVIDWR		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
		000000000E010941 (SCOM)	000000000F010941 (SCOM)
Description	PHB4 SCOM HV Indirect Address Register Write Port		

Bits	SCOM	Field Mnemonic: Description
0:63	WOX	scom_hv_req_write_data.

Register Name	PHB4 SCOM HV Indirect Address Register		
Mnemonic	PE1.PHB2.ETUX08.RSB.RSB.SCOM.SSR.PHB4_SCOM_UVIAR		
Address	PCI0 (PE0)	PCI1 (PE1)	PCI2 (PE2)
		000000000E010942 (SCOM)	000000000F010942 (SCOM)
Description	PHB4 SCOM HV Indirect Address Register		

Bits	SCOM	Field Mnemonic: Description
0	RW	UV_REQ_ADDR_VLD: SCOM UV request valid.
1	RO	Constant = 0b0
2	RW	UV_AUTO_INC: SCOM UV request address auto increment.
3:51	RO	Constant = 0b0000000000000000000000000000000000000000000000000
52:60	RW	UV_REQ_ADDR_VALUE: SCOM UV request indirect address value.
61:63	RO	Constant = 0b000

Register Name	PHB4 SCOM UV Indirect Address Register Read Port		
Mnemonic	PE1.PHB2.ETUX08.RSB.RSB.SCOM.SSR.PHB4_SCOM_UVIDR		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
		000000000E010943 (SCOM)	000000000F010943 (SCOM)
Description	PHB4 SCOM UV Indirect Address Register Read Port		

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	scom_uv_req_read_data.

Register Name	PHB4 SCOM UV Indirect Address Register Write Port		
Mnemonic	PE1.PHB2.ETUX08.RSB.RSB.SCOM.SSR.PHB4_SCOM_UVIDWR		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
		000000000E010943 (SCOM)	000000000F010943 (SCOM)
Description	PHB4 SCOM UV Indirect Address Register Write Port		

Bits	SCOM	Field Mnemonic: Description
0:63	WOX	scom_uv_req_write_data.

Register Name	ETU FIR Register		
Mnemonic	PE1.PHB2.ETUX08.RSB.RSB.REGS.FIR_REG		
Address	**PCI0 (PE0)**	**PCI1 (PE1)**	**PCI2 (PE2)**
		000000000E010948 (SCOM) 000000000E010949 (SCOM1) 000000000E01094A (SCOM2)	000000000F010948 (SCOM) 000000000F010949 (SCOM1) 000000000F01094A (SCOM2)
Description	ETU FIR Register		

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	WOX_AND	WOX_OR	AIB_COMMAND_INVALID: See Outbound Error Status Register, bit 0 for details.
1	RWX	WOX_AND	WOX_OR	AIB_ADDRESS_INVALID: See Outbound Error Status Register, bit 1/2 for details.
2	RWX	WOX_AND	WOX_OR	AIB_ACCESS_ERROR: See Outbound Error Status Register, bit 3/8 for details.
3	RWX	WOX_AND	WOX_OR	PAPR_OUTBOUND_INJECT_ERROR: See Outbound Error Status Register, bit 28 for details.
4	RWX	WOX_AND	WOX_OR	AIB_FATAL_CLASS_ERROR: See Outbound Error Status Register, bit 4/5/9/10/11/14/15 for details.
5	RWX	WOX_AND	WOX_OR	AIB_INF_Class_Error.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
6	RWX	WOX_AND	WOX_OR	AIB_INF_CLASS_ERROR: See Outbound Error Status Register, bit 6 for details.
7	RWX	WOX_AND	WOX_OR	PE_STOP_STATE_SIGNALED: See Outbound Error Status Register, bit 13/22 for details.
8	RWX	WOX_AND	WOX_OR	OUT_COMMON_ARRAY_FATAL_ERROR: See Outbound Error Status Register, bit 23/37/38/40/43/44/45/47/48/49 for details.
9	RWX	WOX_AND	WOX_OR	OUT_COMMON_LATCH_FATAL_ERROR: See Outbound Error Status Register, bit 50/51/52 for details.
10	RWX	WOX_AND	WOX_OR	OUT_COMMON_LOGIC_FATAL_ERROR: See Outbound Error Status Register, bit 19/20/21/53/54/55 for details.
11	RWX	WOX_AND	WOX_OR	BLIF_OUT_INTERFACE_PARITY_ERROR: See Outbound Error Status Register, bit 16 for details.
12	RWX	WOX_AND	WOX_OR	CFG_WRITE_CA_OR_UR_RESPONSE: See Outbound Error Status Register, bit 17 for details.
13	RWX	WOX_AND	WOX_OR	MMIO_REQUEST_TIMEOUT: See Outbound Error Status Register, bit 18 for details.
14	RWX	WOX_AND	WOX_OR	OUT_RRB_SOURCED_ERROR: See Outbound Error Status Register, bit 56/57 for details.
15	RWX	WOX_AND	WOX_OR	CFG_LOGIC_SIGNALED_ERROR: See Outbound Error Status Register, bit 17 for details.
16	RWX	WOX_AND	WOX_OR	RSB_REG_REQUEST_ADDRESS_ERROR: See RSB Error Status Register, bit 00 for details.
17	RWX	WOX_AND	WOX_OR	RSB_FDA_FATAL_ERROR: See RSB Error Status Register, bit 2/3/5 for details.
18	RWX	WOX_AND	WOX_OR	RSB_FDA_INF_ERROR: See RSB Error Status Register, bit 1/4 for details.
19	RWX	WOX_AND	WOX_OR	RSB_FDB_FATAL_ERROR: See RSB Error Status Register, bit 9/10 for details.
20	RWX	WOX_AND	WOX_OR	RSB_FDB_INF_ERROR: See RSB Error Status Register, bit 8 for details.
21	RWX	WOX_AND	WOX_OR	RSB_ERR_FATAL_ERROR: See RSB Error Status Register, bit 7 for details.
22	RWX	WOX_AND	WOX_OR	RSB_ERR_INF_ERROR: See RSB Error Status Register, bit 6 for details.
23	RWX	WOX_AND	WOX_OR	RSB_DBG_FATAL_ERROR: See RSB Error Status Register, bit 13/14 for details.
24	RWX	WOX_AND	WOX_OR	RSB_DBG_INF_ERROR: See RSB Error Status Register, bit 12 for details.
25	RWX	WOX_AND	WOX_OR	PCIE_REQUEST_ACCESS_ERROR: See Outbound Error Status Register, bit 11 for details.
26	RWX	WOX_AND	WOX_OR	RSB_BUS_LOGIC_ERROR: See Outbound Error Status Register, bit 15/27 for details.
27	RWX	WOX_AND	WOX_OR	RSB_UVI_FATAL_ERROR: See RSB Error Status Register, bit 17/19 for details.
28	RWX	WOX_AND	WOX_OR	RSB_UVI_INF_ERROR: See RSB Error Status Register, bit 16/18 for details.
29	RWX	WOX_AND	WOX_OR	SCOM_FATAL_ERROR: See RSB Error Status Register, bit 30/31 for details.
30	RWX	WOX_AND	WOX_OR	SCOM_INF_ERROR: See RSB Error Status Register, bit 28/29 for details.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
31	RWX	WOX_AND	WOX_OR	PCIE_MACRO_ERROR_ACTIVE_STATUS: See RSB Error Status Register, bit 24/25/26 for details.
32	RWX	WOX_AND	WOX_OR	ARB_IODA_FATAL_ERROR: See ARB Error Status Register, bit 33 for details.
33	RWX	WOX_AND	WOX_OR	ARB_MSI_PE_MATCH_ERROR: See ARB Error Status Register, bit 27 for details.
34	RWX	WOX_AND	WOX_OR	ARB_MSI_ADDRESS_ERROR: See ARB Error Status Register, bit 02/03 for details.
35	RWX	WOX_AND	WOX_OR	ARB_TVT_ERROR: See ARB Error Status Register, bit 26/28 for details.
36	RWX	WOX_AND	WOX_OR	ARB_RCVD_FATAL_ERROR_MSG: See ARB Error Status Register, bit 57 for details.
37	RWX	WOX_AND	WOX_OR	ARB_RCVD_NONFATAL_ERROR_MSG: See ARB Error Status Register, bit 58 for details.
38	RWX	WOX_AND	WOX_OR	ARB_RCVD_CORRECTIBLE_ERROR_MSG: See ARB Error Status Register, bit 59 for details.
39	RWX	WOX_AND	WOX_OR	PAPR_INBOUND_INJECT_ERROR: See Outbound Error Status Register, bit 39 for details.
40	RWX	WOX_AND	WOX_OR	ARB_COMMON_FATAL_ERROR: See ARB Error Status Register, bit 4/7/8/9/10/11/12/13/14/15/16/17/18/22/23/36/37/38/42/43/44/45/46/47/48/59/55/56 for details.
41	RWX	WOX_AND	WOX_OR	ARB_TABLE_BAR_DISABLED_ERROR: See ARB Error Status Register, bit 32/41 for details.
42	RWX	WOX_AND	WOX_OR	ARB_BLIF_COMPLETION_ERROR: See ARB Error Status Register, bit 00/01/19 for details.
43	RWX	WOX_AND	WOX_OR	ARB_PCT_TIMEOUT_ERROR: See ARB Error Status Register, bit 34/35 for details.
44	RWX	WOX_AND	WOX_OR	ARB_ECC_CORRECTABLE_ERROR: See ARB Error Status Register, bit 5/20/25/29 for details.
45	RWX	WOX_AND	WOX_OR	ARB_ECC_UNCORRECTABLE_ERROR: See ARB Error Status Register, bit 6/26/30/31 for details.
46	RWX	WOX_AND	WOX_OR	ARB_TLP_POISON_SIGNALED: See ARB Error Status Register, bit 24 for details.
47	RWX	WOX_AND	WOX_OR	ARB_RTT_PENUM_INVALID_ERROR: See ARB Error Status Register, bit 40 for details.
48	RWX	WOX_AND	WOX_OR	MRG_COMMON_FATAL_ERROR: See MRG Error Status Register, bit 08-16/22/23/26/28/30-37/40-50 for details.
49	RWX	WOX_AND	WOX_OR	MRG_TABLE_BAR_DISABLED_ERROR: See MRG Error Status Register, bit 51 for details.
50	RWX	WOX_AND	WOX_OR	MRG_ECC_CORRECTABLE_ERROR: See MRG Error Status Register, bit 40/56/58/60 for details.
51	RWX	WOX_AND	WOX_OR	MRG_ECC_UNCORRECTABLE_ERROR: See MRG Error Status Register, bit 41/57/59/61 for details.
52	RWX	WOX_AND	WOX_OR	MRG_AIB2_TX_TIMEOUT_ERROR: See MRG Error Status Register, bit 24 for details.
53	RWX	WOX_AND	WOX_OR	MRG_MRT_ERROR: See MRG Error Status Register, bit 17/18 for details.
54	RWX	WOX_AND	WOX_OR	MRG_Reserved01.
55	RWX	WOX_AND	WOX_OR	MRG_Reserved02.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
56	RWX	WOX_AND	WOX_OR	TCE_IODA_PAGE_ACCESS_ERROR: See TCE Error Status Register, bit 01/02 for details.
57	RWX	WOX_AND	WOX_OR	TCE_REQUEST_TIMEOUT_ERROR: See TCE Error Status Register, bit 08 for details.
58	RWX	WOX_AND	WOX_OR	TCE_UNEXPECTED_RESPONSE_ERROR: See TCE Error Status Register, bit 13 for details.
59	RWX	WOX_AND	WOX_OR	TCE_COMMON_FATAL_ERROR: See TCE Error Status Register for details.
60	RWX	WOX_AND	WOX_OR	TCE_ECC_CORRECTABLE_ERROR: See TCE Error Status Register, bit 09/11/25/27 for details.
61	RWX	WOX_AND	WOX_OR	TCE_ECC_UNCORRECTABLE_ERROR: See TCE Error Status Register, bit 10/12/26/28 for details.
62	RWX	WOX_AND	WOX_OR	TCE_Reserved01.
63	RWX	WOX_AND	WOX_OR	FIR_INTERNAL_PARITY_ERROR: FIR Internal Parity Error.

Register Name	**ETU FIR MASK Register**
Mnemonic	PE1.PHB2.ETUX08.RSB.RSB.REGS.MASK_REG
Address

TP.TCEP03.XFIR	0x0000000013040000	2017

The POWER9 processor registers are listed in the following tables.

Register Name	Chiplet Control Register 0
Mnemonic	TP.TCEP03.TPCL3.CPLT_CTRL0
Address	0000000013000000 (SCOM) 0000000013000010 (SCOM1) 0000000013000020 (SCOM2)
Description	This register contains the first set of vital chiplet controls.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_OR	WO_CLEAR	CTRL_CC_ABSTCLK_MUXSEL_DC: Select the ABIST clock source for arrays on a chiplet boundary. When set to 1, clocks are used from a chiplet with ABIST.
1	RW	WO_OR	WO_CLEAR	TC_UNIT_SYNCCLK_MUXSEL_DC: Select the synchronous clock for asynchronous latches. (The initial value is 1.)

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
2	RW	WO_OR	WO_CLEAR	CTRL_CC_FLUSHMODE_INH_DC: Prevent pipeline latches from going into flush mode. (The initial value is 1.)
3	RW	WO_OR	WO_CLEAR	CTRL_CC_FORCE_ALIGN_DC: Force an alignment signal to be sent. (The initial value is 1. Drop before dropping flushmode_inh.)
4	RW	WO_OR	WO_CLEAR	TC_UNIT_ARY_WRT_THRU_DC: Set the array into write-through mode. Used for LBIST.
5	RW	WO_OR	WO_CLEAR	TC_UNIT_AVP_MODE: AVP mode. Switches from refresh pulse to phase counter.
6	RW	WO_OR	WO_CLEAR	FREE_USAGE_6A: Free usage.
7	RW	WO_OR	WO_CLEAR	FREE_USAGE_7A: Free usage.
8	RW	WO_OR	WO_CLEAR	CTRL_CC_ABIST_RECOV_DISABLE_DC: New signal to disable recovery.
9	RW	WO_OR	WO_CLEAR	FREE_USAGE_9A: Free usage.
10	RW	WO_OR	WO_CLEAR	TC_UNIT_IOBIST_TX_WRAP_ENABLE_DC:
11	RW	WO_OR	WO_CLEAR	RESERVED_11A: Reserved.
12	RW	WO_OR	WO_CLEAR	TC_SKIT_MODE_BIST_DC:
13	RW	WO_OR	WO_CLEAR	TC_UNIT_DETERMINISTIC_TEST_ENABLE_DC: Forces login into deterministic test mode. For example, for LBIST.
14	RW	WO_OR	WO_CLEAR	TC_UNIT_CONSTRAIN_SAFESCAN_DC: Safe scan of N1L latches. Prevent lock when switching SE.
15	RW	WO_OR	WO_CLEAR	TC_UNIT_RRFA_TEST_ENABLE_DC:
16	RW	WO_OR	WO_CLEAR	TC_NBTI_HDR_ENABLE_OVR_DC: NBTI.
17	RW	WO_OR	WO_CLEAR	TC_NBTI_PROBE_GATE_DC: NBTI.
18	RW	WO_OR	WO_CLEAR	RESERVED_18A: Reserved.
19	RW	WO_OR	WO_CLEAR	RESERVED_19A: Reserved.
20:27	RW	WO_OR	WO_CLEAR	TC_PSRO_SEL_DC: PSRO select.
28	RW	WO_OR	WO_CLEAR	TC_BSC_WRAPSEL_DC: Wrap select for BSC.
29	RW	WO_OR	WO_CLEAR	TC_BSC_INTMODE_DC: INT mode for BSC.
30	RW	WO_OR	WO_CLEAR	TC_BSC_INV_DC: INV for BSC mode.
31	RW	WO_OR	WO_CLEAR	TC_BSC_EXTMODE_DC: EXT mode for BSC.
32	RW	WO_OR	WO_CLEAR	TC_REFCLK_DRVR_EN_DC: Reference clock driver enable.
33	RW	WO_OR	WO_CLEAR	RESERVED_33A: Reserved.
34	RW	WO_OR	WO_CLEAR	RESERVED_34A: Reserved.
35	RW	WO_OR	WO_CLEAR	RESERVED_35A: Reserved.
36	RW	WO_OR	WO_CLEAR	TC_OELCC_EDGE_DELAYED_DC: Allows to delay the alignment by one fast cycle. Only used in dual mesh chiplets.
37	RW	WO_OR	WO_CLEAR	TC_OELCC_ALIGN_FLUSH_DC: Forces the alignment and odd/even toggling latch into a flush state. For DFT only.
38	RW	WO_OR	WO_CLEAR	RESERVED_38A: Reserved.
39	RW	WO_OR	WO_CLEAR	RESERVED_39A: Reserved.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
40:41	RW	WO_OR	WO_CLEAR	CTRL_MISC_CLKDIV_SEL_DC: Clock divider select. 00 = 1024:1 01 = 64:1 10 = 16:1 11 = 4:1
42	RW	WO_OR	WO_CLEAR	RESERVED_42A: Reserved.
43	RW	WO_OR	WO_CLEAR	RESERVED_43A: Reserved.
44	RW	WO_OR	WO_CLEAR	CTRL_CC_DCTEST_DC: TE = 1 only. Enable DCTEST.
45	RW	WO_OR	WO_CLEAR	CTRL_CC_OTP_PRGMODE_DC: TE = 1 only. OTP ROM program mode.
46	RW	WO_OR	WO_CLEAR	CTRL_CC_SSS_CALIBRATE_DC: TE = 1 only. Sensors calibration.
47	RW	WO_OR	WO_CLEAR	CTRL_CC_PIN_LBIST_DC: TE = 1 only. PIN LBIST mode. The LBIST is controlled by the pin, not by the OPCG.
48	RW	WO_OR	WO_CLEAR	FREE_USAGE_48A: Free usage.
49	RW	WO_OR	WO_CLEAR	FREE_USAGE_49A: Free usage.
50	RW	WO_OR	WO_CLEAR	FREE_USAGE_50A: Free usage.
51	RW	WO_OR	WO_CLEAR	FREE_USAGE_51A: Free usage.
52	RW	WO_OR	WO_CLEAR	FREE_USAGE_52A: Free usage.
53	RW	WO_OR	WO_CLEAR	FREE_USAGE_53A: Free usage.
54	RW	WO_OR	WO_CLEAR	FREE_USAGE_54A: Free usage.
55	RW	WO_OR	WO_CLEAR	FREE_USAGE_55A: Free usage.
56	RW	WO_OR	WO_CLEAR	FREE_USAGE_56A: Free usage.
57	RW	WO_OR	WO_CLEAR	FREE_USAGE_57A: Free usage.
58	RW	WO_OR	WO_CLEAR	FREE_USAGE_58A: Free usage.
59	RW	WO_OR	WO_CLEAR	FREE_USAGE_59A: Free usage.
60	RW	WO_OR	WO_CLEAR	FREE_USAGE_60A: Free usage.
61	RW	WO_OR	WO_CLEAR	FREE_USAGE_61A: Free usage.
62	RW	WO_OR	WO_CLEAR	FREE_USAGE_62A: Free usage.
63	RW	WO_OR	WO_CLEAR	FREE_USAGE_63A: Free usage.

Register Name	**Chiplet Control Register 1**
Mnemonic	TP.TCEP03.TPCL3.CPLT_CTRL1
Address	0000000013000001 (SCOM) 0000000013000011 (SCOM1) 0000000013000021 (SCOM2)
Description	This register contains the second set of vital chiplet controls.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_OR	WO_CLEAR	UNUSED_0B: Unused.
1	RW	WO_OR	WO_CLEAR	UNUSED_1B: Unused.
2	RW	WO_OR	WO_CLEAR	UNUSED_2B: Unused.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
3	RW	WO_OR	WO_CLEAR	TC_VITL_REGION_FENCE: VITL fence. Protect the VITL region logic from pollution by other regions during LBIST, or when the chiplet is not initialized and running yet.
4	RW	WO_OR	WO_CLEAR	TC_PERV_REGION_FENCE: Fence for pervasive region.
5	RW	WO_OR	WO_CLEAR	TC_REGION1_FENCE: Fence for region unit1.
6	RW	WO_OR	WO_CLEAR	TC_REGION2_FENCE: Fence for region unit2.
7	RW	WO_OR	WO_CLEAR	TC_REGION3_FENCE: Fence for region unit3.
8	RW	WO_OR	WO_CLEAR	TC_REGION4_FENCE: Fence for region unit4.
9	RW	WO_OR	WO_CLEAR	TC_REGION5_FENCE: Fence for region unit5.
10	RW	WO_OR	WO_CLEAR	TC_REGION6_FENCE: Fence for region unit6.
11	RW	WO_OR	WO_CLEAR	TC_REGION7_FENCE: Fence for region unit7.
12	RW	WO_OR	WO_CLEAR	TC_REGION8_FENCE: Fence for region unit8.
13	RW	WO_OR	WO_CLEAR	TC_REGION9_FENCE: Fence for region unit9.
14	RW	WO_OR	WO_CLEAR	UNUSED_14B: Unused.
15	RW	WO_OR	WO_CLEAR	RESERVED: Reserved.
16	RW	WO_OR	WO_CLEAR	TC_UNIT_MULTICYCLE_TEST_FENCE:
17	RW	WO_OR	WO_CLEAR	UNUSED_17B: Unused.
18	RW	WO_OR	WO_CLEAR	UNUSED_18B: Unused.
19	RW	WO_OR	WO_CLEAR	UNUSED_19B: Unused.
20	RW	WO_OR	WO_CLEAR	UNUSED_20B: Unused.
21	RW	WO_OR	WO_CLEAR	UNUSED_21B: Unused.
22	RW	WO_OR	WO_CLEAR	UNUSED_22B: Unused.
23	RW	WO_OR	WO_CLEAR	UNUSED_23B: Unused.
24	RW	WO_OR	WO_CLEAR	UNUSED_24B: Unused.
25	RW	WO_OR	WO_CLEAR	UNUSED_25B: Unused.
26	RW	WO_OR	WO_CLEAR	UNUSED_26B: Unused.
27	RW	WO_OR	WO_CLEAR	UNUSED_27B: Unused.
28	RW	WO_OR	WO_CLEAR	UNUSED_28B: Unused.
29	RW	WO_OR	WO_CLEAR	UNUSED_29B: Unused.
30	RW	WO_OR	WO_CLEAR	UNUSED_30B: Unused.
31	RW	WO_OR	WO_CLEAR	UNUSED_31B: Unused.

Register Name	Chiplet Configuration Register 0
Mnemonic	TP.TCEP03.TPCL3.CPLT_CONF0
Address	0000000013000008 (SCOM) 0000000013000018 (SCOM1) 0000000013000028 (SCOM2)
Description	This register contains the first set of vital chiplet configuration functions.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:5	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE0_SEL_DC: Probe 0 select.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
6	RW	WO_OR	WO_CLEAR	RESERVED_6C: Reserved.
7	RW	WO_OR	WO_CLEAR	RESERVED_7C: Reserved.
8:13	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE1_SEL_DC: Probe 1 select.
14	RW	WO_OR	WO_CLEAR	RESERVED_14C: Reserved.
15	RW	WO_OR	WO_CLEAR	RESERVED_15C: Reserved.
16:21	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE2_SEL_DC: Probe 2 select.
22	RW	WO_OR	WO_CLEAR	RESERVED_22C: Reserved.
23	RW	WO_OR	WO_CLEAR	RESERVED_23C: Reserved.
24:29	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE3_SEL_DC: Probe 3 select.
30	RW	WO_OR	WO_CLEAR	RESERVED_30C: Reserved.
31	RW	WO_OR	WO_CLEAR	RESERVED_31C: Reserved.
32	RW	WO_OR	WO_CLEAR	CTRL_CC_OFLOW_FEH_SEL_DC: Enables ABIST overflow or failure indication.
33	RW	WO_OR	WO_CLEAR	CTRL_CC_SCAN_PROTECT_DC: Enables scan protection and the scan collision error mechanism.
34	RW	WO_OR	WO_CLEAR	CTRL_CC_SDIS_DC_N: Disables the scan diagnostic scan path.
35	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_35C: Reserved for test control.
36	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_36C: Reserved for test control.
37	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_37C: Reserved for test control.
38	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_38C: Reserved for test control.
39	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_39C: Reserved for test control.
40	RW	WO_OR	WO_CLEAR	CTRL_EPS_MASK_VITL_PCB_ERR_DC: Mask VITL PCB errors from CC or CPLT_CTRL.
41	RW	WO_OR	WO_CLEAR	CTRL_CC_MASK_VITL_SCAN_OPCG_ERR_DC: Mask VITL errors in CC, which are not PCB related.
42	RW	WO_OR	WO_CLEAR	RESERVED_42C: Reserved.
43	RW	WO_OR	WO_CLEAR	RESERVED_43C: Reserved.
44	RW	WO_OR	WO_CLEAR	FREE_USAGE_44C: Free usage.
45	RW	WO_OR	WO_CLEAR	FREE_USAGE_45C: Free usage.
46	RW	WO_OR	WO_CLEAR	FREE_USAGE_46C: Free usage.
47	RW	WO_OR	WO_CLEAR	FREE_USAGE_47C: Free usage.
48:51	RW	WO_OR	WO_CLEAR	TC_UNIT_GROUP_ID_DC: Group ID.
52:54	RW	WO_OR	WO_CLEAR	TC_UNIT_CHIP_ID_DC: Chip ID.
55	RW	WO_OR	WO_CLEAR	RESERVED_ID_55C: Reserved ID.
56:60	RW	WO_OR	WO_CLEAR	TC_UNIT_SYS_ID_DC: System ID.
61	RW	WO_OR	WO_CLEAR	RESERVED_ID_61C: Reserved ID.
62	RW	WO_OR	WO_CLEAR	RESERVED_ID_62C: Reserved ID.
63	RW	WO_OR	WO_CLEAR	RESERVED_ID_63C: Reserved ID.

Register Name	Chiplet Configuration Register 1
Mnemonic	TP.TCEP03.TPCL3.CPLT_CONF1
Address	0000000013000009 (SCOM) 0000000013000019 (SCOM1) 0000000013000029 (SCOM2)
Description	This register contains the second set of vital chiplet configuration functions.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:3	RW	WO_OR	WO_CLEAR	TCEP_AMUX_VSELECT_EQ: AMUX control.
4:5	RW	WO_OR	WO_CLEAR	TCEP_AMUX_VSELECT_PWR_UP:
6:7	RW	WO_OR	WO_CLEAR	TCEP_AMUX_VSELECT_PWR_DN:
8:11	RW	WO_OR	WO_CLEAR	TCEP_AMUX_VSELECT_L3_UP:
12:15	RW	WO_OR	WO_CLEAR	TCEP_AMUX_VSELECT_L3_DN:
16	RW	WO_OR	WO_CLEAR	FREE_USAGE_16D: Free usage.
17	RW	WO_OR	WO_CLEAR	FREE_USAGE_17D: Free usage.
18	RW	WO_OR	WO_CLEAR	FREE_USAGE_18D: Free usage.
19	RW	WO_OR	WO_CLEAR	FREE_USAGE_19D: Free usage.
20	RW	WO_OR	WO_CLEAR	FREE_USAGE_20D: Free usage.
21	RW	WO_OR	WO_CLEAR	FREE_USAGE_21D: Free usage.
22	RW	WO_OR	WO_CLEAR	FREE_USAGE_22D: Free usage.
23	RW	WO_OR	WO_CLEAR	FREE_USAGE_23D: Free usage.
24	RW	WO_OR	WO_CLEAR	FREE_USAGE_24D: Free usage.
25	RW	WO_OR	WO_CLEAR	FREE_USAGE_25D: Free usage.
26	RW	WO_OR	WO_CLEAR	FREE_USAGE_26D: Free usage.
27	RW	WO_OR	WO_CLEAR	FREE_USAGE_27D: Free usage.
28	RW	WO_OR	WO_CLEAR	FREE_USAGE_28D: Free usage.
29	RW	WO_OR	WO_CLEAR	FREE_USAGE_29D: Free usage.
30	RW	WO_OR	WO_CLEAR	FREE_USAGE_30D: Free usage.
31	RW	WO_OR	WO_CLEAR	FREE_USAGE_31D: Free usage.

Register Name	Chiplet Status Register
Mnemonic	TP.TCEP03.TPCL3.CPLT_STAT0
Address	0000000010000100 (SCOM)
Description	An interrupt is sent out on a bit change if not masked by the Chiplet Mask Register. A mask only masks the interrupt, not the status register.

Bits	SCOM	Field Mnemonic: Description
0	ROX	SRAM_ABIST_DONE_DC: SRAM and eDRAM ABIST done.
1	ROX	DRAM_ABIST_DONE_DC: Unused in POWER9 DD1.
2	ROX	RESERVED_2E: Reserved.
3	ROX	RESERVED_3E: Reserved.
4	ROX	TC_DIAG_PORT0_OUT: Diagnostic output port.

Bits	SCOM	Field Mnemonic: Description
5	ROX	TC_DIAG_PORT1_OUT: Diagnostic output port.
6	ROX	RESERVED_6E: Reserved.
7	ROX	PLL_DESTOUT: Reserved.
8	ROX	CC_CTRL_OPCG_DONE_DC: OPCG done. For LBIST, ABIST, or other OPCG runs.
9	ROX	CC_CTRL_CHIPLET_IS_ALIGNED_DC: Indicates that a chiplet is aligned.
10	ROX	FREE_USAGE_10E: Free usage.
11	ROX	FREE_USAGE_11E: Free usage.
12	ROX	FREE_USAGE_12E: Free usage.
13	ROX	FREE_USAGE_13E: Free usage.
14	ROX	FREE_USAGE_14E: Free usage.
15	ROX	FREE_USAGE_15E: Free usage.
16	ROX	FREE_USAGE_16E: Free usage.
17	ROX	FREE_USAGE_17E: Free usage.
18	ROX	FREE_USAGE_18E: Free usage.
19	ROX	FREE_USAGE_19E: Free usage.
20	ROX	FREE_USAGE_20E: Free usage.
21	ROX	FREE_USAGE_21E: Free usage.
22	ROX	FREE_USAGE_22E: Free usage.
23	ROX	FREE_USAGE_23E: Free usage.

Register Name	Chiplet Mask Register
Mnemonic	TP.TCEP03.TPCL3.CPLT_MASK0
Address	0000000010000101 (SCOM)
Description	This register masks an interrupt when a bit changes in the Chiplet Status Register. It does not mask the status itself.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CPLTMASK0: Bitwise masking of the Chiplet Status Register.

Register Name	Control Protect Mode Register
Mnemonic	TP.TCEP03.TPCL3.CTRL_PROTECT_MODE_REG
Address	00000000130003FE (SCOM)
Description	This register enables read and write protection.

Bits	SCOM	Field Mnemonic: Description
0	RW	CTRL_READ_PROTECT_ENABLE: Enable read protection.
1	RW	CTRL_WRITE_PROTECT_ENABLE: Enable write protection.

Register Name	Atomic Lock Register
Mnemonic	TP.TCEP03.TPCL3.CTRL_ATOMIC_LOCK_REG
Address	00000000130003FF (SCOM)
Description	This register enables an atomic lock and an atomic lock counter.

Bits	SCOM	Field Mnemonic: Description
0	RW	CTRL_ATOMIC_LOCK_ENABLE: Enable atomic lock.
1:4	ROX	CTRL_ATOMIC_ID: Atomic ID.
5:7	RO	constant = 0b000
8:15	ROX	CTRL_ATOMIC_ACTIVITY: Atomic lock counter.

Register Name	PSCOMLE Mode Register
Mnemonic	TP.TCEP03.TPCL3.EPS.PSC.PSC.PSCOM_MODE_REG
Address	0000000013010000 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) mode register.

Bits	SCOM	Field Mnemonic: Description
0	RW	ABORT_ON_PCB_ADDR_PARITY_ERROR: Abort on PCB address parity error.
1	RW	ABORT_ON_PCB_WDATA_PARITY_ERROR: Abort on PCB write data parity error.
2	RW	ABORT_ON_DL_RETURN_P0_ERROR: Unused.
3	RW	ABORT_ON_DL_RETURN_WDATA_PARITY_ERROR: Abort on DL return write data parity error.
4	RW	WATCHDOG_ENABLE: Enable watchdog.
5:6	RW	SCOM_HANG_LIMIT: 0b11 = 256 0b10 = 512 0b01 = 768 0b00 = 1023
7	RW	FORCE_ALL_RINGS: Set to a logical 1 if all rings should be enabled independent of the ring address.
8	RW	FSM_SELFRESET_ON_STATEVEC_PARITYERROR_ENABLE: FSM self reset on statevec parity error enable.
9:11	RW	RESERVED_PSCOM_MODE_LT: Reserved.

Register Name	PSCOMLE Error Register
Mnemonic	TP.TCEP03.TPCL3.EPS.PSC.PSC.PSCOM_STATUS_ERROR_REG
Address	0000000013010001 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) error register.

Bits	SCOM	Field Mnemonic: Description
0	RWX	ACCUMULATED_PCB_WDATA_PARITY_ERROR: Accumulated PCB write data parity error.
1	RWX	ACCUMULATED_PCB_ADDRESS_PARITY_ERROR: Accumulated PCB address parity error.
2	RWX	ACCUMULATED_DL_RETURN_WDATA_PARITY_ERROR: Accumulated DL return write data parity error.
3	RWX	ACCUMULATED_DL_RETURN_P0_ERROR: Accumulated DL return P0 error.

Bits	SCOM	Field Mnemonic: Description
4	RWX	ACCUMULATED_UL_RDATA_PARITY_ERROR: Accumulated UL read data parity error.
5	RWX	ACCUMULATED_UL_P0_ERROR: Accumulated UL P0 error.
6	RWX	ACCUMULATED_PARITY_ERROR_ON_INTERFACE_MACHINE: Accumulated parity error on interface machine.
7	RWX	ACCUMULATED_PARITY_ERROR_ON_P2S_MACHINE: Accumulated parity error on p2s machine.
8	RWX	ACCUMULATED_TIMEOUT_WHILE_WAITING_FOR_ULCCH: Accumulated timeout while waiting for ULCCH.
9	RWX	ACCUMULATED_TIMEOUT_WHILE_WAITING_FOR_DLDCH_RETURN: Accumulated timeout while waiting for DLDCH return.
10	RWX	ACCUMULATED_TIMEOUT_WHILE_WAITING_FOR_ULDCH: Accumulated timeout while waiting for ULDCH.
11	RWX	ACCUMULATED_PSCOM_PARALLEL_WRITE_NVLD: Accumulated PSCOM parallel write NVLD.
12	RWX	ACCUMULATED_PSCOM_PARALLEL_READ_NVLD: Accumulated PSCOM parallel read NVLD.
13	RWX	ACCUMULATED_PSCOM_PARALLEL_ADDR_INVALID: Accumulated PSCOM parallel address invalid.
14	RWX	ACCUMULATED_PCB_COMMAND_PARITY_ERROR: Accumulated PCB command parity error.
15	RWX	ACCUMULATED_GENERAL_TIMEOUT: Accumulated general timeout.
16	RWX	ACCUMULATED_SATELLITE_ACKNOWLEDGE_ACCESS_VIOLATION: Accumulated satellite acknowledge access violation.
17	RWX	ACCUMULATED_SATELLITE_ACKNOWLEDGE_INVALID_REGISTER: Accumulated satellite acknowledge invalid register.
18	RWX	TRAPPED_PCB_WDATA_PARITY_ERROR: Trapped PCB write data parity error.
19	RWX	TRAPPED_PCB_ADDRESS_PARITY_ERROR: Trapped PCB address parity error.
20	RWX	TRAPPED_DL_RETURN_WDATA_PARITY_ERROR: Trapped DL return write data parity error.
21	RWX	TRAPPED_DL_RETURN_P0_ERROR: Trapped DL return P0 error.
22	RWX	TRAPPED_UL_RDATA_PARITY_ERROR: Trapped UL read data parity error.
23	RWX	TRAPPED_UL_P0_ERROR: Trapped UL P0 error.
24	RWX	TRAPPED_PARITY_ERROR_ON_INTERFACE_MACHINE: Trapped parity error on interface machine.
25	RWX	TRAPPED_PARITY_ERROR_ON_P2S_MACHINE: Trapped parity error on p2s machine.
26	RWX	TRAPPED_TIMEOUT_WHILE_WAITING_FOR_ULCCH: Trapped timeout while waiting for ULCCH.
27	RWX	TRAPPED_TIMEOUT_WHILE_WAITING_FOR_DLDCH_RETURN: Trapped timeout while waiting for DLDCH return.
28	RWX	TRAPPED_TIMEOUT_WHILE_WAITING_FOR_ULDCH: Trapped timeout while waiting for ULDCH.
29	RWX	TRAPPED_PSCOM_PARALLEL_WRITE_NVLD: Trapped PSCOM parallel write NVLD.
30	RWX	TRAPPED_PSCOM_PARALLEL_READ_NVLD: Trapped PSCOM parallel read NVLD.
31	RWX	TRAPPED_PSCOM_PARALLEL_ADDR_INVALID: Trapped PSCOM parallel address invalid.
32	RWX	TRAPPED_PCB_COMMAND_PARITY_ERROR: Trapped PCB command parity error.
33	RWX	TRAPPED_GENERAL_TIMEOUT: Trapped general timeout.
34	RWX	TRAPPED_SATELLITE_ACKNOWLEDGE_ACCESS_VIOLATION: Trapped satellite acknowledge access violation.
35	RWX	TRAPPED_SATELLITE_ACKNOWLEDGE_INVALID_REGISTER: Trapped satellite acknowledge invalid register.

Register Name	PSCOMLE Error Mask Register
Mnemonic	TP.TCEP03.TPCL3.EPS.PSC.PSC.PSCOM_ERROR_MASK
Address	0000000013010002 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) error mask register.

Bits	SCOM	Field Mnemonic: Description
0	RW	MASK_PCB_WDATA_PARITY_ERROR: Mask PCB write data parity error.
1	RW	MASK_PCB_ADDRESS_PARITY_ERROR: Mask PCB address parity error.
2	RW	MASK_DL_RETURN_WDATA_PARITY_ERROR: Mask DL return write data parity error.
3	RW	MASK_DL_RETURN_P0_ERROR: Mask DL return P0 error.
4	RW	MASK_UL_RDATA_PARITY_ERROR: Mask UL read data parity error.
5	RW	MASK_UL_P0_ERROR: Mask UL P0 error.
6	RW	MASK_PARITY_ERROR_ON_INTERFACE_MACHINE: Mask parity error on interface machine.
7	RW	MASK_PARITY_ERROR_ON_P2S_MACHINE: Mask parity error on p2s machine.
8	RW	MASK_TIMEOUT_WHILE_WAITING_FOR_ULCCH: Mask timeout while waiting for ULCCH.
9	RW	MASK_TIMEOUT_WHILE_WAITING_FOR_DLDCH_RETURN: Mask timeout while waiting for DLDCH return.
10	RW	MASK_TIMEOUT_WHILE_WAITING_FOR_ULDCH: Mask timeout while waiting for ULDCH.
11	RW	MASK_PSCOM_PARALLEL_WRITE_NVLD: Mask PSCOM parallel write NVLD.
12	RW	MASK_PSCOM_PARALLEL_READ_NVLD: Mask PSCOM parallel read NVLD.
13	RW	MASK_PSCOM_PARALLEL_ADDR_INVALID: Mask PSCOM parallel address invalid.
14	RW	MASK_PCB_COMMAND_PARITY_ERROR: Mask PCB command parity error.
15	RW	MASK_GENERAL_TIMEOUT: Mask general timeout.
16	RW	MASK_SATELLITE_ACKNOWLEDGE_ACCESS_VIOLATION: Mask satellite acknowledge access violation.
17	RW	MASK_SATELLITE_ACKNOWLEDGE_INVALID_REGISTER: Mask satellite acknowledge invalid register.

Register Name	PSCOMLE Address Trap Register
Mnemonic	TP.TCEP03.TPCL3.EPS.PSC.PSC.ADDR_TRAP_REG
Address	0000000013010003 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) address trap register.

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	PCB_ADDRESS_OF_LAST_TRANSACTION_WITH_ERROR: PCB address of the last transaction with an error.
16	ROX	PCB_READ_NOTWRITE_OF_LAST_TRANSACTION_WITH_ERROR: PCB read, not write, of the last transaction with an error.
17	ROX	RESERVED_ADDR_LAST_TRAP_LT: reserved_0.
18:30	ROX	SERIAL2PARALLEL_STATE_MACHINE_AT_TIME_OF_ERROR: Serial2 parallel state machine at the time of the error.
31	ROX	SATELLITE_ACKNOWLEDGE_BIT_RETURN_PARITY: This bit is set to 1 if no parity error is detected in the satellite number or acknowledgment bits.

Bits	SCOM	Field Mnemonic: Description
32	ROX	SATELLITE_ACKNOWLEDGE_BIT_WRITE_PARITY_ERROR: Set if a write parity error is detected by the satellite.
33	ROX	SATELLITE_ACKNOWLEDGE_BIT_ACCESS_VIOLATION: Set if an invalid read or write access is detected by the satellite.
34	ROX	SATELLITE_ACKNOWLEDGE_BIT_INVALID_REGISTER: Set if an invalid register address is detected by the satellite.

Register Name	Ring Lock Enable Register
Mnemonic	TP.TCEP03.TPCL3.EPS.PSC.PSC.WRITE_PROTECT_ENABLE_REG
Address	0000000013010005 (SCOM)
Description	This register enables the ring lock.

Bits	SCOM	Field Mnemonic: Description
0	RW	ENABLE_RING_LOCKING: General enable of ring locking upon a write to a specific ring.
1	RW	RESERVED_RING_LOCKING: Reserved.

Register Name	Write Protect Rings Register
Mnemonic	TP.TCEP03.TPCL3.EPS.PSC.PSC.WRITE_PROTECT_RINGS_REG
Address	0000000013010006 (SCOM)
Description	This register writes ring protect bit maps.

Bits	SCOM	Field Mnemonic: Description
0:15	RW	WRITE_PROTECT_RINGS: Write a protect bit map for each ring.

Register Name	Atomic Lock Mask Register
Mnemonic	TP.TCEP03.TPCL3.EPS.PSC.PSC.ATOMIC_LOCK_MASK_LATCH_REG
Address	0000000013010007 (SCOM)
Description	This register provides a bit mask for atomic locking.

Bits	SCOM	Field Mnemonic: Description
0:15	RW	ATOMIC_LOCK_MASK: A bit mask for atomic locking on a ring-by-ring basis.

Register Name	Ring Fence Enable Mask Register
Mnemonic	TP.TCEP03.TPCL3.EPS.PSC.PSC.RING_FENCE_MASK_LATCH_REG
Address	0000000013010008 (SCOM)
Description	This register provides a bit mask for ring fencing.

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1:15	RW	RING_FENCE_ENABLE_MASK: Enable bit mask for ring fencing on a ring-by-ring basis.

Register Name	Synchronous Configuration Register
Mnemonic	TP.TCEP03.TPCL3.SYNC_CONFIG
Address	0000000013030000 (SCOM)
Description	Configuration of CC counters.

Bits	SCOM	Field Mnemonic: Description
0:3	RW	SYNC_PULSE_DELAY: Delay the incoming synchronous pulse. The default is 8 latches including asynchronous. 0000 = Delay by 8 latches (default). 0001 = Delay by 2 latches. 0010 = Delay by 3 latches. 0011 = Delay by 4 latches. 0100 = Delay by 5 latches. 0101 = Delay by 6 latches. 0110 = Delay by 7 latches. 0111 = Delay by 8 latches. 1000 = Delay by 9 latches. 1001 = Delay by 10 latches. 1010 = Delay by 11 latches. 1011 = Delay by 12 latches. 1100 = Delay by 13 latches. 1101 = Delay by 14 latches. 1110 = Delay by 15 latches. 1111 = Delay by 16 latches.
4	RW	LISTEN_TO_SYNC_PULSE_DIS: Disable phase counter synchronization by sync_pulse signal (default is enabled). **Note:** When listen_to_sync is enabled, the chiplet becomes corrupted for 200 cycles.
5	RW	SYNC_PULSE_INPUT_SEL: The default is 0. When set to 1, the alternative input of the sync_pulse will be used. **Note:** When toggling the input select, the chiplet becomes corrupted for 200 cycles.
6	RW	USE_SYNC_FOR_SCAN: When set, use OPCG initial alignment for scan requests.
7	RW	CLEAR_CHIPLET_IS_ALIGNED: This bit clears the chiplet_is_aligned bit. See the Chiplet Status Register.
8	RW	UNIT_REGION_CLKCMD_ENABLE: Enable the unit interface to start or stop one dedicated region. Used for POWER9 cache/core.
9	RW	DISABLE_PCB_ITR: Disable interrupt generation within CC. Interrupt sent on each HLD event.
10	RW	ENABLE_VITL_ALIGN_CHECK: Enable the VITL align check to compare alignment of incoming synchronous pulse with 2:1 VITL LCB.
11	RW	SYNC_PULSE_OUT_DIS: Disables sync_pulse output when set to 1. The master chiplet will no longer send synchronous pulses to slave chiplets.
12:19	RW	UNUSED1219: Unused.

Register Name	OPCG Alignment Register
Mnemonic	TP.TCEP03.TPCL3.OPCG_ALIGN
Address	0000000013030001 (SCOM)
Description	OPCG alignment

Bits	SCOM	Field Mnemonic: Description
0:3	RW	INOP_ALIGN: INOP phase alignment: 0 = None 1 = 2:1 2 = 3:1 3 = 4:1 4 = 6:1 5 = 8:1 6 = 12:1 7 = 16:1 8 = 24:1 9-15 = 48:1
4:7	RW	SNOP_ALIGN: SNOP phase alignment: 0 = None 1 = 2:1 2 = 3:1 3 = 4:1 4 = 6:1 5 = 8:1 6 = 12:1 7 = 16:1 8 = 24:1 9-15 = 48:1
8:11	RW	ENOP_ALIGN: ENOP phase alignment: 0 = None 1 = 2:1 2 = 3:1 3 = 4:1 4 = 6:1 5 = 8:1 6 = 12:1 7 = 16:1 8 = 24:1 9-15 = 48:1
12:19	RW	INOP_WAIT: INOP cycle delay (0-255).
20:31	RW	SNOP_WAIT: SNOP cycle delay (0-4095).
32:39	RW	ENOP_WAIT: ENOP cycle delay (0-255).
40	RW	INOP_FORCE_SG: Set SG high during INOP.
41	RW	SNOP_FORCE_SG: Set SG high during SNOP.
42	RW	ENOP_FORCE_SG: Set SG high during ENOP (including LOOP phase).
43	RW	NO_WAIT_ON_CLK_CMD: 0 = A clock change request will first wait the OPCG_WAIT cycles. 1 = A clock change request will not wait, when not in flush.
44:45	RW	ALIGN_SOURCE_SELECT: 0: 0 = Use inopa setting from opcg_reg0. 1 = Use rising edge of synchronous pulse. 2 = Use unit0_sync_lvl to align (for AVP: refresh0). 3 = Use unit1_sync_lvl to align (for AVP: refresh1).

Bits	SCOM	Field Mnemonic: Description
46	RW	UNUSED46: Unused.
47:51	RW	SCAN_RATIO: Scan ratio. The default is 4:1 = 00011. 0 to 15 = (n+1):1 16 = 24:1 17 = 32:1 18 = 48:1 19 = 64:1 20 = 128:1
52:63	RW	OPCG_WAIT_CYCLES: Old PAD value; delay at the beginning and end of the OPCG run, to allow DC signals to be there at the right time (0-4095). The default is 0x020. **Note:** Must be higher than plat depth.

Register Name	**OPCG Control 0 Register**
Mnemonic	TP.TCEP03.TPCL3.OPCG_REG0
Address	0000000013030002 (SCOM)
Description	OPCG control register 0

Bits	SCOM	Field Mnemonic: Description
0	RW	RUNN_MODE: 0 = BIST-mode; used for LBIST. 1 = RUNN-mode; used for ABIST/IOBIST.
1	RWX	OPCG_GO: Start OPCG. The bit is cleared when OPCG completes. Poll for opcg_done in the Chiplet Status Register.
2	RWX	RUN_SCAN0: Run scan0 (overrides all BIST mode settings but the scan_ratio). Starts a scan0 run, and the bit is cleared when OPCG is done. Poll for opcg_done in the Chiplet Status Register.
3	RW	SCAN0_MODE: Sets PRPGs in scan0_mode but does not run the automatic scan0 sequence.
4	RWX	OPCG_IN_SLAVE_MODE: When selected, OPCG waits for the master chiplet to get started. When Keep_MS_Mode is 0, SLAVE_MODE is cleared after the incoming trigger.
5	RWX	OPCG_IN_MASTER_MODE: When selected, OPCG sends out a trigger to all slave chiplets. When Keep_MS_Mode is 0, MASTER_MODE is cleared after sending out one master trigger.
6	RW	KEEP_MS_MODE: When set to 1, OPCG in master and slave mode bits are not cleared after one incoming OPCG trigger. The default is to clear master and slave mode bits.
7	RW	TRIGGER_OPCG_ON_UNIT0_SYNC_LVL: Unit pin used for AVP can trigger OPCG (unit0_sync_lvl).
8	RW	TRIGGER_OPCG_ON_UNIT1_SYNC_LVL: Unit pin used for AVP can trigger OPCG (unit1_sync_lvl).
9	RWX	RUN_CHIPLET_SCAN0: Run scan0 on all regions and types, will clear the chiplet at all.
10	RWX	RUN_CHIPLET_SCAN0_NO_PLL: Run scan0 on all regions and types; clears the chiplet at all exclude-PLL regions. PLL can continue to run.
11	RW	RUN_OPCG_ON_UPDATE_DR: Start the OPCG engine when scan update (update_dr) is received (set pulse). Cronus requires this bit to be set at 1 for a set pulse WRITE.
12	RW	RUN_OPCG_ON_CAPTURE_DR: Start the OPCG engine when scan update (capture_dr) is received (set pulse). Cronus requires this bit to be set at 1 for a set pulse READ.
13	RW	STOP_RUNN_ON_XSTOP: RUNN mode. Stops RUNN on checkstop.
14	RW	OPCG_STARTS_BIST: RUNN mode. The OPCG engine controls start_bist for ABIST or IOBIST (see the BIST Register).
15:20	RW	UNUSED1520: Unused.

Bits	SCOM	Field Mnemonic: Description
21:63	RWX	LOOP_COUNT: Loop counter for LBIST and RUNN. write = Target value. read = Current counter value. Counts from 0 to the target value.

Register Name	OPCG Control 1 Register
Mnemonic	TP.TCEP03.TPCL3.OPCG_REG1
Address	0000000013030003 (SCOM)
Description	OPCG Control Register 1

Bits	SCOM	Field Mnemonic: Description
0:11	RW	SCAN_COUNT: BIST mode: Channel scan count (s = 0-4095) RUNN-mode: start_bist match value (0:11)
12:23	RW	MISR_A_VAL: BIST mode: a value for MISR aperture RUNN-mode: start_bist match value (12:23)
24:35	RW	MISR_B_VAL: BIST mode: b value for MISR aperture RUNN-mode: start_bist match value (24:35)
36:47	RW	MISR_INIT_WAIT: BIST mode: delay MISR aperture; MISRs become active after this number of loops.
48	RW	OPCG_SUPPRESS_EVEN_CLK: OPCG creates only even, and not odd, clocks. Used for RUNN to create only one clock in fast domain. The default is 0.
49	RW	SCAN_CLK_USE_EVEN: Generate scan clock in an even cycle instead of an odd cycle. The default is 0 (odd cycle).
50:51	RW	UNUSED2: Unused.
52	RW	RTIM_THOLD_FORCE: Force rtim_thold low when not in test_dc mode (must be 0 at all times).
53	RW	DISABLE_ARY_CLK_DURING_FILL: LBIST and SCAN0. Prevent the firing of the ARY HLD bit during NSL fill.
54	RW	SG_HIGH_DURING_FILL: LBIST and SCAN0. Hold SG high during NSL fill.
55:56	RW	LBIST_SKITTER_CTL: BIST mode: 00 = Enable skitter during lbist_ip 01 = Enable skitter when misr_active; see misr_init_wait 10 = Skitter OPCG_GO mode; falling edge = start, rising edge = stop 11 = Unused
57	RW	MISR_MODE: BIST mode. MISR aperture mode (0: a-1 to b-1, 1: Start to a and b to end).
58	RW	INFINITE_MODE: Infinite mode. RUNN and LBIST will run indefinitely and ignore the loop count.
59:63	RW	NSL_FILL_COUNT: BIST mode. NSL-fill count (0-31).

Register Name	OPCG Control 2 Register
Mnemonic	TP.TCEP03.TPCL3.OPCG_REG2
Address	0000000013030004 (SCOM)
Description	OPCG control register 2

Bits	SCOM	Field Mnemonic: Description
0	RWX	OPCG_GO2: Start OPCG for broadcast sequences (start sequence).
1:3	RW	PRPG_WEIGHTING: prpg_activate: 1/2, 1/4, 1/8, 1/16, 1/2, 3/4, 7/8, 15/16.
4:15	RWX	PRPG_VALUE: Set to 0 to keep PRPG always on, else seed.
16:27	RW	PRPG_A_VAL: a value for PRPG aperture.
28:39	RW	PRPG_B_VAL: b value for PRPG aperture.
40	RW	PRPG_MODE: PRPG aperture mode (0: a-1 to b-1, 1: Start to a and b to end).
41:63	RW	UNUSED41_63: Unused.

Register Name	**Scan Region and Type Register**
Mnemonic	TP.TCEP03.TPCL3.SCAN_REGION_TYPE
Address	0000000013030005 (SCOM)
Description	Sets the scan region and type.

Bits	SCOM	Field Mnemonic: Description
0	RWX	SYSTEM_FAST_INIT: Default is 0. When set to 1, the MASK bits in the CMSK chain govern which part will be scanned or scan0. MASK = 1: scan0. MASK = 0: Partial or scan chain.
1:2	RO	constant = 0b00
3	NCX	SCAN_REGION_VITL: Scan clock region vitl (vital = clock).
4	RWX	SCAN_REGION_PERV: Scan clock region perv (pervasive).
5	RWX	SCAN_REGION_UNIT1: Scan clock region eqpb (PB).
6	RWX	SCAN_REGION_UNIT2: Scan clock region l30 (L3, NC).
7	RWX	SCAN_REGION_UNIT3: Scan clock region l31 (L3, NC).
8	RWX	SCAN_REGION_UNIT4: Scan clock region l20 (L2, CC).
9	RWX	SCAN_REGION_UNIT5: Scan clock region l21 (L2, CC).
10	RWX	SCAN_REGION_UNIT6: Scan clock region anep, e9_an (iVRM, VDM, DCC, SKEW).
11	RWX	SCAN_REGION_UNIT7: Scan clock region pbieq (PB).
12	RWX	SCAN_REGION_UNIT8: Scan clock region refr0 (L3).
13	RWX	SCAN_REGION_UNIT9: Scan clock region refr1 (L3).
14	RWX	SCAN_REGION_UNIT10: Scan clock region dpll (CLK).
15:47	RO	constant = 0b000000000000000000000000000000000
48	RW	SCAN_TYPE_FUNC: Scan chain func (functional).
49	RW	SCAN_TYPE_CFG: Scan chain mode (boot configuration and debug configuration).
50	RW	SCAN_TYPE_CCFG_GPTR: Scan chain ccfg / gptr (pervasive: CC configuration; others: GPTR).
51	RW	SCAN_TYPE_REGF: Scan chain regf (register files).
52	RW	SCAN_TYPE_LBIST: Scan chain lbst (LBIST).
53	RW	SCAN_TYPE_ABIST: Scan chain abst (ABIST).
54	RW	SCAN_TYPE_REPR: Scan chain repr (array repair).
55	RW	SCAN_TYPE_TIME: Scan chain time (array timing).

Bits	SCOM	Field Mnemonic: Description
56	RW	SCAN_TYPE_BNDY: Scan chain bndy (boundary IOs).
57	RW	SCAN_TYPE_FARR: Scan chain farr (fast array unload).
58	RW	SCAN_TYPE_CMSK: Scan chain cmsk (LBIST channel mask).
59	RW	SCAN_TYPE_INEX: Scan chain idex (c14 ASIC).
60:63	RO	constant = 0b0000

Register Name	Clock Region Register
Mnemonic	TP.TCEP03.TPCL3.CLK_REGION
Address	0000000013030006 (SCOM)
Description	Start and stop clocks.

Bits	SCOM	Field Mnemonic: Description
0:1	RWX	CLOCK_CMD: Command for clock control: 00 = NOP 01 = Start 10 = Stop 11 = Pulse (one pulse)
2	RWX	SLAVE_MODE: When selected, the clock command waits for the master chiplet to start. The bit is cleared after the incoming slave trigger and Keep_MS_Mode_after_trigger is set to 0.
3	RWX	MASTER_MODE: When selected, the clock command sends out a trigger to all slave chiplets. The bit is cleared after sending out one master trigger and Keep_MS_Mode_after_trigger is set to 0.
4	RWX	CLOCK_REGION_PERV: For clock region perv (pervasive).
5	RWX	CLOCK_REGION_UNIT1: For clock region eqpb (PB).
6	RWX	CLOCK_REGION_UNIT2: For clock region l30 (L3, NC).
7	RWX	CLOCK_REGION_UNIT3: For clock region l31 (L3, NC).
8	RWX	CLOCK_REGION_UNIT4: For clock region l20 (L2, CC).
9	RWX	CLOCK_REGION_UNIT5: For clock region l21 (L2, CC).
10	RWX	CLOCK_REGION_UNIT6: For clock region anep, e9_an (iVRM, VDM, DCC, SKEW).
11	RWX	CLOCK_REGION_UNIT7: For clock region pbieq (PB).
12	RWX	CLOCK_REGION_UNIT8: For clock region refr0 (L3).
13	RWX	CLOCK_REGION_UNIT9: For clock region refr1 (L3).
14	RWX	CLOCK_REGION_UNIT10: For clock region dpll (CLK).
15:47	RO	constant = 0b000000000000000000000000000000000
48	RWX	SEL_THOLD_SL: Select SL tholds.
49	RWX	SEL_THOLD_NSL: Select NSL tholds.
50	RWX	SEL_THOLD_ARY: Select array thold.
51	RO	constant = 0b0
52	RW	CLOCK_PULSE_USE_EVEN: For dual mesh support. The default for pulse is ODD phase; when this bit is set, pulse is applied on EVEN phase.
53:63	RO	constant = 0b00000000000

Register Name	Clock Status SL Register
Mnemonic	TP.TCEP03.TPCL3.CLOCK_STAT_SL
Address	0000000013030008 (SCOM)
Description	Clocks running SL

3	RWX	PCB_ADDRESS_NOT_VALID_ERR: Invalid address.
4	RWX	PCB_PARITY_ON_ADDR_ERR: Parity error on the address.
5	RWX	PCB_PARITY_ON_DATA_ERR: Parity error on data.
6	RWX	PCB_PROTECTED_ACCESS_INVALID_ERR: Protection violation.
7	RWX	PCB_PARITY_ON_SPCIF_ERR: Parity error on spcif.
8	RWX	PCB_WRITE_AND_OPCG_IP_ERR: A PCB write was attempted while OPCG is running.
9	RWX	SCAN_READ_AND_OPCG_IP_ERR: A scan read was attempted while OPCG is running.
10	RWX	CLOCK_CMD_CONFLICT_ERR: A clock command is in progress.
11	RWX	SCAN_COLLISION_ERR: Scan region was selected on a running region.
12	RWX	PREVENTED_SCAN_COLLISION_ERR: PCB request to set a scan region that is running.
13	RWX	OPCG_TRIGGER_ERR: OPCG was triggered while OPCG is running.
14	RWX	PHASE_CNT_CORRUPTION_ERR: The phase counters inside the chiplet are out of sync.
15	RWX	CLOCK_CMD_PREVENTED_ERR: Security or scan collision prevented a clock start.
16	RWX	PARITY_ON_OPCG_SM_ERR: Parity error on the OPCG state machine.

Bits	SCOM	Field Mnemonic: Description
17	RWX	PARITY_ON_CLOCK_MUX_REG_ERR: Parity error on scan/clock region/type or clock status register.
18	RWX	PARITY_ON_OPCG_REG_ERR: Parity error on OPCG registers.
19	RWX	PARITY_ON_SYNC_CONFIG_REG_ERR: Parity error on synchronization configuration register.
20	RWX	PARITY_ON_XSTOP_REG_ERR: Parity error on checkstop register.
21	RWX	PARITY_ON_GPIO_REG_ERR: Parity error on GP0,4,5,6 registers.
22	RWX	CLKCMD_REQUEST_ERR: Region clkcmd has one request pending but received a second one.
23	RWX	CBS_PROTOCOL_ERR: CBS protocol error. The REQ / ACK sequence is wrong.
24	RWX	VITL_ALIGN_ERR: VITL alignment is out of sync to sync pulse.
25	RWX	UNIT_SYNC_LVL_ERR: Unit0 and Unit1 sync lvl pulse are not in sync. AVP is broken.
26	RWX	PARITY_ON_SELFBOOT_CMD_STATE_ERR: Parity error on selfboot cmd state.
27	RWX	UNUSED_ERROR27: Unused.
28	RWX	UNUSED_ERROR28: Unused.
29	RWX	UNUSED_ERROR29: Unused.
30	RWX	UNUSED_ERROR30: Unused.
31	RWX	UNUSED_ERROR31: Unused.

Register Name	OPCG Capture 1 Register
Mnemonic	TP.TCEP03.TPCL3.OPCG_CAPT1
Address	0000000013030010 (SCOM)
Description	OPCG capture 1 control.

Bits	SCOM	Field Mnemonic: Description
0:3	RW	COUNT: 0000 = 12 cycles 0001 – 1100 = Cycles 1-12 1101-1111 = 24 cycles for normal, slow regions
4:8	RW	SEQ_01: Sequence cycle 1 for normal/slow region (SL, NSL, ARY, SE, FCE).
9:13	RW	SEQ_02: Sequence cycle 2 for normal/slow region (SL, NSL, ARY, SE, FCE).
14:18	RW	SEQ_03: Sequence cycle 3 for normal/slow region (SL, NSL, ARY, SE, FCE).
19:23	RW	SEQ_04: Sequence cycle 4 for normal/slow region (SL, NSL, ARY, SE, FCE).
24:28	RW	SEQ_05: Sequence cycle 5 for normal/slow region (SL, NSL, ARY, SE, FCE).
29:33	RW	SEQ_06: Sequence cycle 6 for normal/slow region (SL, NSL, ARY, SE, FCE).
34:38	RW	SEQ_07: Sequence cycle 7 for normal/slow region (SL, NSL, ARY, SE, FCE).
39:43	RW	SEQ_08: Sequence cycle 8 for normal/slow region (SL, NSL, ARY, SE, FCE).
44:48	RW	SEQ_09: Sequence cycle 9 for normal/slow region (SL, NSL, ARY, SE, FCE).
49:53	RW	SEQ_10: Sequence cycle 10 for normal/slow region (SL, NSL, ARY, SE, FCE).
54:58	RW	SEQ_11: Sequence cycle 11 for normal/slow region (SL, NSL, ARY, SE, FCE).
59:63	RW	SEQ_12: Sequence cycle 12 for normal/slow region (SL, NSL, ARY, SE, FCE).

Register Name	OPCG Capture 2 Register
Mnemonic	TP.TCEP03.TPCL3.OPCG_CAPT2
Address	0000000013030011 (SCOM)
Description	OPCG control capture 2.

Bits	SCOM	Field Mnemonic: Description
0:3	RW	UNUSED_CAPT2:
4:8	RW	SEQ_13_01EVEN: Sequence cycle 1 is even for fast region or cycle 13 for normal region (SL, NSL, ARY, SE, FCE).
9:13	RW	SEQ_14_01ODD: Sequence cycle 1 is odd for fast region or cycle 14 for normal region (SL, NSL, ARY, SE, FCE).
14:18	RW	SEQ_15_02EVEN: Sequence cycle 2 is even for fast region or cycle 15 for normal region (SL, NSL, ARY, SE, FCE).
19:23	RW	SEQ_16_02ODD: Sequence cycle 2 is odd for fast region or cycle 16 for normal region (SL, NSL, ARY, SE, FCE).
24:28	RW	SEQ_17_03EVEN: Sequence cycle 3 is even for fast region or cycle 17 for normal region (SL, NSL, ARY, SE, FCE).

29:33	RW	SEQ_09ODD: Sequence cycle 9 is odd for fast region (SL, NSL, ARY, SE, FCE).

Bits	SCOM	Field Mnemonic: Description
34:38	RW	SEQ_10EVEN: Sequence cycle 10 is even for fast region (SL, NSL, ARY, SE, FCE).
39:43	RW	SEQ_10ODD: Sequence cycle 10 is odd for fast region (SL, NSL, ARY, SE, FCE).
44:48	RW	SEQ_11EVEN: Sequence cycle 11 is even for fast region (SL, NSL, ARY, SE, FCE).
49:53	RW	SEQ_11ODD: Sequence cycle 11 is odd for fast region (SL, NSL, ARY, SE, FCE).
54:58	RW	SEQ_12EVEN: Sequence cycle 12 is even for fast region (SL, NSL, ARY, SE, FCE).
59:63	RW	SEQ_12ODD: Sequence cycle 12 is odd for fast region (SL, NSL, ARY, SE, FCE).

Register Name	**Debug CBS CC Register**
Mnemonic	TP.TCEP03.TPCL3.DBG_CBS_CC
Address	0000000013030013 (SCOM)
Description	Debug CBS CC Register

Bits	SCOM	Field Mnemonic: Description
0	ROX	DBG_RESET_EP: Reset endpoint.
1	ROX	DBG_OPCG_IP: OPCG in progress, not in idle state.
2	ROX	DBG_VITL_CLKOFF: VITL HLD stopped. When enabled, plat-depth cycles are needed to switch this latch.
3	ROX	DBG_TEST_ENABLE: Test enable.
4	ROX	DBG_CBS_REQ: CBS Interface. Request (latched).
5:7	ROX	DBG_CBS_CMD: CBS Interface. Command (latched).
8:12	ROX	DBG_CBS_STATE: CBS Command State Machine 00000=Idle.
13	ROX	DBG_SECURITY_DEBUG_MODE: Status of the security mode bit.
14	ROX	DBG_CBS_PROTOCOL_ERROR: CBS protocol error. Request raised, although state machine is not in idle state. Need reset_ep to clear this bit. No impact on IPL.
15	ROX	DBG_PCB_IDLE: PCB Interface in idle state.
16:19	ROX	DBG_CURRENT_OPCG_MODE: The current (latest) OPCG mode: 0 = NOP 1 = LBIST 2 = ABIST 3 = RUNN 4 = SCAN0 5 = SCAN 6 = SCAN rotate 7 = SCAN with UpdateDR 8 = SCAN with CaptureDR 9 = CLK Change Request 10-15 = Unused
20:23	ROX	DBG_LAST_OPCG_MODE: Previous OPCG mode.
24	ROX	DBG_PCB_ERROR: PCB interface error. Read the CC error register or set CBS_CMD = 001 to switch the FSI CBS debug information to the CC error register.
25	ROX	DBG_PARITY_ERROR: Any parity error, non-PCB parity. Read the CC error register or set CBS_CMD = 001 to switch the FSI CBS debug information to the CC error register.
26	ROX	DBG_CC_ERROR: Any other CC error. Read the CC error register or set CBS_CMD = 001 to switch the FSI CBS debug information to the CC error register.
27	ROX	DBG_CHIPLET_IS_ALIGNED: Set to 1 when a valid align pulse was sent out.

Bits	SCOM	Field Mnemonic: Description
28	ROX	DBG_PCB_REQUEST_SINCE_RESET: Reset clears this bit, and the first PCB request sets it.
29	ROX	DBG_PARANOIA_TEST_ENABLE_CHANGE: Rising or falling edge on test enable, after reset. Need reset_ep to clear. No impact on IPL.
30	ROX	DBG_PARANOIA_VITL_CLKOFF_CHANGE: Rising or falling edge on vitl_clkoff, after reset. Need reset_ep to clear. No impact on IPL.
31	ROX	TP_TPFSI_CBS_ACK: This is the only representation of the CC acknowledge signal that is sent to FSI.

Register Name	CC Protect Mode Register
Mnemonic	TP.TCEP03.TPCL3.CC_PROTECT_MODE_REG
Address	00000000130303FE (SCOM)
Description	Enables read and write protection.

Bits	SCOM	Field Mnemonic: Description
0	RW	CC_READ_PROTECT_ENABLE: Enables read protection.
1	RW	CC_WRITE_PROTECT_ENABLE: Enables write protection.

Register Name	Atomic Lock Register
Mnemonic	TP.TCEP03.TPCL3.CC_ATOMIC_LOCK_REG
Address	00000000130303FF (SCOM)
Description	Enables an atomic lock and an atomic lock counter.

Bits	SCOM	Field Mnemonic: Description
0	RW	CC_ATOMIC_LOCK_ENABLE: Enables atomic lock.
1:4	ROX	CC_ATOMIC_ID: Atomic ID.
5:7	RO	constant = 0b000
8:15	ROX	CC_ATOMIC_ACTIVITY: Atomic lock counter.

Register Name	Global Checkstop FIR Register
Mnemonic	TP.TCEP03.XFIR
Address	0000000013040000 (SCOM)
Description	Global checkstop FIR

Bits	SCOM	Field Mnemonic: Description
0	RWX	XFIR_IN0: Summary bit (any checkstop).
1	RWX	XFIR_IN1: Checkstop broadcast via OOB.
2	RWX	XFIR_IN2: Unused.
3	RWX	XFIR_IN3: Checkstop from pervasive unit.
4	RWX	XFIR_IN4: Checkstop from L30.
5	RWX	XFIR_IN5: Checkstop from L31.
6	RWX	XFIR_IN6: Checkstop from L20.

Bits	SCOM	Field Mnemonic: Description
7	RWX	XFIR_IN7: Checkstop from L21.
8	RWX	XFIR_IN8: Checkstop from NC0.
9	RWX	XFIR_IN9: Checkstop from NC1.
10	RWX	XFIR_IN10: Unused.
11	RWX	XFIR_IN11: Checkstop from CME0.
12	RWX	XFIR_IN12: Checkstop from CME1.
13:25	RWX	XFIR_IN13: Unused.
26	RWX	XFIR_IN26: Checkstop on debug trigger.

Register Name	Global Recoverable FIR Register
Mnemonic	TP.TCEP03.RFIR
Address	0000000013040001 (SCOM)
Description	Global recoverable FIR

Bits	SCOM	Field Mnemonic: Description
0	ROX	RFIR_IN0: Local checkstop from NX and CXA0.
1	ROX	LFIR_RECOV_ERR: Recoverable error from pervasive unit.
2	ROX	RFIR_IN4: Recovery from L30.
3	ROX	RFIR_IN5: Recovery from L31.
4	ROX	RFIR_IN6: Recovery from L20.
5	ROX	RFIR_IN7: Recovery from L21.
6	ROX	RFIR_IN8: Recovery from NC0.
7	ROX	RFIR_IN9: Recovery from NC1.
8	ROX	RFIR_IN10: Unused.
9	ROX	RFIR_IN11: Recovery from CME0.
10	ROX	RFIR_IN12: Recovery from CME1.
11:23	ROX	RFIR_IN13: Unused.

Register Name	FIR Mask Register
Mnemonic	TP.TCEP03.FIR_MASK
Address	0000000013040002 (SCOM)
Description	FIR mask

Bits	SCOM	Field Mnemonic: Description
0	RW	FIR_MASK_IN0: Mask for XFIR summary bit.
1	RW	FIR_MASK_IN1: Mask for XFIR broadcast via OOB.
2	RW	FIR_MASK_IN2: Unused.
3	RW	FIR_MASK_IN3: Mask for XFIR/RFIR from pervasive unit.
4	RW	FIR_MASK_IN4: Mask for CX XFIR and RFIR.

Bits	SCOM	Field Mnemonic: Description
5:25	RW	FIR_MASK_IN5: Unused.
26	RW	FIR_MASK_IN26: Mask for debug trigger and local checkstop to recoverable error.

Register Name	Special Attention Register
Mnemonic	TP.TCEP03.SPATTN
Address	0000000013040004 (SCOM) 0000000013040005 (SCOM1) 0000000013040006 (SCOM2)
Description	Special attention

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	ROX	NCX	NCX	SPATTN_IN0: Unused special attentions.
1	ROX	NCX	NCX	SPATTN_IN1: Unused special attentions.
2	ROX	NCX	NCX	SPATTN_IN2: Unused special attentions.
3	ROX	NCX	NCX	SPATTN_IN3: Unused special attentions.
4	ROX	NCX	NCX	SPATTN_IN4: Unused special attentions.
5	ROX	NCX	NCX	SPATTN_IN5: Unused special attentions.
6	ROX	NCX	NCX	SPATTN_IN6: Unused special attentions.
7	ROX	NCX	NCX	SPATTN_IN7: Unused special attentions.
8	ROX	NCX	NCX	SPATTN_IN8: Unused special attentions.
9	ROX	NCX	NCX	SPATTN_IN9: Unused special attentions.

Register Name	Special Attention Mask Register
Mnemonic	TP.TCEP03.SPA_MASK
Address	0000000013040007 (SCOM)
Description	Special attention mask

Bits	SCOM	Field Mnemonic: Description
0:9	RW	SPA_MASK_IN: Special attention mask.

Register Name	Mode Register
Mnemonic	TP.TCEP03.TPCL3.EPS.FIR.MODE_REG
Address	0000000013040008 (SCOM)
Description	Mode register

Bits	SCOM	Field Mnemonic: Description
0	RW	MODE_IN0: Unused.
1	RW	MODE_IN1: Unused.
2	RW	MODE_IN2: Unused.
3	RW	MODE_IN3: Unused.

Bits	SCOM	Field Mnemonic: Description
4	RW	MODE_IN4: Stop chip TOD on checkstop. (Unused in POWER9.)
5	RW	MODE_IN5: Stop chip TOD on recoverable. (Unused in POWER9.)
6	RW	MODE_IN6: Disable propagation of checkstop to other chips.
7	RW	MODE_IN7: Unused.
8	RW	MODE_IN8: Enable checkstop on special attention.
9	RW	MODE_IN9: mask_direct/local_error.
10	RW	MODE_IN10: Unused.
11	RW	MODE_IN11: Unused.
12:15	RW	MODE_IN: Unused.

Register Name	Host Attention Register
Mnemonic	TP.TCEP03.HOSTATTN
Address	0000000013040009 (SCOM)
Description	Host attention

Bits	SCOM	Field Mnemonic: Description
0	ROX	HOSTATTN_IN0: Host attention summary bit.
1	ROX	HOSTATTN_IN1: Unused.
2	ROX	HOSTATTN_IN2: Unused.
3	ROX	HOSTATTN_IN3: Unused.
4	ROX	HOSTATTN_IN4: Unused.
5	ROX	HOSTATTN_IN5: Unused.
6	ROX	HOSTATTN_IN6: Unused.
7	ROX	HOSTATTN_IN7: Unused.
8	ROX	HOSTATTN_IN8: Unused.
9	ROX	HOSTATTN_IN9: Unused.
10	ROX	HOSTATTN_IN10: Unused.
11	ROX	HOSTATTN_IN11: Unused.
12	ROX	HOSTATTN_IN12: Unused.
13	ROX	HOSTATTN_IN13: Unused.
14	ROX	HOSTATTN_IN14: Unused.
15	ROX	HOSTATTN_IN15: Unused.
16	ROX	HOSTATTN_IN16: Unused.
17	ROX	HOSTATTN_IN17: Unused.
18	ROX	HOSTATTN_IN18: Unused.
19	ROX	HOSTATTN_IN19: Unused.
20	ROX	HOSTATTN_IN20: Unused.
21	ROX	HOSTATTN_IN21: Unused.
22	ROX	HOSTATTN_IN22: Unused.

Register Name	Local FIR Register
Mnemonic	TP.TCEP03.LOCAL_FIR
Address	000000001304000A (SCOM) 000000001304000B (SCOM1) 000000001304000C (SCOM2)
Description	Local FIR

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	WOX_AND	WOX_OR	FIR_IN0: CFIR internal parity error.
1	RWX	WOX_AND	WOX_OR	FIR_IN1: Errors from Control.
2	RWX	WOX_AND	WOX_OR	FIR_IN2: Local errors from CC (PCB error).
3	RWX	WOX_AND	WOX_OR	FIR_IN3: Local errors from CC (OPCG, parity, scan collision, and so on).
4	RWX	WOX_AND	WOX_OR	FIR_IN4: Local errors from PSC (PCB error).
5	RWX	WOX_AND	WOX_OR	FIR_IN5: Local errors from PSC (parity error).
6	RWX	WOX_AND	WOX_OR	FIR_IN6: Local errors from Thermal (parity error).
7	RWX	WOX_AND	WOX_OR	FIR_IN7: Local errors from Thermal (PCB error).
8	RWX	WOX_AND	WOX_OR	FIR_IN8: Local errors from Thermal (Trip error critical).
9	RWX	WOX_AND	WOX_OR	FIR_IN9: Local errors from Thermal (Trip error fatal).
10	RWX	WOX_AND	WOX_OR	FIR_IN10: therm volttrip error.
11	RWX	WOX_AND	WOX_OR	FIR_IN11: Local errors from Debug (error).
12	RWX	WOX_AND	WOX_OR	FIR_IN12: Local errors from L3 Trace Array0 (SCOM error).
13	RWX	WOX_AND	WOX_OR	FIR_IN13: Local errors from L3 Trace Array0.
14	RWX	WOX_AND	WOX_OR	FIR_IN14: Local errors from L3 Trace Array1 (SCOM error).
15	RWX	WOX_AND	WOX_OR	FIR_IN15: Local errors from L3 Trace Array1.
16	RWX	WOX_AND	WOX_OR	FIR_IN16: Local errors from L20 Trace Array (SCOM error).
17	RWX	WOX_AND	WOX_OR	FIR_IN17: Local errors from L20 Trace Array.
18	RWX	WOX_AND	WOX_OR	FIR_IN18: Local errors from L21 Trace Array (SCOM error).
19	RWX	WOX_AND	WOX_OR	FIR_IN19: Local errors from L21 Trace Array.
20	RWX	WOX_AND	WOX_OR	FIR_IN20: Unused.
21	RWX	WOX_AND	WOX_OR	FIR_IN21: Local errors from duty cycle adjustment ex00_c0.
22	RWX	WOX_AND	WOX_OR	FIR_IN22: Local errors from duty cycle adjustment ex00_c1.
23	RWX	WOX_AND	WOX_OR	FIR_IN23: Local errors from duty cycle adjustment ex00_l2.
24	RWX	WOX_AND	WOX_OR	FIR_IN24: Local errors from duty cycle adjustment ex01_c0.
25	RWX	WOX_AND	WOX_OR	FIR_IN25: Local errors from duty cycle adjustment ex01_c1.
26	RWX	WOX_AND	WOX_OR	FIR_IN26: Local errors from duty cycle adjustment ex01_l2.
27	RWX	WOX_AND	WOX_OR	FIR_IN27: Local errors from skew adjustment skewadj6way.
28	RWX	WOX_AND	WOX_OR	FIR_IN28: Unused.
29	RWX	WOX_AND	WOX_OR	FIR_IN29: Unused.
30	RWX	WOX_AND	WOX_OR	FIR_IN30: Unused.
31	RWX	WOX_AND	WOX_OR	FIR_IN31: Unused.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
32	RWX	WOX_AND	WOX_OR	FIR_IN32: Unused.
33	RWX	WOX_AND	WOX_OR	FIR_IN33: Unused.
34	RWX	WOX_AND	WOX_OR	FIR_IN34: Unused.
35	RWX	WOX_AND	WOX_OR	FIR_IN35: Unused.
36	RWX	WOX_AND	WOX_OR	FIR_IN36: Unused.
37	RWX	WOX_AND	WOX_OR	FIR_IN37: Unused.
38	RWX	WOX_AND	WOX_OR	FIR_IN38: Unused.
39	RWX	WOX_AND	WOX_OR	FIR_IN39: Unused.
40	RWX	WOX_AND	WOX_OR	FIR_IN40: Unused.
41	RWX	WOX_AND	WOX_OR	FIR_IN41: Malfunction alert broadcast via OOB.

Register Name	Local FIR Mask Register
Mnemonic	TP.TCEP03.TPCL3.EPS.FIR.LOCAL_FIR_MASK
Address	000000001304000D (SCOM) 000000001304000E (SCOM1) 000000001304000F (SCOM2)
Description	Local FIR mask

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:41	RW	WO_AND	WO_OR	LFIR_MASK_IN: Mask for LEM error collection vector.

Register Name	Local FIR Action 0 Register
Mnemonic	TP.TCEP03.TPCL3.EPS.FIR.LOCAL_FIR_ACTION0
Address	0000000013040010 (SCOM)
Description	Local FIR action 0

Bits	SCOM	Field Mnemonic: Description
0:41	RW	FIR_ACTION0_IN: action0 mask.

Register Name	Local FIR Action 1 Register
Mnemonic	TP.TCEP03.TPCL3.EPS.FIR.LOCAL_FIR_ACTION1
Address	0000000013040011 (SCOM)
Description	Local FIR action 1

Bits	SCOM	Field Mnemonic: Description
0:41	RW	FIR_ACTION1_IN: action1 mask.

Register Name	Group Checkstop Trigger Register
Mnemonic	TP.TCEP03.TPCL3.EPS.FIR.GXSTOP_TRIG_REG
Address	0000000013040013 (SCOM)
Description	Group checkstop trigger register

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP_TRIG_IN0: Mask bit for system checkstop.
1	RW	GXSTP_TRIG_IN1: Mask bit for recoverable error.
2	RW	GXSTP_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP_TRIG_IN3: Mask bit for local checkstop.
4	RW	GXSTP_TRIG_IN4: Mask bit for type 4 error (host attention).
5	RW	GXSTP_TRIG_IN5: Mask bit for OOB sys_checkstop input (0).
6	RW	GXSTP_TRIG_IN6: Mask bit for OOB sys_checkstop input (1).
7	RW	GXSTP_TRIG_IN7: Mask bit for group checkstop input (0).
8	RW	GXSTP_TRIG_IN8: Mask bit for group checkstop input (1).
9	RW	GXSTP_TRIG_IN9: Mask bit for debug checkstop on trigger.
10	RW	GXSTP_TRIG_IN10: Unused.
11	RW	GXSTP_TRIG_IN11: Unused.

Register Name	Group 0 Checkstop Mask Register
Mnemonic	TP.TCEP03.TPCL3.EPS.FIR.GXSTOP0_MASK_REG
Address	0000000013040014 (SCOM)
Description	Group 0 checkstop mask

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP0_TRIG_IN0: Mask bit for system checkstop.
1	RW	GXSTP0_TRIG_IN1: Mask bit for recoverable error.
2	RW	GXSTP0_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP0_TRIG_IN3: Mask bit for local checkstop.
4	RW	GXSTP0_TRIG_IN4: Mask bit for type 4 error (host attention).
5	RW	GXSTP0_TRIG_IN5: Mask bit for OOB sys_checkstop input (0).
6	RW	GXSTP0_TRIG_IN6: Mask bit for OOB sys_checkstop input (1).
7	RW	GXSTP0_TRIG_IN7: Mask bit for group checkstop input (0).
8	RW	GXSTP0_TRIG_IN8: Mask bit for group checkstop input (1).
9	RW	GXSTP0_TRIG_IN9: Mask bit for debug checkstop on trigger.
10	RW	GXSTP0_TRIG_IN10: Unused.
11	RW	GXSTP0_TRIG_IN11: Unused.

Register Name	Group 1 Checkstop Mask Register
Mnemonic	TP.TCEP03.TPCL3.EPS.FIR.GXSTOP1_MASK_REG
Address	0000000013040015 (SCOM)
Description	Group 1 checkstop mask

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP1_TRIG_IN0: Mask bit for system checkstop.
1	RW	GXSTP1_TRIG_IN1: Mask bit for recoverable error.
2	RW	GXSTP1_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP1_TRIG_IN3: Mask bit for local checkstop.
4	RW	GXSTP1_TRIG_IN4: Mask bit for type 4 error (host attention).
5	RW	GXSTP1_TRIG_IN5: Mask bit for OOB sys_checkstop input (0).
6	RW	GXSTP1_TRIG_IN6: Mask bit for OOB sys_checkstop input (1).
7	RW	GXSTP1_TRIG_IN7: Mask bit for group checkstop input (0).
8	RW	GXSTP1_TRIG_IN8: Mask bit for group checkstop input (1).
9	RW	GXSTP1_TRIG_IN9: Mask bit for debug checkstop on trigger.
10	RW	GXSTP1_TRIG_IN10: Unused.
11	RW	GXSTP1_TRIG_IN11: Unused.

Register Name	Group 2 Checkstop Mask Register
Mnemonic	TP.TCEP03.TPCL3.EPS.FIR.GXSTOP2_MASK_REG
Address	0000000013040016 (SCOM)
Description	Group 2 checkstop mask

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP2_TRIG_IN0: Mask bit for system checkstop.
1	RW	GXSTP2_TRIG_IN1: Mask bit for recoverable error.
2	RW	GXSTP2_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP2_TRIG_IN3: Mask bit for local checkstop.
4	RW	GXSTP2_TRIG_IN4: Mask bit for type 4 error (host attention).
5	RW	GXSTP2_TRIG_IN5: Mask bit for OOB sys_checkstop input (0).
6	RW	GXSTP2_TRIG_IN6: Mask bit for OOB sys_checkstop input (1).
7	RW	GXSTP2_TRIG_IN7: Mask bit for group checkstop input (0).
8	RW	GXSTP2_TRIG_IN8: Mask bit for group checkstop input (1).
9	RW	GXSTP2_TRIG_IN9: Mask bit for debug checkstop on trigger.
10	RW	GXSTP2_TRIG_IN10: Unused.
11	RW	GXSTP2_TRIG_IN11: Unused.

Register Name	Summary Mask Register
Mnemonic	TP.TCEP03.TPCL3.EPS.FIR.SUM_MASK_REG
Address	0000000013040017 (SCOM)
Description	Summary mask register

Bits	SCOM	Field Mnemonic: Description
0	RW	SMASK_IN0: System checkstop summary bit.
1	RW	SMASK_IN1: Recoverable summary bit.
2	RW	SMASK_IN2: Special Attention summary bit.
3	RW	SMASK_IN3: Local checkstop summary bit.
4	RW	SMASK_IN4: Type 4 (host attention summary bit.

Register Name	Local Checkstop Error Register
Mnemonic	TP.TCEP03.LOCAL_XSTOP_ERR
Address	0000000013040018 (SCOM)
Description	Local checkstop error

Bits	SCOM	Field Mnemonic: Description
0	ROX	LOCAL_XSTOP_IN0: Local checkstop summary bit.
1	ROX	LOCAL_XSTOP_IN1: Unused.
2	ROX	LOCAL_XSTOP_IN2: Unused.
3	ROX	LOCAL_XSTOP_IN3: Unused.
4	ROX	LOCAL_XSTOP_IN4: Unused.
5	ROX	LOCAL_XSTOP_IN5: Unused.
6	ROX	LOCAL_XSTOP_IN6: Unused.
7	ROX	LOCAL_XSTOP_IN7: Unused.
8	ROX	LOCAL_XSTOP_IN8: Unused.
9	ROX	LOCAL_XSTOP_IN9: Unused.
10	ROX	LOCAL_XSTOP_IN10: Unused.
11	ROX	LOCAL_XSTOP_IN11: Unused.
12	ROX	LOCAL_XSTOP_IN12: Unused.
13	ROX	LOCAL_XSTOP_IN13: Unused.
14	ROX	LOCAL_XSTOP_IN14: Unused.
15	ROX	LOCAL_XSTOP_IN15: Unused.
16	ROX	LOCAL_XSTOP_IN16: Unused.
17	ROX	LOCAL_XSTOP_IN17: Unused.
18	ROX	LOCAL_XSTOP_IN18: Unused.
19	ROX	LOCAL_XSTOP_IN19: Unused.
20	ROX	LOCAL_XSTOP_IN20: Unused.
21	ROX	LOCAL_XSTOP_IN21: Unused.

Bits	SCOM	Field Mnemonic: Description
22	ROX	LOCAL_XSTOP_IN22: Unused.

Register Name	Local Checkstop Mask Register
Mnemonic	TP.TCEP03.LOCAL_XSTOP_MASK
Address	0000000013040019 (SCOM)
Description	Local checkstop mask

Bits	SCOM	Field Mnemonic: Description
0:21	RW	LOCAL_XSTOP_MASK_IN: Local checkstop mask.

Register Name	Host Attention Mask Register
Mnemonic	TP.TCEP03.HOSTATTN_MASK
Address	000000001304001A (SCOM)
Description	Host attention mask

Bits	SCOM	Field Mnemonic: Description
0:21	RW	HOSTATTN_MASK_IN: Host attention mask.

Register Name	DTS Thermal Sensor Result 0 Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.DTS_RESULT0
Address	0000000013050000 (SCOM)
Description	DTS thermal sensor results 0

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	DTS_0_RESULT: Calibrated DTS result of sensor with ID 0.
16:31	ROX	DTS_1_RESULT: Calibrated DTS result of sensor with ID 1.
32:63	RO	constant = 0b00000000000000000000000000000000

Register Name	DTS Trace Results Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.DTS_TRC_RESULT
Address	0000000013050003 (SCOM)
Description	DTS trace results

Bits	SCOM	Field Mnemonic: Description
0:43	ROX	TIMESTAMP_COUNTER_VALUE: Time stamp counter value during DTS trace mode.
44	ROX	TIMESTAMP_COUNTER_OVERFLOW_ERR: Overflow error bit of the time stamp counter value during DTS trace mode.
45:47	RO	constant = 0b000
48:63	ROX	DTS_1_RESULT: Calibrated DTS result of sensor with ID 1.

Register Name	Thermal Mode Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.THERM_MODE_REG
Address	000000001305000F (SCOM)
Description	Enables and controls CPM and DTS.

Bits	SCOM	Field Mnemonic: Description
0	RW	THERM_DIS_CPM_BUBBLE_CORR: Critical path result bubble correction active.
1	RW	THERM_FORCE_THRES_ACT: Forces tpc_therm_thres_mac clock gating off and activates clocks.
2:4	RW	THERM_THRES_TRIP_ENA: Enables therm_thres_trip compare. 1xx = trip0, warning. x1x = trip1, critical. xx1 = trip2, fatal.
5	RW	THERM_DTS_SAMPLE_ENA: 0 = No DTS sampling. 1 = DTS sampling is enabled and a below-counter compare match can occur.
6:9	RW	THERM_SAMPLE_PULSE_CNT: A 16 MHz sample pulse is fed into an 18-bit counter. therm_sample_pulse_cnt enables the selection of a high order bit of the counter to enable resolution of sampling DTSs between 2.5 µs and 80 ms. An edge detection circuit detects the rising edge of the selected counter bit and this triggers a DTS sample. 0000 = 16 ms. 0001 = 8 ms. 0010 = 4 ms. 0011 = 2 ms. 0100 = 1 ms. 0101 = 0.5 ms. 0110 = 250 µs. 0111 = 125 µs. 1000 = 62 .5 µs. 1001 = 31.3 µs. 1010 = 15.6 µs. 1011 = 7.8 µs. 1100 = 3.9 µs. 1101 = 2 µs. 1110 = 1 µs. 1111 = 0.5 µs.
10:11	RW	THERM_THRES_MODE_ENA: Forces maximum or minimum mode in the threshold unit: 00 = Off. 11 = Illegal. 10 = Maximum mode. 01 = Minimum mode.
12	RW	DTS_TRIGGER_MODE: Unused.
13	RW	DTS_TRIGGER_SEL: Unused.
14	RW	THERM_THRES_OVERFLOW_MASK: 0 = therm_overflow_err is enabled. 1 = therm_overflow_err is disabled.
15	RW	THERM_MODE_UNUSED: Unused.
16:19	RW	THERM_DTS_READ_SEL: Selects which DTS result will be provided with PCB read addr_v(4): 0000 = DTS 0. 0001 = DTS 1. 0010 = DTS 2. 0100 = DTS 4. 1111 = Worst case sensor.

Bits	SCOM	Field Mnemonic: Description
20:21	RW	THERM_DTS_ENABLE_L1: loop1 DTS enables: 1x = DTS 0 available. x1 = DTS 1 available.
22:34	RO	constant = 0b0000000000000
35:36	RW	Reserved field.

Register Name	Skitter Control Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.SKITTER_MODE_REG
Address	0000000013050010 (SCOM)
Description	Skitter control register

Bits	SCOM	Field Mnemonic: Description
0	RW	SKITTER_HOLD_SAMPLE: Forces skitter to hold the current sample.
1	RW	DISABLE_SKITTER_STICKINESS: A value of '0' specifies accumulation mode. A value of '1' samples a new value on each cycle and resets the sticky value.
2:3	RW	SKITTER_MODE_UNUSED1: Unused.
4:5	RW	SKITTER_HOLD_DBGTRIG_SEL: bit0 = hold_on_trigger0 bit1 = hold_on_trigger1
6:7	RW	SKITTER_RESET_TRIG_SEL: bit0 = reset_sticky_on_trigger0. bit1 = reset_sticky_on_trigger1.
8:9	RW	SKITTER_SAMPLE_GUTS: Selects which guts to measure: 00 = guts1. 01 = guts2. 10 = guts3. 11 = guts4.
10:43	RO	constant = 0b0000000000000000000000000000000000
44	ROX	SKITTER_HOLD_SAMPLE_WITH_TRIGGER: Forces skitter to hold the current sample on debug trigger; this has highest priority.
45	ROX	SKITTER_DATA_V_LT: If set to '1', the data requested by a skitter force read register has finished and data is present in the skitter data register in the collector macro. The data be read by any combination of V25/V26/V27 PCB reads.

Register Name	Error Injection Control Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.INJECT_REG
Address	0000000013050011 (SCOM)
Description	Error injection control register

Bits	SCOM	Field Mnemonic: Description
0:1	RW	THERM_INJECT_TRIP: 00 = No injection. 01 = Warning trip level injection. 10 = Critical trip level injection. 11 = Fatal trip level injection.

Bits	SCOM	Field Mnemonic: Description
2:3	RW	THERM_INJECT_MODE: 00 = No injection. 01 = Injection on the next DTS sample. 10 = Solid injection for the next DTS samples till bit setting changes. 11 = Not used.

Register Name	Thermal Control Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.CONTROL_REG
Address	0000000013050012 (SCOM)
Description	Control / force reset register

Bits	SCOM	Field Mnemonic: Description
0	WO_1P	Reserved field.
1	WO_1P	Reserved field.
2	WO_1P	Reserved field.
3	WO_1P	Reserved field.
4	WO_1P	Reserved field.
5	WO_1P	Reserved field.
6	WO_1P	Reserved field.
7	WO_1P	Reserved field.
8	WO_1P	Reserved field.
9	WO_1P	Reserved field.
10	WO_1P	Reserved field.
11	WO_1P	Reserved field.
12	WO_1P	Reserved field.

Register Name	Thermal Error Status Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.ERR_STATUS_REG
Address	0000000013050013 (SCOM)
Description	Thermal error status register

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.
1	ROX	Reserved field.
2	ROX	Reserved field.
3	ROX	Reserved field.
4	ROX	Reserved field.
5	ROX	Reserved field.
6	ROX	Reserved field.
7	ROX	Reserved field.
8	ROX	Reserved field.

Bits	SCOM	Field Mnemonic: Description
9	ROX	Reserved field.
10	ROX	Reserved field.
11	ROX	Reserved field.
12	ROX	Reserved field.
13	ROX	Reserved field.
14	ROX	Reserved field.
15	ROX	Reserved field.
16	ROX	SERIAL_SHIFTCNT_MODEREG_PARITY_ERR_MASK: Serial shift count parity error mask.
17	ROX	THERM_MODEREG_PARITY_ERR_MASK: Thermal Mode Register parity error mask.
18	ROX	SKITTER_MODEREG_PARITY_ERR_MASK: Skitter Mode Register parity error mask.
19	ROX	SKITTER_FORCEREG_PARITY_ERR_MASK: Skitter Force Register parity error mask.
20	ROX	SCAN_INIT_VERSION_REG_PARITY_ERR_MASK: Scan Initial Version Register parity error mask.
21	ROX	VOLT_MODEREG_PARITY_ERR_MASK: Volt Mode Register parity error mask.
22	RO	constant = 0b0
23	ROX	COUNT_STATE_ERR_MASK: Count state machine error mask.
24	ROX	RUN_STATE_ERR_MASK: Run state machine error mask.
25	ROX	THRES_STATE_ERR_MASK: Threshold state machine error mask.
26	ROX	OVERFLOW_ERR_MASK: DTS calibration calculation overflow error mask.
27	ROX	SHIFTER_PARITY_ERR_MASK: Shifter parity error mask.
28	ROX	SHIFTER_VALID_ERR_MASK: Shifter valid error mask.
29	ROX	TIMEOUT_ERR_MASK: Timeout error mask.
30	ROX	F_SKITTER_READ_ERR_MASK: Force skitter read error mask.
31	ROX	PCB_ERR_MASK: Pervasive control bus error mask.
32:39	RO	constant = 0b00000000
40:43	ROX	Reserved field.
44:46	ROX	Reserved field.
47	ROX	Reserved field.
48	ROX	Reserved field.
49:50	ROX	Reserved field.
51:54	ROX	Reserved field.
55	ROX	Reserved field.
56	ROX	Reserved field.
57	ROX	Reserved field.
58	ROX	Reserved field.
59	ROX	Reserved field.
60:63	RO	constant = 0b0000

Register Name	Skitter Force Read Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.SKITTER_FORCE_REG
Address	0000000013050014 (SCOM)
Description	Skitter Force Read Register

Bits	SCOM	Field Mnemonic: Description
0	RW	F_SKITTER_READ: Forces the read of a particular skitter.

Register Name	Skitter Clock Source Control Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.SKITTER_CLKSRC_REG
Address	0000000013050016 (SCOM)
Description	Skitter clock source control register

Bits	SCOM	Field Mnemonic: Description
0:2	RW	SKITTER0_CLKSRC: Selects the clock to measure: 000 = Local mesh clock. 001 = External pin skitter_c1_1_in. 010 = Local d1clk only if d_mode = 1. 011 = External pin skitter_c1_2_in. 100 = Local lclk only if d_mode = 1. 101 = External pin skitter_c1_3_in. 110 = Unused. 111 = External pin skitter_c1_4_in.
3:35	RO	constant = 0b000000000000000000000000000000000
36:37	RW	SKITTER0_DELAY_SELECT: Selects the delay to be added between the skitter0 clock source multiplexer and the inverter chain. The base line delay is 12.2 psec. 00 = No delay. 01 = 0.6 psec. 10 = 1.8 psec. 11 = 5 psec.

Register Name	Skitter Data 0 Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.SKITTER_DATA0
Address	0000000013050019 (SCOM)
Description	Skitter data register read bit0:63

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Skitter Data 1 Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.SKITTER_DATA1
Address	000000001305001A (SCOM)
Description	Skitter data register read bit32:95

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Skitter Data 2 Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.SKITTER_DATA2
Address	000000001305001B (SCOM)
Description	Skitter data register read bit64:127

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Timestamp Counter Read Register
Mnemonic	TP.TCEP03.TPCL3.EPS.THERM.TIMESTAMP_COUNTER_READ
Address	000000001305001C (SCOM)
Description	Timestamp counter read

Bits	SCOM	Field Mnemonic: Description
0:43	ROX	TIMESTAMP_COUNTER_VALUE: Time stamp counter value during DTS trace mode.
44	ROX	TIMESTAMP_COUNTER_OVERFLOW_ERR: Overflow error bit of the time stamp counter value during DTS trace mode.

12. CACHE Chiplet PCB Slave

The POWER9 processor registers are listed alphabetically by mnemonic in the following address table.

Mnemonic	Address	Page
TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.ASSIST_INTERRUPT_REG	0x00000000130F0011	2036

The POWER9 processor registers are listed in the following tables.

Register Name	Primary Address Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.PRIMARY_ADDRESS_REG
Address	00000000130F0000 (SCOM)
Description	Contains the slave's primary address

Bits	SCOM	Field Mnemonic: Description
0:5	RO	Reserved field.

Register Name	Multicast Group 1 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.MULTICAST_GROUP_1
Address	00000000130F0001 (SCOM)
Description	Multicast group 1

Bits	SCOM	Field Mnemonic: Description
0:2	RO	constant = 0b111
3:5	RW	MULTICAST1_GROUP: Multicast group1 setting.

Register Name	Multicast Group 2 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.MULTICAST_GROUP_2
Address	00000000130F0002 (SCOM)
Description	Multicast group 2

Bits	SCOM	Field Mnemonic: Description
0:2	RO	constant = 0b111
3:5	RW	MULTICAST2_GROUP: Multicast group2 setting.

Register Name	Multicast Group 3 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.MULTICAST_GROUP_3
Address	00000000130F0003 (SCOM)
Description	Multicast group 3

Bits	SCOM	Field Mnemonic: Description
0:2	RO	constant = 0b111
3:5	RW	MULTICAST3_GROUP: Multicast group3 setting.

Register Name	Multicast Group 4 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.MULTICAST_GROUP_4
Address	00000000130F0004 (SCOM)
Description	Multicast group 4

Bits	SCOM	Field Mnemonic: Description
0:2	RO	constant = 0b111
3:5	RW	MULTICAST4_GROUP: Multicast group4 setting.

Register Name	Timeout Select Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.TIMEOUT_REG
Address	00000000130F0010 (SCOM)
Description	Timeout select register

Bits	SCOM	Field Mnemonic: Description
0:1	RW	Reserved field.

Register Name	Assist Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.ASSIST_INTERRUPT_REG
Address	00000000130F0011 (SCOM)
Description	Assist interrupt register

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.
1	ROX	Reserved field.
2	ROX	Reserved field.

Register Name	Vital Scan Out Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.VITAL_SCAN_OUT
Address	00000000130F0017 (SCOM)
Description	Vital scan out

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved.

Register Name	Chiplet Heartbeat Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.HEARTBEAT_REG
Address	00000000130F0018 (SCOM)
Description	Chiplet heartbeat register

Bits	SCOM	Field Mnemonic: Description
0	ROX	HEARTBEAT_DEAD: Chiplet heartbeat not detected.

Register Name	PLL Lock Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.PLL_LOCK_REG
Address	00000000130F0019 (SCOM)
Description	Lock indications from PLLs

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	Reserved field.

Register Name	Attention Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.ATTN_INTERRUPT_REG
Address	00000000130F001A (SCOM)
Description	Attention interrupt

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.

Register Name	Recoverable Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.RECOV_INTERRUPT_REG
Address	00000000130F001B (SCOM)
Description	Recoverable interrupt

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.

Register Name	Checkstop Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.XSTOP_INTERRUPT_REG
Address	00000000130F001C (SCOM)
Description	Checkstop interrupt

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.

Register Name	Slave Configuration Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.SLAVE_CONFIG_REG
Address	00000000130F001E (SCOM)
Description	Slave configuration register

Bits	SCOM	Field Mnemonic: Description
0	RW	CFG_DISABLE_PERV_THOLD_CHECK: Disables the pervasive thold check.
1	RW	CFG_DISABLE_MALF_PULSE_GEN: Disables pulse generation for a malfunction alert. Switches back to level.
2	RW	CFG_STOP_HANG_CNT_SYS_XSTP: Disables a hang counter stop for system checkstop.
3	RW	CFG_DISABLE_CL_ATOMIC_LOCK: Disables the atomic lock for chiplet accesses.
4	RW	CFG_DISABLE_HEARTBEAT: Disables a check for voltage and grid clock in the chiplet.
5	RW	CFG_DISABLE_FORCE_TO_ZERO: Disables force to zero for error cases.
6	RW	CFG_PM_DISABLE: Disables the power management set/reset interface for the NET CNTRLx Registers.
7	RW	CFG_PM_MUX_DISABLE: Disables the PM multiplexer request signal.
8:13	RW	ERROR_MASK: Mask bits for slave error reporting.
14:15	RW	Reserved.

Register Name	Error Capture Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.ERROR_REG
Address	00000000130F001F (SCOM)
Description	Error capture register

Bits	SCOM	Field Mnemonic: Description
0	RWX_WCLEAR	CE_ERROR: Correctable error on the PCB bus.
1:3	RWX_WCLEAR	CHIPLET_ERRORS: Errors reported by chiplet. This register is for debug purposes only. It holds meaningful data only if it is cleared after each error. 000 = No error. 001 = XSCOM command blocked due to pending errors. 010 = Chiplet offline. 011 = Partial good. 100 = Invalid address / address error / bad access type. 101 = Clock error. 110 = Parity error / received unexpected packet / wrong packet number. 111 = Timeout.
4	RWX_WCLEAR	PARITY_ERROR: Parity error on the PCB Interface.
5	RWX_WCLEAR	DATA_BUFFER_ERROR: Parity error in the data buffer.
6	RWX_WCLEAR	ADDR_BUFFER_ERROR: Parity error in the address buffer.
7	RWX_WCLEAR	PCB_FSM_ERROR: Invalid state error in the PCB FSM.
8	RWX_WCLEAR	CL_FSM_ERROR: Invalid state error in the chiplet FSM.
9	RWX_WCLEAR	INT_RX_FSM_ERROR: Invalid state error in the interrupt RX FSM.
10	RWX_WCLEAR	INT_TX_FSM_ERROR: Invalid state error in the interrupt TX FSM.
11	RWX_WCLEAR	INT_TYPE_ERROR: Invalid interrupt type.
12	RWX_WCLEAR	CL_DATA_ERROR: Parity error on the chiplet interface.
13	RWX_WCLEAR	INFO_ERROR: Parity error on the chiplet information lines.
14	RWX_WCLEAR	UNUSED_0: Unused.
15	RWX_WCLEAR	CHIPLET_ATOMIC_LOCK_ERROR: Chiplet atomic lock error.
16	RWX_WCLEAR	PCB_INTERFACE_ERROR: Error of the PCB interface component for the internal endpoint.
17	RWX_WCLEAR	CHIPLET_OFFLINE: Heartbeat check indicated that the chiplet is offline.
18	RWX_WCLEAR	EDRAM_SEQUENCE_ERR: Error in the eDRAM power up sequence.
19	RWX_WCLEAR	CTRL_REG_PARITY_ERROR: Control register parity is bad.
20	RWX_WCLEAR	ADDRESS_REG_PARITY_ERROR: Address register parity is bad.
21	RWX_WCLEAR	TIMEOUT_REG_PARITY_ERROR: Timeout select register parity is bad.
22	RWX_WCLEAR	CONFIG_REG_PARITY_ERROR: Slave configuration register parity is bad.
23	RWX_WCLEAR	UNUSED_1:
24	RWX_WCLEAR	DIV_REG_PARITY_ERROR: Register parity is bad.
25:28	RWX_WCLEAR	PLL_UNLOCK_ERROR: Unlock from a chiplet PLL.

Register Name	Hang Pulse 0 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.HANG_PULSE_0_REG
Address	00000000130F0020 (SCOM)
Description	Hang pulse generation register 0

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_0: Value of hang pulse 0. Time period = 2^{value} x (precounter_reg + 1) / pcb_freq, where 34 ≥ value > 0.
6	RW	SUPPRESS_HANG_0: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse 1 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.HANG_PULSE_1_REG
Address	00000000130F0021 (SCOM)
Description	Hang pulse generation register 1

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_1: Value of hang pulse 1. Time period = 2^{value} x (precounter_reg + 1) / pcb_freq, where 34 ≥ value > 0.
6	RW	SUPPRESS_HANG_1: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse 2 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.HANG_PULSE_2_REG
Address	00000000130F0022 (SCOM)
Description	Hang pulse generation register 2

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_2: Value of hang pulse 2. Time period = 2^{value} x (precounter_reg + 1) / pcb_freq, where 34 ≥ value > 0.
6	RW	SUPPRESS_HANG_2: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse 3 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.HANG_PULSE_3_REG
Address	00000000130F0023 (SCOM)
Description	Hang pulse generation register 3

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_3: Value of hang pulse 3. Time period = 2^{value} x (precounter_reg + 1) / pcb_freq, where 34 ≥ value > 0.
6	RW	SUPPRESS_HANG_3: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse 4 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.HANG_PULSE_4_REG
Address	00000000130F0024 (SCOM)
Description	Hang pulse generation register 4

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_4: Value of hang pulse 4. Time period = 2^{value} x (precounter_reg + 1) / pcb_freq, where 34 ≥ value > 0.
6	RW	SUPPRESS_HANG_4: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse 5 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.HANG_PULSE_5_REG
Address	00000000130F0025 (SCOM)
Description	Hang pulse generation register 5. This hang counter is used exclusively to generate the malfunction alert pulse.

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_5: Value of hang pulse 5. Time period = 2^{value} x (precounter_reg + 1) / pcb_freq, where 34 ≥ value > 0.
6	RW	SUPPRESS_HANG_5: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse 6 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.HANG_PULSE_6_REG
Address	00000000130F0026 (SCOM)
Description	Hang pulse generation register 6. This hang counter is used exclusively for the heartbeat generation.

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_6: Value of hang pulse 6. Time period = 2^{value} x (precounter_reg + 1) / pcb_freq, where 34 ≥ value > 0.
6	RW	SUPPRESS_HANG_6: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Pre-Counter Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.PRE_COUNTER_REG
Address	00000000130F0028 (SCOM)
Description	Divider for hang counter clock

Bits	SCOM	Field Mnemonic: Description
0:7	RW	PRE_COUNTER: Divider for hang counter clock. Divides clock by n + 1. The default value is n = 0.

Register Name	eDRAM Status Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.EDRAM_STATUS
Address	00000000130F0029 (SCOM)
Description	eDRAM control status register

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	EDRAM_STAT: eDRAM control status.

Register Name	NET CTRL0 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.NET_CTRL0
Address	00000000130F0040 (SCOM) 00000000130F0041 (SCOM1) 00000000130F0042 (SCOM2)
Description	NET CTRL0 register. (N/A in pervasive chiplets.)

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	RWX_WAND	RWX_WOR	CHIPLET_ENABLE: Set if chiplet is good.
1	RWX	RWX_WAND	RWX_WOR	PCB_EP_RESET: Output is ORed to the global EP reset.
2	RWX	RWX_WAND	RWX_WOR	CLK_ASYNC_RESET: For a POWER9 cache chiplet, the EQ skew adjustment is reset. For a POWER9 core chiplet, the core duty cycle adjustment is reset. For a POWER9 memory chiplet, the memory asynchronous glitchless multiplexer is reset.
3	RWX	RWX_WAND	RWX_WOR	PLL_TEST_EN: Test enable for chiplet PLL.
4	RWX	RWX_WAND	RWX_WOR	PLL_RESET: Reset for chiplet PLL.
5	RWX	RWX_WAND	RWX_WOR	PLL_BYPASS: Enable bypass for chiplet PLL.
6	RWX	RWX_WAND	RWX_WOR	VITAL_SCAN: Scan control for chiplet vital domain.
7	RWX	RWX_WAND	RWX_WOR	VITAL_SCAN_IN: Scan in for the chiplet vital domain.
8	RWX	RWX_WAND	RWX_WOR	VITAL_PHASE: Phase for vital domain.
9	RWX	RWX_WAND	RWX_WOR	FLUSH_ALIGN_OVR: Override flush, flush_nto1, align in chiplet to 1.
10	RWX	RWX_WAND	RWX_WOR	VITAL_AL: Align for vital domain.
11	RWX	RWX_WAND	RWX_WOR	ACT_DIS: LCB control signal for vital logic.
12	RWX	RWX_WAND	RWX_WOR	MPW1: LCB control signal for vital logic.
13	RWX	RWX_WAND	RWX_WOR	MPW2: LCB control signal for vital logic.
14	RWX	RWX_WAND	RWX_WOR	MPW3: LCB control signal for vital logic.
15	RWX	RWX_WAND	RWX_WOR	DELAY_LCLKR: LCB control signal for vital logic.
16	RWX	RWX_WAND	RWX_WOR	VITAL_THOLD: Thold for the chiplet vital domain.
17	RWX	RWX_WAND	RWX_WOR	FLUSH_SCAN_N: Flush scan control.
18	RWX	RWX_WAND	RWX_WOR	FENCE_EN: Fencing signal for chiplet.
19	RWX	RWX_WAND	RWX_WOR	CPLT_RCTRL: Chiplet receiver enable.
20	RWX	RWX_WAND	RWX_WOR	CPLT_DCTRL: Chiplet driver enable.
21	RWX	RWX_WAND	RWX_WOR	Reserved field.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
22	RWX	RWX_WAND	RWX_WOR	ADJ_FUNC_CLKSEL: POWER9 cache chiplet: Clock select for skew adjustment/duty cycle adjustment logic. POWER9 core chiplet: Skew sense to skew adjustment fencing.
23:24	RWX	RWX_WAND	RWX_WOR	Reserved field.
25	RWX	RWX_WAND	RWX_WOR	TP_FENCE_PCB: Fence the Chiplet from the PCB Bus. If set, PCB Slave will report *Chiplet Offline*.
26	RWX	RWX_WAND	RWX_WOR	LVLTRANS_FENCE: Fence control for level translators.
27	RWX	RWX_WAND	RWX_WOR	ARRAY_WRITE_ASSIST_EN: Array write assist.
28	RWX	RWX_WAND	RWX_WOR	HTB_INTEST: HTB in test mode.
29	RWX	RWX_WAND	RWX_WOR	HTB_EXTEST: HTB in test mode.
30	RWX	RWX_WAND	RWX_WOR	Reserved field.
31	RWX	RWX_WAND	RWX_WOR	PLLFORCE_OUT_EN: PLL force out enable.

Register Name	NET CTRL1 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.NET_CTRL1
Address	00000000130F0044 (SCOM) 00000000130F0045 (SCOM1) 00000000130F0046 (SCOM2)
Description	NET CTRL1 register. (N/A in pervasive chiplets.)

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	RWX_WAND	RWX_WOR	PLL_CLKIN_SEL: PLL CLKIN select.
1	RWX	RWX_WAND	RWX_WOR	CLK_DCC_BYPASS_EN: POWER9 cache chiplet: L2-0, L2-1, L3 duty cycle control bypass. POWER9 core chiplet: Core duty cycle control bypass. POWER9 memory chiplet: Memory duty cycle control bypass.
2	RWX	RWX_WAND	RWX_WOR	CLK_PDLY_BYPASS_EN: POWER9 cache chiplet: L2-0, L2-1, L3 progdly bypass. POWER9 core chiplet: Core progdly bypass. POWER9 memory chiplet: Memory progdly bypass.
3	RWX	RWX_WAND	RWX_WOR	CLK_DIV_BYPASS_EN: Enables clock divider bypass.
4	RWX	RWX_WAND	RWX_WOR	REFCLK_CLKMUX0_SEL: Select for reference clock mux0.
5	RWX	RWX_WAND	RWX_WOR	REFCLK_CLKMUX1_SEL: Select for reference clock mux1.
6	RWX	RWX_WAND	RWX_WOR	PLL_BNDY_BYPASS_EN: Bypass for IOP PLL.
7	RWX	RWX_WAND	RWX_WOR	Reserved field.
8:15	RWX	RWX_WAND	RWX_WOR	DPLL_TEST_SEL: DPLL test out multiplexing.
16:19	RWX	RWX_WAND	RWX_WOR	SB_STRENGTH: Sector buffer driver strength.
20	RWX	RWX_WAND	RWX_WOR	ASYNC_TYPE:
21	RWX	RWX_WAND	RWX_WOR	ASYNC_OBS:
22	RWX	RWX_WAND	RWX_WOR	CPM_CAL_SET: CPM calibrate.
23	RWX	RWX_WAND	RWX_WOR	SENSEADJ_RESET0: POWER9 cache chiplet: L2-0 duty cycle adjustment reset.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
24	RWX	RWX_WAND	RWX_WOR	SENSEADJ_RESET1: POWER9 cache chiplet: L2-1 duty cycle adjustment reset.
25	RWX	RWX_WAND	RWX_WOR	CLK_PULSE_EN: Clock pulse mode enable.
26:27	RWX	RWX_WAND	RWX_WOR	CLK_PULSE_MODE: Clock pulse mode setting.
28:31	RWX	RWX_WAND	RWX_WOR	Reserved field.

Register Name	PPM General Power Management Mode Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_COMMON_REGS.PPM_GPMMR
Address	00000000130F0100 (SCOM) 00000000130F0101 (SCOM1) 00000000130F0102 (SCOM2)
Description	PPM general power management mode register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	WOX_CLEAR	WOX_OR	Reserved field.
1	ROX	NCX	NCX	Reserved field.
2	ROX	NCX	NCX	Reserved field.
3	ROX	NCX	NCX	Reserved field.
4	ROX	NCX	NCX	Reserved field.
5	ROX	NCX	NCX	Reserved field.
6	RW	WO_CLEAR	WO_OR	Reserved field.
7	RW	WO_CLEAR	WO_OR	Reserved field.
8	RW	WO_CLEAR	WO_OR	Reserved field.
9	RW	WO_CLEAR	WO_OR	Reserved field.
10	RW	WO_CLEAR	WO_OR	Reserved field.
11	RO	NC	NC	Reserved field.
12:14	RW	WO_CLEAR	WO_OR	Reserved field.
15	RW	WO_CLEAR	WO_OR	Reserved field.
16:63	RO	RO	RO	constant = 0b000000000000000000000000000000000000000000000000

Register Name	QPPM QUAD Power Management Mode Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_QPMMR
Address	00000000130F0103 (SCOM) 00000000130F0104 (SCOM1) 00000000130F0105 (SCOM2)
Description	QPPM QUAD power management mode register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_FORCE_FSAFE: Forces the FSAFE frequency override to occur as described in the next field.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
1:11	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_FSAFE: Safe frequency. This field establishes the frequency to which the DPLL (and therefore QUAD) will be forced in SAFE mode (for example, if loss of the OCC heartbeat is detected and OCC_HEARTBEAT_EN is set). In this event, the hardware overrides the FMIN, FMAX, and FREQ_MULT fields in the QPPM DPLL Frequency Control Register to send this value to the DPLL instead. Note that when this occurs the HIRES portions of those frequency fields are overridden to zeroes. Firmware must ensure that this frequency is supported by all possible voltages (external and internal) and analog clocking circuits at the time. Failure to do so can result in unpredictable machine behavior.
12	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_ENABLE_FSAFE_UPON_HEARTBEAT_LOSS:
13	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_ENABLE_DROOP_PROTECT_UPON_HEARTBEAT_LOSS: When set, the QCCR[DROOP_PROTECT_DATA] is used based on the setting of ERR_REG [OCC_HEARTBEAT_LOSS].
14	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_ENABLE_PFETS_UPON_IVRM_DROPOUT: **Note:** This bit must *always* be 0, such that this function is never used.
15	RO	RO	RO	constant = 0b0
16	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_ENABLE_PCB_INTR_UPON_HEARTBEAT_LOSS: When set, the rising edge of OCC_HEARTBEAT_LOSS will cause an interrupt to the OCC complex.
17	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_ENABLE_PCB_INTR_UPON_IVRM_DROPOUT: When set, the rising edge of IVRM_DROPOUT_ERR will cause an interrupt to the OCC complex.
18	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_ENABLE_PCB_INTR_UPON_LARGE_DROOP: Final VDM data bit 1 (large droop detect).
19	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_ENABLE_PCB_INTR_UPON_EXTREME_DROOP: Final VDM data bit 0 (extreme droop detect).
20	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_CME_INTERPPM_IVRM_ENABLE: CME inter-PPM communication enable. iVRM enablement (including iVRM control and PFET control register addresses 0x01B0 – 0x01B2 and 0x0118 – 0x01A): 0 = Write access to the iVRM enablement subset of QUAD PPM registers from Core PPMs is disabled. 1 = Write access to the iVRM enablement subset of QUAD PPM registers from Core PPMs is enabled. CME_INTERPPM_IVRM_SEL selects between CorePPM1 and CorePPM2.
21	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_CME_INTERPPM_IVRM_SEL: CME inter-PPM communication select. iVRM enablement: 0 = If CME_INTERPPM_IVRM_ENABLE = 1, CorePPM1 is enabled. 1 = If CME_INTERPPM_IVRM_ENABLE = 1, CorePPM2 is enabled. **Note:** If CME_INTERPPM_IVRM_ENABLE = 0, this bit has no effect.
22	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_CME_INTERPPM_ACLK_ENABLE: CME inter-PPM communication enable. Analog clock controls (register addresses 0x0160 – 0x0162): 0 = Write access to the analog clock control subset of QUAD PPM registers from Core PPMs is disabled. 1 = Write access to the Analog Clock Control subset of QUAD PPM registers from Core PPMs is enabled. CME_INTERPPM_ANACLK_SEL selects between CorePPM1 and CorePPM2.
23	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_CME_INTERPPM_ACLK_SEL: CME inter-PPM communication select. Analog clock controls: 0 = If CME_INTERPPM_ANACLK_ENABLE = 1, CorePPM1 is enabled. 1 = If CME_INTERPPM_ANACLK_ENABLE = 1, CorePPM2 is enabled. **Note:** If CME_INTERPPM_ANACLK_ENABLE = 0, this bit has no effect.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
24	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_CME_INTERPPM_VDATA_ENABLE: CME inter-PPM communication enable. Voltage data control (PPM iVRM Data Value Register 0x01B4 and VDM Configuration and Control Registers 0x01B6 – 0x01BA). 0 = Write access to the voltage data control subset of QUAD PPM registers from Core PPMs is disabled. 1 = Write access to the voltage data control subset of QUAD PPM registers from Core PPMs is enabled. CME_INTERPPM_VDATA_SEL selects between CorePPM1 and CorePPM2.
25	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_CME_INTERPPM_VDATA_SEL: CME inter-PPM communication select. Voltage data control: 0 = If CME_INTERPPM_VDATA_ENABLE = 1, CorePPM1 is enabled. 1 = If CME_INTERPPM_VDATA_ENABLE = 1, CorePPM2 is enabled. **Note:** If CME_INTERPPM_VDATA_ENABLE = 0, this bit has no effect.
26	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_CME_INTERPPM_DPLL_ENABLE: CME inter-PPM communication enable. DPLL control registers (addresses 0x0151 – 0x0154): 0 = Write access to the DPLL control subset of QUAD PPM registers from Core PPMs is disabled. 1 = Write access to the DPLL control subset of QUAD PPM registers from Core PPMs is enabled. CME_INTERPPM_DPLL_SEL selects between CorePPM1 and CorePPM2.
27	RW	WO_CLEAR	WO_OR	QPPM_QPMMR_CME_INTERPPM_DPLL_SEL: CME inter-PPM communication select. DPLL control: 0 = If CME_INTERPPM_DPLL_ENABLE = 1, CorePPM1 is enabled 1 = If CME_INTERPPM_DPLL_ENABLE = 1, CorePPM2 is enabled **Note:** If CME_INTERPPM_ DPLL_ENABLE = 0, this bit has no effect.

Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_COMMON_REGS.PPM_PFCS
Address	00000000130F0118 (SCOM) 00000000130F0119 (SCOM1) 00000000130F011A (SCOM2)
Description	PPM PFET control state

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:1	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_FORCE_STATE: Domain V_{DD} PFET force state. Provides a means for firmware to force the domain V_{DD} PFETs to well known end states using the hardware sequencing mechanisms: b00 = No operation. b01 = Force V_{off}. b10 = No operation (reserved). b11 = Force V_{on}. This field is valid only if bits 4:5 = 00 (that is, both vdd_pfet_val_override *and* vdd_pfet_sel_override are disabled).
2:3	RW	WO_CLEAR	WO_OR	PPM_PFCS_VCS_PFET_FORCE_STATE: Domain V_{CS} PFET force state. This field is used only in QUAD PPM; it is unused in Core PPM. It provides a means for firmware to force the domain V_{CS} PFETs to well known end states using the hardware sequencing mechanisms: b00 = No operation. b01 = Force V_{off}. b10 = No operation (reserved). b11 = Force V_{on}. This field is valid only if bits 6:7 = 00 (that is, both vcs_pfet_val_override *and* vcs_pfet_sel_override are disabled).
4	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_VAL_OVERRIDE: Domain V_{DD} PFET value override.
5	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_SEL_OVERRIDE: Domain V_{DD} PFET stage select override.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
6	RW	WO_CLEAR	WO_OR	PPM_PFCS_VCS_PFET_VAL_OVERRIDE: Domain V_{CS} PFET value override. For QUAD PPM use only. Unused in Core PPM.
7	RW	WO_CLEAR	WO_OR	PPM_PFCS_VCS_PFET_SEL_OVERRIDE: Domain V_{CS} PFET stage select override. For QUAD PPM use only. Unused in Core PPM.
8	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_REGULATION_FINGER_EN: Domain V_{DD} PFET regulation finger enable. Intended to be used to control the regulation PFET enable when iVRMs are enabled. If this bit is asserted, the value of the PFET finger (eg pfet_enable(0)) is controlled by vdd_pfet_regulation_finger_value. If this bit is not asserted, the PFET finger is controlled by the PFET FSM and/or any relevant overrides in place.
9	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_REGULATION_FINGER_VALUE: Domain V_{DD} PFET regulation finger value. Intended to be used to control the regulation PFET enable when iVRMs are enabled. If vdd_pfet_regulation_finger_enable = 1, a write to this bit sets the state of the V_{DD} PFET enable(0) regardless of the setting of the regular pfet_enable FSM. If it is not asserted, the PFET sequencer controls this finger with the vdd_pfet_enable_value.
10:11	RW	WO_CLEAR	WO_OR	PPM_PFCS_RESERVED_10_11: Implemented but unused.
12:19	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_ENABLE_VALUE: V_{DD} PFET enable value. Intended for manual control override usage. A write to this field sets the state of the Core Domain PFET Enables directly. If vdd_pfet_val_override = 1, a write to this field sets the state of the core PFET Enables until core_vdd_pfet_val_override is cleared. If vdd_pfet_val_override = 0, a write to this field takes on the value for one cycle and then returns to the value produced by the core_vdd_pfet_valN hard-coded facilities. A write of this type is not recommended and might produce undefined results. Reads will return the present state.

20:23	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_SEL_VALUE: V_{DD} PFET select value. Intended for manual control override usage. A write to this field will index value N into the vdd_power_enable register, where N is 0 to 8, if vdd_pfet_sel_override = 1. If vdd_pfet_sel_override = 0, the field is written but no further action is taken. 0x0 = 0b11111111 # On.
				0x1 = 0b01111111.
				0x2 = 0b00111111.
				0x3 = 0b00011111.
				0x4 = 0b00001111.
				0x5 = 0b00000111.
				0x6 = 0b00000011.
				0x7 = 0b00000001.
				0x8 = 0b00000000 # Off.
				0x9 to 0xF = Reserved reads will return the present state of the field.

24:31	RW	WO_CLEAR	WO_OR	PPM_PFCS_VCS_PFET_ENABLE_VALUE: V_{CS} PFET enable value. This field is used only in QUAD PPM; it is unused in Core PPM. It is intended for manual control override usage. A write to this field sets the state of the V_{CS} PFET Enables directly. If vcs_pfet_val_override = 1, a write to this field sets the state of the V_{CS} PFET Enables until vcs_pfet_val_override is cleared. If eco_vdd_pfet_val_override = 0, a write to this field takes on the value for one cycle and then returns to the value produced by the eco_vdd_pfet_valN_slat registers. A write of this type is not recommended and might produce undefined results. Reads will return the present state.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description

32:35	RW	WO_CLEAR	WO_OR	PPM_PFCS_VCS_PFET_SEL_VALUE: V_{CS} PFET select value. This field is used only in QUAD PPM; it is unused in Core PPM. It is intended for manual control override usage. A write to this field will index value N into the vcs_power_enable register, where N is 0 to 8, if vcs_pfet_sel_override = 1. If vcs_pfet_sel_override = 0, the field is written but no further action is taken.
				0x0 = 0b11111111 # On.
				0x1 = 0b01111111.
				0x2 = 0b00111111.
				0x3 = 0b00011111.

Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_ERRSUM
Address	00000000130F0120 (SCOM)
Description	QPPM ERRSUM

Bits	SCOM	Field Mnemonic: Description
0	RWX_WCLEAR	QPPM_ERRSUM_PM_ERROR: An unmasked PPM error is present. Intended for use by special PCB multicast to see the error state of all QUAD chiplets with a single read.
1:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000000

Register Name	QPPM Error Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_ERR
Address	00000000130F0121 (SCOM)
Description	QPPM errors

Bits	SCOM	Field Mnemonic: Description
0	RWX_WCLEAR	QPPM_ERR_PCB_INTERRUPT_PROTOCOL_ERR: Firmware wrote the PPMPIG to request a PCB interrupt before its previously requested interrupt had been completed (meaning PPMPIG[PENDING_SOURCE(0)] = 1 OR (PPMPIG[INTR_GRANTED] AND [GRANTED_SOURCE](0)) = 1.
1	RWX_WCLEAR	QPPM_ERR_SPECIAL_WKUP_PROTOCOL_ERR: Firmware cleared its special wake-up request (indicated by GPMMR[SPECIAL_WKUP_REQUESTED] before GPMMR[SPECIAL_WKUP_DONE] was set. This violates our agreed upon protocol and potentially confuses the Hcode managing the state of the QUAD chiplets.
2	RWX_WCLEAR	QPPM_ERR_SPECIAL_WKUP_DONE_PROTOCOL_ERR: Hardware or firmware cleared the special wake-up done indicator after it was set although a special wake-up request was still active (indicated by GPMMR[SPECIAL_WKUP_REQUESTED] . This violates our agreed upon protocol and potentially confuses the Hcode managing the state of the QUAD (cache and core) chiplets.
3	RWX_WCLEAR	QPPM_ERR_PFET_SEQ_PROGRAM_ERR: The PFET sequencer reached an invalid state due to incorrect configuration by a program.
4	RWX_WCLEAR	QPPM_ERR_OCC_HEARTBEAT_LOSS: OCC heartbeat lost event occurred. When enabled in the QPMMR, this will bit will engage the FSAFE mode or cause an interrupt to the OCC complex.
5	RWX_WCLEAR	QPPM_ERR_L2_EX0_CLK_SYNC_ERR: The SKEWADJ macro violated the agreed protocol by changing the value of the CLK_SYNC_DONE without a corresponding CLK_SYNC_ENABLE change (that is, a rising edge of the DONE when ENABLE = 0 or a falling edge of the DONE when ENABLE = 1).

Bits	SCOM	Field Mnemonic: Description
6	RWX_WCLEAR	QPPM_ERR_L2_EX1_CLK_SYNC_ERR: The SKEWADJ macro violated the agreed protocol by changing the value of the CLK_SYNC_DONE without a corresponding CLK_SYNC_ENABLE change (that is, a rising edge of the DONE when ENABLE = 0 or a falling edge of the DONE when ENABLE = 1).
7	RWX_WCLEAR	QPPM_ERR_EDRAM_SEQUENCE_ERR: The user wrote an invalid sequence into either the EX0 or EX1 EDRAM_ENABLE_ENCODE fields of the EDRAM_CTRL_REG, but the resulting decoded ACTUAL controls remained unchanged to protect the eDRAM circuitry.
8	RWX_WCLEAR	QPPM_ERR_EDRAM_PGATE_ERR: The user tried to power gate either V_{DD} or V_{CS} in the cache chiplet when the ERAM was enabled, but the hardware forced PFET enable bit0 to keep power on to protect the eDRAM circuitry.
9	RWX_WCLEAR	QPPM_ERR_DPLL_INT_ERR: DPLL internal error.
10	RWX_WCLEAR	QPPM_ERR_DPLL_DYN_FMIN_ERR: DPLL Dynamic Fmin error.
11	RWX_WCLEAR	QPPM_ERR_DPLL_DCO_FULL_ERR: DPLL DCO full.
12	RWX_WCLEAR	QPPM_ERR_DPLL_DCO_EMPTY_ERR: DPLL DCO empty.
13:16	RWX_WCLEAR	QPPM_ERR_INVERTED_VDM_DATA: Final VDM droop data summary bits 0:3. These are the same as what feeds the DPLL dynamic encode data input, but inverted to create positive active signals.
17	RWX_WCLEAR	QPPM_ERR_CME0_IVRM_DROPOUT_ERR: CME0 signaled a dropout threshold condition, which is enabled via QPMMR. When enabled in QPMMR, this bit engages the IVRM_PROTECT mechanism or causes an interrupt to the OCC complex.
18	RWX_WCLEAR	QPPM_ERR_CME1_IVRM_DROPOUT_ERR: CME1 signaled a dropout threshold condition (which is then ORed with the above bit).
19	RWX_WCLEAR	QPPM_ERR_SPARE_19: Spare error bit.
20:23	RWX_WCLEAR	QPPM_ERR_SPARE_20_23: Spare error bits.
24:63	RO	constant = 0b0000000000000000000000000000000000000000

Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_ERRMSK
Address	00000000130F0122 (SCOM)
Description	QPPM error mask

Bits	SCOM	Field Mnemonic: Description
0:23	RW	QPPM_ERRMSK_RESERVED_0_23: Mask for this error: 0 = Not masked. 1 = Masked. When set, the corresponding bit is set in the Error Register but masked from being reported in the ERRSUM Register and to the FIR.
24:63	RO	constant = 0b0000000000000000000000000000000000000000

Register Name	QPPM DPLL Frequency Control Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_DPLL_FREQ
Address	00000000130F0151 (SCOM)
Description	QPPM DPLL frequency control

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1:11	RW	QPPM_DPLL_FREQ_FMAX: When DPLL_PARM_CTRL_REG (ENABLE_FMAX_TARGET) = 1, this field contains the requested maximum DPLL frequency target. Otherwise, this field should be set to match the FREQ_MULT field below. This field is ignored by hardware and the value sent to the DPLL is replaced with the FSAFE value in the event of a OCC_HEARTBEAT_LOSS ERR when ENABLE_FSAFE_UPON_HEARTBEAT_LOSS is set (as reflected in DPLLSTAT[FSAFE_ACTIVE]).The frequency equation is the same as FREQ_MULT below. **Hardware Implementation Note:** Anticipating a divider of 8: FMAX(0:7), corresponding to bits 1:8 of this register, connect to: DPLL.FF_FMAX_MULT_INTG(0:7). FMAX(8:10), corresponding to bits 9:11 of this register, connect to: DPLL.FF_FMAX_MULT_FRAC(0:2).
12:15	RW	QPPM_DPLL_FREQ_HIRES_FMAX: Same description as HIRES_FREQ_MULT, below, but for FMAX control. In response to FSAFE activation, this field is ignored by hardware and the value sent to the DPLL is replaced by all zeroes. **Hardware Implementation Note:** Anticipating a divider of 8: HIRES_FMAX(0:4), corresponding to bits 12:15 of this register, connect to: DPLL.FF_FMAX_MULT_FRAC(3:6). Note that this excludes DPLL.FF_FMAX_MULT_FRAC(7), which is tied to zero.
16	RO	constant = 0b0
17:27	RW	QPPM_DPLL_FREQ_FMULT: Primary DPLL frequency multiplier input, used to define the DPLL frequency target. This value is used in the absence of droop events when DPLL_PARM_CTRL_REG [ENABLE_JUMP_PROTECT] = 1 and in the absence of voltage overshoot or undershoot when DPLL_PARM_CTRL_REG [ENABLE_FMAX_TARGET] = 1 or DPLL_PARM_CTRL_REG [ENABLE_FMIN_TARGET] = 1, respectively. This field is ignored by hardware and the value sent to the DPLL is replaced with the FSAFE value in response to FSAFE activation. The frequency given is FMULT x (REFCLK DPLL_DIVIDER). With a REFCLK of 133 MHz and DPLL_DIVIDER of 8 yields FMAX x 16.667 MHz. This allows a range from 0 to 8.5GHz to be set although practical timing limits will not allow this full range to be realized. **Hardware Implementation Note:** Anticipating a divider of 8: FMULT(0:7), corresponding to bits 17:24 of this register, connect to: DPLL.MULT_INTG(0:7). FMULT(8:10), corresponding to bits 25:27 of this register, connect to: DPLL.MULT_FRAC(0:2).
28:31	RW	QPPM_DPLL_FREQ_HIRES_FMULT: This field provides frequency control with a resolution greater than 16.67 Mhz such that all DPLL inputs can be controlled. However, this field is anticipated to be all zero since the Pstate resolution planned to be 16.67Mhz. **Hardware Implementation Note:** Anticipating a divider of 8: HIRES_FMULT(0:4), corresponding to bits 28:31 of this register, connect to: DPLL.MULT_FRAC(3:6). Note that this excludes FF_MULT_FRAC(7), which is tied to zero.
32	RO	constant = 0b0
33:43	RW	QPPM_DPLL_FREQ_FMIN: Minimum DPLL frequency only used in Dynamic DPLL mode when DPLL_PARM_CTRL_REG[ENABLE_FMIN_TARGET] = 1'. Note that this field is *not* honored when DPLL_PARM_CTRL_REG[ENABLE_JUMP_PROTECT] = 1 and a droop event occurs. This field is ignored by hardware and the value sent to the DPLL is replaced with the FSAFE value in response to FSAFE activation. The frequency equation is the same as FMAX. **Hardware Implementation Note:** Anticipating a divider of 8: FMIN(0:7), corresponding to bits 33:40 of this register, connect to: DPLL.FMIN_MULT_INTG(0:7). FMIN(8:10), corresponding to bits 41:43 of this register, connect to: DPLL.FMIN_MULT_FRAC(0:2).
44:47	RW	QPPM_DPLL_FREQ_HIRES_FMIN: Same description as HIRES_FREQ_MULT, but for FMIN control. **Hardware Implementation Note:** Anticipating a divider of 8: HIRES_FMIN(0:4), corresponding to bits 44:47 of this register, connect to: DPLL.FMIN_MULT_FRAC(3:6). Note that this excludes FF_MULT_FRAC(7), which is tied to zero.

Bits	SCOM	Field Mnemonic: Description
48:62	RO	constant = 0b000000000000000

Register Name	QPPM DPLL Control Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_DPLL_CTRL
Address	00000000130F0152 (SCOM) 00000000130F0153 (SCOM1) 00000000130F0154 (SCOM2)
Description	QPPM DPLL control

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_DPLL_LOCK_SEL: DPLL lock sensitivity select.
1	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_ENABLE_JUMP_PROTECT: Allow the DPLL to instantly drop frequency by a configured amount in response to the dynamic encoded input bits.
2	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_FF_BYPASS: Enables frequency filter bypass.
3	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_DCO_OVERRIDE: Enables the following two fields to control the DCO manually in a special manufacturing test mode for DPLL characterization.
4	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_DCO_INCR: Increments DCO control logic for manufacturing test mode.
5	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_DCO_DECR: Decrements DCO control logic for manufacturing test mode.
6:15	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_FF_SLEWRATE: Out of lock slew rate for DPLL to use when changing frequency (when not performing droop recovery).
16	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_SS_ENABLE: Spread spectrum mode enable. Not planned for use on POWER9. Should be left as 0. Causes DPLL to oscillate between ff_min_[intg|frac] and mult_[intg|frac] settings.
17:19	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_RESERVED_17_19: Implemented but not used.
20	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_SLEW_DN_SEL: When set, the scan-only slew_rate_dn latches in the DPLL control the slew down rate such that it can react faster.
21	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_ENABLE_JUMP_TARGET_UPDATE: If this bit is set, the DPLL constantly samples the DCO to calculate the jump amount, meaning it jumps relative to the present frequency on the cycle the droop happens, not relative to the nominal frequency (Fmult). Therefore, if this bit is not set and ENABLE_FMIN_TARGET is set, then guardbanding must be done against Fmin (instead of Fmult) minus the large drop amount.
22	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_ENABLE_FMIN_TARGET: When set, causes DPLL to slew down to Fmin when dynamic encoded data = 0xC. If ENABLE_JUMP_PROTECT is also set, dynamic encoded data of 0x8 causes a small (instead of large) drop amount . When this bit is not set and ENABLE_JUMP_PROTECT = 1, then 0xC causes a small drop and 0x8 causes a large drop instead.
23	RW	WO_CLEAR	WO_OR	QPPM_DPLL_CTRL_ENABLE_FMAX_TARGET: When set, causes DPLL to slew up to Fmax when dynamic encoded data = 0xF, and Fmult when 0xE.

Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_DPLL_STAT
Address	00000000130F0155 (SCOM)
Description	QPPM DPLL output status register

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1:11	ROX	QPPM_DPLL_STAT_FREQOUT: Digital numeric output from the DPLL indicating what full speed frequency it is currently driving on the Core and L2 clock grids. (The L3 grid is driven by this frequency / 2.) This register bits 0:11 are scaled the same as the FMIN and FMAX settings in the DPLL_FREQ register, so the same equation can be used to convert this number to MHz. **Hardware Implementation Note:** FREQOUT(0:7), corresponding to bits 1:8 of this register, connect to FF_MULT_INTG_OUT(0:7) FREQOUT(8:10), corresponding to bits 9:11 of this register, connect to FF_MULT_FRAC_OUT(0:2).
12:16	ROX	QPPM_DPLL_STAT_HIRES_FREQOUT: Higher resolution, extended portion of the frequency output of the DPLL. **Hardware Implementation Note:** Connected to FF_MULT_FRAC_OUT(3:7).
17:56	RO	constant = 0b0000000000000000000000000000000000000000
57:58	RO	QPPM_DPLL_STAT_RESERVED_57_59: Implemented but not used.
59	ROX	QPPM_DPLL_STAT_FSAFE_ACTIVE: Set when (ERR[OCC_HEARTBEAT_LOSS] *and* QPMMR[ENABLE_FSAFE_UPON_HEARTBEAT_LOSS]) = 1, indicating that the hardware is forcing the frequency inputs of the DPLL to FSAFE instead of the values in the DPLL Frequency Control Register.
60	ROX	QPPM_DPLL_STAT_UPDATE_COMPLETE: Indicates that the internal DPLL save point is at the requested FNOM target.
61	ROX	QPPM_DPLL_STAT_FREQ_CHANGE: DPLL Frequency change is ongoing (output of DPLL). **Note:** This is asserted whenever the DPLL is slewing to a new target.
62	ROX	QPPM_DPLL_STAT_BLOCK_ACTIVE: DPLL output indicating that a droop recovery is in progress and no frequency updates are being processed.
63	ROX	QPPM_DPLL_STAT_LOCK: DPLL Lock Indicator (flock output from DPLL).

Register Name	QPPM DPLL Output Characterization Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_DPLL_OCHAR
Address	00000000130F0156 (SCOM)
Description	QPPM DPLL output characterization register

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1:11	ROX	QPPM_DPLL_OCHAR_FREQOUT_MAX: Contains the largest value of the DPLL frequency output seen since the last read of this register (updated every cycle). This field is set to FF_MULT_INTG_OUT(0:7) : FF_MULT_FRAC_OUT(0:2) when this register is read or if that value is larger than this field.
12:16	ROX	QPPM_DPLL_OCHAR_HIRES_FREQOUT_MAX: Contains the largest value of the DPLL frequency output seen since the last read of this register (updated every cycle). This field is set to FF_MULT_FRAC_OUT(3:7) when this register is read or if FF_MULT_INTG_OUT(0:7) : FF_MULT_FRAC_OUT(0:7) is larger than FREQOUT_MAX : HIRES_FREQOUT_MAX.
17:20	RO	constant = 0b0000

Bits	SCOM	Field Mnemonic: Description
21:31	ROX	QPPM_DPLL_OCHAR_FREQOUT_AVG: Contains a running average of the value of the DPLL frequency output. On a read, this field is set to the DPLL FF_MULT_INTG_OUT(0:7) : FF_MULT_FRAC_OUT(0:2). Otherwise, this field updates (increments or decrements) based on the signed carryout of the next field.
32:36	ROX	QPPM_DPLL_OCHAR_HIRES_FREQOUT_AVG: Contains a running average of the value of the DPLL frequency HIRES_FREQ_MULT input. On a read to this register, this field is set to FF_MULT_FRAC_OUT(3:7). Otherwise, this field increments by 1 if the FF_MULT_INTG_OUT(0:7) : FF_MULT_FRAC_OUT(0:7) is greater than FREQOUT_AVG : HIRES_FREQOUT_AVG or decrements by 1 if the value is less.
37:40	RO	constant = 0b0000
41:51	ROX	QPPM_DPLL_OCHAR_FREQOUT_MIN: Contains the smallest value of the DPLL frequency output seen since the last read of this register (updated every cycle). This field is set to FF_MULT_INTG_OUT(0:7) : FF_MULT_FRAC_OUT(0:2) when this register is read or if that value is smaller than this field.
52:56	ROX	QPPM_DPLL_OCHAR_HIRES_FREQOUT_MIN: Contains the smallest value of the DPLL frequency output seen since the last read of this register (updated every cycle). This field is set to FF_MULT_FRAC_OUT(3:7) when this register is read or if FF_MULT_INTG_OUT(0:7) : FF_MULT_FRAC_OUT(0:7) is smaller than FREQOUT_MIN : HIRES_FREQOUT_MIN.

21:31	ROX	QPPM_DPLL_ICHAR_FREQIN_MAX: Contains the largest value provided to the DPLL frequency MULT input since the last read of this register. This field is set to DPLL_FREQ[FREQIN] when this register is read or if that field is written with a value larger than this field.
32:36	ROX	QPPM_DPLL_ICHAR_HIRES_FREQIN_MAX: Contains the largest value of the DPLL frequency output seen since the last read of this register (updated every cycle). This field is set to HIRES_FREQIN when this register is read or if FREQIN : HIRES_FREQIN is larger than FREQIN_MAX : HIRES_FREQIN_MAX.
37:40	RO	constant = 0b0000
41:51	ROX	QPPM_DPLL_ICHAR_FREQIN_MIN: Contains the smallest value of the DPLL frequency MULT input since the last read of this register. This field is set to DPLL_FREQ[FREQIN] when this register is read or if that field is written with a value smaller than this field.
52:56	ROX	QPPM_DPLL_ICHAR_HIRES_FREQIN_MIN: Contains the smallest value of the DPLL frequency output seen since the last read of this register (updated every cycle). This field is set to HIRES_FREQIN when this register is read or if FREQIN : HIRES_FREQIN is smaller than FREQIN_MIN : HIRES_FREQIN_MIN.
57:63	RO	constant = 0b0000000

Register Name	QPPM OCC Heartbeat Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_OCCHB
Address	00000000130F015F (SCOM)
Description	QPPM OCC heartbeat

Bits	SCOM	Field Mnemonic: Description
0:15	RW	QPPM_OCCHB_OCC_HEARTBEAT_COUNT: When written, this field defines the starting value for a counter that increments at ~1 µs if OCC_HEARTBEAT_EN = 1 and the counter value is non-zero. If OCC_HEARTBEAT_EN = 0 or the counter value is 0, the counter does not increment. A heartbeat lost event occurs if OCC_HEARTBEAT_EN = 1 and this counter becomes 0 (as a result of either a written value or counter wrapping). The pulses used by this counter come from a free running pervasive hang timer pulse (PM_Hang_Pulse) programmed to be ~32 ns that has a 5-bit precounter whose carryout forms a resultant ~1 µs decremented pulse. Upon writing this register with OCC_HEARTBEAT_EN = 1, the precounter is cleared and will begin counting upon the next PM_Hang_Pulse. This PM_Hang_Pulse might arrive immediately or a full duration later. With a (215 - 1) range and a ~1µs incremented time yields a heartbeat range of 1 µs (+ 0 to 32 ns) (value 0xFFFF) to 65.535 µs (+ 0 to 32 ns) (value 0x0001). The value chosen to be written for debug purposes only, writing 0x0000 will cause an immediate heartbeat_lost if OCC_HEARTBEAT_EN = 1. Reads return the current value of the counter. Firmware must establish the PPM_DPLL_PARM_REG[FSAFE] frequency value before writing this field with OCC_HEARTBEAT_EN = 1. A heartbeat lost event causes the following action: Force the DPLL to the frequency defined in QPMMR[FSAFE] if enabled by QPMMR[ENABLE_FSAFE_UPON_HEARTBEAT_LOSS].
16	RW	QPPM_OCCHB_OCC_HEARTBEAT_ENABLE:
17:63	RO	constant = 0b00000000000000000000000000000000000000000000000

29:35	RO	constant = 0b0000000
36	ROX	QPPM_QACSR_L2_EX0_CLK_SYNC_DONE: Clock sync enable to the analog clock SKEWADJ macro for the L2 EX0 clock grid. When changing the corresponding EXCGCR[SYNC_ENABLE] bit, code must wait for this bit to transition to the same value before proceeding. The SKEWADJ macro is not allowed to change the value of this signal unless the corresponding enable changes first; otherwise, the corresponding ERR[L2_EX0_CLK_SYNC_ERR] will be set. **Note:** When SKEWADJ is in hold mode, this signal will be asserted all the time.
37	ROX	QPPM_QACSR_L2_EX1_CLK_SYNC_DONE: Clock sync enable to the analog clock SKEWADJ macro for the L2 EX1 clock grid. Same as above.
38:63	RO	constant = 0b00000000000000000000000000

Register Name	PPM Clock Grid Control Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_COMMON_REGS.PPM_CGCR
Address	00000000130F0164 (SCOM)
Description	PPM clock grid control register

Bits	SCOM	Field Mnemonic: Description
0	RW	PPM_CGCR_CLKGLM_ASYNC_RESET: Glitchless clock multiplexer asynchronous reset for this chiplet.
1:2	RW	PPM_CGCR_RESERVED_1_2: Implemented but not used.
3	RW	PPM_CGCR_CLKGLM_SEL: Glitchless clock multiplexer select for this chiplet. 0 = Reference clock. 1 = DPLL output (full speed Div1 for core, half speed Div2 for cache).
4:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000

Register Name	QPPM EX Clock Grid Control Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_EXCGCR
Address	00000000130F0165 (SCOM) 00000000130F0166 (SCOM1) 00000000130F0167 (SCOM2)
Description	QPPM EX clock grid control register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:3	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX0_CLK_SB_STRENGTH: Clock sector buffer strength(0:3) for the L2 EX0 clock grid.
4	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX0_CLK_SB_SPARE0: Implemented but not used. Reserved for future use.
5	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX0_CLK_SB_PULSE_MODE_EN: Pulse mode enable to clock sector buffers for the L2 EX0 clock grid.26:27.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
6:7	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX0_CLK_SB_PULSE_MODE: Pulse mode(0:1) to Clock sector buffers for the L2 EX0 clock grid. 00 = Safest (Widest) Pulse. 01 = Wide Pulse. 10 = Narrow Pulse. 11 = Medium Pulse.
8:11	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX0_CLK_SW_RESCLK: Resonant clock inductor switch(0:3) for the L2 EX0 clock grid.
12	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX0_CLK_SW_SPARE1: Implemented but not used. Reserved for future use.
13:15	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_RESERVED_13_15: Implemented but not used.
16:19	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX1_CLK_SB_STRENGTH: Clock sector buffer strength(0:3) for the L2 EX1 clock grid.
20	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX1_CLK_SB_SPARE0: Implemented but not used.
21	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX1_CLK_SB_PULSE_MODE_EN: Pulse mode enable to clock sector buffers for the L2 EX1 clock grid.
22:23	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX1_CLK_SB_PULSE_MODE: Pulse mode(0:1) to clock sector buffers for the L2 EX1 clock grid. 00 = Safest (Widest) Pulse. 01 = Wide Pulse. 10 = Narrow Pulse. 11 = Medium Pulse.
24:27	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX1_CLK_SW_RESCLK: Resonant clock inductor switch(0:3) for the L2 EX1 clock grid.
28	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX1_CLK_SW_SPARE1: Implemented but not used. Reserved for future use.
29:31	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_RESERVED_29_31: Implemented but not used.
32	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX0_CLKGLM_ASYNC_RESET: Glitchless clock multiplexer asynchronous reset for the L2 cache EX0 domain.
33	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX1_CLKGLM_ASYNC_RESET: Glitchless clock multiplexer asynchronous reset for the L2 cache EX1 domain.
34	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX0_CLKGLM_SEL: Glitchless clock multiplexer select for the L2 cache EX0 domain. 0 = Reference clock. 1 = DPLL output (full speed Div1 for core, half speed Div2 for cache).
35	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX1_CLKGLM_SEL: Glitchless clock multiplexer select for the L2 cache EX1 domain. 0 = Reference clock. 1 = DPLL output (full speed Div1 for core, half speed Div2 for cache).
36	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX0_CLK_SYNC_ENABLE: Clock sync enable to the analog clock SKEWADJ macro for the L2 EX0 clock grid. Firmware must assert, then wait for the corresponding QACSR bit to assert, before enabling at-speed (non reference clock) functional clocks on the grid. Likewise, firmware must de-assert, and wait for the corresponding QACSR bit to de-assert, before switching the clock grid away from full speed clocks (that is, DPLL). This signal must remain asserted for the clock grid to remain synchronous with the other (core and L3) grids in the QUAD.
37	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX1_CLK_SYNC_ENABLE: Clock sync enable to the analog clock SKEWADJ macro for the L2 EX1 clock grid. The same requirements as L2_EX0_CLK_SYNC_ENABLE apply.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
38	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX0_CLK_SB_OVERRIDE: When set, use QACCR(0:7) instead of this register (0:7) to feed the clock sector buffer controls for the L2 EX0 clock grid.
39	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX1_CLK_SB_OVERRIDE: When set, use QACCR(0:7) instead of this register(16:23) to feed the clock sector buffer controls for the L2 EX1 clock grid.
40	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX0_CLK_SW_OVERRIDE: When set, use QACCR(8:12) instead of this register (8:12) to feed the resonant clock switch controls for the L2 EX0 clock grid.
41	RW	WO_CLEAR	WO_OR	QPPM_EXCGCR_L2_EX1_CLK_SW_OVERRIDE: When set, use QACCR(8:12) instead of this register (24:28) to feed the resonant clock switch controls for the L2 EX1 clock grid.
42:63	RO	RO	RO	constant = 0b0000000000000000000000

Register Name	**PPM PCB Interrupt Generation Register**
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_COMMON_REGS.PPM_PIG
Address	00000000130F0180 (SCOM)
Description	PPM PCB interrupt generation register

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b1
1:3	RW	PPM_PIG_REQ_INTR_TYPE: PCB interrupt request type (written by Hcode).
4:15	RW	PPM_PIG_REQ_INTR_PAYLOAD: PCB interrupt request payload (written by Hcode).
16:31	ROX	PPM_PIG_GRANTED_PACKET: Granted interrupt packet content. If INTR_GRANTED is 1, this field contains the interrupt currently being sent; otherwise, it contains the interrupt most recently sent. The format depends on the value of the GRANTED_SOURCE field: 01 = Copied from bits 0:15 of this register. 10 = Core = 0x[AB]YXW; QUAD = 0xE80W. 11 = Core = 0xD801; QUAD = 0xF80Z. where: [A or B] is decided by CPMMR[STOP_EXIT_TYPE_SEL]. Y = 0x8, or 0xC if malfunction alert is present. X = The state of the external interrupts (MSGSND, OS, HYP, '0'). W = The state of the four special wake-up sources (OTR, FSP, OCC, HYP). Z = Encoded hardware error indication (0; voltage droop; iVRM dropout; OCC heartbeat loss). **Note:** By convention, bit 4, when set, typically indicates a hardware-generated interrupt, although for the QUAD type 6 and 7, this bit is not latched in the OCB.
32	ROX	PPM_PIG_INTR_GRANTED: An interrupt request is in process. The value of this bit determines the meaning of the other bits in this register: 0 = Contains information about the most recent interrupt that was sent. 1 = Reflects the interrupt currently being sent. This bit is set when the arbiter issues a grant to the source reflected in the GRANTED_SOURCE field. This bit is cleared when the granted interrupt receives a Receive ACK.
33	RO	constant = 0b0
34:35	ROX	PPM_PIG_GRANTED_SOURCE: Interrupt source currently or most recently granted to place an interrupt on the PCB network (encoded). 00 = No interrupt has ever been processed. 01 = SCOM request (Maps to PENDING_SOURCE 001). 10 = Hardware stop exit (maps to PENDING_SOURCE 010). 11 = Hardware error notification (maps to PENDING_SOURCE 100).

Bits	SCOM	Field Mnemonic: Description
36	RO	constant = 0b0
37:39	ROX	PPM_PIG_PENDING_SOURCE: Bit per interrupt source indicating which are currently waiting for arbitration. xx1 = SCOM request from CME (in bits 0:15 of this register). x1x = Hardware stop exit. 1xx = Hardware error (CPPM: CME; QPPM: OCC heartbeat).
40	RWX_WCLEAR	PPM_PIG_NETWORK_RESET_OCCURRED: Sticky bit set when a network reset occurs (debug use only) and cleared only on SCOM write of this bit to one. **Note:** For indication only; network reset has no other effect on PPM.
41:63	RO	constant = 0b00000000000000000000000

Register Name	**PPM iVRM Control Register**
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_COMMON_REGS.PPM_IVRMCR
Address	00000000130F01B0 (SCOM) 00000000130F01B1 (SCOM1) 00000000130F01B2 (SCOM2)
Description	PPM iVRM control register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	PPM_IVRMCR_IVRM_VID_VALID: VID valid signal. 0 = Deassert valid signal. 1 = Assert valid signal. Upon rising edge of this signal, the iVRM circuit samples the VID and PFET_STRENGTH values provided by the IVRMDVR. QUAD PPM usage: These bits are always sent to the cache iVRM and all core PPMs, where it is forwarded to each core chiplet iVRM unless it is locally overridden in its core PPM. Core PPM usage: If CIVRMLCR[IVRM_LOCAL_CONTROL] = 1, these values are driven to the Core iVRM. Otherwise, the value driven comes from input pins from the QUAD PPM IVRMDVR.
1	RW	WO_CLEAR	WO_OR	PPM_IVRMCR_IVRM_BYPASS_B: Internal VRM V_{DD} bypass (negative active). QUAD PPM usage: These bits are always sent to the cache iVRM and all core PPMs, where it is forwarded to each core chiplet iVRM unless it is locally overridden in its core PPM. Core PPM usage: If CIVRMLCR[IVRM_LOCAL_CONTROL] = 1, these values are driven to the core iVRM. Otherwise, the value driven comes from input pins from the QUAD PPM IVRMDVR.
2	RW	WO_CLEAR	WO_OR	PPM_IVRMCR_IVRM_POWERON: Internal VRM V_{DD} power on. QUAD PPM usage: These bits are always sent to the cache iVRM and all core PPMs, where it is forwarded to each core chiplet iVRM unless it is locally overridden in its core PPM. Core PPM usage: If CIVRMLCR[IVRM_LOCAL_CONTROL] = 1, these values are driven to the core iVRM. Otherwise, the value driven comes from input pins from the QUAD PPM IVRMDVR.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
3	RW	WO_CLEAR	WO_OR	PPM_IVRMCR_IVRM_VREG_SLOW_DC: Must be set before doing rapid changes (for example, dropping to V_{min}), even after turning off clocks. This is needed to avoid trying to get there too fast and losing stability of the internal iVRM VID movement loop. QUAD PPM usage: These bits are always sent to the cache iVRM and all core PPMs, where it is forwarded to each core chiplet iVRM unless it is locally overridden in its core PPM. Core PPM usage: If CIVRMLCR[IVRM_LOCAL_CONTROL] = 1, these values are driven to the core iVRM. Otherwise, the value driven comes input pins from the QUAD PPM IVRMDVR.
4:7	RW	WO_CLEAR	WO_OR	PPM_IVRMCR_RESERVED_4_7: Implemented but unused.
8:63	RO	RO	RO	constant = 0b00000000000000000000000000000000000000000000000000000000

Register Name	**PPM iVRM Status Register**
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_COMMON_REGS.PPM_IVRMST
Address	00000000130F01B3 (SCOM)
Description	PPM iVRM status register

Bits	SCOM	Field Mnemonic: Description
0	ROX	PPM_IVRMST_IVRM_VID_DONE: V_{DD} iVRM done indicator. Raises when the iVRM circuits are done processing a change request, triggered by a rising edge of IVRMCR[IVRM_VID_VALID] and stays set until the VALID is cleared.
1:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000000

Register Name	**PPM iVRM Data Value Register**
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_COMMON_REGS.PPM_IVRMDVR
Address	00000000130F01B4 (SCOM)
Description	PPM iVRM data value register

Bits	SCOM	Field Mnemonic: Description
0:7	RW	PPM_IVRMDVR_IVRM_IVID: Writes to this field will drive the VID value representing the requested voltage to the QUAD iVRMs (4 Core V_{DD} and Cache V_{DD}) 0:7 = ivid(0:7). Encoded based on zero origin at 512 mV with 4 mV granularity. 0x00 = 512 mV. 0x01 = 516 mV. 0x7F = 1.532 mV. QUAD PPM usage: These bits are always sent to the cache iVRM and all core PPMs, where it is forwarded to each core chiplet iVRM unless it is locally overridden in its core PPM. Core PPM usage: If CIVRMLCR[IVRM_LOCAL_CONTROL] = 1, these values are driven to the core iVRM. Otherwise, the value driven comes from input pins from the QUAD PPM IVRMDVR.
8:10	RW	PPM_IVRMDVR_RESERVED_8_10: Implemented but not used.
11:15	RW	PPM_IVRMDVR_IVRM_PFET_STRENGTH_CORE: PFET strength value driven to this chiplet's iVRMs. This value written is dependent on the current input voltage, the requested output voltage (IVRM_IVID), and the ratio of the power needed at the requested voltage to the maximum power. QUAD PPM usage: This value is sent to all core PPMs, where it is forwarded to each core chiplet iVRM unless it is locally overridden in its core PPM. Core PPM usage: If CIVRMLCR[IVRM_LOCAL_CONTROL] = 1, these values are driven to the core iVRM. Otherwise, the value driven comes from QUAD PPM IVRMDVR.

Bits	SCOM	Field Mnemonic: Description
16:18	RW	PPM_IVRMDVR_RESERVED_16_18: Implemented but not used.
19:23	RW	PPM_IVRMDVR_IVRM_PFET_STRENGTH_CACHE: QUAD PPM usage: PFET strength value driven to the cache iVRMs. The written value is dependent on the current input voltage, the requested output voltage (IVRM_IVID), and the ratio of the power needed at the request voltage to the maximum power. Core PPM usage: This field is unused.
24:63	RO	constant = 0b0000000000000000000000000000000000000000

Register Name	PPM iVRM Actual Value Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_COMMON_REGS.PPM_IVRMAVR
Address	00000000130F01B5 (SCOM)
Description	PPM iVRM actual value register

Bits	SCOM	Field Mnemonic: Description
0:7	ROX	Reserved field.
8	ROX	Reserved field.
9:10	RO	constant = 0b00
11:15	ROX	Reserved field.
16:23	RO	constant = 0b00000000
24	ROX	Reserved field.
25	ROX	Reserved field.
26	ROX	Reserved field.
27	ROX	Reserved field.
28:63	RO	constant = 0b000000000000000000000000000000000000

Register Name	QPPM VDM Configuration Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_VDMCFGR
Address	00000000130F01B6 (SCOM)
Description	QPPM VDM configuration register

Bits	SCOM	Field Mnemonic: Description
0:7	RW	QPPM_VDMCFGR_VDM_VID_COMPARE: Writes to this field will drive VID value representing the requested compare voltage to the QUAD VDMs (four Core and Cache). Encoded based on zero origin at 512 mV with 4 mV granularity. 0x00 = 512 mV. 0x01 = 516 mV. 0x7F = 1.532 mV. **Note:** The actual maximum voltage supported is 0xBF (1.276 mV) and the minimum voltage is 0x10 (576 mV). Attempts to set a voltage outside of this supported range will clip at the minimum or maximum value. Also note that the iVRM clips at a lower maximum voltage value.

Bits	SCOM	Field Mnemonic: Description
8:11	RW	QPPM_VDMCFGR_VDM_OVERVOLT: Voltage droop monitor (VDM) over voltage threshold select value. 0x0 = Forces VDM output active (logic 1) 0x1 = 8 mV 0x2 = 16 mV 0x3 = 24 mV 0x4 = 32 mV 0x5 = 40 mV 0x6 = 48 mV 0x7 = 56 mV 0x8 to 0xF = 64 mV
12:15	RW	QPPM_VDMCFGR_VDM_DROOP_SMALL: Voltage droop monitor (VDM) small threshold select value. 0x0 = Forces VDM output inactive (logic 1) 0x1 = -8 mV 0x2 = -16 mV 0x3 = -24 mV 0x4 = -32 mV 0x5 = -40 mV 0x6 = -48 mV 0x7 = -56 mV 0x8 = -64 mV 0x9 = -72 mV 0xA = -80 mV 0xB = -88 mV 0xC = -92 mV 0xD = -96 mV 0xE = -96 mV 0xF = -96 mV
16:19	RW	QPPM_VDMCFGR_VDM_DROOP_LARGE: Voltage droop monitor (VDM) large threshold select value. This field uses the same encoding as the previous field.
20:23	RW	QPPM_VDMCFGR_VDM_DROOP_XTREME: Voltage droop monitor (VDM) extreme threshold select value. This field uses the same encoding as the QPPM_VDMCFGR_VDM_DROOP_SMALL field.
24:63	RO	constant = 0b0000000000000000000000000000000000000000

Register Name	PPM VDM Control Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_COMMON_REGS.PPM_VDMCR
Address	00000000130F01B8 (SCOM) 00000000130F01B9 (SCOM1) 00000000130F01BA (SCOM2)
Description	PPM VDM control register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	PPM_VDMCR_VDM_POWERON: Enables analog circuits in the VDM for this chiplet to burn power (0.6 mW). Once this bit is set, it takes 10 µs for VDM output indicators to be valid.
1	RW	WO_CLEAR	WO_OR	PPM_VDMCR_VDM_DISABLE: VDM disable for this chiplet. Like a logical fence, setting this bit forces VDM droop indication outputs to all 1.
2:63	RO	RO	RO	constant = 0b000000000000000000000000000000000000000000000000000000000 00000

Register Name	QPPM QUAD Voltage Characterization Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_VOLT_CHAR
Address	00000000130F01BB (SCOM)
Description	QPPM QUAD voltage characterization register

Bits	SCOM	Field Mnemonic: Description
0:7	ROX	QPPM_VOLT_CHAR_VID_COMPARE_MAX: Maximum value of the QUAD voltage compare value since the last read. Resets to VDMCFGR[VDM_VID_COMPARE] on read.
8:15	ROX	QPPM_VOLT_CHAR_VID_COMPARE_MIN: Minimum value of the QUAD voltage compare value since the last read. Resets to VDMCFGR[VDM_VID_COMPARE] on read.
16	ROX	QPPM_VOLT_CHAR_IVRM_ENABLED_HISTORY: Sticky latch that indicates if IVRM_VID_VALID has been set to the QUAD chiplet since this register was last read. On read, resets to the value of IVRMAVR[IVRM_VID_VALID].
17:63	RO	constant = 0b00000000000000000000000000000000000000000000000

Register Name	QPPM QUAD Control Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMQ.PPM_QUAD_REGS.QPPM_QCCR
Address	00000000130F01BD (SCOM) 00000000130F01BE (SCOM1) 00000000130F01BF (SCOM2)
Description	QPPM QUAD control register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:3	RW	WO_CLEAR	WO_OR	QPPM_QCCR_L3_EX0_EDRAM_ENABLE_ENCODE: Enables the eDRAM charge pumps in L3 EX0. On power-on, the bits must be asserted in order from 0 -> 3 (0x0, 8, C, E, F), and on power down they must be de-asserted in the opposite order from 3 -> 0 (0xF, E, C, 8, 0); this means that a thermometer encode is required in sequencing these bits. Any attempt to sequence them in a different order will update this field, but will not change the *actual* value being driven to the L3 and will set a bit in the Error Register. These bits (0:3) correspond to EDRAM_ENABLE_DC, EDRAM_VWL_ENABLE_DC, L3_EX0_EDRAM_VROW_VBLH_ENABLE_DC, and EDRAM_VPP_ENABLE_DC outputs.
4:7	RW	WO_CLEAR	WO_OR	QPPM_QCCR_L3_EX1_EDRAM_ENABLE_ENCODE: Enables the eDRAM charge pumps in L3 EX1. See the previous field for details.
8:11	RW	WO_CLEAR	WO_OR	QPPM_QCCR_SPARE_8_11: Implemented but not used (spare).
12:15	RW	WO_CLEAR	WO_OR	QPPM_QCCR_DROOP_PROTECT_DATA: These bits are ANDed with FORCE_DROOP_DATA in response to the setting of ERR_REG [OCC_HEARTBEAT_LOSS] when QPMMR[ENABLE_DROOP_PROTECT_UPON_HEARTBEAT_LOSS] is set.
16:19	RW	WO_CLEAR	WO_OR	QPPM_QCCR_FORCE_DROOP_DATA: These bits are used to drive the steady state value of the vdm_droop_inject, unless overridden by PULSE_DROOP_ENABLE or by DROOP_PROTECT_DATA if enabled in response to heartbeat loss. **Note:** For this data, a zero indicates a droop occurred, in thermometer code format.
20:23	WO_4P	NC	WO_4P	QPPM_QCCR_PULSE_DROOP_DATA: These bits can be used to pulse the vdm_droop_inject, based on PULSE_DROOP_ENABLE.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
24	WO_4P	NC	WO_4P	QPPM_QCCR_PULSE_DROOP_ENABLE: This field (intended to be set with the WO_OR address) chooses what value drives the vdm_droop_inject output to the QUAD. Based on this value: 0 = vdm_droop_inject is driven only with FORCE_DROOP_DATA. 1 = Causes the PULSE_DROOP_DATA to be ANDed with the FORCE_DROOP_DATA before driving vdm_droop_inject.
25:29	RO	RO	RO	constant = 0b00000
30	RW	WO_CLEAR	WO_OR	QPPM_QCCR_PB_PURGE_REQ: Pulse to the power bus logic in the cache clock domain to request them to purge their asynchronous buffers in preparation to power off the QUAD. Stop Hcode must wait for PB_PURGE_DONE_LVL before continuing. **Note:** This is a pulse and therefore does not use a CCFG latch.
31	ROX	NCX	NCX	QPPM_QCCR_PB_PURGE_DONE_LVL: Acknowledgment from power bus that the buffers are empty and can safely be fenced and clocked off. Note: This signal is from the cache clock domain and must be latched with metastability hardened latches before feeding this SCOM bit (not latched into the CCFG ring).
32:35	ROX	NCX	NCX	QPPM_QCCR_L3_EX0_EDRAM_ENABLE_ACTUAL: Actual decoded values being driven to EX0 on the EDRAM_ENABLE_DC, EDRAM_VWL_ENABLE_DC, EDRAM_VROW_VBLH_ENABLE_DC, and EDRAM_VPP_ENABLE_DC outputs. **Note:** Captured by a scannable latch placed on the CCFG ring.
36:39	ROX	NCX	NCX	QPPM_QCCR_L3_EX1_EDRAM_ENABLE_ACTUAL: Actual decoded values being driven to EX1 on the EDRAM_ENABLE_DC, EDRAM_VWL_ENABLE_DC, EDRAM_VROW_VBLH_ENABLE_DC, and EDRAM_VPP_ENABLE_DC outputs. **Note:** Captured by a scannable latch placed on the CCFG ring.
40	ROX	NCX	NCX	QPPM_QCCR_L3_EDRAM_SEQ_ERR: Value of ERR_REG[EDRAM_SEQ_ERR] for convenience. **Note:** Captured by a scannable latch placed on the CCFG ring.
41	ROX	NCX	NCX	QPPM_QCCR_L3_EDRAM_PGATE_ERR: Value of ERR_REG[EDRAM_PGATE_ERR] for convenience. **Note:** Captured by a scannable latch placed on the CCFG ring.
42	ROX	NCX	NCX	QPPM_QCCR_L3_EX0_EDRAM_UNLOCKED: Value of the input from EX0 L3 that is used to suppress eDRAM enable changes until a scan flush has occurred. **Note:** Captured by a scannable latch placed on the CCFG ring.
43	ROX	NCX	NCX	QPPM_QCCR_L3_EX1_EDRAM_UNLOCKED: Value of the input from EX1 L3 that is used to suppress eDRAM enable changes until a scan flush has occurred. **Note:** Captured by a scannable latch placed on the CCFG ring.
44:63	RO	RO	RO	constant = 0b00000000000000000000

Register Name	Protect Mode Register
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.PROTECT_MODE_REG
Address	00000000130F03FE (SCOM)
Description	Enables read and write protection.

Bits	SCOM	Field Mnemonic: Description
0	RW	READ_PROTECT_ENABLE: Enable read protection.

Bits	SCOM	Field Mnemonic: Description
1	RW	WRITE_PROTECT_ENABLE: Enable write protection.

Register Name	**Atomic Lock Register**
Mnemonic	TP.TPCHIP.NET.PCBSLEP03.PPMPCBSLV.ATOMIC_LOCK_REG
Address	00000000130F03FF (SCOM)
Description	A bit mask for atomic locking on a ring-by-ring basis.

Bits	SCOM	Field Mnemonic: Description
0	RW	ATOMIC_LOCK_ENABLE: Enable atomic lock.
1:4	ROX	ATOMIC_ID: Atomic ID.
5:7	RO	constant = 0b000
8:15	ROX	ATOMIC_ACTIVITY: Atomic lock counter.

13. CACHE Core Chiplet

The POWER9 processor registers are listed alphabetically by mnemonic in the following address table.

The POWER9 processor registers are listed in the following tables.

Register Name	Trace Array High Data Register
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR0.TRACE_HI_DATA_REG
Address	0000000013010400 (SCOM)
Description	This register provides the high trace array data.

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	TRACE_HI_DATA: Trace array data 0:63.

Register Name	Trace Array Low Data Register
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR0.TRACE_LO_DATA_REG
Address	0000000013010401 (SCOM)
Description	This register provides the low trace array data.

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	TRACE_LO_DATA: Trace array data 64:95.
32:41	ROX	TRACE_ADDRESS: Trace address.
42:50	ROX	TRACE_LAST_BANK: Trace last bank.

Bits	SCOM	Field Mnemonic: Description
51	ROX	TRACE_LAST_BANK_VALID: Trace last bank valid.
52	ROX	TRACE_WRITE_ON_RUN: Trace write-on-run indicator.
53	ROX	TRACE_RUNNING: Trace run indicator.
54:63	ROX	TRACE_HOLD_ADDRESS: Trace hold address (pointing to last entry).

Register Name	Trace Control Configuration Register
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR0.TRACE_TRCTRL_CONFIG
Address	0000000013010402 (SCOM)
Description	This register contains trace control configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	STORE_ON_TRIG_MODE: Enable store on trigger mode.
1	RW	WRITE_ON_RUN_MODE: Enable unconditional forced write when trace_run.
2:9	RW	EXTEND_TRIG_MODE: Counter value for extended trigger mode.
10	RW	BANK_MODE: Enable bank mode.
11	RW	ENH_TRACE_MODE: Enable enhanced trace mode.
12	RW	LOCAL_CLOCK_GATE_CONTROL: When this bit is set, internal clock gating is disabled. The trace control logic and the trace data pipeline are always clocked.
13	RW	UNUSED_13B: Unused.
14:17	RW	TRACE_SELCT_CONTROL: Selector for two sets of external trace bus multiplexers. tra_mux0_sel(0:1) and tra_mux1_sel(0:1).
18:21	RW	SPARE_CONTROL: Spare control bits.

Register Name	Trace Data Configuration Register 0
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR0.TRACE_TRDATA_CONFIG_0
Address	0000000013010403 (SCOM)
Description	This register contains a trace data compare mask for bits 0 – 63.

Bits	SCOM	Field Mnemonic: Description
0:63	RW	CMP_MSK_LT_B_0_TO_63: Trace data compare mask for bits 0 to 63.

Register Name	Trace Data Configuration Register 1
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR0.TRACE_TRDATA_CONFIG_1
Address	0000000013010404 (SCOM)
Description	This register contains a trace data compare mask for bits 64 – 87.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CMP_MSK_LT_B_64_TO_87: Trace data compare mask for bits 64 to 87.

Register Name	Trace Data Configuration Register 2
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR0.TRACE_TRDATA_CONFIG_2
Address	0000000013010405 (SCOM)
Description	This register contains patterns A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNA: pattern_match_pata_0_to_23.
24:47	RW	PATTERNB: pattern_match_patb_0_to_23.

Register Name	Trace Data Configuration Register 3
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR0.TRACE_TRDATA_CONFIG_3
Address	0000000013010406 (SCOM)
Description	This register contains patterns C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNC: pattern_match_patc_0_to_23.
24:47	RW	PATTERND: pattern_match_patd_0_to_23.

Register Name	Trace Data Configuration Register 4
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR0.TRACE_TRDATA_CONFIG_4
Address	0000000013010407 (SCOM)
Description	This register contains masks A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKA: mska.
24:47	RW	MASKB: mskb.

Register Name	Trace Data Configuration Register 5
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR0.TRACE_TRDATA_CONFIG_5
Address	0000000013010408 (SCOM)
Description	This register contains masks C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKC: mskc.
24:47	RW	MASKD: mskd.

Register Name	Trace Data Configuration Register 9
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR0.TRACE_TRDATA_CONFIG_9
Address	0000000013010409 (SCOM)
Description	This register contains trace data configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	DISABLE_COMPRESSION: Disable trace data compression (store data every cycle).
1	RW	ERROR_BIT_COMPRESSION_CARE_MASK: Take into account changes in the error bit for trace data compression (default = 0).
2:3	RW	MATCHA_MUXSEL: Match PATTERNA against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
4:5	RW	MATCHB_MUXSEL: Match PATTERNB against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
6:7	RW	MATCHC_MUXSEL: Match PATTERNC against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
8:9	RW	MATCHD_MUXSEL: Match PATTERND against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
10:13	RW	TRIG0_OR_MASK: The OR of all selected MATCHes is ORed with result of TRIG0_AND. 0b1xxx = Select MATCHA OR. 0bx1xx = Select MATCHB OR. 0bxx1x = Select MATCHC OR. 0bxxx1 = Select MATCHD OR. 0b0000 = Select to not OR any MATCHes.
14:17	RW	TRIG0_AND_MASK: The AND of following selected MATCHes is ORed with result of TRIG0_OR. 0b1xxx = Select MATCHA AND. 0bx1xx = Select MATCHB AND. 0bxx1x = Select MATCHC AND. 0bxxx1 = Select MATCHD AND. 0b0000 = Select to not AND any MATCHes together to form TRIG0.
18:21	RW	TRIG1_OR_MASK: The OR of all selected MATCHes is ORed with result of TRIG1_AND. 0b1xxx = Select MATCHA OR. 0bx1xx = Select MATCHB OR. 0bxx1x = Select MATCHC OR. 0bxxx1 = Select MATCHD OR. 0b0000 = Select to not OR any MATCHes to form TRIG1.
22:25	RW	TRIG1_AND_MASK: The AND of following selected MATCHes is ORed with result of TRIG1_OR. 0b1xxx = Select MATCHA AND. 0bx1xx = Select MATCHB AND. 0bxx1x = Select MATCHC AND. 0bxxx1 = Select MATCHD AND. 0b0000 = Select to not AND any MATCHes together to form TRIG1.
26	RW	TRIG0_NOT_MODE: Invert TRIG0 before using it.
27	RW	TRIG1_NOT_MODE: Invert TRIG1 before using it.
28:31	RW	MATCH_NOT_MODE: Invert the match polarity before using it to form a trigger. 0b1000 inverts MATCHA. 0b0100 inverts MATCHB. 0b0010 inverts MATCHC. 0b0001 inverts MATCHD.

Bits	SCOM	Field Mnemonic: Description
32:35	RW	Reserved field.
36	RW	DD1_STRETCH_TRIGGER_PULSES: (DD1 workaround.) Stretch trigger output pulses to two clocks. Must be enabled for MCFAST and L2FAST traces.
37	RW	Reserved field.

Register Name	Trace Array High Data Register
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR1.TRACE_HI_DATA_REG
Address	0000000013010440 (SCOM)
Description	This register provides the high trace array data.

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	TRACE_HI_DATA: Trace array data 0:63.

Register Name	Trace Array Low Data Register
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR1.TRACE_LO_DATA_REG
Address	0000000013010441 (SCOM)
Description	This register provides the low trace array data.

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	TRACE_LO_DATA: Trace array data 64:95.
32:41	ROX	TRACE_ADDRESS: Trace address.
42:50	ROX	TRACE_LAST_BANK: Trace last bank.
51	ROX	TRACE_LAST_BANK_VALID: Trace last bank valid.
52	ROX	TRACE_WRITE_ON_RUN: Trace write-on-run indicator.
53	ROX	TRACE_RUNNING: Trace run indicator.
54:63	ROX	TRACE_HOLD_ADDRESS: Trace hold address (pointing to last entry).

Register Name	Trace Control Configuration Register
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR1.TRACE_TRCTRL_CONFIG
Address	0000000013010442 (SCOM)
Description	This register contains trace control configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	STORE_ON_TRIG_MODE: Enable store on trigger mode.
1	RW	WRITE_ON_RUN_MODE: Enable unconditional forced write when trace_run.
2:9	RW	EXTEND_TRIG_MODE: Counter value for extended trigger mode.
10	RW	BANK_MODE: Enable bank mode.
11	RW	ENH_TRACE_MODE: Enable enhanced trace mode.
12	RW	LOCAL_CLOCK_GATE_CONTROL: When this bit is set, internal clock gating is disabled. The trace control logic and the trace data pipeline are always clocked.

Bits	SCOM	Field Mnemonic: Description
13	RW	UNUSED_13B: Unused.
14:17	RW	TRACE_SELCT_CONTROL: Selector for two sets of external trace bus multiplexers, tra_mux0_sel(0:1) and tra_mux1_sel(0:1).
18:21	RW	SPARE_CONTROL: Spare control bits.

Register Name	Trace Data Configuration Register 0
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR1.TRACE_TRDATA_CONFIG_0
Address	0000000013010443 (SCOM)
Description	This register contains a trace data compare mask for bits 0 – 63.

Bits	SCOM	Field Mnemonic: Description
0:63	RW	CMP_MSK_LT_B_0_TO_63: Trace data compare mask for bits 0 to 63.

Register Name	Trace Data Configuration Register 1
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR1.TRACE_TRDATA_CONFIG_1
Address	0000000013010444 (SCOM)
Description	This register contains a trace data compare mask for bits 64 – 87.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CMP_MSK_LT_B_64_TO_87: Trace data compare mask for bits 64 to 87.

Register Name	Trace Data Configuration Register 2
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR1.TRACE_TRDATA_CONFIG_2
Address	0000000013010445 (SCOM)
Description	This register contains patterns A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNA: pattern_match_pata_0_to_23.
24:47	RW	PATTERNB: pattern_match_patb_0_to_23.

Register Name	Trace Data Configuration Register 3
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR1.TRACE_TRDATA_CONFIG_3
Address	0000000013010446 (SCOM)
Description	This register contains patterns C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNC: pattern_match_patc_0_to_23.
24:47	RW	PATTERND: pattern_match_patd_0_to_23.

Register Name	Trace Data Configuration Register 4
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR1.TRACE_TRDATA_CONFIG_4
Address	0000000013010447 (SCOM)
Description	This register contains masks A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKA: mska.
24:47	RW	MASKB: mskb.

Register Name	Trace Data Configuration Register 5
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR1.TRACE_TRDATA_CONFIG_5
Address	0000000013010448 (SCOM)
Description	This register contains masks C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKC: mskc.
24:47	RW	MASKD: mskd.

Register Name	Trace Data Configuration Register 9
Mnemonic	TP.TCEP03.TPCL3.L3TRA0.TR1.TRACE_TRDATA_CONFIG_9
Address	0000000013010449 (SCOM)
Description	This register contains trace data configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	DISABLE_COMPRESSION: Disable trace data compression (store data every cycle).
1	RW	ERROR_BIT_COMPRESSION_CARE_MASK: Take into account changes in the error bit for trace data compression (default = 0).
2:3	RW	MATCHA_MUXSEL: Match PATTERNA against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
4:5	RW	MATCHB_MUXSEL: Match PATTERNB against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
6:7	RW	MATCHC_MUXSEL: Match PATTERNC against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.

Bits	SCOM	Field Mnemonic: Description
8:9	RW	MATCHD_MUXSEL: Match PATTERND against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
10:13	RW	TRIG0_OR_MASK: The OR of all selected MATCHes is ORed with result of TRIG0_AND. 0b1xxx = Select MATCHA OR. 0bx1xx = Select MATCHB OR. 0bxx1x = Select MATCHC OR. 0bxxx1 = Select MATCHD OR. 0b0000 = Select to not OR any MATCHes.
14:17	RW	TRIG0_AND_MASK: The AND of following selected MATCHes is ORed with result of TRIG0_OR. 0b1xxx = Select MATCHA AND. 0bx1xx = Select MATCHB AND. 0bxx1x = Select MATCHC AND. 0bxxx1 = Select MATCHD AND. 0b0000 = Select to not AND any MATCHes together to form TRIG0.
18:21	RW	TRIG1_OR_MASK: The OR of all selected MATCHes is ORed with result of TRIG1_AND. 0b1xxx = Select MATCHA OR. 0bx1xx = Select MATCHB OR. 0bxx1x = Select MATCHC OR. 0bxxx1 = Select MATCHD OR. 0b0000 = Select to not OR any MATCHes to form TRIG1.
22:25	RW	TRIG1_AND_MASK: The AND of following selected MATCHes is ORed with result of TRIG1_OR. 0b1xxx = Select MATCHA AND. 0bx1xx = Select MATCHB AND. 0bxx1x = Select MATCHC AND. 0bxxx1 = Select MATCHD AND. 0b0000 = Select to not AND any MATCHes together to form TRIG1.
26	RW	TRIG0_NOT_MODE: Invert TRIG0 before using it.
27	RW	TRIG1_NOT_MODE: Invert TRIG1 before using it.
28:31	RW	MATCH_NOT_MODE: Invert the match polarity before using it to form a trigger. 0b1000 inverts MATCHA. 0b0100 inverts MATCHB. 0b0010 inverts MATCHC. 0b0001 inverts MATCHD.
32:35	RW	Reserved field.
36	RW	DD1_STRETCH_TRIGGER_PULSES: (DD1 workaround.) Stretch trigger output pulses to two clocks. Must be enabled for MCFAST and L2FAST traces.
37	RW	Reserved field.

Register Name	**Trace Array High Data Register**
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR0.TRACE_HI_DATA_REG
Address	0000000013010480 (SCOM)
Description	This register provides the high trace array data.

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	TRACE_HI_DATA: Trace array data 0:63.

Register Name	Trace Array Low Data Register
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR0.TRACE_LO_DATA_REG
Address	0000000013010481 (SCOM)
Description	This register provides the low trace array data.

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	TRACE_LO_DATA: Trace array data 64:95.
32:41	ROX	TRACE_ADDRESS: Trace address.
42:50	ROX	TRACE_LAST_BANK: Trace last bank.
51	ROX	TRACE_LAST_BANK_VALID: Trace last bank valid.
52	ROX	TRACE_WRITE_ON_RUN: Trace write-on-run indicator.
53	ROX	TRACE_RUNNING: Trace run indicator.
54:63	ROX	TRACE_HOLD_ADDRESS: Trace hold address (pointing to last entry).

Register Name	Trace Control Configuration Register
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR0.TRACE_TRCTRL_CONFIG
Address	0000000013010482 (SCOM)
Description	This register contains trace control configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	STORE_ON_TRIG_MODE: Enable store on trigger mode.
1	RW	WRITE_ON_RUN_MODE: Enable unconditional forced write when trace_run.
2:9	RW	EXTEND_TRIG_MODE: Counter value for extended trigger mode.
10	RW	BANK_MODE: Enable bank mode.
11	RW	ENH_TRACE_MODE: Enable enhanced trace mode.
12	RW	LOCAL_CLOCK_GATE_CONTROL: When this bit is set, internal clock gating is disabled. The trace control logic and the trace data pipeline are always clocked.
13	RW	UNUSED_13B: Unused.
14:17	RW	TRACE_SELCT_CONTROL: Selector for two sets of external trace bus multiplexers, tra_mux0_sel(0:1) and tra_mux1_sel(0:1).
18:21	RW	SPARE_CONTROL: Spare control bits.

Register Name	Trace Data Configuration Register 0
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR0.TRACE_TRDATA_CONFIG_0
Address	0000000013010483 (SCOM)
Description	This register contains a trace data compare mask for bits 0 – 63.

Bits	SCOM	Field Mnemonic: Description
0:63	RW	CMP_MSK_LT_B_0_TO_63: Trace data compare mask for bits 0 to 63.

Register Name	Trace Data Configuration Register 1
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR0.TRACE_TRDATA_CONFIG_1
Address	0000000013010484 (SCOM)
Description	This register contains a trace data compare mask for bits 64 – 87.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CMP_MSK_LT_B_64_TO_87: Trace data compare mask for bits 64 to 87.

Register Name	Trace Data Configuration Register 2
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR0.TRACE_TRDATA_CONFIG_2
Address	0000000013010485 (SCOM)
Description	This register contains patterns A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNA: pattern_match_pata_0_to_23.
24:47	RW	PATTERNB: pattern_match_patb_0_to_23.

Register Name	Trace Data Configuration Register 3
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR0.TRACE_TRDATA_CONFIG_3
Address	0000000013010486 (SCOM)
Description	This register contains patterns C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNC: pattern_match_patc_0_to_23.
24:47	RW	PATTERND: pattern_match_patd_0_to_23.

Register Name	Trace Data Configuration Register 4
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR0.TRACE_TRDATA_CONFIG_4
Address	0000000013010487 (SCOM)
Description	This register contains masks A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKA: mska.
24:47	RW	MASKB: mskb.

Register Name	Trace Data Configuration Register 5
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR0.TRACE_TRDATA_CONFIG_5
Address	0000000013010488 (SCOM)
Description	This register contains masks C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKC: mskc.
24:47	RW	MASKD: mskd.

Register Name	Trace Data Configuration Register 9
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR0.TRACE_TRDATA_CONFIG_9
Address	0000000013010489 (SCOM)
Description	This register contains trace data configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	DISABLE_COMPRESSION: Disable trace data compression (store data every cycle).
1	RW	ERROR_BIT_COMPRESSION_CARE_MASK: Take into account changes in the error bit for trace data compression (default = 0).
2:3	RW	MATCHA_MUXSEL: Match PATTERNA against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
4:5	RW	MATCHB_MUXSEL: Match PATTERNB against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
6:7	RW	MATCHC_MUXSEL: Match PATTERNC against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
8:9	RW	MATCHD_MUXSEL: Match PATTERND against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
10:13	RW	TRIG0_OR_MASK: The OR of all selected MATCHes is ORed with result of TRIG0_AND. 0b1xxx = Select MATCHA OR. 0bx1xx = Select MATCHB OR. 0bxx1x = Select MATCHC OR. 0bxxx1 = Select MATCHD OR. 0b0000 = Select to not OR any MATCHes.
14:17	RW	TRIG0_AND_MASK: The AND of following selected MATCHes is ORed with result of TRIG0_OR. 0b1xxx = Select MATCHA AND. 0bx1xx = Select MATCHB AND. 0bxx1x = Select MATCHC AND. 0bxxx1 = Select MATCHD AND. 0b0000 = Select to not AND any MATCHes together to form TRIG0.
18:21	RW	TRIG1_OR_MASK: The OR of all selected MATCHes is ORed with result of TRIG1_AND. 0b1xxx = Select MATCHA OR. 0bx1xx = Select MATCHB OR. 0bxx1x = Select MATCHC OR. 0bxxx1 = Select MATCHD OR. 0b0000 = Select to not OR any MATCHes to form TRIG1.

Bits	SCOM	Field Mnemonic: Description
22:25	RW	TRIG1_AND_MASK: The AND of following selected MATCHes is ORed with result of TRIG1_OR. 0b1xxx = Select MATCHA AND. 0bx1xx = Select MATCHB AND. 0bxx1x = Select MATCHC AND. 0bxxx1 = Select MATCHD AND. 0b0000 = Select to not AND any MATCHes together to form TRIG1.
26	RW	TRIG0_NOT_MODE: Invert TRIG0 before using it.
27	RW	TRIG1_NOT_MODE: Invert TRIG1 before using it.
28:31	RW	MATCH_NOT_MODE: Invert the match polarity before using it to form a trigger. 0b1000 inverts MATCHA. 0b0100 inverts MATCHB. 0b0010 inverts MATCHC. 0b0001 inverts MATCHD.
32:35	RW	Reserved field.
36	RW	DD1_STRETCH_TRIGGER_PULSES: (DD1 workaround.) Stretch trigger output pulses to two clocks. Must be enabled for MCFAST and L2FAST traces.
37	RW	Reserved field.

Register Name	Trace Array High Data Register
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR1.TRACE_HI_DATA_REG
Address	00000000130104C0 (SCOM)
Description	This register provides the high trace array data.

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	TRACE_HI_DATA: Trace array data 0:63.

Register Name	Trace Array Low Data Register
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR1.TRACE_LO_DATA_REG
Address	00000000130104C1 (SCOM)
Description	This register provides the low trace array data.

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	TRACE_LO_DATA: Trace array data 64:95.
32:41	ROX	TRACE_ADDRESS: Trace address.
42:50	ROX	TRACE_LAST_BANK: Trace last bank.
51	ROX	TRACE_LAST_BANK_VALID: Trace last bank valid.
52	ROX	TRACE_WRITE_ON_RUN: Trace write-on-run indicator.
53	ROX	TRACE_RUNNING: Trace run indicator.
54:63	ROX	TRACE_HOLD_ADDRESS: Trace hold address (pointing to last entry).

Register Name	Trace Control Configuration Register
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR1.TRACE_TRCTRL_CONFIG
Address	00000000130104C2 (SCOM)
Description	This register contains trace control configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	STORE_ON_TRIG_MODE: Enable store on trigger mode.
1	RW	WRITE_ON_RUN_MODE: Enable unconditional forced write when trace_run.
2:9	RW	EXTEND_TRIG_MODE: Counter value for extended trigger mode.
10	RW	BANK_MODE: Enable bank mode.
11	RW	ENH_TRACE_MODE: Enable enhanced trace mode.
12	RW	LOCAL_CLOCK_GATE_CONTROL: When this bit is set, internal clock gating is disabled. The trace control logic and the trace data pipeline are always clocked.
13	RW	UNUSED_13B: Unused.
14:17	RW	TRACE_SELCT_CONTROL: Selector for two sets of external trace bus multiplexers, tra_mux0_sel(0:1) and tra_mux1_sel(0:1).
18:21	RW	SPARE_CONTROL: Spare control bits.

Register Name	Trace Data Configuration Register 0
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR1.TRACE_TRDATA_CONFIG_0
Address	00000000130104C3 (SCOM)
Description	This register contains a trace data compare mask for bits 0 – 63.

Bits	SCOM	Field Mnemonic: Description
0:63	RW	CMP_MSK_LT_B_0_TO_63: Trace data compare mask for bits 0 to 63.

Register Name	Trace Data Configuration Register 1
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR1.TRACE_TRDATA_CONFIG_1
Address	00000000130104C4 (SCOM)
Description	This register contains a trace data compare mask for bits 64 – 87.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CMP_MSK_LT_B_64_TO_87: Trace data compare mask for bits 64 to 87.

Register Name	Trace Data Configuration Register 2
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR1.TRACE_TRDATA_CONFIG_2
Address	00000000130104C5 (SCOM)
Description	This register contains patterns A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNA: pattern_match_pata_0_to_23.

Bits	SCOM	Field Mnemonic: Description
24:47	RW	PATTERNB: pattern_match_patb_0_to_23.

Register Name	Trace Data Configuration Register 3
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR1.TRACE_TRDATA_CONFIG_3
Address	00000000130104C6 (SCOM)
Description	This register contains patterns C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNC: pattern_match_patc_0_to_23.
24:47	RW	PATTERND: pattern_match_patd_0_to_23.

Register Name	Trace Data Configuration Register 4
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR1.TRACE_TRDATA_CONFIG_4
Address	00000000130104C7 (SCOM)
Description	This register contains masks A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKA: mska.
24:47	RW	MASKB: mskb.

Register Name	Trace Data Configuration Register 5
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR1.TRACE_TRDATA_CONFIG_5
Address	00000000130104C8 (SCOM)
Description	This register contains masks C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKC: mskc.
24:47	RW	MASKD: mskd.

Register Name	Trace Data Configuration Register 9
Mnemonic	TP.TCEP03.TPCL3.L3TRA1.TR1.TRACE_TRDATA_CONFIG_9
Address	00000000130104C9 (SCOM)
Description	This register contains trace data configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	DISABLE_COMPRESSION: Disable trace data compression (store data every cycle).
1	RW	ERROR_BIT_COMPRESSION_CARE_MASK: Take into account changes in the error bit for trace data compression (default = 0).

Bits	SCOM	Field Mnemonic: Description
2:3	RW	MATCHA_MUXSEL: Match PATTERNA against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
4:5	RW	MATCHB_MUXSEL: Match PATTERNB against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
6:7	RW	MATCHC_MUXSEL: Match PATTERNC against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
8:9	RW	MATCHD_MUXSEL: Match PATTERND against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
10:13	RW	TRIG0_OR_MASK: The OR of all selected MATCHes is ORed with result of TRIG0_AND. 0b1xxx = Select MATCHA OR. 0bx1xx = Select MATCHB OR. 0bxx1x = Select MATCHC OR. 0bxxx1 = Select MATCHD OR. 0b0000 = Select to not OR any MATCHes.
14:17	RW	TRIG0_AND_MASK: The AND of following selected MATCHes is ORed with result of TRIG0_OR. 0b1xxx = Select MATCHA AND. 0bx1xx = Select MATCHB AND. 0bxx1x = Select MATCHC AND. 0bxxx1 = Select MATCHD AND. 0b0000 = Select to not AND any MATCHes together to form TRIG0.
18:21	RW	TRIG1_OR_MASK: NOTE: the OR of all selected MATCHes is ORed with result of TRIG1_AND. 0b1xxx = Select MATCHA OR 0bx1xx = Select MATCHB OR 0bxx1x = Select MATCHC OR 0bxxx1 = Select MATCHD OR 0b0000 = Select to not OR any MATCHes to form TRIG1.
22:25	RW	TRIG1_AND_MASK: The AND of following selected MATCHes is ORed with result of TRIG1_OR. 0b1xxx = Select MATCHA AND. 0bx1xx = Select MATCHB AND. 0bxx1x = Select MATCHC AND. 0bxxx1 = Select MATCHD AND. 0b0000 = Select to not AND any MATCHes together to form TRIG1.
26	RW	TRIG0_NOT_MODE: Invert TRIG0 before using it.
27	RW	TRIG1_NOT_MODE: Invert TRIG1 before using it.
28:31	RW	MATCH_NOT_MODE: Invert the match polarity before using it to form a trigger. 0b1000 inverts MATCHA. 0b0100 inverts MATCHB. 0b0010 inverts MATCHC. 0b0001 inverts MATCHD.
32:35	RW	Reserved field.
36	RW	DD1_STRETCH_TRIGGER_PULSES: (DD1 workaround.) Stretch trigger output pulses to two clocks. Must be enabled for MCFAST and L2FAST traces.

Bits	SCOM	Field Mnemonic: Description
37	RW	Reserved field.

Register Name	Debug Mode Register
Mnemonic	TP.TCEP03.TPCL3.EPS.DBG.DBG_MODE_REG
Address	00000000130107C0 (SCOM)
Description	This is debug macro configuration register 0 for the configuration component.

Bits	SCOM	Field Mnemonic: Description
0:2	RW	GLB_BRCST_MODE: global_broadcast_mode (0 to 2): 100 = dbg_trace_run and dbg_trace_freeze. 101 = pc_tcdbg_trace_run_fncd and dbg_trace_freeze. 110 = dbg_triggers_out(0 to 1). 111 = pc_tcdbg_triggers(0 to 1) (from core).
3:5	RW	TRACE_SEL_MODE: Select source for trace_run and bank. 001 = Core trace run and bank. 010 = TP broadcast run and 0. 011 = tc_dbg_inter_brcst latched. 100 = tc_dbg_dbg_sync_brcst_rcv. else = dbg_trace_run and dbg_trace_bank.
6:7	RW	TRIG_SEL_MODE: Select source for tcdbg_trigger(0). 10 = Global broadcast. 11 = pc_tcdbg_trigger (from core). else = dbg_triggers_out(0:1).
8	RW	STOP_ON_XSTOP_SELECTION: Enable trace stop on checkstop.
9	RW	STOP_ON_RECOV_ERR_SELECTION: Enable trace stop on recoverable error.
10	RW	STOP_ON_SPATTN_SELECTION: Enable trace stop on special attention.
11	RW	FREEZE_SEL_MODE: Select freeze source: 0 = Local debug freeze. 1 = Via broadcast: tp_tcdbg_glb_brcst(1).
12:13	RW	SYNC_BRCST_MODE: Originally used for synchronous broadcast mode; currently unused because it is obsolete. See trace_sel_mode.
14	RO	constant = 0b0
15	RO	constant = 0b0
16:31	ROX	dbg_status.
32:63	RO	constant = 0b00000000000000000000000000000000

Register Name	Debug Trace Control Register
Mnemonic	TP.TCEP03.TPCL3.EPS.DBG.DEBUG_TRACE_CONTROL
Address	00000000130107D0 (SCOM)
Description	This is the trace start/stop/rest using SCOM command register. Use write data(0/1/2) = 1. This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0	WOX	Reserved field.
1	WOX	Reserved field.
2	WOX	Reserved field.

Register Name	Extra Trace Mode Register
Mnemonic	TP.TCEP03.TPCL3.EPS.DBG.XTRA_TRACE_MODE
Address	00000000130107D1 (SCOM)
Description	This register provides an extra or dedicated trace mode register for core triggers.

Bits	SCOM	Field Mnemonic: Description
0:37	RW	XTRA_TRACE_MODE_DATA: Extra / dedicated trace mode register for core triggers.

Register Name	L2 FIR Register
Mnemonic	EX07.L2.L2MISC.L2CERRS.FIR_REG
Address	0000000013010C00 (SCOM) 0000000013010C01 (SCOM1) 0000000013010C02 (SCOM2)
Description	L2 FIR register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	WOX_AND	WOX_OR	CACHE_RD_CE: Hardware trigger mechanism at point cache read occurs that detects a CE by ECCCK on RC/CO/SN read. **Note:** PRD counts the number of these and then triggers line delete.
1	RWX	WOX_AND	WOX_OR	CACHE_RD_UE: Hardware trigger mechanism at point cache read occurs that detects a UE (non-SUE) by ECCCK on RC/CO/SN read.
2	RWX	WOX_AND	WOX_OR	CACHE_RD_SUE: Hardware trigger mechanism at point cache read occurs that detects a SUE by ECCCK on RC/CO/SN read.
3	RWX	WOX_AND	WOX_OR	HW_DIR_INTIATED_LINE_DELETE_OCCURRED: Hardware-initiated line delete occurred (ID state injected into the DIR) by RC or SN machine.
4	RWX	WOX_AND	WOX_OR	CACHE_UE_SUE_DETECTED_ON_MODIFIED_LINE_BY_CO: L2 cast-out where a L2 cache read detected UE/SUE and line is M,Mu,T,Tn.
5	RWX	WOX_AND	WOX_OR	CACHE_UE_SUE_DETECTED_ON_NON_MODIFIED_LINE_BY_CO: L2 cast-out where a L2 cache read detected UE/SUE and line is Me,Te,Ten,Sl,S.
6	RWX	WOX_AND	WOX_OR	DIR_CE_DETECTED: L2 corrected a CE in the L2 directory.
7	RWX	WOX_AND	WOX_OR	DIR_UE_DETECTED: L2 detected a UE in the L2 directory.
8	RWX	WOX_AND	WOX_OR	DIR_STUCK_BIT_CE: L2 detected an SBCE in the L2 directory.
9	RWX	WOX_AND	WOX_OR	DIR_SBCE_REPAIR_FAILED: PEC attempted to repair and cast-out a SBCE condition but failed. The cache line was lost.
10	RWX	WOX_AND	WOX_OR	MULTIPLE_DIR_ERRORS_DETECTED: **Depricated:** *This FIR bit should always be masked.* Multiple CE/UE detected between two hang (early hang) pulse time windows.
11	RWX	WOX_AND	WOX_OR	LRU_READ_ERROR_DETECTED: LRU array has illegal value in it (due to a flipped bit).
12	RWX	WOX_AND	WOX_OR	RC_POWERBUS_DATA_TIMEOUT: RC timed out waiting for processor bus to return data.
13	RWX	WOX_AND	WOX_OR	NCU_POWERBUS_DATA_TIMEOUT: NCU timed out waiting for processor bus to return data.
14	RWX	WOX_AND	WOX_OR	HW_CONTROL_ERROR: Internal hardware control error.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
15	RWX	WOX_AND	WOX_OR	LRU_ALL_MEMBERS_IN_CGC_ARE_LINE_DELETED: All members in a single congruence class have been deleted.
16	RWX	WOX_AND	WOX_OR	CACHE_INHIBITED_HIT_CACHEABLE_ERROR: Cache inhibited LD/ST hit a line in the L2 cache. Software error.
17	RWX	WOX_AND	WOX_OR	RC_LOAD_RECEIVED_PB_CRESP_ADR_ERR: RC was doing a fabric operation on behalf of a load and received a CRESP=addr_err.
18	RWX	WOX_AND	WOX_OR	RC_STORE_RECEIVED_PB_CRESP_ADR_ERR: RC was doing a fabric operation on behalf of a store and received a CRESP=addr_err.
19	RWX	WOX_AND	WOX_OR	RC_POWBUS_DATA_CE_ERR_FROM_F2CHK: RC incoming power bus data had a CE error.
20	RWX	WOX_AND	WOX_OR	RC_POWBUS_DATA_UE_ERR_FROM_F2CHK: RC incoming power bus data had a UE error.
21	RWX	WOX_AND	WOX_OR	RC_POWBUS_DATA_SUE_ERR_FROM_F2CHK: RC incoming power bus data had a SUE error.
22	RWX	WOX_AND	WOX_OR	TGT_NODAL_REQ_DINC_ERR: Foreign CPS request got retry DINC.
23	RWX	WOX_AND	WOX_OR	RC_LOAD_RECEIVED_PB_CRESP_ADR_ERR_FOR_HYP: RC was doing a fabric operation on behalf of a load and received a CRESP=addr_err for HYP memory.
24	RWX	WOX_AND	WOX_OR	RCDAT_RD_PARITY_ERR: RCDAT read parity error.
25	RWX	WOX_AND	WOX_OR	CO_PSH_RECEIVED_PB_CRESP_ADR_ERR: CO or SNP was doing a fabric operation on behalf of a store and received a CRESP=addr_err.
26	RWX	WOX_AND	WOX_OR	LVDIR_PERR: LVDIR took a parity error.
27	RWX	WOX_AND	WOX_OR	RC_LOAD_RECEIVED_PB_ACK_DEAD_FROM_ALINKRECOV: RC load received pb_ack_dead from alinkrecov.
28	RWX	WOX_AND	WOX_OR	DARN_DATA_TIMEOUT: Darn timed out waiting for data.
29	RWX	WOX_AND	WOX_OR	RC_STORE_RECEIVED_PB_ACK_DEAD_FROM_ALINKRECOV:
30:35	RWX	WOX_AND	WOX_OR	Reserved field.
36	RWX	WOX_AND	WOX_OR	CACHE_RD_CE_AND_UE: Cache read CE and UE popped within a short hang pulse. Could be a triple bit error.
37:39	RWX	WOX_AND	WOX_OR	Reserved field.
40	RWX	WOX_AND	WOX_OR	SCOM_ERR1: SCOM error.
41	RWX	WOX_AND	WOX_OR	SCOM_ERR2: SCOM error.
42:63	RO	RO	RO	constant = 0b0000000000000000000000

Description	L2 FIR action0 register

Bits	SCOM	Field Mnemonic: Description
0:41	RW	FIR_ACTION0: Action0 select for corresponding bit in FIR. (Action0,Action1) = Action select. (0,0) = Checkstop error. (0,1) = Recoverable error. (1,0) = Reserved. (1,1) = Local core checkstop.
42:63	RO	constant = 0b0000000000000000000000

Register Name	**L2 FIR Action1 Register**
Mnemonic	EX07.L2.L2MISC.L2CERRS.FIR_ACTION1_REG
Address	0000000013010C07 (SCOM)
Description	L2 FIR action1 register

Bits	SCOM	Field Mnemonic: Description
0:41	RW	FIR_ACTION1: Action1 select for corresponding bit in FIR. (Action0,Action1) = Action select. (0,0) = Checkstop error. (0,1) = Recoverable error. (1,0) = Reserved. (1,1) = Local core checkstop.
42:63	RO	constant = 0b0000000000000000000000

Register Name	**L2 Mode 0 Register**
Mnemonic	EX07.L2.L2MISC.L2CERRS.MODE_REG0
Address	0000000013010C0A (SCOM)
Description	L2 mode register 0

Bits	SCOM	Field Mnemonic: Description
0	RW	CFG_LRU_DIRECT_MAP: Enables direct mapped LRU mode.
1	RW	CFG_RANDOM_EN: Enables random LRU mode.
2	RW	CFG_SINGLE_MEM_EN: Enables only one member per congruence class to be used.
3:10	RW	CFG_SINGLE_MEM: One-hot member to use in single member mode.
11	RW	CFG_L3_DIS: Indicates that the L3 below the L2 is disabled.
12	RW	CFG_CO_SOFT_PURGE_ME_SX_EN: Enables CO soft purge on shared. All Me and Sx cache lines are dropped when they are cast out of the L2.

Bits	SCOM	Field Mnemonic: Description
13	RW	CFG_CO_SOFT_PURGE_ALL_LINES_EN: Enables CO soft purge on modified. All Mx and Tx cache lines are dropped when they are cast out of the L2. This mode is *only* intended for use at boot up where software ID destroys the boot-code preloaded into the L2 by flushing the L2. **Note:** While this bit is set, if ICSWs or Part64B lines are attempted, the COFSM will discard these operations.
14	RW	CFG_DCBZ_TRASHMODE_EN: Enable RC, for L2 trash mode, to treat 128-byte-marked stores or DCBZs such that RC will not go to the processor bus but instead pretend like it received a CRESP=go_m. **Software restriction:** ICSW and ICSWcr instructions should NOT be issued while in this mode (reproducible trash mode) since this will cause the COFSM to go to the processor bus. If trash is being run as non-reproducible (that is, PB active), then ICSW/ICSWcr can be sent and the COFSM will attempt them on the power bus.
15	RW	CFG_CAC_ERR_REPAIR_EN: Enable cache error repair. Enables RC and SN to trigger a purge action (of the line they are working on) if they detect a CE/UE/SUE on a cache read.
16	RW	CFG_LINEDEL_ON_CAC_UE_EN: Enable line delete on cache UE (or a software trig_det CE). L2 RC/SN, upon detecting a UE (or a software trig_det CE) on a cache read, will trigger a purge of the line and write the dir=Id. The Ioad will cause the L2 to never allocate into this physical location (that is, the L2 assumes these cache line cells are damaged). **Note:** If this bit is set to Disable, then software trig_det ce should not be activated. If software trig_det is activated, the RC will purge the line on CE, but the software trig_det ce masking will never reset since it is waiting for the RC to indicate it wrote an ID on behalf of the CE (which this bit prevented).
17	RW	CFG_HW_TRIG_LINEDEL_LDDISP_CE_EN: **Note:** This is for lab debug *only*. Enables line delete on detection of any RC dispatch of a load that is an L2 hit that results in a cache CE or UE (SUE will not trigger the line delete). Upon detecting a CE/UE on a cache read, will trigger a purge of the line and write the dir=Id. The Ioad will cause the L2 to never allocate into this physical location (that is, the L2 assumes these cache line cells are damaged). **Warning:** This aggressive line delete policy could cause soft CEs to quickly form a large number of line delete locations in the cache (that is, to the point where a CGC in the L2 has been completely line deleted away, causing a hang). This lab-only mode is intended for early-bring-up parts.
18:20	RWX	CFG_C0_L2_PB_ARB_RATE_SEL: Selects how fast the L2 requests to the PB.
21	RW	CFG_HASH_L3_ADDR_EN:
22	RW	CFG_RC_FRC_DISP_EQ_NTM_INIG_SI_TO_RCR_EN: Enables TM trash mode where IN or IG goes to L3 instead of PB.
23	RW	CFG_SYSMAP_SM_NOT_LG_SEL: Selects single chip groups.
24:31	RWX	CFG_Q_BIT_TID_MASK: QOS bits help PB and MC arbitrate.
32	RW	CFG_STQ_PF_EN: Enables store spawned prefetching.
33	RW	CFG_DCACHE_CAPP_LPC_MODE_EN: Enables store spawned prefetching.
34	RW	CFG_PERFMON_INFO_SRC_ED_SEL: Selects ED DCACHE information to include Sl interventions.
35:37	RWX	CFG_C1_L2_PB_ARB_RATE_SEL: Selects how fast the L2 requests to the PB.
38	RW	CFG_SKIP_GRP_SCOPE_EN: Forces RCs to skip group scope when upgrading from LN scope, used for chip = group PB settings.
39	RW	Reserved field.
40:63	RO	constant = 0b000000000000000000000000

Register Name	L2 Mode 1 Register
Mnemonic	EX07.L2.L2MISC.L2CERRS.MODE_REG1
Address	0000000013010C0B (SCOM)
Description	L2 mode register 1

Bits	SCOM	Field Mnemonic: Description
0	RW	CFG_ECCCK_CE_UE_SUE_ERR_DET_DIS: When set to 1, this field causes ECCCK CE, UE, SUE to all be gated off from being seen by RC/CO/SN and FIR logic (that is, RCDSP masks ECCCK signals). This bit is meant as a fail-safe mode. All errors will be ignored by RC/CO/SN. FIR bits will not get set. SUE data that is brought in or forms due to misses will *lose* is-SUE stamp on the next L2 load request LD(S) and load request LD(E) hit (that is, RC ignores all errors and assumes data should be used as is).
1	RW	CFG_ECCCK_UE_SUE_DET_DIS: When 1, causes ECCCK UE, SUE to all be gated off from being seen by RC/CO/SN and FIR logic (that is, RCDSP masks ECCCK signals. This bit should *not* be activated, as it can result in hang conditions if SUE/UE form when SUE/UE causes DERR to be sent to the core and RC ignores this and fails to resend data.
2:3	RW	Reserved field.
4:7	RW	HANG_POLL_PULSE_DIV: Hang pulse divider.
8:11	RW	DATA_POLL_PULSE_DIV: Data hang pulse divider.
12:15	RW	Reserved field.
16	RW	PM03_SMT_MODE_ROTATION_DIS: When 1, disables PERFMON thread information rotation.
17	RW	PM47_SMT_MODE_ROTATION_DIS: When 1, disables PERFMON thread information rotation.
18:19	RW	Reserved field.
20:22	RW	PM07_TID_ROTATE_PLSS_RATE: Time period the L2 will stay on a given thread before switching to the next thread.
23:24	RW	Reserved field.
25	RW	PM03_L23_EVENT_TID_SEL_EN: When 1, enables thread selection for PERFMON information.
26:27	RW	PM03_L23_EVENT_TID_SEL_NUM: Specifies the thread.
28	RO	constant = 0b0
29	RW	PM47_L23_EVENT_TID_SEL_EN: When 1, enables thread selection for PERFMON information.
30:31	RW	PM47_L23_EVENT_TID_SEL_NUM: Specifies the thread.
32:63	RO	constant = 0b00000000000000000000000000000000

Register Name	Line Delete on Trigger Register
Mnemonic	EX07.L2.L2MISC.L2CERRS.LINEDEL_TRIG_REG
Address	0000000013010C0D (SCOM)
Description	L2 one shot line delete on next CE trigger register

Bits	SCOM	Field Mnemonic: Description
0	RW	LINEDEL_TRIG: When this register is written and triggers the L2 to do a line delete on the next RC load hit CE (or UE, if the CE migrated to an UE) it detects, only one RC should be triggered to do so if multiple dispatches occur with their own CE. Once this bit is set, the L2 must mask future settings of FIR Bit0 (l2rcdsp_fir_rccosn_cr_ce_err) until after the l2f2ctl_scom_ldel_on_cr_ce_or_ue_done field is set (that is, the CE line delete is purged). PRD firmware will go through the following sequence: 1) PRD detects FIR Bit0(l2rcdsp_fir_rccosn_cr_ce_err) for x times in a given time period. 2a) PRD triggers line delete on CE by setting LineDel_CE_Trig Reg(bit0). This *must* now gate future setting of FIR Bit0 (l2rcdsp_fir_rccosn_cr_ce_err) until hardware sets LineDel_CE_Trig Reg(bit1) in step 3. 2b) PRD writes FIR Bit0 (l2rcdsp_fir_rccosn_cr_ce_err) to 0. 3) Hardware watches for next CE (or UE since CE might have mutated to UE) to do a line delete on a CR of a CE/UE. Hardware will set LineDel_CE_Trig Reg(bit1). 4) Optional software step: PRD detects is LineDel_CE_Trig Reg(bit1) set and then writes LineDel_CE_Trig Reg (bit0:1) = 00 (that is, clears trigger and status). 5) Increments total number of line deletes installed in the L2 cache. If PRD:LineDelCntr > 6, then put this process in _guarded_ status. Else, PRD return to step 1 (to wait for next FIR bit0 setting).
1	RWX	LINEDEL_DONE: Line delete done status bit. Must be written back to 0 before the next line delete trigger.
2:3	RW	LINEDEL_SPARE: Spare bits.
4:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000

Register Name	PRD Purge Engine Command Register
Mnemonic	EX07.L2.L2MISC.L2CERRS.PRD_PURGE_CMD_REG
Address	0000000013010C0E (SCOM)
Description	PRD purge engine command register

Bits	SCOM	Field Mnemonic: Description
0	RW	PRD_PURGE_CMD_TRIGGER: When this register is written and this trigger bit is loaded with a 1, the purge engine mechanism starts. **Note:** The reg_busy must be 0 (that is, completion bit set) before the state of any of the purge_cmd register is changed.
1:4	RW	PRD_PURGE_CMD_TYPE: 0000 = L2 Cache_Flush. mem(0:2), addr(48:55), bank (ra56), must all be set to 0. 0010 = L2 Dir Line_Delete. mem(0:2), addr(48:55), bank (ra56), must be set to the directory entry being deleted. The RC will victimize entry and write directory to ID. 0011 = L2 Cache_mini_flush. mem(0:2) and bank must be set to 0. addr(48:55) can be set to any CGC. L2 will flush all eight members in the next 32 CGC.
5:8	RO	constant = 0b0000
9	RWX	PRD_PURGE_CMD_REG_BUSY: Command register is waiting to be serviced by the purge state machine.
10	ROX	PRD_PURGE_CMD_PRGSM_BUSY_ON_THIS: The purge machine has taken this register's command.
11	ROX	PRD_PURGE_CMD_PRGSM_BUSY: The purge machine is currently busy.
12:16	RO	constant = 0b00000
17:19	RW	PRD_PURGE_CMD_MEM: The member associated with L2 line delete commands. For an L2 Cache_Flush command, member(0:2) must be set to 0b000.
20:27	RW	PRD_PURGE_CMD_CGC: CGC address for L2 line delete commands. For an L2 cache flush command, cgc(0:7) must be set to 0x00.
28	RW	PRD_PURGE_CMD_BANK: Bank for L2 line delete commands. For an L2 cache flush command, bank must be set to 0.
29	RWX	PRD_PURGE_CMD_ERR: Attempted write to command register while cmd_reg_busy = 1, or illegal TTYPE.

Bits	SCOM	Field Mnemonic: Description
30:63	RO	constant = 0b0000000000000000000000000000000000

Register Name	PHYP Purge Engine Command Register
Mnemonic	EX07.L2.L2MISC.L2CERRS.PHYP_PURGE_CMD_REG
Address	0000000013010C0F (SCOM)
Description	Hypervisor purge engine command register

Bits	SCOM	Field Mnemonic: Description
0	RW	PHYP_PURGE_CMD_TRIGGER: When this register is written and this trigger bit is loaded with a 1, the purge engine mechanism to starts. **Note:** The reg_busy field must be 0 (that is, completion bit set) before the state of any of the purge_cmd register is changed.
1:4	RW	PHYP_PURGE_CMD_TYPE: 0000 = L2 Cache_Flush. mem(0:2), addr(48:55), bank (ra56), must all be set to 0. 0010 = L2 Dir Line_Delete. mem(0:2), addr(48:55), bank (ra56), must be set to the directory entry being deleted. The RC will victimize entry and write directory to ID. 0011 = L2 Cache_mini_flush. mem(0:2) and bank must be set to 0. addr(48:55) can be set to any CGC. L2 will flush all eight members in the next 32 CGC.
5:8	RO	constant = 0b0000
9	RWX	PHYP_PURGE_CMD_REG_BUSY: Command register is waiting to be serviced by purge state machine.
10	ROX	PHYP_PURGE_CMD_PRGSM_BUSY_ON_THIS: Purge machine has taken this register's command.
11	ROX	PHYP_PURGE_CMD_PRGSM_BUSY: Purge machine is currently busy.
12:16	RO	constant = 0b00000
17:19	RW	PHYP_PURGE_CMD_MEM: The member associated with L2 line delete commands. For an L2 cache flush command, member(0:2) must be set to 0b000.
20:27	RW	PHYP_PURGE_CMD_CGC: The CGC address for L2 line delete commands. For an L2 cache flush command, cgc(0:7) must be set to 0x00.
28	RW	PHYP_PURGE_CMD_BANK: Bank for L2 line delete commands. For an L2 cache flush command, bank must be set to 0.
29	RWX	PHYP_PURGE_CMD_ERR: Attempted to write cmd_reg while cmd_reg_busy = 1 or illegal TTYPE.

Register Name	L3 FIR Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.FIR_REG
Address	0000000013011C00 (SCOM) 0000000013011C01 (SCOM1) 0000000013011C02 (SCOM2)
Description	L3 FIR Register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	WOX_AND	WOX_OR	L3_RDDSP_SEGR_LCO_ALL_MEM_UNAVAIL_ERR: When this error occurs, no members are available for a particular CGC. This causes an infinite hang of a CI machine. There may be no members available due to a combination of line delete, column delete, eDRAM bank fail, and SEGR LCO mode.
1	RWX	WOX_AND	WOX_OR	L3_FIR_SPARE1: spare1.
2	RWX	WOX_AND	WOX_OR	L3_FIR_SPARE2: spare2.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
3	RWX	WOX_AND	WOX_OR	L3_DRAM_POS_WORDLINE_FAIL: This error indicates at least one CE and one UE have occurred within one fabric data hang pulse interval. This is an indication that a word line fail may be occurring.
4	RWX	WOX_AND	WOX_OR	L3_CAC_RD_CE_DET_NOT_LINDEL_REQ: CE detected on L3 cache read that is not a line delete request.
5	RWX	WOX_AND	WOX_OR	L3_CAC_RD_UE_DET: UE detected on L3 cache read.
6	RWX	WOX_AND	WOX_OR	L3_CAC_RD_SUE_DET: SUE detected on L3 cache read.
7	RWX	WOX_AND	WOX_OR	L3_CAC_WR_DATA_CE_FROM_PB: CE detected on processor bus write data for prefetch, LCO, or cache inject.
8	RWX	WOX_AND	WOX_OR	L3_CAC_WR_DATA_UE_FROM_PB: UE detected on processor bus write data for prefetch, LCO, or cache inject.
9	RWX	WOX_AND	WOX_OR	L3_CAC_WR_DATA_SUE_FROM_PB: SUE detected on processor bus write data for prefetch, LCO, or cache inject.
10	RWX	WOX_AND	WOX_OR	L3_CAC_WR_DATA_CE_FROM_L2: CE detected on write data from L2 CPI buffer.
11	RWX	WOX_AND	WOX_OR	L3_CAC_WR_DATA_UE_FROM_L2: UE detected on write data from L2 CPI buffer.
12	RWX	WOX_AND	WOX_OR	L3_CAC_WR_DATA_SUE_FROM_L2_OR_WIHPC: SUE detected on write data from L2 CPI buffer or WIHPC (on an L3HPC PWI).
13	RWX	WOX_AND	WOX_OR	L3_DIR_RD_CE_DET: Directory CE occurred.
14	RWX	WOX_AND	WOX_OR	L3_DIR_RD_UE_DET: Directory UE occurred.
15	RWX	WOX_AND	WOX_OR	L3_DIR_RD_PHANTOM_ERROR: Directory error occurred but not found during correction sequence.
16	RWX	WOX_AND	WOX_OR	L3_PB_MAST_WR_ADDR_ERR: Received addr_error CRESP on snoop machine or castout operation.
17	RWX	WOX_AND	WOX_OR	L3_PB_MAST_RD_ADDR_ERR: Received addr_error CRESP for prefetch operation.
18	RWX	WOX_AND	WOX_OR	L3_ADDR_HANG_DETECTED: Some L3 machine hung waiting for combined response or FLINK hang.
19	RWX	WOX_AND	WOX_OR	L3_LRU_INVAL_CNT: LRU invalid count error. Violation of requirement that, when not in DMAP or fixed-member mode, each group must have a member with lru_cnt = 0 for first class and a member with lru_cnt = 0 for second class if there is a second class member.
20	RWX	WOX_AND	WOX_OR	L3_PPE_RD_CE_DET: PPE CE occurred.
21	RWX	WOX_AND	WOX_OR	L3_PPE_RD_UE_DET: PPE UE occurred.
22	RWX	WOX_AND	WOX_OR	L3_PPE_RD_SUE_DET: PPE SUE occurred.
23	RWX	WOX_AND	WOX_OR	L3_MACH_HANG_DETECTED: Prefetch or write inject machine processor bus data hang check.
24	RWX	WOX_AND	WOX_OR	L3_HW_CONTROL_ERR: Hardware control error. See the Hardware Control Error Read0/1 SCOM Registers for details.
25	RWX	WOX_AND	WOX_OR	L3_SNP_CACHE_INHIBIT_ERR: Cache inhibited operation was hit in the L3 directory. This is usually a software bug.
26	RWX	WOX_AND	WOX_OR	L3_LINE_DEL_CE_DONE: Snoop machine or read machine has performed a line delete.
27	RWX	WOX_AND	WOX_OR	L3_DRAM_ERROR: DRAM command collision error.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
28	RWX	WOX_AND	WOX_OR	L3_LRU_ERROR: LRU array parity error. Parity is checked whenever the LRU array is read. The hardware automatically recovers from this error. On an RD request or snoop, the array is read, but parity errors are not corrected (no LRU array write). Thus, repeated read to the location with the parity error may cause this bit to repeated assert.
29	RWX	WOX_AND	WOX_OR	L3_ALL_MEMBERS_DELETED_ERROR: All members are either column or line deleted in some CGC class.
30	RWX	WOX_AND	WOX_OR	L3_REFRESH_TIMER_ERROR: Refresh timer pulse either was not configured to run properly or has stopped.
31	RWX	WOX_AND	WOX_OR	L3_PB_MAST_WR_ACK_DEAD: Received ack_dead or ed_ack_dead CRESP on CO, SN operation (PB write).
32	RWX	WOX_AND	WOX_OR	L3_PB_MAST_RD_ACK_DEAD: Received ack_dead or ed_ack_dead CRESP on PF operation (PB read).
33	RWX	WOX_AND	WOX_OR	SCOM_ERR1: SCOM error FIR 1.
34	RWX	WOX_AND	WOX_OR	SCOM_ERR2: SCOM error FIR 2.

Register Name	L3 Mode 1 Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.MODE_REG1
Address	0000000013011C0A (SCOM)
Description	L3 mode register 1

Bits	SCOM	Field Mnemonic: Description
0	RW	L3_LCO_ENABLE_CFG: When on, enables L3.1 lateral cast outs. If set, the user *must* configure group, ID, and victim fields in this register. Also, when modifying any of the target IDs or victim bits while the machine is running, you must SCOM-write this bit off, and then write it back on along with the other updates. A leading edge detect of 0 to 1 causes the logic to sample the other bits.
1	RW	L3_LCO_TARGET_GROUP: Set the target group/chip for this chiplet.
2:5	RW	L3_LCO_TARGET_ID: Set the target ID for this chiplet.
6:21	RW	L3_LCO_TARGET_VICTIMS: Set the allowable target victims for this chiplet. **Notes:** 1. If no targets are enabled in this register, l3_lco_enable_cfg should be set to zero. 2. If only one target is enabled (self does not count) in this register, the dial l3_lco_hash_mask_home_tgts_dis field should be turned on.
22	RW	L3_SCOM_CINJ_LCO_DIS: When on, disables acceptance of cache injects and LCOs. This field is only for back-up purposes.
23:62	RO	constant = 0b0000000000000000000000000000000000000000

Register Name	L3 eDRAM Bank Soft Disable Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.EDRAM_BANK_SOFT_DIS
Address	0000000013011C0B (SCOM)
Description	L3 eDRAM bank soft disable

Bits	SCOM	Field Mnemonic: Description
0:9	RW	L3_EDRAM_BANK_SOFT_DIS_CFG: eDRAM banks can be soft disabled using this register. eDRAM banks that are disabled in this way are refreshed and can be read, but are never written. Specifically, eDRAM banks that are disabled with this register, but not disabled with the eDRAM macro internal disable SLAT, are still refreshed and readable, though they are never selected for a cache line insertion. 0 = Bank is not disabled. 1 = Bank is disabled.
10:21	RO	constant = 0b000000000000

Register Name	L3 eDRAM and Charge Pump Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.EDRAM_REG
Address	0000000013011C0C (SCOM)
Description	L3 eDRAM and charge pump register

Bits	SCOM	Field Mnemonic: Description
0	RW	L3_CP_UTIL_EN_DC: When on, enables charge pump monitoring.
1:2	RW	L3_CP_UTIL_SEL_DC: Selects the internal reference source for charge pump monitoring.
3	RW	L3_EDRAM_REG_SPARE3: Spare.
4:6	RW	L3_CP_UTIL_EXT_SEL: Selects which charge pump to monitor. Values 0 to 5 are valid (there are six charge pumps).
7:12	RWX	L3_UTIL_MON_BITS: Charge pump monitor bits.
13:63	RO	constant = 0b000000000000000000000000000000000000000000000000000

Register Name	L3 Error Inject Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.ERR_INJ_REG
Address	0000000013011C0D (SCOM)
Description	L3 error inject register

Bits	SCOM	Field Mnemonic: Description
0	RWX_WOR	L3_SINGLE_CAC_ERR_INJ: When on, injects a single error into the cache. Cleared by hardware when injection has occurred.
1	RW	L3_SOLID_CAC_ERR_INJ: When on, injects a solid error into the cache.
2:3	RW	L3_CAC_ERR_INJ_TYPE: Define cache error inject type.
4	RWX_WOR	L3_SINGLE_DIR_ERR_INJ: When on, injects a single error into the directory. Cleared by hardware when injection has occurred.
5	RW	L3_SOLID_DIR_ERR_INJ: When on, injects a solid error into the directory unless the l3_rand_dir_err_enable bit is set, in which case the errors will be random about 25% of the time.
6	RW	L3_DIR_ERR_INJ_TYPE: Define directory error inject type. 0 = CE. 1 = UE. **Note:** This bit should not be altered while l3_single_dir_err_inj is set. If this restriction is not followed, it is unpredictable if a CE or UE will be injected.
7	RWX_WOR	L3_SINGLE_LRU_ERR_INJ: When on, injects a single error (parity) into the LRU array. Cleared by hardware when injection has occurred.
8	RW	L3_SOLID_LRU_ERR_INJ: When on, injects a solid error (parity) into the LRU array.
9:45	RO	constant = 0b0000000000000000000000000000000000000

Register Name	L3 PRD Purge Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.PRD_PURGE_REG
Address	0000000013011C0E (SCOM)
Description	L3 PRD Purge Register

Bits	SCOM	Field Mnemonic: Description
0	RWX_WOR	L3_PRD_PURGE_REQ: When set, will initiate a purge of the type specified by the TTYPE field beginning at the address specified in the address field. This bit will remain set until the purge is completed.
1:4	RW	L3_PRD_PURGE_TTYPE: This field specifies which kind of operation is to be done: full purge, single line purge, single line delete, full blind purge, or dynamic purge. **Note:** Dynamic purge is similar to a full purge, except that it starts without waiting for work pending in the L3 to complete. It is only used for lab stress purposes, as it increases the probability of a purge encountering a collision. Outside of the lab environment, software does not use dynamic purge and waits for internally pending transactions to complete before a purge runs.
5	RWX_WOR	L3_PRD_LINE_DEL_ON_NEXT_CE: When set, will cause RD and snoop machines to delete the line on the next occurrence of a CE. This bit will be reset by hardware when the line delete is done.
6	RW	L3_PRD_LINE_DEL_ON_ALL_CE: When set, will cause RD and snoop machines to delete the line on every occurrence of a CE.
7:8	RW	Reserved field.
9	ROX	L3_PRD_PURGE_BUSY_ERR: When set, indicates that a purge was requested when this register was still busy from a previous purge request. The request that caused this bit to be set will be dropped.
10:11	RW	Reserved field.
12:16	RW	L3_PRD_PURGE_MEMBER: Specifies the member for a purge. 0 - 19 = Members 0 to 19. 20 - 31 = Reserved. This field is used only for single line delete/purge. Full, blind, and dynamic always purge all 20 members of the cache.
17:28	RW	L3_PRD_PURGE_DIR_ADDR: Specifies the congruence class to begin the purge.
29:63	RO	constant = 0b00000000000000000000000000000000000

Register Name	**L3 Refresh Timer Control Register**
Mnemonic	EX07.L3.L3_CARB.L3CACTL.DRAM_REF_REG
Address	0000000013011C0F (SCOM)
Description	L3 refresh timer control register and init DRAM

Bits	SCOM	Field Mnemonic: Description
0:3	RW	L3_REF_TIMER_DIVIDE_MAJOR: Major divide value. In conjunction with minor divide value, controls the division of the refresh timer pulse before it is sent to eDRAMs. Refresh period (must be $\leq$ 40 μs) = period_of(tc_l3_edram_refresh) $\times$ (1 + major) $\times$ (10 + minor) $\times$ 524.
4	RWX	L3_SCOM_INIT_DRAM: When set will cause an initialization of the eDRAM. Cleared by the L3 when eDRAM is ready (eDRAM initialization is complete).
5	RW	L3_SCOM_QUIESCE_CACHE: When set will cause the cache arbiter to quiesce system commands to the cache. This is a SCOM-based backup to the tc_cc_l3_quiesce_lvl pin.
6	RW	L3_SCOM_QUIESCE_CACHE_LFSR: When set will cause the cache arbiter to quiesce system commands to the cache based off of an LFSR, toggling on and off every 2k or 1k cycles. This is for stress testing.
7	RWX	L3_SCOM_QUIESCE_REFRESH: When set will put the L3 into a refresh quiesced state. This must occur before reference clock domain is clock-stopped to ensure stop is not in the middle of a refresh. Refresh will begin again when a dram_init command is received from OHA.
8:11	RW	L3_REF_TIMER_DIVIDE_MINOR: Minor divide value. In conjunction with the major divide value, controls the division of the refresh timer pulse before it is sent to eDRAMs. Refresh period (must be $\leq$ 40 μs) = period_of(tc_l3_edram_refresh) $\times$ (1 + major) $\times$ (10 + minor) $\times$ 524.
12:23	RO	constant = 0b000000000000

Register Name	L3 Error Report 0 Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.L3_ERR_RPT0_REG
Address	0000000013011C10 (SCOM)
Description	L3 error report register 0

35	RO	CO_MACHINE_HANG_ERR: co_machine_hang_err.

Register Name	L3 LRU Segregated LCO Mode Configuration Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.LRU_VIC_ALLOC_REG
Address	0000000013011C11 (SCOM)
Description	L3 LRU segregated LCO mode configuration register

Bits	SCOM	Field Mnemonic: Description
0:19	RW	L3_COLUMN_SEGR_LCO_COLUMN_L2_CFG: Each bit corresponds to a directory member. This register is only used if l3_column_alloc_md_cfg = segregated_lco_mode. If set, that member can only be used for lines inserted by way of L2 cast-outs or L3 prefetch. If cleared, that member can only be used for lines inserted by way of incoming LCOs. When in segregated_lco_mode, there must be at least one enabled member per group (group A = members 0 to 9, group B = members 10 to 19) designated for L2 cast-out/L3 prefetch and one enabled member per group designated for incoming LCOs. Software must take into account any disabled eDRAM bank members and set this register appropriately. If no member is available for an operation, then the CI machine will hang in an infinite loop, continually failing dispatch and a FIR is set (dial: l3_all_members_deleted_error).
20:21	RW	L3_COLUMN_ALLOC_MD_CFG: When in normal mode, members can be used for either L2 cast-outs or incoming LCOs. When in segregated_lco_mode, the value of l3_segr_lco_column_l2_cfg determines which members can be used for L2 cast-outs versus incoming LCOs.
22:55	RO	constant = 0b0000000000000000000000000000000000

Register Name	L3 RTIM Pulse Period Monitor Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.L3_RTIM_PERIOD_MONITOR
Address	0000000013011C12 (SCOM)
Description	Indicates the period of the RTIM pulse from pervasive

Bits	SCOM	Field Mnemonic: Description
0:7	RWX	L3_RTIM_PERIOD_MON: Indicates the number of cycles between the refresh timer pulse from pervasive. POR is 10 when running at 3.7 GHz, for example.
8:63	RO	constant = 0b00000000000000000000000000000000000000000000000000000000

Register Name	L3 PM Purge Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.PM_PURGE_REG
Address	0000000013011C13 (SCOM)
Description	L3 PM purge register

Bits	SCOM	Field Mnemonic: Description
0	RWX_WOR	L3_PM_PURGE_REQ: When set, initiates a purge. This bit will remain set until the purge is completed (or successfully aborted).
1	ROX	L3_PM_PURGE_BUSY_ERR: When set, indicates that a purge was requested after another PM purge had already been requested (and not yet completed). The second request (the one that caused this bit to be set) will be dropped. Once set, this bit will not reset until another purge request comes in (that is, setting (0) again).
2	RWX_WOR	L3_PM_PURGE_ABORT: When set, a purge is aborted. This bit will clear once the PM purge has been successfully aborted. When the abort is successfully complete, it will also cause (0) to clear. This bit will only set when there is a valid purge to abort (that is, it will not remain set if there was no PM purge to abort in the first place.

Bits	SCOM	Field Mnemonic: Description
3:5	RO	constant = 0b000

Register Name	L3 PHYP Purge Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.PHYP_PURGE_REG
Address	0000000013011C14 (SCOM)
Description	L3 PHYP purge register

Bits	SCOM	Field Mnemonic: Description
0	RWX_WOR	L3_PHYP_PURGE_REQ: When set, initiates a purge of the type specified by the TTYPE field beginning at the address specified in the address field. This bit will remain set until the purge is completed.
1:4	RW	L3_PHYP_PURGE_TTYPE: This field specifies which kind of operation is to be done: full purge, single line purge, single line delete, full blind purge, or dynamic purge. **Note:** Dynamic purge is similar to a full purge, except that it starts without waiting for work pending in the L3 to complete. It is only used for lab stress purposes, as it increases the probability of a purge encountering a collision. Outside of the lab environment, software does not use dynamic purge and waits for internally pending transactions to complete before a purge runs.
5	RWX_WOR	L3_PHYP_LINE_DEL_ON_NEXT_CE: When set, will cause RD and snoop machines to delete the line on the next occurrence of a CE. This bit will be reset by hardware when the line delete is done.
6	RW	L3_PHYP_LINE_DEL_ON_ALL_CE: When set, will cause RD and snoop machines to delete the line on every occurrence of a CE.
7:8	RW	Reserved field.
9	ROX	L3_PHYP_PURGE_BUSY_ERR: When set, indicates that a purge was requested when this register was still busy from a previous purge request. The request that caused this bit to be set will be dropped.
10:11	RW	Reserved field.
12:16	RW	L3_PHYP_PURGE_MEMBER: Specifies the member for a purge. 0 - 19 = Members 0 to 19. 20 - 31 = Reserved. This field is used only for single line delete/purge. Full, blind, and dynamic always purge all 20 members of the cache.
17:28	RW	L3_PHYP_PURGE_DIR_ADDR: Specifies the congruence class to begin the purge.
29:63	RO	constant = 0b00000000000000000000000000000000000

Register Name	L3 Line Deleted Members Count Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.LINE_DELETED_MEMBERS_REG
Address	0000000013011C15 (SCOM)
Description	L3 line deleted members count register

Bits	SCOM	Field Mnemonic: Description
0:4	RWX	L3_LINE_DELETED_MEMBERS: L3 line deleted member count. This register monitors the number of deleted members in any access congruence class. It can be cleared, and will simply continue monitoring.
5:60	RO	constant = 0b00000000000000000000000000000000000000000000000000000000

Register Name	Disable L2 RCMD Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.PM_L2_RCMD_DIS_REG
Address	0000000013011C18 (SCOM)
Description	Disable L2 RCMD register

Bits	SCOM	Field Mnemonic: Description
0	RW	L3_PM_L2_RCMD_DIS_CFG: When set, snoops from the fabric (RCMD) are not forwarded to the L2. This is asserted before the L2 is stop-clocked (but after L2 is idle) to ensure L2 is not stopped in the middle of a snoop.

Register Name	L3 eDRAM RD Error Status 0 Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.ED_RD_ERR_STAT_REG0
Address	0000000013011C19 (SCOM)
Description	L3 eDRAM RD error status register 0

Bits	SCOM	Field Mnemonic: Description
0	RWX_WAND	L3_ED_RD_ERR_STAT_VAL: When set, indicates that the syndrome, DW, RA, and bank have been captured for an eDRAM CE, UE, or SUE.
1	ROX	L3_ED_RD_ERR_STAT_1ST_BEAT_UE: Indicates the first beat had a UE. This is redundant since it can be determined from the syndrome, but it is useful for debugging.
2	ROX	L3_ED_RD_ERR_STAT_2ND_BEAT_UE: Indicates the second beat had a UE. This redundant since it can be determined from the syndrome, but it is useful for debugging.
3	ROX	L3_ED_RD_ERR_STAT_SPARE3: Spare bit 3.
4:11	ROX	L3_ED_RD_ERR_STAT_1ST_BEAT_SYNDROME: Captures the syndrome of the first beat when a CE, UE, or SUE occurs.
12:19	ROX	L3_ED_RD_ERR_STAT_2ND_BEAT_SYNDROME: Captures the syndrome of the second beat when a CE, UE, or SUE occurs.
20:22	ROX	L3_ED_RD_ERR_STAT_DW: Indicates which DW when a CE, UE, or SUE occurred. Will be the same DW captured over both beats.
23:47	RO	constant = 0b0000000000000000000000000

Register Name	L3 eDRAM RD Error Status 1 Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.ED_RD_ERR_STAT_REG1
Address	0000000013011C1A (SCOM)
Description	L3 eDRAM RD error status register 1

Bits	SCOM	Field Mnemonic: Description
0:13	ROX	L3_ED_RD_ERR_STAT_RA: Captures the RA when a CE, UE, or SUE occurred.
14:17	ROX	L3_ED_RD_ERR_STAT_BANK: Captures which eDRAM bank when a CE, UE, or SUE occurred.
18:38	RO	constant = 0b000000000000000000000

Register Name	L3 eDRAM Bank Fail SCOM Read Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.EDRAM_BANK_FAIL_SCOM_RD
Address	0000000013011C1B (SCOM)
Description	L3 eDRAM bank fail

Bits	SCOM	Field Mnemonic: Description
0:2	ROX	L3_EDRAM_BANK_FAIL_SCOM_RD: The L3 includes a set of SLATs on the refresh repair scan ring called edram_bank_fail. These latches are set by ABIST to indicate the associated eDRAM banks that must be disabled. While ABIST must set these latches, disabling the associated eDRAM macros via their internal disable SLATs is optional and only affects power consumption. The L3 internally functionally disables eDRAM banks that are indicated as "off" via these edram_bank_fail SLATs. The edram_bank_fail SLATs can be read through SCOM using this register. 0x0 = All eDRAM banks are on; banks 0-9 are all good. 0x1 = eDRAM banks 0-1 are off; eDRAM banks 2-9 are on. 0x2 = eDRAM banks 2-3 are off; eDRAM banks 0-1 and 4-9 are on. 0x3 = eDRAM banks 4-5 are off; eDRAM banks 0-3 and 6-9 are on. 0x4 = eDRAM banks 6-7 are off; eDRAM banks 0-5 and 8-9 are on. 0x5 = eDRAM banks 8-9 are off; eDRAM banks 0-7 are on. This is the read-only version (delayed by one clock) of the value from the SLATs referred to above.

Register Name	L3 Read Epsilon Configuration Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.L3_RD_EPSILON_CFG_REG
Address	0000000013011C29 (SCOM)
Description	L3 read Epsilon configuration register

Bits	SCOM	Field Mnemonic: Description
0:11	RW	L3_WT4CR_RD_TIER0_EPS_VAL: Epsilon for extend protection after CRESP for triangle protection. Read Epsilon is used when providing intervention data. The tier0 value is used for local-node scope commands. 1 maps to a count of one clock, 2 maps to a count of two clocks, and so on, but 0 (and 0xFFF) maps to the maximum value of 4095.
12:23	RW	L3_WT4CR_RD_TIER1_EPS_VAL: Epsilon for extend protection after CRESP for triangle protection. Read Epsilon is used when providing intervention data. The tier1 value is used for near-node and group scope commands. 1 maps to a count of one clock, 2 maps to a count of two clocks, and so on, but 0 (and 0xFFF) maps to the maximum value of 4095.
24:35	RW	L3_WT4CR_RD_TIER2_EPS_VAL: Epsilon for extend protection after CRESP for triangle protection. Read Epsilon is used when providing intervention data. The tier2 value is used for remote-node and vectored-group scope commands. 1 maps to a count of one clock, 2 maps to a count of two clocks, and so on, but 0 (and 0xFFF) maps to the maximum value of 4095.

Bits	SCOM	Field Mnemonic: Description
36	RW	L3_RD_EPS_MODE_SEL_CFG: Controls tier selection for different command scope: mode1 = Use scope as tier selection. mode2 = Use largest tier (tier2) for all protection.
37:63	RO	constant = 0b000000000000000000000000000

Register Name	L3 Write and Read/Write Epsilon Configuration Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.L3_WR_EPSILON_CFG_REG
Address	0000000013011C2A (SCOM)
Description	L3 write and read/write Epsilon configuration register

Bits	SCOM	Field Mnemonic: Description
0:11	RW	L3_WT4CR_WR_TIER1_EPS_VAL: Epsilon for extend protection after CRESP for triangle protection. Write Epsilon is used for cast-out, snoop push, and LCO. LCO use is mode-able. The tier1 value is used for near-node and group scope commands. 1 maps to a count of one clock, 2 maps to a count of two clocks, and so on, but 0 (and 0xFFF) maps to the maximum value of 4095.
12:23	RW	L3_WT4CR_WR_TIER2_EPS_VAL: Epsilon for extend protection after CRESP for triangle protection. write eps is used for cast-out, snoop push and LCO. LCO use is mode-able. The tier2 value is used for remote-node and vectored-group scope commands. 1 maps to a count of one clock, 2 maps to a count of two clocks, and so on, but 0 (and 0xFFF) maps to the maximum value of 4095.
24	RW	L3_EN_WT4CR_WR_EPS_ON_LCO: Enable the use of write Epsilon for LCO commands. Default is to *not* use extended protection for LCOs.
25	RW	L3_EN_WT4CR_WR_EXTENDED_MODE: Write extended mode: 0 = Select Epsilon tier based on scope. This is the default value. 1 = Always use the largest tier for all scopes.
26:29	RW	L3_EPS_STEP_MODE: Divider of L3 clocks to produce *L3 step*, which is used when the Epsilon counter is based on internal L3 clock rather than the pb_xx_epsilon_step input (dial l3_eps_cnt_use_l3_divider_en = ON). Note that 'L3 stop' (if used) goes through the eps_divider (l3_eps_divider_mode). This field is used for both read and write Epsilons. The +1 effect is due to the counter resetting to 0 and running off the L3 clock. Range: 0x0 = Step once every 16 cycles. 0x1:0xf = Divide by encoded value + 1.
30:33	RW	L3_EPS_DIVIDER_MODE: Divide down the PB step/L3 step: 0x0 = Maximum division; divide by 16 (1/ 16). 0x1 - 0xF = Divide by the encoded value. This field is used for both read and write Epsilons.
34	RW	EPS_CNT_USE_L3_DIVIDER_EN: This field is used for both read and write Epsilons. 0 = Epsilon step based on pb_step_transition. 1 = Epsilon step based on L3 clock.
35:63	RO	constant = 0b00000000000000000000000000000

Register Name	L3 Mode 0 Register
Mnemonic	EX07.L3.L3_MISC.L3CERRS.MODE_REG0
Address	0000000013011C2B (SCOM)
Description	L3 mode register 0

Bits	SCOM	Field Mnemonic: Description
0	RW	L3_DISABLED_CFG: When on, disables this L3.

Bits	SCOM	Field Mnemonic: Description
1	RW	L3_DMAP_CI_EN_CFG: When on, puts L3 into direct map mode. This only affects cache-insertions. Note that enabling hashing (l3_addr_hash_en_cfg) and enabling direct-map-mode results in a CGC mapping that may be unexpected. This bit must only be changed when the cache is empty (reset-with-ABIST-clear or purged).
2	RW	L3_RDSN_LINEDEL_UE_EN: When on, enables RD and SN machines to line delete when they see cache read UEs. This needs to be set in IPL process.
3	RW	L3_NO_ALLOCATE_MODE_EN: When on, enables the L3 to enter a non-allocation mode after a UE occurs.
4	RWX	L3_NO_ALLOCATE_MODE_ACTIVE: When on, indicates that L3 is currently in non-allocation mode.
5	RW	L3_MODE_REG0_SPARE5: Spare.
6	RW	L3_MODE_REG0_SPARE6: Spare.
7	RW	L3_MODE_REG0_SPARE7: Spare.
8	RW	L3_LCO_RTY_LIMIT_DISABLE: When set, will never use an LCO retry limit count to change to CO_memory. Retried LCOs will always be retried as another LCO.
9	RW	L3_DYN_LCO_BLK_DIS_CFG: When on, disables the block on LCO related behaviors (allows LCOs to occur).
10	RW	L3_LCO_ADDR_TGT_ENABLE: When on, will enable a special LCO mode whereby all L3 cast-outs will be LCOed to a set of four L3.1s based on address bits 39:40. The intention of this mode is for wafer test or other bring-up situations where memory is not installed but a footprint larger than one L3 is desired. In this configuration, there would only be one core running and the entire address space would have to fit in the four L3.1s. The code or test would have to be loaded into the L3 by some means other than fetching from memory. The four L3.1s will effectively become memory. This mode overrides the l3_lco_enable_cfg dial setting. If more than one core is enabled in this mode, the L3 cannot be used as backing store for transactional memory. This mode does not work with cast-throughs; thus, if enabled, L2 must have cast-throughs disabled.
11	RW	L3_ADDR_HASH_EN_CFG: When on, will enable hashing of the L3 address, aa44:53 == aa34:43 XOR aa44:53. When this is used there is a corresponding dial in L2 that must be set: cfg_hash_l3_addr_en. Note that enabling hashing (here) and enabling direct-map-mode (l3_dmap_ci_en_cfg) results in a CGC mapping that may be unexpected.
12	RW	L3CERRS_CFG_DCACHE_CAPP_MODE: When on, enables DCACHE CAPP mode.
13	RW	L3CERRS_LCO_RETRY_THROTL_DIS: When on, disables the throttling of incoming LCOs via retries, based on the heuristic mechanism.
14:17	RW	L3_HANG_POLL_PULSE_DIV: Poll hang pulse divider.
18:21	RW	L3_DATA_POLL_PULSE_DIV: Data hang pulse divider.
22	RW	L3_SYSMAP_SM_NOT_LG_SEL: When off (the default), the large address map is supported. When on, the small address map is supported.
23:46	RO	constant = 0b000000000000000000000000

Register Name	CME_SCOM CME LFIR Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_LFIR
Address	0000000013012000 (SCOM) 0000000013012001 (SCOM1) 0000000013012002 (SCOM2)
Description	CME_SCOM CME LFIR

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_INTERNAL_ERROR: PPE asserted an internally detected error condition that caused it to halt. This indication is intended to be reported to both Core PPM macros to be forwarded to the OCC complex as an error interrupt.
1	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_EXTERNAL_ERROR: PPE detected an error condition on an external interface to the memory bolt-on that caused it to halt. This indication is intended to be reported to both core PPM macros to be forwarded to the OCC complex as an error interrupt.
2	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_PROGRESS_ERROR: PPE detected a lack of forward progress that caused it to halt. This indication is intended to be reported to both core PPM macros to be forwarded to the OCC complex as an error interrupt.
3	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_BREAKPOINT_ERROR: PPE halted either upon a hardware debug or software-requested breakpoint event. This indication is intended to be reported to both core PPM macros to be forwarded to the OCC complex as an error interrupt.
4	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_WATCHDOG: PPE asserted a watchdog timeout condition. Will likely be masked; for debug information only.
5	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_HALTED: PPE asserted a halt condition. Will likely be masked since there are several sources of halt that may be valid.
6	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_DEBUG_TRIGGER: PPE asserted a debug trigger.
7	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_SRAM_UE: SRAM uncorrectable error. CME will get a MCHK. Should be marked as as a recoverable error for run-time diagnostics reporting.
8	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_SRAM_CE: SRAM correctable error. CME received corrected data, but SRAM content is bad until the next scrub to that line. (Should be masked in the product; unmasked and marked as a recoverable error in manufacturing test.)
9	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_SRAM_SCRUB_ERR: Scrub timer tick occurred when scrub is still pending.
10	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_BCE_ERROR: Block copy engine error. BCE received an error from L3 or NCU. This also causes an interrupt to the CME, if it is running.
11	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_SPARE11: Implemented but not used. Inputs tied to 0.
12	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_SPARE12: Implemented but not used. Inputs tied to 0.
13	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_C0_IVRM_DROPOUT: Dropout was detected on core0 chiplet iVRM. Note that if IDCR[DROPOUT_NOTIFY_ENABLE] = 1, the unmasked value of this bit is ORed with the two subsequent dropout indication events and sent to the QPPM as a level signal.
14	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_C1_IVRM_DROPOUT: Dropout was detected on core1 chiplet iVRM.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
15	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_CACHE_IVRM_DROPOUT: Dropout was detected on cache chiplet iVRM.
16	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_EXTREME_DROOP_ERR: Extreme droop (as reported to the DPLL) over time exceeded the threshold in VCTR. Note that if VCCR[DROOP_NOTIFY_ENABLE] = 1, the unmasked value of this bit is ORed with the three subsequent droop indication events and sent to the QPPM as a level signal (ORed with the dropout indications above).
17	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_LARGE_DROOP_ERR: Large droop (as reported to the DPLL) over time exceeded the threshold in VCTR.
18	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_SMALL_DROOP_ERR: Small droop (as reported to the DPLL) over time exceeded the threshold in VCTR.
19	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_UNEXPECTED_DROOP_ENCODE: Detected non-thermometer code that should not be caused by metastability (that is, b'0001', b'0011', b'0010', or b'0111'). For debug and characterization only.
20	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_FIR_PARITY_ERR_DUP: Internal FIR parity error duplicate (same as fir_parity_err).
21	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_FIR_PARITY_ERR: Internal FIR parity error.
22:63	RO	RO	RO	constant = 0b000000000000000000000000000000000000000000

0:21	RW	CME_SCOM_LFIRACT1_FIR_ACTION1: LSB of action select for corresponding bit in FIR.
22:63	RO	constant = 0b000000000000000000000000000000000000000000

Register Name	PPE Local SRAM Control Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CMEARB.CSCR
Address	000000001301200A (SCOM) 000000001301200B (SCOM1) 000000001301200C (SCOM2)
Description	PPE local SRAM control register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	CSCR_SRAM_ACCESS_MODE: SRAM access mode.
1	RWX	WOX_CLEAR	WOX_OR	CSCR_SRAM_SCRUB_ENABLE: Enable background scrub (atomic read-write) to periodically check, and if needed, correct the data in the SRAM for bit flips due to alpha particles. This bit is cleared by the hardware when a UE is detected to assist with fault analysis.
2	RW	WO_CLEAR	WO_OR	CSCR_ECC_CORRECT_DIS: Do not correct the data coming out of the array on ECC detected correctable errors. This will cause CEs to report an error back to the PPE in addition to the usual UEs.
3	RW	WO_CLEAR	WO_OR	CSCR_ECC_DETECT_DIS: Do not flag an error back to PPE for ECC miscompares. Data from the SRAM is always treated as good. Note that errors are always detected and reported to the FIR and must be masked there independently from this bit.
4	RW	WO_CLEAR	WO_OR	CSCR_ECC_INJECT_TYPE: Used only when ECC_INJECT_ERR is set. When set to 1, causes an ECC error to be reported on every SRAM read. When set to 0, causes a single ECC error to be indicated on the next SRAM read to occur, since it also clears ECC_INJECT_ERR when that happens.
5	RWX	WOX_CLEAR	WOX_OR	CSCR_ECC_INJECT_ERR: When set, the hardware will inject or cause a dummy uncorrectable error (UE) to be reported to both the PPE and the FIR on all SRAM reads. The SRAM contents are not modified. Type of error to inject is determined by the previous bit. If ECC_INJECT_TYPE = 1, then this bit clears when the first error is injected. Note this bit can also be set by the PPE local register CFMSR.
6:7	RW	WO_CLEAR	WO_OR	CSCR_SPARE_6_7: Implemented but unused.
8:46	RO	RO	RO	constant = 0b000000000000000000000000000000000000000
47:59	RWX	WOX_CLEAR	WOX_OR	CSCR_SRAM_SCRUB_INDEX: 32 KB scrub index. This field is auto-incremented by hardware for every scrub operation. Upon a UE detection, this field is over-written with the index of the double-word containing the error. **Note:** SRAM_SCRUB_ENABLE should be set to 0 when writing this field to prevent one cycle window from ignoring this write if a scrub update happens to occur concurrently.
60:63	RO	RO	RO	constant = 0b0000

Register Name	**PPE Local SRAM Address Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CMEARB.CSAR
Address	000000001301200D (SCOM)
Description	PPE local SRAM address register

Bits	SCOM	Field Mnemonic: Description
0:15	RO	constant = 0b0000000000000000
16:28	RW	CSAR_SRAM_ADDRESS: Address of an 8-byte SRAM entry in the 32 KB SRAM array.
29:63	RO	constant = 0b00000000000000000000000000000000000

Register Name	**PPE Local SRAM Data Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CMEARB.CSDR
Address	000000001301200E (SCOM)
Description	PPE Local SRAM Data Register

Bits	SCOM	Field Mnemonic: Description
0:63	RWX	CSDR_SRAM_DATA: 8-byte SRAM data entry for the address given by the SRAM_ADDRESS. Reads cause this register to be written with data from the local SRAM. Writes cause the local SRAM to be written with the contents of this register.

Register Name	**CME SCOM CME Local BCE Control and Status Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_BCECSR
Address	000000001301200F (SCOM)
Description	CME_SCOM CME local BCE control and status register (BCECSR)

Bits	SCOM	Field Mnemonic: Description
0	ROX	CME_SCOM_BCECSR_BUSY: This field reads as '1' whenever the BCE is busy processing a transfer. This status bit is also routed to the CME external interrupt controller. It is an error to attempt to issue another start command to a busy BCE. This bit is cleared if an error occurs during the transaction.
1	RW_WCLEAR	CME_SCOM_BCECSR_ERROR: This bit is set if an error occurs during the transaction and locks this register until cleared, by writing this bit to a '1'. All of the other fields of this register are ignored on a write when this bit is set.
2:3	RO	constant = 0b00
4	RW	CME_SCOM_BCECSR_RNW: Read, not write. 0 = The transfer is a write from SRAM into main memory 1 = The transfer is a read from main memory into SRAM.
5	RW	CME_SCOM_BCECSR_BARSEL: Specifies which BCEBAR[n] to use for main memory addressing. 0 = Use BCEBAR[0]. 1 = Use BCEBAR[1]. **Note:** It is an error to issue a start command specifying a disabled or improperly initialized BAR (IPL host boot code requirement).
6	RW	CME_SCOM_BCECSR_PRIORITY: Specifies whether the transfer will be given priority on the processor bus over other units. Set only when block copy latency is important. 0 = Transfer will not have priority. 1 = Transfer will have priority. **Note:** Causes a trusted processor bus operation.

Bits	SCOM	Field Mnemonic: Description
7	RW	CME_SCOM_BCECSR_INJECT_ERR: when on, causes the BCE to report a false error on the last block copy transaction.
8:12	RO	constant = 0b00000
13:15	RW	CME_SCOM_BCECSR_TYPE: Specifies the access mode (processor bus TTYPE) for writes from SRAM into main memory: 0 = Default mode (standard 8-byte coherent partial-DMA write). 1 = Atomic ADD. 2 = Atomic AND. 3 = Atomic OR. 4 = Atomic XOR. 5:7 = Illegal. This field is ignored for reads, but must specify a valid value for write transfers.
16	RO	constant = 0b0
17:27	RW	CME_SCOM_BCECSR_NUM_BLOCKS: The number of 8-byte blocks to transfer for writes, or the number of 32-byte blocks to transfer for reads. This field is decremented after each block is successfully transferred. While busy, this indicates which block is currently being copied and will always be 0 after a successfully completed transfer. After a stop or error, this can be read to determine how many blocks have not yet been successfully copied. **Note:** Using a value of 0 will complete instantly and not transfer any data (for testing code). Using a value greater than 0x400 is not advised because it will cause the BCE to transfer some blocks twice, potentially overwriting data.
28:39	RW	CME_SCOM_BCECSR_SBASE: Written with the SRAM block index of the first block of the transfer when the transfer is initiated, this field will be seen to increment (and possibly wrap) during the transfer. The SRAM address associated with SBASE is 0xFFFF8000 + ((SBASE × size) % 32KB) where size is 32 bytes for reads and 8 bytes for writes. When BUSY clears without an ERROR, (that is, on a STOP or when the block copy completes), this index points to the block after the one successfully written.
40:41	RO	constant = 0b00
42:63	RW	CME_SCOM_BCECSR_MBASE: Written with the main memory block index of the first block of the transfer when the transfer is initiated, this field will be seen to increment (and possibly wrap) during the transfer. The main memory address associated with MBASE is pbase + ((MBASE × size) % extent) where pbase is the processor bus base address implied by the BCEBAR[n] register selected for the transfer, size is 32 bytes for reads and 8 bytes for writes, and extent is the BCEBAR[n] aperture size.

Register Name	**PPE External Interface XCR Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CMEPPE.PPE.PPE_XIXCR
Address	0000000013012010 (SCOM)
Description	PPE External Interface XCR

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1:3	WOX	PPE_XIXCR_XCR: PPE external control register CMD command: 000 = Clear debug status. 001 = Halt. 010 = Resume. 011 = Single-step. 100 = Toggle XSR[TRH]. 101 = Soft reset. 110 = Hard reset. 111 = Force halt.
4:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000

Register Name	**MIB External Interface MEM Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CMEPPE.MIB.MIB_XIMEM
Address	0000000013012017 (SCOM)
Description	MIB external interface MEM information

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	MIB_XIMEM_MEM_ADDR: MEM transaction buffer current or previous transaction byte address.
32	ROX	MIB_XIMEM_MEM_R_NW: MEM transaction buffer current or previous transaction type, read if '1' and write if '0'.
33	ROX	MIB_XIMEM_MEM_BUSY: Indicates if the transaction buffer is occupied with an ongoing transaction. Busy is cleared when the transaction is completed.
34	ROX	MIB_XIMEM_MEM_IMPRECISE_ERROR_PENDING: Indicates that the current or previous transaction had an imprecise error. Cleared when it is reported back to PPE. **Note:** The address of the erroneous transaction is copied into the SGB address latches such that the memory interface can continue to service I-fetches.
35:42	ROX	MIB_XIMEM_MEM_BYTE_ENABLE: MEM transaction buffer current or previous transaction byte enables.
43	ROX	MIB_XIMEM_MEM_LINE_MODE: MEM transaction buffer current or previous transaction line mode. Indicates a 32-byte read request when set to '1'.
44:48	RO	constant = 0b00000
49:51	ROX	MIB_XIMEM_MEM_ERROR: MEM transaction buffer error code. Current or previous transaction got an error on the memory interface when non-zero.
52:61	RO	constant = 0b0000000000

Bits	SCOM	Field Mnemonic: Description
62	ROX	MIB_XIMEM_MEM_IFETCH_PENDING: Indicates a instruction fetch is pending on the MEM interface when set to 1.
63	ROX	MIB_XIMEM_MEM_DATAOP_PENDING: When set to 1, indicates a data transaction is pending on the MEM interface.

Register Name	MIB External Interface Store Gather Buffer Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CMEPPE.MIB.MIB_XISGB
Address	0000000013012018 (SCOM)
Description	MIB external interface store gather buffer information

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	MIB_XISGB_STORE_ADDRESS: Contains either the 4-byte SGB address tag or the address of an imprecise store error that occurred when performing a previous data transaction.
32:34	RO	constant = 0b000
35	ROX	MIB_XIMEM_MEM_IMPRECISE_ERROR_PENDING: Indicates that the current or previous transaction had an imprecise error. This field is cleared when it is reported back to PPE. **Note:** The address of the erroneous transaction is copied into the SGB address latches such that the memory interface can continue to service instruction fetches.
36:39	ROX	MIB_XISGB_SGB_BYTE_VALID: Byte valid bits within the 4B tag. Cleared when the SGB contents are committed, meaning either flushed to memory or copied into the transaction buffer. **Note:** These bits can never be set if a MEM_IMPRECISE_ERROR is pending.
40:62	RO	constant = 0b00000000000000000000000
63	ROX	MIB_XISGB_SGB_FLUSH_PENDING: When set to 1, indicates a store gather buffer flush to memory is pending on the MEM interface. Can only happen if MEM_BUSY in the MEM transaction buffer is set to 0.

Register Name	MIB External Interface ICACHE Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CMEPPE.MIB.MIB_XIICAC
Address	0000000013012019 (SCOM)

Register Name	CME_LCL CME Local External Interrupt Source Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_LCL_EISR
Address	0000000013012025 (SCOM)
Description	CME_LCL CME local external interrupt source register

Bits	SCOM	Field Mnemonic: Description
0	ROX	CME_LCL_EISR_DEBUGGER: Debugger software uses this bit to produce an interrupt. The physical input is tied low. The respective EITR bit must be set to Edge so that a WOR to this register or pulse from the EIIR will produce an interrupt.
1	ROX	CME_LCL_EISR_DEBUG_TRIGGER: Asserted if the trace array logic analyzer logic has detected a trigger condition.
2	ROX	CME_LCL_EISR_QUAD_CHECKSTOP: QUAD checkstop present.
3	ROX	CME_LCL_EISR_PVREF_FAIL: The precision voltage reference circuit has failed and voltage regulation and VDM measurement is now in question.
4	ROX	CME_LCL_EISR_OCC_HEARTBEAT_LOST: OCC heartbeat lost indication from QPPM.
5	ROX	CME_LCL_EISR_CORE_CHECKSTOP: Core pair checkstop condition (recoverable).
6	ROX	CME_LCL_EISR_DROPOUT_DETECT: An iVRM dropout event occurred (pulse). May be used for characterization or tuning the iVRM deadzone where it is no longer able to regulate voltage.
7	ROX	CME_LCL_EISR_INTERCME_DIRECT_IN_0: Tied to INTERCME_DIRECT_IN Bit 0. Used for general communication from the sibling CME.
8	ROX	CME_LCL_EISR_BCE_BUSY_HIGH: High priority block copy engine busy indication. (Same source as bit 23, but as Low Priority; only one of these two bits should ever be unmasked). Falling edge indicates completion or error.
9	ROX	CME_LCL_EISR_BCE_TIMEOUT: Notification that BCE has not made forward progress in the time period corresponding to two scrub timer pulses (regardless of scrub enable). The BCE remains active but CME can use this notification to communicate a problem to the OCC.
10	ROX	CME_LCL_EISR_DOORBELL3_C0: Core 0 Doorbell 3 - a non-zero value is present in Core 0 PPM_CME_DOORBELL_REG3(0:7).
11	ROX	CME_LCL_EISR_DOORBELL3_C1: Core 1 Doorbell 3 - a non-zero value is present in Core 1 PPM_CME_DOORBELL_REG3(0:7).
12	ROX	CME_LCL_EISR_PC_INTR_PENDING_C0: Core 0 interrupt pending (Stop Exit Request) from PC. Mask when core is not in Stop state.
13	ROX	CME_LCL_EISR_PC_INTR_PENDING_C1: Core 1 interrupt pending (Stop Exit Request) from PC. Mask when core is not in Stop state.
14	ROX	CME_LCL_EISR_SPECIAL_WAKEUP_C0: Core 0 special wake-up present (input from Core0 PPM). **Note:** Code should mask this bit when core is not in Stop state.

Bits	SCOM	Field Mnemonic: Description
15	ROX	CME_LCL_EISR_SPECIAL_WAKEUP_C1: Core 1 special wake-up present (input from Core1 PPM). **Note:** Code should mask this bit when core is not in Stop state.
16	ROX	CME_LCL_EISR_REG_WAKEUP_C0: Core 0 external or malfunction alert interrupt wake-up source is present and enabled as a wake-up source. Code should mask this bit when core is not in Stop state. **Note:** When WSR[PC_FUSED_CORE_MODE] = '1', the hardware maps external interrupts for even threads to this bit; otherwise threads 0:3.
17	ROX	CME_LCL_EISR_REG_WAKEUP_C1: Core 1 external or malfunction alert interrupt wake-up is present and enabled as a wake-up source. Code should mask this bit when core is not in Stop state. **Note:** When WSR[PC_FUSED_CORE_MODE] = '1', the hardware maps external interrupts for odd threads to this bit; otherwise threads 4:7.
18	ROX	CME_LCL_EISR_DOORBELL2_C0: Core 0 Doorbell 2 - a non-zero value is present in Core 0 PPM_CME_DOORBELL_REG2(0:7).
19	ROX	CME_LCL_EISR_DOORBELL2_C1: Core 1 Doorbell 2 - a non-zero value is present in Core 1 PPM_CME_DOORBELL_REG2(0:7).
20	ROX	CME_LCL_EISR_PC_PM_STATE_ACTIVE_C0: Core 0 PM State Active, as controlled by FWMR. The direct signal will produce interrupts when the Core Chiplet enters ANY Stop state; the moded settings in FWMR allows for the entry into Stop 1 or all Stop Levels to be filtered to the CME.
21	ROX	CME_LCL_EISR_PC_PM_STATE_ACTIVE_C1: Core 1 PM State Active, as controlled by FWMR. The direct signal will produce interrupts when the Core Chiplet enters ANY Stop state; the moded settings in FWMR allows for the entry into Stop 1 or all Stop Levels to be filtered to the CME.
22	ROX	CME_LCL_EISR_L2_PURGE_DONE: L2 Purge Done (level) in response to the SICR L2 PURGE or ABORT request.
23	ROX	CME_LCL_EISR_NCU_PURGE_DONE: NCU Purge Done (level) in response to the SICR L2 PURGE or ABORT request.
24	ROX	CME_LCL_EISR_CHTM_PURGE_DONE_C0: Core 0 hardware trace macro purge done pulse indication.
25	ROX	CME_LCL_EISR_CHTM_PURGE_DONE_C1: Core 1 hardware trace macro purge done pulse indication.
26	ROX	CME_LCL_EISR_BCE_BUSY_LOW: Lower priority block copy engine busy indication (same source as bit 6, but as High Priority; only one of these two bits should ever be unmasked). Falling edge indicates completion or error.
27:28	ROX	CME_LCL_EISR_FINAL_VDM_DATA01: Final VDM Data bits 0:1.
29	ROX	CME_LCL_EISR_COMM_RECVD: CME Communication Received - Indicates that ICRR has been updated by the partner CME.
30	ROX	CME_LCL_EISR_COMM_SEND_ACK: CME Communication send acknowledgments. Indicates that the partner CME has affirmatively acknowledged the sent communication. Firmware must clear this bit (and cme_comm_send_nack) before writing to ICSR to ensure that acknowledgments are accurately recorded.
31	ROX	CME_LCL_EISR_COMM_SEND_NACK: CME Communication send negative acknowledgments. Indicates that the partner CME has negatively acknowledged the sent communication. Firmware must clear this bit (and cme_comm_send_ack) before writing to ICSR to ensure that acknowledgments are accurately recorded.
32:33	ROX	CME_LCL_EISR_SPARE_32_33: Implemented but unused. The physical inputs are tied low.
34	ROX	CME_LCL_EISR_PMCR_UPDATE_C0: PMCR update received from Core 0 (or via SCOM).
35	ROX	CME_LCL_EISR_PMCR_UPDATE_C1: PMCR update received from Core 1 (or via SCOM).
36	ROX	CME_LCL_EISR_DOORBELL0_C0: Core 0 Doorbell 0. A non-zero value is present in Core0 PPM_CME_DOORBELL_REG0(0:7).
37	ROX	CME_LCL_EISR_DOORBELL0_C1: Core 1 Doorbell 0. A non-zero value is present in Core1 PPM_CME_DOORBELL_REG0(0:7).
38:39	ROX	CME_LCL_EISR_INTERCME_DIRECT_IN_1_2: Tied to INTERCME_DIRECT_IN Bit(1:2). Used for general communication from the sibling CME.

Bits	SCOM	Field Mnemonic: Description
40	ROX	CME_LCL_EISR_DOORBELL1_C0: Core 0 Doorbell 1. A non-zero value is present in Core 0 PPM_CME_DOORBELL_REG1(0:7).
41	ROX	CME_LCL_EISR_DOORBELL1_C1: Core 1 Doorbell 1. A non-zero value is present in Core 1 PPM_CME_DOORBELL_REG1(0:7).
42:43	ROX	CME_LCL_EISR_RESERVED_42_43: Implemented but unused. The physical inputs are tied low.
44:63	RO	constant = 0b00000000000000000000

Register Name	CME_LCL CME Local External Interrupt Mask Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_LCL_EIMR
Address	0000000013012026 (SCOM)
Description	CME_LCL CME local external interrupt mask register

Bits	SCOM	Field Mnemonic: Description
0:43	RO	CME_LCL_EIMR_INTERRUPT_MASK: (See the CME External Interrupt Source Register for bit definitions.) Masks the respective event from producing an interrupt to the CME. The events are still captured in the EISR but are not reported via interrupt signals. 0 = Not masked (enabled). 1 = Masked.
44:63	RO	constant = 0b00000000000000000000

Register Name	CME_LCL CME Local External Interrupt Polarity Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_LCL_EIPR
Address	0000000013012027 (SCOM)
Description	CME_LCL CME local external interrupt polarity register

Bits	SCOM	Field Mnemonic: Description
0:43	RO	CME_LCL_EIPR_INTERRUPT_POLARITY: (See CME External Interrupt Source Register for bit definitions.) Establishes the edge or polarity of an interrupt. 0 = Falling low. If this bit is set to low, the respective EISR bit follows the inverted input to the OISR from the unit driving the signal. 1 = Rising high. If this bit is set to high, the respective EISR bit follows the direct input to the EISR from the unit driving the signal. When set, the respective bit in the OITR[n] is set to Edge, then the Falling and Rising meanings apply as follows: If this bit is set to Falling, a transition from 1 to 0 of the input signal to the EISR sets the respective EISR bit. If this bit is set to Rising, a transition from 0 to 1 of the input signal to the EISR sets the respective EISR bit.
44:63	RO	constant = 0b00000000000000000000

Register Name	CME_LCL CME Local External Interrupt Type Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_LCL_EITR
Address	0000000013012028 (SCOM)
Description	CME_LCL CME Local External Interrupt Type Register

Bits	SCOM	Field Mnemonic: Description
0:43	RO	CME_LCL_EITR_INTERRUPT_TYPE: See the CME External Interrupt Source for bit definitions. Establishes the type of interrupt that is monitored. 0 = Level. When set to Level, the respective EISR bit follows the input to the EISR from the unit driving the signal but with the polarity defined by the EIPR. Specifically, if the respective EIPR bit is set to High, this register retains the polarity of the incoming signal; if the respective EIPR bit is set to Low, this register captures the inverted polarity of the incoming signal. 1 = Edge. When set to Edge, the respective EISR bit is asserted upon the transition defined by the CME External Interrupt Source Register of the input from the unit driving the signal. Specifically, if the respective EIPR bit is set to Rising, a transition from 0 to 1 sets the bit; if the respective EIPR bit is set to Falling, a transition from 1 to 0 sets the bit. **Note:** When set to Level, attempts to override the signal setting via W1CLR or WOR to the CME External Interrupt Source Register will not stick as the signal input is the priority. Firmware must control the source of the Level signal to control the state of the EISR bit. When set to Edge, CLEAR and OR operations to the EISR will stick (clear or set respectively) in the EISR. **Engineering Note:** For firmware testing, a potential interrupt injection technique for Level interrupts is to override their definition to Edge and then use the OR register associated with the CME External Interrupt Source Register. This allows the injected transition to stick, as the logic will not follow the input interrupt signal. However, if the firmware is expecting to find status in the driving unit, this technique may not be appropriate.
44:63	RO	constant = 0b00000000000000000000

Register Name	CME_LCL CME Local External Interrupt Status Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_LCL_EISTR
Address	0000000013012029 (SCOM)

23	RW	CME_SCOM_EIIR_NCU_PURGE_DONE: ORed with the same EISR bit position and name.
24	WO_4P	CME_SCOM_EIIR_CHTM_PURGE_DONE_C0: ORed with the same EISR bit position and name.
25	WO_4P	CME_SCOM_EIIR_CHTM_PURGE_DONE_C1: ORed with the same EISR bit position and name.
26:63	RO	constant = 0b00000000000000000000000000000000000000

Register Name	**CME_SCOM CME VDM Count Configuration Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_VCCR
Address	000000001301202C (SCOM)
Description	CME_SCOM CME VDM count configuration register

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CME_SCOM_VCCR_SMALL_EVENT_THRESHOLD: Number of timer periods (or 4:1 cycle periods if DROOP_TIMER_MODE = 0) that a small droop event was seen. Used for event duration profiling (16b).
16:27	RW	CME_SCOM_VCCR_LARGE_EVENT_THRESHOLD: Number of timer periods (or 4:1 cycle periods if DROOP_TIMER_MODE = 0) that a large droop event was seen. Used for event duration profiling (12b).
28:35	RW	CME_SCOM_VCCR_EXTREME_EVENT_THRESHOLD: Number of timer periods (or 4:1 cycle periods if DROOP_TIMER_MODE = 0) that an extreme droop event was seen. Used for event duration profiling (8b).
36:37	RW	CME_SCOM_VCCR_DROOP_PROFILE_TYPE: Chooses profile type in the programmable VECR event fields: 00 = Total droop duration (of that level or deeper). 01 = Only that level droop duration (without going deeper). 10 = That level-in-a-row duration (despite going deeper, before or after). 11 = Only that level in-a-row duration (without ever going deeper). **Note:** Setting an above threshold = 0x0 makes the DROOP_PROFILE(1) a *don't care*.
38	RW	CME_SCOM_VCCR_DROOP_TIMER_MODE: 0 = The VDCR counters increment their 1:1 precounter every cycle that droop level is active, and this precounter increments the corresponding 4:1droop counter whenever it carries. 1 = The VDCR counters increment if its droop level input was ever active for one or more cache cycles between two timer input pulses (~31ns period) without a deeper droop in that same period.
39	RW	CME_SCOM_VCCR_DROOP_CHAR_MODE: Enables Droop characterization mode. When set, this changes the behavior of the VDM Sample counters (VDCR & VNCR, but not VECR) for lab characterization and disables runtime monitoring (threshold detects) from setting Droop errors in the FIR. Based on this mode, the fields in VDCR and VNCR: 0 = Count how many times a droop state has occurred so far during the configured droop sample window, and clear at the beginning of each sample period 1 = Count how many times a droop has occurred since the last read to that register, which clears it. In this mode, code must read the QMFR register simultaneously to compare against the delta in either CYCLES or TIMEBASE pulses (dependent on DROOP_TIMER_MODE).
40	RW	CME_SCOM_VCCR_DROOP_NOTIFY_ENABLE: Causes VDM droop indication to notify the QPPM macro by enabling the UNMASKED FIR bits for the three dropout errors to OR into the (now misnamed) QPPM_IVRM_DROPOUT signal.
41:43	RW	CME_SCOM_VCCR_SPARE41_43: Implemented but not used.
44:58	RO	constant = 0b000000000000000

Bits	SCOM	Field Mnemonic: Description
59:63	RW	CME_SCOM_VCCR_DROOP_SAMPLE_RATE: Sample rate used when DROOP_CHAR_MODE = 0, whose meaning is dependent on the value of DROOP_TIMER_MODE: 0 = This field specifies the rising edge of which bit of the QFMR[CYCLES] to use to start a new sample window 1 = Bits (1:4) of this field are used as a TSEL using the PPE timer to select which output bit is used to start a new sample window (bit 0 is unused). This delay is defined as $2^{(29 - select)}$/ Nest_Frequency. The default value for this register corresponds to 262 µs (assuming a 2 GHz processor bus). **Note:** When this register is written, the first sample window will be truncated (smaller) than the selected value depending on the relative value in the selected timer being used. An event threshold may still be reached despite the smaller window.

Register Name	CME_SCOM CME IVRM Dropout Configuration Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_IDCR
Address	000000001301202D (SCOM)
Description	CME_SCOM CME iVRM dropout configuration register

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CME_SCOM_IDCR_DROPOUT_EVENT_THRESHOLD: Number of sustained dropout periods that must be counted before setting a Dropout Event. Setting this field to zero disables dropout event notifications when this field is non-zero, DROPOUT_CHAR_MODE == 0, and any of the three *_DROPOUT_EVENT_COUNT == the value of this field, the corresponding *_IVRM_DROPOUT bit is set in the FIR register and is ORed as a pulse into the DROPOUT_DETECT bit in the EISR.
24:31	RW	CME_SCOM_IDCR_DROPOUT_INAROW_THRESHOLD: Dropout count value used to determine a sustained dropout period has occurred. How many 4:1 cache cycles (or timer periods if DROPOUT_TIMER_MODE = 1) in a row the dropout must be present before being counted in the *_DROPOUT_EVENT_COUNT. Note that a value of '1' causes every Dropout to be counted.
32	RW	CME_SCOM_IDCR_DROPOUT_TIMER_MODE: Dropout period timer select. Controls the Dropout Present condition used to increment the *_DROPOUT_INAROW_COUNT. 0 = Every 4:1 cache cycle counts towards the droop count. (Implementation note: Dropout Present is connected to the output of the 'dropout indication' latch, which follows the value of dropout input.) 1 = Dropout indication must be asserted for an entire CME input timer pulse period to be counted (~31 ns). (Implementation note: Set-dominant sticky 'dropout indication' latch running at 4:1 is set on every timer pulse and is reset whenever the dropout input = '0'. Dropout present is the AND of the indication latch output and the timer pulse.
33	RW	CME_SCOM_IDCR_DROPOUT_CHAR_MODE: Enables Dropout Characterization mode. Changes the behavior of the *_DROPOUT_EVENT_COUNT for run-time monitoring versus lab characterization of the iVRM dead zone. Based on this mode, the *_DROPOUT_EVENT_COUNT fields: 0 = Count how many times a sustained dropout period has been detected so far during the configured dropout sample window, and clear at the beginning of each sample window. 1 = Count how many time s a sustained dropout period has occurred since the last read to that register, which clears it. In this mode code must read the QFMR register simultaneously to compare against the delta in either CYCLES or TIMEBASE pulses (dependent on DROPOUT_TIMER_MODE).
34:35	RW	CME_SCOM_IDCR_SIBLING_CORE_DROPOUT_ENABLE: Connected to cme_dropout_enable_out(0:1). Used by the QUAD Manager hcode to control the dropout detection of the other pair of cores in the QUAD in the sibling CME. These bits must be set to '11' for the non-QUAD Manager CME.
36:37	RW	CME_SCOM_IDCR_CORE_DROPOUT_ENABLE: These are ANDed with cme_dropout_enable_in(0:1) from the sibling CME to enable the C[01]_IVRM_DROPOUT function. These bits must be set to '11' for the non-QUAD Manager CME.
38	RW	CME_SCOM_IDCR_CACHE_DROPOUT_ENABLE: Connected to cme_dropout_enable_out(2). This bit is also AND'd with cme_dropout_enable_in(2) to enable the CACHE_IVRM_DROPOUT function in this CME. This bit must also be set to '1' for the non-QUAD Manager CME.
39	RW	CME_SCOM_IDCR_SPARE: Implemented but not used.

Bits	SCOM	Field Mnemonic: Description
40	RW	CME_SCOM_IDCR_DROPOUT_NOTIFY_ENABLE: Causes Dropout indication to notify the QPPM macro by enabling the UNMASKED FIR bits for the three Dropout errors to OR into the QPPM_IVRM_DROPOUT signal.
41:43	RW	CME_SCOM_IDCR_SPARE41_43: Implemented but not used.
44:58	RO	constant = 0b000000000000000
59:63	RW	CME_SCOM_IDCR_DROPOUT_SAMPLE_RATE: Sample Rate used when DROPOUT_CHAR_MODE = 0, whose meaning is dependent on the value of DROPOUT_TIMER_MODE: 0 = This field specifies rising edge of which bit of the QFMR[CYCLES] to use to start a new sample window 1 = Bits (1:4) of this field are used as a TSEL using the PPE timer to select which output bit is used to start a new sample window (bit 0 unused). This delay is defined as $2^{(29 - \text{select})}$ / Nest_Frequency. The default value for this register corresponds to 262 µs (assuming a 2 GHz processor bus). Note that when this register is written, the first sample window will be truncated (smaller) than the selected value dependent on the relative value in the selected timer being used. An event threshold may still be reached despite the smaller window.

Register Name	CME_SCOM CME Core IVRM Dropout Sample Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_CIDSR
Address	000000001301202E (SCOM)
Description	CME_SCOM CME core iVRM dropout sample register

Bits	SCOM	Field Mnemonic: Description
0:23	ROX	CME_SCOM_CIDSR_C0_DROPOUT_EVENT_COUNT: Count of how many sustained dropouts have been detected for the core chiplet 0 iVRM. This counter always saturates at 0xFFFFFF and clears when the IDCR is written. Additionally, the behavior of this field depends on the value of IDCR[DROPOUT_CHAR_MODE].
24:31	ROX	CME_SCOM_CIDSR_C0_DROPOUT_INAROW_COUNT: Counter recording how many dropout indications for the core chiplet 0 iVRM have occurred in-a-row form a sustained dropout period. This field increments on each dropout present and resets when either: a) this field equals the DROPOUT_INAROW_THRESHOLD, b) the Dropout Present indicator = 0, or c) the IDCR register is written. **Notes:** 1. If a reset occurs on a cycle when dropout is present, the counter is set to a value of 1, else it resets to 0. 2. When in CHAR_MODE, starting a new sample window does not affect this counter.
32:55	ROX	CME_SCOM_CIDSR_C1_DROPOUT_EVENT_COUNT: Count of how many sustained dropouts have been detected for the core chiplet 1 iVRM. This field operates like the core chiplet 0 counter in the preceding fields.
56:63	ROX	CME_SCOM_CIDSR_C1_DROPOUT_INAROW_COUNT: Counter recording how many dropout indications for the core chiplet 1 iVRM have occurred in-a-row form a sustained dropout period. This field operates like the core chiplet 0 counter in the preceding fields.

Register Name	CME_SCOM CME QUAD/Cache iVRM Dropout Sample Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_QIDSR
Address	000000001301202F (SCOM)
Description	CME_SCOM CME QUAD/cache iVRM dropout sample register

Bits	SCOM	Field Mnemonic: Description
0:23	ROX	CME_SCOM_QIDSR_CACHE_DROPOUT_EVENT_COUNT: Count of how many sustained dropouts have been detected for the cache chiplet iVRM. This field operates like the core chiplet counters in the CME_SCOM CME Core iVRM Dropout Sample Register.

Bits	SCOM	Field Mnemonic: Description
24:31	ROX	CME_SCOM_QIDSR_CACHE_DROPOUT_INAROW_COUNT: Counter recording how many dropout indications for the Cache Chiplet iVRM have occurred in-a-row form a sustained dropout period. This field operates like the Core Chiplet counters in the preceding register.
32:34	ROX	CME_SCOM_QIDSR_DROPOUT_SAMPLE: Instantaneous values coming directly from the iVRM dropout signals. Bit0 = Core0 (Core2 for CME1). Bit1 = Core1 (Core3 for CME1). Bit2 = Cache.
35:61	RO	constant = 0b000000000000000000000000000

Register Name	CME_SCOM CME Block Copy Engine Base Address Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_BCEBAR0
Address	0000000013012030 (SCOM)
Description	CME_SCOM CME block copy engine base address register0

Bits	SCOM	Field Mnemonic: Description
0:7	RO	constant = 0b00000000
8:43	RW	CME_SCOM_BCEBAR0_BASE: Specifies bits 8:43 of the processor bus base address of the mapping. If this mapping is enabled (BCEBAR[SIZE] not 0), the base address is required to be aligned such that the BCEBAR[SIZE] - 1 low-order bits of the field are '0'.
44:56	RO	constant = 0b0000000000000
57:58	RW	CME_SCOM_BCEBAR0_RD_SCOPE: Scope for Read transaction broadcasts across the processor bus to the system Memory controllers, used to optimize processor bus traffic and latency. **Note:** Should be set intelligently based on known physical memory mapping based on CME Memory Location Affinity.
59	RW	CME_SCOM_BCEBAR0_WR_SCOPE: Scope for Write transaction broadcasts. See above for definition. **Note:** Local Node Scope is not allowed for writes through the NCU.
60	RW	CME_SCOM_BCEBAR0_VG_TARGET_SEL: Selects the 16-bit target for vectored group transactions to use. Note: this bit is ignored for read transactions when RD_SCOPE != 01 or for write transactions when WR_SCOPE != 1, in which case the target is always 0x0000. This bit should only be set as a workaround for power bus issues.
61:63	RW	CME_SCOM_BCEBAR0_SIZE: Specifies the size of the mapping: 0 = Mapping disabled 1 = 1 MB 2 = 2 MB 3 = 4 MB 4 = 8 MB 5 = 16 MB 6 = 32 MB 7 = 64 MB

Register Name	CME_SCOM CME Block Copy Engine Base Address 1 Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_BCEBAR1
Address	0000000013012031 (SCOM)
Description	CME_SCOM CME block copy engine base address 1 register

Bits	SCOM	Field Mnemonic: Description
0:7	RO	constant = 0b00000000
8:43	RW	CME_SCOM_BCEBAR1_BASE: Specifies bits 8:43 of the processor bus base address of the mapping. If this mapping is enabled (BCEBAR[SIZE] not 0), the base address is required to be aligned such that the BCEBAR[SIZE] - 1 low-order bits of the field are '0'.
44:56	RO	constant = 0b0000000000000
57:58	RW	CME_SCOM_BCEBAR1_RD_SCOPE: Scope for Read transaction broadcasts across the processor bus to the system Memory controllers, used to optimize processor bus traffic and latency. **Note:** Should be set intelligently based on known physical memory mapping based on CME Memory Location Affinity.
59	RW	CME_SCOM_BCEBAR1_WR_SCOPE: Scope for Write transaction broadcasts. See above for definition. **Note:** Local Node Scope is not allowed for writes through the NCU.
60	RW	CME_SCOM_BCEBAR1_VG_TARGET_SEL: Selects the 16-bit Target for Vectored Group transactions to use. Note: this bit is ignored for read transactions when RD_SCOPE != 01 or for write transactions when WR_SCOPE != 1, in which case the target is always 0x0000. This bit should only be set as a workaround for power bus issues.
61:63	RW	CME_SCOM_BCEBAR1_SIZE: Specifies the size of the mapping: 0 = Mapping disabled 1 = 1 MB 2 = 2 MB 3 = 4 MB 4 = 8 MB 5 = 16 MB 6 = 32 MB 7 = 64 MB

Register Name	CME_SCOM CME QUAD Frequency Measurement Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_QFMR
Address	0000000013012032 (SCOM)
Description	CME_SCOM CME QUAD frequency measurement register

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	CME_SCOM_QFMR_TIMEBASE: CME Timebase free-running counter whose least significant bit increments every CME timer input pulse, which will be configured to run at nest (processor bus) clock64. (At 2 GHz, this will increment every 32 ns, and this counter will wrap every 137 seconds.) Firmware must perform all delta calculations (including accounting for the wrap condition) to perform elapsed time functions.
32:63	ROX	CME_SCOM_QFMR_CYCLES: Free-running cycle counter that accumulates number of QUAD cycles4. Delta of this field per unit time (using the TIMEBASE field in this register) allows for an accurate average frequency calculation: CoreFreqavg = (Freqnest 8) * delta(CYCLESA,CYCLESB) delta(TIMEBASEA,TIMEBASEB), where the delta(A,B) function includes counter wraproll-over correction as follows: delta(A,B) = (((D = B – A) < 0) ? D+=232 : D).

Register Name	CME_SCOM CME Average Frequency Sample Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_AFSR
Address	0000000013012033 (SCOM)
Description	CME_SCOM CME average frequency sample register

Bits	SCOM	Field Mnemonic: Description
0:19	ROX	CME_SCOM_AFSR_INST_CYCLE_SAMPLE: Instantaneous count of the number of cycles that elapsed during the last sample period. Allows firmware to perform an average frequency calculation over the most recent sample period. The sample rate is controlled by FWMR[AVG_FREQ_TSEL]. The average frequency can then be calculated by firmware as: (Nest_Frequency* INST_CYCLE_SAMPLE 2^(29-FWMR[AVG_FREQ_TSEL])).
20:31	RO	constant = 0b000000000000
32:51	ROX	CME_SCOM_AFSR_AVG_CYCLE_SAMPLE: Running average of sampled cycles collected since the last read to this register. Allows firmware to perform a slightly longer term average frequency calculation. **Note:** Reads reset this field to INST_CYCLE_SAMPLE. For every INST_CYCLE_SAMPLE sample, the hardware performs the following calculation: AVG_CYCLE_SAMPLE = (3*AVG_CYCLE_SAMPLE + INST_CYCLE_SAMPLE)4 This means that after four samples, this field will contain 32% previous avg + 11% three samples ago + 14% two samples ago + 19% the last sample + 25% INST_CYCLE_SAMPLE, which is approximately 13 *previous AVG_CYCLE_SAMPLE + 25 * average of last 3 samples + 14 INST_CYCLE_SAMPLE.
52:62	RO	constant = 0b00000000000
63	ROX_CLRPART	CME_SCOM_AFSR_SAMPLE_VALID: A sample has occurred and caused this register to be updated since the last time it was read.

Register Name	**CME_SCOM CME Average Frequency Threshold Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_AFTR
Address	0000000013012034 (SCOM)
Description	CME_SCOM CME Average Frequency Threshold Register

Bits	SCOM	Field Mnemonic: Description
0:19	ROX	CME_SCOM_AFTR_MAX_CYCLE_SAMPLE: Largest INST_CYCLE_SAMPLE value that occurred since the last read to this register. **Note:** Reads reset this field to AFSR[INST_CYCLE_SAMPLE].
20:31	RO	constant = 0b000000000000
32:51	ROX	CME_SCOM_AFTR_MIN_CYCLE_SAMPLE: Smallest INST_CYCLE_SAMPLE value that occurred since the last read to this register. **Note:** Reads reset this field to AFSR[INST_CYCLE_SAMPLE].
52:63	RO	constant = 0b000000000000

Register Name	**CME_SCOM CME VDM Droop Count Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_VDCR
Address	0000000013012035 (SCOM)
Description	CME_SCOM CME VDM droop count register

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	CME_SCOM_VDCR_VDM_EXTREME_DROOP_CTR: Extreme droop threshold counter (16b). This counter always saturates at 0xFFFF and clears when the VDSR is written. Otherwise the behavior of this field depends on the value of DROOP_CHAR_MODE. (Increments when b'0xxx'.)
16:39	ROX	CME_SCOM_VDCR_VDM_LARGE_DROOP_CTR: Large droop threshold counter (24b). This counter always saturates at 0xFFFFFF and clears when the VDSR is written. Otherwise the behavior of this field depends on the value of DROOP_CHAR_MODE. (Increments when b'10xx'.)

Bits	SCOM	Field Mnemonic: Description
40:63	ROX	CME_SCOM_VDCR_VDM_SMALL_DROOP_CTR: Small droop threshold counter (24b). This counter always saturates at 0xFFFFFF and clears when the VDSR is written. Otherwise the behavior of this field depends on the value of DROOP_CHAR_MODE. (Increments when b'110x'.)

Register Name	**CME_SCOM CME VDM No-Droop Count Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_VNCR
Address	0000000013012036 (SCOM)
Description	No-droop count register

Bits	SCOM	Field Mnemonic: Description
0:15	RO	constant = 0b0000000000000000
16:39	ROX	CME_SCOM_VNCR_VDM_NO_DROOP_CTR: No droop threshold counter (24b). This counter always saturates at 0xFFFFFF and clears when the VDSR is written. Otherwise the behavior of this field depends on the value of DROOP_CHAR_MODE and DROOP_TIMER_MODE. (Increments when b'1110'.)
40:63	ROX	CME_SCOM_VNCR_VDM_OVERVOLT_CTR: Overvolt threshold counter (24b). This counter always saturates at 0xFFFFFF and clears when the VDSR is written. Otherwise the behavior of this field depends on the value of DROOP_CHAR_MODE and DROOP_TIMER_MODE. (Increments when b'1111'.)

Register Name	**CME_SCOM CME VDM Data Sample Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_VDSR
Address	0000000013012037 (SCOM)
Description	CME_SCOM CME VDM data sample register

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	CME_SCOM_VDSR_INSTANT_VDM_CONTROL_SUMMARY: Instantaneous VDM summary to DPLL.
4:7	ROX	CME_SCOM_VDSR_INSTANT_CACHE_VDM_DATA: Instantaneous cache VDM output.
8:11	ROX	CME_SCOM_VDSR_INSTANT_CORE0_VDM_DATA: Instantaneous core chiplet 0 VDM output.
12:15	ROX	CME_SCOM_VDSR_INSTANT_CORE1_VDM_DATA: Instantaneous core chiplet 1 VDM output.
16:19	ROX	CME_SCOM_VDSR_INSTANT_CORE2_VDM_DATA: Instantaneous core chiplet 2 VDM output.
20:23	ROX	CME_SCOM_VDSR_INSTANT_CORE3_VDM_DATA: Instantaneous core chiplet 3 VDM output.
24:31	RO	constant = 0b00000000
32:35	ROX	CME_SCOM_VDSR_STICKY_VDM_CONTROL_SUMMARY: Worst case VDM summary to DPLL per-cycle sticky-AND operation. Resets to 1111 on read.
36:39	ROX	CME_SCOM_VDSR_STICKY_CACHE_VDM_DATA: Worst case cache VDM output per-cycle sticky-AND operation. Resets to 1111 on read.
40:43	ROX	CME_SCOM_VDSR_STICKY_CORE0_VDM_DATA: Worst case core chiplet 0 VDM output per-cycle sticky-AND operation. Resets to 1111 on read.
44:47	ROX	CME_SCOM_VDSR_STICKY_CORE1_VDM_DATA: Worst case core chiplet 1 VDM output per-cycle sticky-AND operation. Resets to 1111 on read.
48:51	ROX	CME_SCOM_VDSR_STICKY_CORE2_VDM_DATA: Worst case core chiplet 2 VDM output per-cycle sticky-AND operation. Resets to 1111 on read.
52:55	ROX	CME_SCOM_VDSR_STICKY_CORE3_VDM_DATA: Worst case (sticky) core chiplet 3 VDM output per-cycle sticky-AND operation. Resets to 1111 on read.

Bits	SCOM	Field Mnemonic: Description
56:63	RO	constant = 0b00000000

Register Name	CME_SCOM CME VDM Event Count Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_VECR
Address	0000000013012038 (SCOM)
Description	CME_SCOM CME VDM event count register

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	CME_SCOM_VECR_TOTAL_DROOP_EVENT_CTR: Total number of droop events detected (starting from over-volt or no-droop condition, regardless of depth).
16:31	ROX	CME_SCOM_VECR_SMALL_EVENT_PROFILE_CTR: Number of small droop profiled events, counts how often the small droop event > small threshold based on DROOP_PROFILE_TYPE. 00 = Total droop duration (small or deeper). 01 = Small-only droop duration (without ever going deeper). 10 = Small-in-a-row duration (despite going deeper, before or after). 11 = Small-only in-a-row duration (without ever going deeper).
32:43	ROX	CME_SCOM_VECR_LARGER_DROOP_EVENT_CTR: Number of large (or deeper) droop events detected (starting from over-volt or no-droop droop condition).
44:55	ROX	CME_SCOM_VECR_LARGE_EVENT_PROFILE_CTR: Number of large droop profiled events, counts how often the large droop event > large threshold based on DROOP_PROFILE_TYPE. 00 = Total droop duration (large or deeper). 01 = Large-only droop duration (without ever going deeper). 10 = Large-in-a-row duration (despite going deeper, before or after). 11 = Large-only in-a-row duration (without ever going deeper).
56:63	ROX	CME_SCOM_VECR_EXTREME_DROOP_EVENT_CTR: Number of extreme droop profiled events, droop event > extreme threshold based on DROOP_PROFILE_TYPE. 00 or 01 = Total extreme droop duration (deeper not possible). 10 or 11 = Extreme-in-a-row duration (deeper not possible).

Register Name	CME_SCOM CME VDM Count Threshold Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_VCTR
Address	0000000013012039 (SCOM)
Description	CME_SCOM CME VDM Count Threshold Register

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CME_SCOM_VCTR_VDM_EXTREME_DROOP_THRESHOLD: Extreme droop threshold. A value of all zeros disables this threshold. Otherwise, when DROOP_CHAR_MODE = '0', if this value matches the count value for this same field in VDCR, an LFIR[extreme_droop_err] is indicated.
16:39	RW	CME_SCOM_VCTR_VDM_LARGE_DROOP_THRESHOLD: Large droop threshold. A value of all zeros disables this threshold. Otherwise, when DROOP_CHAR_MODE = '0', if this value matches the count value for this same field in VDCR, an LFIR[large_droop_err] is indicated.
40:63	RW	CME_SCOM_VCTR_VDM_SMALL_DROOP_THRESHOLD: Small droop threshold. A value of all zeros disables this threshold. Otherwise, when DROOP_CHAR_MODE = '0', if this value matches the count value for this same field in VDCR, an LFIR[small_droop_err] is indicated.

Register Name	CME_SCOM CME Local Mode Control Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_LMCR
Address	000000001301203A (SCOM) 000000001301203B (SCOM1) 000000001301203C (SCOM2)
Description	CME_SCOM CME local mode control register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_PMCR_OVERRIDE_EN: Enables SCOM writes to both PMCRS registers for manual testing access. Disables core chiplet updates from the PMCR serial interface from PC. 0 = Core shifter updates are accepted; SCOM updates are blocked and return Invalid Access return code. 1 = SCOM updates are accepted; core shifter updates are ignored. Note: This bit is intended to only be changed during IPL, not during run time.
1	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_PSCR_OVERRIDE_EN: Enables SCOM write to the PSCRS registers for manual testing access. Disables core chiplet updates from the PSCR serial interface from PC. Same behavior as the previous bit.
2	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_PMSR_OVERRIDE_EN: Enable SCOM control for the stop-GPE or manual testing to serially shift values into the processor cores. 0 = CME writes are accepted; SCOM updates are ignored and return invalid access return code. 1 = SCOM writes are accepted; CME writes are blocked and timeout (PPE MCHK) will occur. **Note:** This bit is intended to only be changed during IPL, not during run time.
3	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_BCECSR_OVERRIDE_EN: Disables local register writes to the BCECSR to allow SCOM to perform block copy operations to the CME SRAM instead. Same behavior as the previous bit.
4	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_IDR_LCL_SAMPLE_EN: Allow the CME local interface to control the iVRM Dropout Data and Configuration Registers. If this bit is set to one and SCOM attempts to read the CIDSR and QIDSR or to write the IDCR, an invalid access error code is returned on the SCOM interface. If this bit is zero, CME attempts to read the CIDSR and QIDSR or to write the IDCR local registers are ignored (will cause a timeout) and do not clear the sample registers.
5	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_VDM_LCL_SAMPLE_EN: Allow the CME local interface to sample the VDM Sample Registers. If this bit is set to one and SCOM attempts to read the VCSR or VDSR, an invalid access error code is returned on the SCOM interface. If this bit is zero, CME attempts to read the VCSR and VDSR local registers are ignored (will cause a timeout) and do not clear the registers.
6	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_FREQ_LCL_SAMPLE_EN: Allow the CME local interface to sample the frequency sample registers. If this bit is set to one and SCOM attempts to read the AFSR or AFTR, an invalid access error code is returned on the SCOM interface. If this bit is zero, CME attempts to read the AFSR and AFTR local registers are ignored (will cause a timeout) and do not clear the registers.
7	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_LOCK_PCB_ON_ERR: When set, unmasked PCB errors will cause the PCB queue logic to lock or stop accepting new PCB requests from the memory bolt-on, in order to preserve debug data in the interface registers.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
8	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_QUEUED_WR_EN: Enable CME to perform queued PCB write operations. If not set, attempts to store to queued PCB address encodes will return a DSI error to PPE.
9	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_QUEUED_RD_EN: Enable CME to perform queued PCB read operations. If not set, attempts to load from queued PCB address encodes will return a DSI error to PPE.
10	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_MASK_PURGE_INTERFACE: Suppress CME from sending and receiving purge request to the L2, NCU, and CHTM. When this bit is set: the PURGE and PURGE_ABORT bits in the SICR should be gated off to always output zero from the CME to those units, and mask off the PURGE_DONE inputs from those units into the EISR (but does not mask off the corresponding EIIR bits).
11	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_SPARE_11: Implemented but unused.
12	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_C0_AUTO_SPECIAL_WAKEUP_DISABLE: When set, specifies to not automatically force PM_EXIT = 1 and PM_ENTRY_ACK = 0 to core 0 in response to a special wake-up request, and to not automatically assert done back to the Core PPM (using instead the values in the SICR). **Notes:** 1. This bit should be set by CME Hcode when the core chiplet is in a STOP state > 1 or transitioning in or out of the STOP state. 2. When this mode is set, special wake-up interrupts in the EIMR must never be masked by code during run time (but otherwise in auto mode, special wake-ups should only be unmasked when the core is in stop state). This bit should be cleared by hcode when the core is in a stop state such that special wake-up transitions intersecting with regular wake-ups do not create blips on PM_EXIT and confuse the PC logic.
13	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_C1_AUTO_SPECIAL_WAKEUP_DISABLE: Same as previous bit, but for core chiplet 1.
14	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_C0_HALTED_STOP_OVERRIDE_DISABLE: By default, the POWER9 core chiplets should be allowed to automatically go in and out of STOP state when the PPE is halted and not available to service its STOP entry and exit requests (in effect converting all stop requests to a Level1). This allows the system to continue running when the CME is being halted for lab debug, or in the unlikely event that a CME error happens. This bit should be set by CME Hcode when either core chiplet is in a STOP state > 1 or transitioning in or out of STOP state. 1 = PPE halted has no effect on the PC STOP interface signals to core chiplet 0. 0 = PPE halted indication is ORed with the CME_SCOM_FWMR[STOP_OVERRIDE_MODE] functionality for core chiplet 0.
15	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_C1_HALTED_STOP_OVERRIDE_DISABLE: Same as previous bit, but for core chiplet 1.
16	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_STOP_OVERRIDE_MODE: Override to disable CME being involved in Stop sequencing, in effect converting all new stop requests into stop level 1. Setting this mode will prevent the core chiplets from hanging on STOP instructions if the CME does not respond. Available to software or simulation as a workaround. (Equivalent to setting both treat_sleep_as nap and treat_winkle_as_sleep in POWER8). **Note:** The user is responsible to first special wake-up the core chiplets corresponding to this CME before changing this bit. **Implementation note:** When set, always assert PM_ENTRY_ACK, PM_WAKE_UP, and deassert BLOCK_INTERRUPTS to both core chiplets, regardless of the values of these controls in SICR.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
17	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_STOP_ACTIVE_MASK: This mode will gate off PC_PM_STATE_ACTIVE from both core chiplets from setting the EISR (using the interrupt bolt-on fence such that it is still visible in the EINR), allowing the EIMR to remain unchanged. **Note:** Must only be set if STOP_OVERRIDE_MODE = 1; otherwise PC (and therefore the core chiplet) will hang.
18	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_AUTO_STOP1_DISABLE: Disables instant entry and exit nap mode for stop 1 without CME code involvement. This bit must be set to enable auto-promote or CME hardware workarounds for the stop 1 state. When this bit is set, the CME is responsible for controlling the stop interface to PC via the SICR for stop level 1 transitions. **Note:** The user is responsible to first special wake-up the core chiplets corresponding to this CME before changing this bit. When this bit is set, STOP1_ACTIVE_ENABLE must also be set. **Implementation note:** When a Core Chiplet asserts PC_PM_STATE_ACTIVE with PC_PM_STATE = 1 (or = 0, although it should never occur), the hardware by default automatically asserts the stop interface control signals to that core chiplet as described in STOP_OVERRIDE MODE without CME involvement. Setting this bit disables that hardware functionality.
19	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_STOP1_ACTIVE_ENABLE: This mode will enable PC_PM_STATE_ACTIVE from a core chiplet to set the EISR when a core chiplet asserts PC_PM_STATE_ACTIVE with PC_PM_STATE = 1 (or = 0, although it should never occur), allowing the EIMR to remain unchanged. Otherwise, the EISR for that core chiplet (using the interrupt bolt-on fence such that it is still visible in the EINR) is not set for this condition.
20	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_FENCE_EISR: Fence off all interrupt inputs from causing EISR bits to be set. May be used for workarounds to keep from having to clean up the EISR afterwards. **Note:** Implemented in hardware by asserting all fence inputs to the ICB.
21	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_PC_DISABLE_DROOP: Assert disable droop signal to both cores. Used to temporarily disable instruction throttling for workarounds or reconfiguration. ORed with CME_LCL_LMCR to feed a single output of CME.
22:23	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_SPARE_22_23: Implemented but unused.
24:27	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_AVG_FREQ_TSEL: Sample rate used by the AFSR[INST_CYCLE_SAMPLE] calculation, using the PPE timer, defined as $2^{(29\text{-select})}$ / Nest_Frequency. This field selects which timer output bit is used to sample the sample cycle counter. Note: The user must ensure that the value chosen never exceeds the equivalent of 2^{31} processor cycles; otherwise the sample will wrap and the calculation will be invalid. The default value for this register corresponds to 262 µs (assuming a 2 GHz processor bus).
28:31	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_SPARE_28_31: Implemented but unused.
32	WO_4P	NCX	WO_4P	CME_SCOM_LMCR_RESET_IMPRECISE_QERR: Reset the PCB queue imprecise error, to unlock the CME core SIB interface after an error occurs on a queued transaction.
33	WO_4P	NCX	WO_4P	CME_SCOM_LMCR_SET_ECC_INJECT_ERR: Write 1 to this bit causes an SRAM error to be injected by setting ECC_INJECT_ERR in the CME_SCOM_FWMR. **Note:** The ECC_INJECT_TYPE of error injected is only controllable by firmware in the CMEFWM.
34:62	RO	RO	RO	constant = 0b00000000000000000000000000000

Register Name	CME_SCOM CME Local Core Stop Interface Control Register

Description	CME_SCOM CME Local Core Stop Interface Control Register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PM_ENTRY_ACK_C0: Core 0 STOP entry acknowledgment to PC. **Note:** Output may also be asserted automatically for STOP level 1 or if the CME is halted as per LMCR bit 34.
1	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PM_ENTRY_ACK_C1: Core 1 STOP entry acknowledgment to PC. **Note:** Output may also be asserted automatically for STOP level 1 or if the CME is halted as per LMCR bit 35.
2	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PM_BLOCK_INTERRUPTS_C0: Core 0 block interrupts from allowing PC to start instructions in STOP state. **Note:** Output may also be asserted automatically for STOP level1 or if the CME is Halted as per LMCR bit 34.
3	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PM_BLOCK_INTERRUPTS_C1: Core 1 block interrupts from allowing PC to start instructions in STOP state. **Note:** Output may also be asserted automatically for STOP level1 or if the CME is Halted as per LMCR bit 35.
4	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PM_EXIT_C0: Core 0 request for PC to exit STOP state. **Note:** Output may also be asserted automatically for STOP level1 or if the CME is Halted as per LMCR bit 34.
5	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PM_EXIT_C1: Core 1 request for PC to exit STOP state. **Note:** Output may also be asserted automatically for STOP level 1 or if the CME is Halted as per LMCR bit 35.
6	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PCC_CORE_INTF_QUIESCE_C0: Core 0 processor common core logical fence.
7	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PCC_CORE_INTF_QUIESCE_C1: Core 1 processor common core logical fence.
8	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_L2_CORE_INTF_QUIESCE_C0: Core 0 logical fence to the L2.
9	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_L2_CORE_INTF_QUIESCE_C1: Core 1 logical fence to the L2.
10	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PCBMUX_REQ_C0: Core 0 PCB multiplexer request. See SISR for grant.
11	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PCBMUX_REQ_C1: Core 1 PCB multiplexer request. See SISR for grant.
12:15	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_RESERVED_12_15: Implemented but unused.
16	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_SPECIAL_WKUP_DONE_C0: Connected to special wake-up done output to Core 0 PPM only when LMCR[SPECIAL_WAKEUP_DONE_OVERRIDE] = 1.
17	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_SPECIAL_WKUP_DONE_C1: Connected to special wake-up done output to Core 1 PPM only when LMCR[SPECIAL_WAKEUP_DONE_OVERRIDE] = 1.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
18	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_L2_PURGE: L2 purge request.
19	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_L2_PURGE_ABORT: L2 purge abort.
20	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PC_THROTTLE_REQ: Requests PC to engage instruction throttling to both core chiplets.
21	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_NCU_TLBIE_QUIESCE: Request NCU to start ignoring new incoming TLBIEs.
22	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_NCU_PURGE: NCU purge request (needed for QUAD STOP states).
23	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_NCU_PURGE_ABORT: NCU purge abort (needed for QUAD STOP states).
24	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_CHTM_PURGE_C0: Core 0 CHTM purge request (needed for for QUAD STOP states).
25	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_CHTM_PURGE_C1: Core 1 CHTM purge request (needed for QUAD STOP states).
26	WO_4P	NC	WO_4P	CME_SCOM_SICR_HMI_REQUEST_C0: Pulse that sets a bit in core 0 HMER register to send an interrupt to the hypervisor. Intended for debug or workarounds.
27	WO_4P	NC	WO_4P	CME_SCOM_SICR_HMI_REQUEST_C1: Pulse that sets a bit in core 1 HMER register to send an interrupt to the hypervisor. Intended for debug or workarounds.
28	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PPM_SPARE_OUT_C0: Spare output signal to Core 0 PPM.
29	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PPM_SPARE_OUT_C1: Spare output signal to Core 1 PPM.
30:31	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_RESERVED_30_31: Implemented but unused.

Register Name	Processor Stop Control Core 0 Shadow Thread 0 Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_SCOM_PSCRS00
Address	0000000013012044 (SCOM)
Description	Processor Stop Control Register Core 0 Shadow Thread 0

Bits	SCOM	Field Mnemonic: Description
0	RWX	CME_SCOM_PSCRS00_SPARE0: Implemented but unused.
1	RWX	CME_SCOM_PSCRS00_OS_STATUS_DISABLE_A_N: OS status disable. Corresponds to PSSCR[41]. When '1' causes status field to return all zeros when read by OS.
2	RWX	CME_SCOM_PSCRS00_STATE_LOSS_ENABLE_A_N: Stop state loss enable. Corresponds to PSSCR[42]. When set, allows hardware to lose state, for example, allocate core resource to the remaining threads.
3	RWX	CME_SCOM_PSCRS00_EXIT_CRITERION_A_N: Stop exit criterion. Corresponds to PSSCR[43]. 0 = Exit power-saving mode on any interrupt without any state loss. 1 = Exit power-saving mode only on LPCR PECE conditions and take system reset interrupt with HV = 1; state loss is allowed and implementation-dependent.
4:7	RWX	CME_SCOM_PSCRS00_POWER_SAVING_LIMIT_A_N: Power-saving level limit. Corresponds to PSSCR[44:47]. Causes an OS stop request greater than or equal to this value to take an interrupt to the hypervisor instead.
8	RWX	CME_SCOM_PSCRS00_HYP_VIRT_EXIT_ENABLE: Hypervisor virtualization exit enable. Corresponds to PECE[17] and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.

Bits	SCOM	Field Mnemonic: Description
9	RWX	CME_SCOM_PSCRS00_EXT_EBB_EXIT_ENABLE: External event-based branch exit enable. Corresponds to PECE[18] and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
10	RWX	CME_SCOM_PSCRS00_EXT_RESUME_EXIT_ENABLE: External resume exit enable. Corresponds to PECE[19] and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
11	RWX	CME_SCOM_PSCRS00_EXT_EXIT_ENABLE: External OS exit enable. Corresponds to PECE[49] and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
12	RWX	CME_SCOM_PSCRS00_DEC_EXIT_ENABLE: Decrementer exit enable. Corresponds to PECE[50]. Unused by CME since this exit event is handled inside the core directly. Available to CME only for potential workarounds or sampling.
13	RWX	CME_SCOM_PSCRS00_HMI_EXIT_ENABLE: Hypervisor maintenance interrupt exit enable. Corresponds to PECE[51] and enables the malfunction alert interrupt source in WSR[32] to cause an exit from STOP state.
14:15	RWX	CME_SCOM_PSCRS00_LEVEL_TRANSITION_RATE_A_N: Stop level transition rate field. Corresponds to PSSCR[54:55]. The requested rate of progression from initial to maximum power-saving level if stop promote is implemented. Rate of progression increases with the value of level transition rate field actual rates corresponding to each value are defined by firmware and are TBD.
16:19	RWX	CME_SCOM_PSCRS00_MAX_PROMOTE_LEVEL_A_N: Maximum stop request level. Corresponds to PSSCR[56:59]. Allows hardware to auto-promote to deeper levels as the power-saved core ages (without waking up). Setting this field ≤ initial request level disables promotion. Setting this field to zero always disables auto-promotion. See STOP_REQUEST_LEVEL encoding in the following field.
20:23	RWX	CME_SCOM_PSCRS00_STOP_REQUEST_LEVEL_A_N: Stop request level. Corresponds to PSSCR[60:63]. 0x0 = Stop 0 (Quiesce thread only). 0x1 = Stop 1 (legacy nap). 0x2 = Stop 2 (legacy fast sleep). 0x3 = Stop 3 (if supported, legacy fast sleep @V_{min} using iVRMs). 0x4 = Stop 4 (instant-on; legacy deep sleep without HV loss). 0x5 - 0x7 = Reserved. 0x8 = Stop 8 (legacy deep sleep plus shared L2 clock off). 0x9 = Stop 9 (legacy fast winkle, for lab and simulation only). 0xA = Reserved. 0xB = Stop 11 (legacy deep winkle). 0xC - 0xF = Reserved.
24:63	RO	constant = 0b0000000000000000000000000000000000000000

Description	Processor Stop Control Register Core 0 Shadow Thread 1

Bits	SCOM	Field Mnemonic: Description
0	RWX	CME_SCOM_PSCRS01_SPARE0: Implemented but unused.
1	RWX	CME_SCOM_PSCRS01_OS_STATUS_DISABLE_A_N: OS status disable. Corresponds to PSSCR[41]. When '1' causes status field to return all 0's when read by OS.
2	RWX	CME_SCOM_PSCRS01_STATE_LOSS_ENABLE_A_N: Stop state loss enable. Corresponds to PSSCR[42]. When set, allows hardware to lose state, for example, allocate core resource to the remaining threads.

Bits	SCOM	Field Mnemonic: Description
3	RWX	CME_SCOM_PSCRS01_EXIT_CRITERION_A_N: Stop exit criterion. Corresponds to PSSCR[43]. 0 = Exit power-saving mode on any interrupt without any state loss. 1 = Exit power-saving mode only on LPCR PECE conditions and take system reset interrupt with HV = 1; state loss is allowed and implementation-dependent.
4:7	RWX	CME_SCOM_PSCRS01_POWER_SAVING_LIMIT_A_N: Power-saving level limit. Corresponds to PSSCR[44:47]. Causes an OS stop request greater than or equal to this value to take an interrupt to the hypervisor instead.
8	RWX	CME_SCOM_PSCRS01_HYP_VIRT_EXIT_ENABLE: Hypervisor virtualization exit enable. Corresponds to PECE[17] and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
9	RWX	CME_SCOM_PSCRS01_EXT_EBB_EXIT_ENABLE: External event-based branch exit enable. Corresponds to PECE[18] and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
10	RWX	CME_SCOM_PSCRS01_EXT_RESUME_EXIT_ENABLE: External resume exit enable. Corresponds to PECE[19] and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
11	RWX	CME_SCOM_PSCRS01_EXT_EXIT_ENABLE: External OS exit enable. Corresponds to PECE[49] and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
12	RWX	CME_SCOM_PSCRS01_DEC_EXIT_ENABLE: Decrementer exit enable. Corresponds to PECE[50]. Unused by CME since this exit event is handled inside the core directly. Available to CME only for potential workarounds or sampling.
13	RWX	CME_SCOM_PSCRS01_HMI_EXIT_ENABLE: Hypervisor maintenance interrupt exit enable. Corresponds to PECE[51] and enables the malfunction alert interrupt source in WSR[32] to cause an exit from STOP state.
14:15	RWX	CME_SCOM_PSCRS01_LEVEL_TRANSITION_RATE_A_N: Stop level transition rate field. Corresponds to PSSCR[54:55]. The requested rate of progression from initial to maximum power-saving level if stop promote is implemented. Rate of progression increases with the value of level transition rate field actual rates corresponding to each value are defined by firmware and are TBD.
16:19	RWX	CME_SCOM_PSCRS01_MAX_PROMOTE_LEVEL_A_N: Maximum stop request level. Corresponds to PSSCR[56:59]. Allows hardware to auto-promote to deeper levels as the power-saved core ages (without waking up). Setting this field ≤ initial request level disables promotion. Setting this field to zero always disables auto-promotion. See STOP_REQUEST_LEVEL encoding in the following field.
20:23	RWX	CME_SCOM_PSCRS01_STOP_REQUEST_LEVEL_A_N: Stop Request Level. Corresponds to PSSCR[60:63]. 0x0 = Stop 0 (Quiesce thread only). 0x1 = Stop 1 (legacy nap). 0x2 = Stop 2 (legacy fast sleep). 0x3 = Stop 3 (if supported, legacy fast sleep @V_{min} using iVRMs). 0x4 = Stop 4 (instant-on; legacy deep sleep without HV loss). 0x5 - 0x7 = Reserved. 0x8 = Stop 8 (legacy deep sleep plus shared L2 clock off). 0x9 = Stop 9 (legacy fast winkle, for lab and simulation only). 0xA = Reserved. 0xB = Stop 11 (legacy deep winkle). 0xC - 0xF = Reserved.

Description	Processor Stop Control Register Core 0 Shadow Thread 3

Bits	SCOM	Field Mnemonic: Description
0	RWX	CME_SCOM_PSCRS03_SPARE0: Implemented but unused.
1	RWX	CME_SCOM_PSCRS03_OS_STATUS_DISABLE_A_N: OS status disable. Corresponds to PSSCR[41]. When '1' causes status field to return all 0's when read by OS.
2	RWX	CME_SCOM_PSCRS03_STATE_LOSS_ENABLE_A_N: Stop state loss enable. Corresponds to PSSCR[42]. When set, allows hardware to lose state, for example, allocate core resource to the remaining threads.
3	RWX	CME_SCOM_PSCRS03_EXIT_CRITERION_A_N: Stop exit criterion. Corresponds to PSSCR[43]. 0 = Exit power-saving mode on any interrupt without any state loss. 1 = Exit power-saving mode only on LPCR PECE conditions and take system reset interrupt with HV = 1; state loss is allowed and implementation-dependent.
4:7	RWX	CME_SCOM_PSCRS03_POWER_SAVING_LIMIT_A_N: Power-saving level limit. Corresponds to PSSCR[44:47]. Causes an OS stop request greater than or equal to this value to take an interrupt to the hypervisor instead.
8	RWX	CME_SCOM_PSCRS03_HYP_VIRT_EXIT_ENABLE: Hypervisor virtualization exit enable. Corresponds to PECE[17] and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
9	RWX	CME_SCOM_PSCRS03_EXT_EBB_EXIT_ENABLE: External event-based branch exit enable. Corresponds to PECE[18] and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
10	RWX	CME_SCOM_PSCRS03_EXT_RESUME_EXIT_ENABLE: External resume exit enable. Corresponds to PECE[19] and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
11	RWX	CME_SCOM_PSCRS03_EXT_EXIT_ENABLE: External OS exit enable. Corresponds to PECE[49] and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
12	RWX	CME_SCOM_PSCRS03_DEC_EXIT_ENABLE: Decrementer exit enable. Corresponds to PECE[50]. Unused by CME since this exit event is handled inside the core directly. Available to CME only for potential workarounds or sampling.
13	RWX	CME_SCOM_PSCRS03_HMI_EXIT_ENABLE: Hypervisor maintenance interrupt exit enable. Corresponds to PECE[51] and enables the malfunction alert interrupt source in WSR[32] to cause an exit from STOP state.
14:15	RWX	CME_SCOM_PSCRS03_LEVEL_TRANSITION_RATE_A_N: Stop level transition rate field. Corresponds to PSSCR[54:55]. The requested rate of progression from initial to maximum power-saving level if stop promote is implemented. Rate of progression increases with the value of level transition rate field actual rates corresponding to each value are defined by firmware and are TBD.
16:19	RWX	CME_SCOM_PSCRS03_MAX_PROMOTE_LEVEL_A_N: Maximum stop request level. Corresponds to PSSCR[56:59]. Allows hardware to auto-promote to deeper levels as the power-saved core ages (without waking up). Setting this field ≤ initial request level disables promotion. Setting this field to zero always disables auto-promotion. See STOP_REQUEST_LEVEL encoding in the following field.

Bits	SCOM	Field Mnemonic: Description
20:23	RWX	CME_SCOM_PSCRS03_STOP_REQUEST_LEVEL_A_N: Stop Request Level. Corresponds to PSSCR[60:63]. 0x0 = Stop 0 (Quiesce thread only). 0x1 = Stop 1 (legacy nap). 0x2 = Stop 2 (legacy fast sleep). 0x3 = Stop 3 (if supported, legacy fast sleep @V_{min} using iVRMs). 0x4 = Stop 4 (instant-on; legacy deep sleep without HV loss). 0x5 - 0x7 = Reserved. 0x8 = Stop 8 (legacy deep sleep plus shared L2 clock off). 0x9 = Stop 9 (legacy fast winkle, for lab and simulation only). 0xA = Reserved. 0xB = Stop 11 (legacy deep winkle). 0xC - 0xF = Reserved.

Register Name	CME_LCL CME Local Stop Interface Status Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_LCL_SISR
Address	000000001301204C (SCOM)
Description	CME_LCL CME Local Stop Interface Status Register

Bits	SCOM	Field Mnemonic: Description
0	ROX	CME_LCL_SISR_PM_ENTRY_ACK_C0_ACTUAL: Actual value being driven on the CME output to Core 0 PC after all overrides have been applied.
1	ROX	CME_LCL_SISR_PM_ENTRY_ACK_C1_ACTUAL: Actual value being driven on the CME output to Core 1 PC after all overrides have been applied.
2	ROX	CME_LCL_SISR_PM_BLOCK_INTERRUPTS_C0_ACTUAL: Actual value being driven on the CME output to Core 0 PC after all overrides have been applied.
3	ROX	CME_LCL_SISR_PM_BLOCK_INTERRUPTS_C1_ACTUAL: Actual value being driven on the CME output to Core 1 PC after all overrides have been applied.
4	ROX	CME_LCL_SISR_PM_EXIT_C0_ACTUAL: Actual value being driven on the CME output to Core 0 PC after all overrides have been applied.
5	ROX	CME_LCL_SISR_PM_EXIT_C1_ACTUAL: Actual value being driven on the CME output to Core 1 PC after all overrides have been applied.
6:8	ROX	CME_LCL_SISR_RESERVED_6_8: Not implemented.
9	ROX	CME_LCL_SISR_PC_FUSED_CORE_MODE: Input signal indicating the system is in fused core mode. **Note:** This bit is not valid (will be zero) when the L2 domain (which includes PC common core) is fenced.
10	ROX	CME_LCL_SISR_PCBMUX_GRANT_C0: Core 0 PCB multiplexer grant. See SICR for request.
11	ROX	CME_LCL_SISR_PCBMUX_GRANT_C1: Core 1 PCB multiplexer grant. See SICR for request.
12:15	ROX	CME_LCL_SISR_RESERVED_12_15: Not implemented.
16	ROX	CME_LCL_SISR_SPECIAL_WAKEUP_DONE_C0_ACTUAL: Actual value being driven on the CME output to C0PPM after all overrides have been applied.
17	ROX	CME_LCL_SISR_SPECIAL_WAKEUP_DONE_C1_ACTUAL: Actual value being driven on the CME output to C1PPM after all overrides have been applied.
18:29	ROX	CME_LCL_SISR_RESERVED_18_29: Not implemented.

Bits	SCOM	Field Mnemonic: Description
30:31	ROX	CME_LCL_SISR_L2_INTF_QUIESCE_DONE_LVL_0_1: Indicates the L2 interface is quiesced per core.
32	ROX	CME_LCL_SISR_PC_UNMASKED_ATTN_C0: Core 0 Unmasked special attention indication.
33	ROX	CME_LCL_SISR_PC_UNMASKED_ATTN_C1: Core 1 Unmasked special attention indication.
34	ROX	CME_LCL_SISR_PM_STATE_ACTIVE_C0: Core 0 PM state active (raw value from PC). **Note:** May also conditionally cause an external interrupt.
35	ROX	CME_LCL_SISR_PM_STATE_ACTIVE_C1: Core 1 PM state active (raw value from PC). **Note:** May also conditionally cause an external interrupt.
36:39	ROX	CME_LCL_SISR_PM_STATE_C0: Core 0 PM state (stop level).
40:43	ROX	CME_LCL_SISR_PM_STATE_C1: Core 1 PM state (stop level).
44	ROX	CME_LCL_SISR_PM_STATE_ALL_HV_C0: Core 0 all threads in HV state.
45	ROX	CME_LCL_SISR_PM_STATE_ALL_HV_C1: Core 1 all threads in HV state.
46	ROX	CME_LCL_SISR_PC_INSTR_RUNNING_C0: Core 0 instructions running on at least one thread.
47	ROX	CME_LCL_SISR_PC_INSTR_RUNNING_C1: Core 1 instructions running on at least one thread.
48:51	ROX	CME_LCL_SISR_PC_NON_HV_RUNNING_C0: Core 0 per thread 0..3 indication if it is running in non-HV mode (used only for instant-on latency measurement).
52:55	ROX	CME_LCL_SISR_PC_NON_HV_RUNNING_C1: Core 1 per thread 0..3 indication if it is running in non-HV mode.
56	ROX	CME_LCL_SISR_ALLOW_REG_WAKEUP_C0: Core 0 PPM allow regular wake-up (control for OCC power shifting).
57	ROX	CME_LCL_SISR_ALLOW_REG_WAKEUP_C1: Core 1 PPM allow regular wake-up (control for OCC power shifting).
58:63	RO	constant = 0b000000

Register Name	CME_LCL Inter-CME Local Communication Receive Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CME.CME_LCL_ICRR
Address	000000001301204D (SCOM)
Description	CME local communication receive register

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	CME_LCL_ICRR_CME_COMM_RECV: Data received from partner CME.
32:63	RO	constant = 0b00000000000000000000000000000000

Register Name	HTM Collection Mode Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CHTMLBS0.CHTM.SC.HTM_MODE
Address	0000000013012200 (SCOM)
Description	HTM collection mode register

Bits	SCOM	Field Mnemonic: Description
0	RW	HTMSC_MODE_HTM_ENABLE: HTM enable. Set by software to start HTM trace.
1:2	RW	HTMSC_MODE_CONTENT_SEL: HTM content selection mode: Core instruction trace, LLAT trace, PPE trace, or Direct Memory Write.
3	RW	HTMSC_MODE_SPARE0: Unused bit.

Bits	SCOM	Field Mnemonic: Description
4:9	RW	HTMSC_MODE_CAPTURE: HTM capture mode(0:5) has different meanings based on the value of the content selection mode: When htm_mode_q(1 TO 2) == 00, that is, Core Instruction Trace. 00xxxx = tc_pc_trace_active asserted when HTM_STAT[Tracing] = 1 to purge the ERAT when entering and exiting trace. 01xxxx = tc_pc_trace_active asserted when HTM_MODE[HTM_Trace_enable] = 1 to purge the ERAT only at the beginning. When htm_mode_q(1 TO 2) == 01, that is, LLAT Trace. 0xxxxx = capture on assertion of l2_htm_llat_disp_req, that is, any dispatch request. 1xxxxx = capture on assertion of l2_htm_llat_disp_req AND l2_llat_htm_rcdisp_occurred, that is, only on passed dispatch. x0xxxx = capture on assertion of l2_htm_llat_disp_req, that is, loads or stores. x1xxxx = capture on assertion of l2_htm_llat_disp_req AND l2_llat_htm_rcdisp_ld_not_st, that is, only loads. xx0xxx = capture on assertion of l2_llat_htm_pbl3hit_dval. xx1xxx = no capture on assertion of l2_llat_htm_pbl3hit_dval - enable embedded time stamp. When htm_mode_q(1 TO 2) == 11, that is, Direct Memory Write. 1xxxxx = Enable HPMC-IMA Mode.
10	RW	HTMSC_MODE_DD1EQUIV: POWER8 processor with NVLink technology DD1equiv for purge done not asserted bug HW238754.
11:12	RW	HTMSC_MODE_SPARE_1TO2: Spare bits.
13	RW	HTMSC_MODE_WRAP: 0 = Stop trace when it reaches the top of trace memory. 1 = Continue trace until a stop trigger is received. Trace wraps to the beginning of trace memory when the top has been reached.
14	RW	HTMSC_MODE_DIS_TSTAMP: 0 = Writing of time stamps is enabled. 1 = Writing of time stamps is disabled.
15	RW	HTMSC_MODE_SINGLE_TSTAMP: 0 = Additional time stamp written on timer overflow. 1 = Time stamp only before new record (if enabled).
16	RW	HTMSC_MODE_DIS_STALL: 0 = Core execution stalls when buffer full, Core Trace only. 1 = Core instruction trace stall disabled.
17	RW	HTMSC_MODE_MARKERS_ONLY: 0 = Normal trace. 1 = Ave only markers and enabled stamps.
18	RW	HTMSC_MODE_DIS_GROUP: 0 = Send cmd as programmed. Convert nodal to group scope. 1 = If programmed to group or nodal, send as VGs.
19:23	RW	HTMSC_MODE_SPARES: Spares.
24:39	RW	HTMSC_MODE_VGTARGET: VG target bits used in VGs mode.
40:63	RO	constant = 0b000000000000000000000000

Register Name	HTM Trace Memory Configuration Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CHTMLBS0.CHTM.SC.HTM_MEM
Address	0000000013012201 (SCOM)
Description	HTM Trace Memory Configuration Register

Bits	SCOM	Field Mnemonic: Description
0	RW	HTMSC_MEM_ALLOC: 0 = Memory based address not configured. 1 = Memory address configured. This bit must be written to zero before setting since the HTM looks for the 0->1 transition to indicate the memory address has been updated.
1:3	RW	HTMSC_MEM_SCOPE: Configure the scope used when writing the HTM trace memory. If the scope is not large enough, the HTM will get an address error. If the scope is too large, HTM will experience excessive delay. Set scope to system if CHTM memory is on foreign link.
4	RW	HTMSC_MEM_PRIORITY: Configure the starting priority used when writing the HTM trace memory.
5	RW	HTMSC_MEM_SIZE_SMALL: 0 = Trace memory size from 512 MB to 256 GB. 1 = Trace memory size from 16 MB to 8 GB.
6:7	RW	HTMSC_MEM_SPARE: Spare bits.
8:39	RW	HTMSC_MEM_BASE: Trace memory base address (8:39). The trace memory base address must be aligned on a Trace Memory Size boundary.

Bits	SCOM	Field Mnemonic: Description
40:48	RW	HTMSC_MEM_SIZE: When htmsc_mem_size_small = 0, these bits define the mask to bits (26:35) of the trace memory base address and define the size of the trace memory between 512 MB and 256 GB. When htmsc_mem_size_small = 1, these bits define the mask to bits (31:39) of the trace memory base address and define the size of the trace memory between 16 MB and 8 GB.
49:56	RO	constant = 0b00000000

Register Name	HTM Trace Status Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CHTMLBS0.CHTM.SC.HTM_STAT
Address	0000000013012202 (SCOM)
Description	HTM Trace Status Register

Bits	SCOM	Field Mnemonic: Description
0	ROX	HTMCO_STATUS_PURGE_IN_PROG: Purge in progress.
1	ROX	HTMCO_STATUS_PURGE_DONE: Purge done.
2	ROX	HTMCO_STATUS_CRESP_OV: Not set in CHTM.
3	ROX	HTMCO_STATUS_REPAIR: Address repair. Asserted on occurrence of address error to indicate the need of software to clear and update HTM_MEM. Will stay high until HTM_MEM updated.
4	ROX	HTMCO_STATUS_BUF_WAIT: Buffer waiting. Asserted on condition of data buffers full in tracing state. Any markers, stamps, and trace data will be lost.
5	ROX	STATUS_TRIG_DROPPED_Q: Buffer Overrun Trigger. Asserted on buffer overrun due to trigger lost. Cleared on the writing of 1 to the reset trigger bit, htmsc_trig_reset.
6	ROX	HTMCO_STATUS_ADDR_ERROR: Address error. Asserted on address error when write buffer was allocated. Need to set new address range.
7	ROX	STATUS_REC_DROPPED_Q: Buffer Overrun data. Asserted on buffer overrun due to trace data lost. Cleared on the writing of 1 to the reset trigger bit, htmsc_trig_reset.
8	ROX	HTMCO_STATUS_INIT: Asserted when htm_cofsm is in Init state.
9	ROX	HTMCO_STATUS_PREREQ: Asserted when htm_cofsm is in Pre-req state.
10	ROX	HTMCO_STATUS_READY: Asserted when htm_cofsm is in Ready state.
11	ROX	HTMCO_STATUS_TRACING: Asserted when htm_cofsm is in Tracing state.
12	ROX	HTMCO_STATUS_PAUSED: Asserted when htm_cofsm is in Paused state.
13	ROX	HTMCO_STATUS_FLUSH: Asserted when htm_cofsm is in Flush state.
14	ROX	HTMCO_STATUS_COMPLETE: Asserted when htm_cofsm is in Complete state.
15	ROX	HTMCO_STATUS_ENABLE: Asserted when htm_cofsm is in Enable state.
16	ROX	HTMCO_STATUS_STAMP: Asserted when htm_cofsm is in Stamp state.
17	ROX	STATUS_SCOM_ERROR: SCOM ERROR: Asserted to indicate to the HTM that a SCOM error indication was received from the SCOM satellite. Cleared on the writing of 1 to the reset trigger bit, htmsc_trig_reset.
18:19	ROX	STATUS_UNUSED: NHTM only. Unused in CHTM.
20:63	RO	constant = 0b00000000000000000000000000000000000000000000

Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CHTMLBS0.CHTM.SC.HTM_LAST
Address	0000000013012203 (SCOM)
Description	HTM Last Address Register

Bits	**SCOM**	**Field Mnemonic: Description**
0:7	RO	constant = 0b00000000
8:56	ROX	HTM_LAST_ADDRESS: The last cache line address of the memory trace. Valid only when HTM is in the complete state.
57:63	RO	constant = 0b0000000

Register Name	**HTM SCOM Trigger Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CHTMLBS0.CHTM.SC.HTM_TRIG
Address	0000000013012204 (SCOM)
Description	HTM SCOM Trigger Register

Bits	**SCOM**	**Field Mnemonic: Description**
0	RW	HTMSC_TRIG_START: Start trigger.
1	RW	HTMSC_TRIG_STOP: Stop trigger.
2	RW	HTMSC_TRIG_PAUSE: Pause trigger.
3	RW	HTMSC_TRIG_STOP_ALT: Stop trigger 2. Legacy bit that used to be the freeze trigger in POWER6 implementation.
4	RW	HTMSC_TRIG_RESET: Reset trigger.
5	RW	HTMSC_TRIG_MARK_VALID: Mark type valid.
6:15	RW	HTMSC_TRIG_MARK_TYPE: Mark type is put into mark record when bit 5 is set.
16:63	RO	constant = 0b000000000000000000000000000000000000000000000000

Register Name	**HTM Trigger Control Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CHTMLBS0.CHTM.SC.HTM_CTRL
Address	0000000013012205 (SCOM)
Description	HTM Trigger Control Register

Bits	**SCOM**	**Field Mnemonic: Description**
0:1	RW	HTMSC_CTRL_TRIG: Local trigger forwarding. 00 = Local triggers are not forwarded to the processor bus; they are inserted into the trace when tracing. Both local and global triggers control the HTM. 01 = Local triggers are not forwarded to the processor bus; they are inserted into the trace when tracing. Only local triggers control the HTM. 1x = Local triggers are forwarded to the processor bus; they are not inserted into the trace when tracing. Only global triggers control the HTM.
2	RW	HTMSC_CTRL_MTSPR_TRIG: MTSPR trigger control. 0 = Ignore MTSPR trace triggers. 1 = Treat MTSPR trace triggers as local triggers.

Bits	SCOM	Field Mnemonic: Description
3	RW	HTMSC_CTRL_MTSPR_MARK: MTSPR marker control. 0 = Ignore MTSPR trace markers. 1 = Treat MTSPR trace markers as local markers.
4:5	RW	HTMSC_CTRL_MARK: MTSPR marker forwarding/insertion. 00 = Local markers are not forwarded to the processor bus. Both local and global markers are inserted into the trace. 01 = Local markers are not forwarded to the processor bus. Only local markers are inserted into the trace. 10 = Local markers are forwarded to the processor bus. Only global markers are inserted into the trace. 11 = Local markers are forwarded to the processor bus. Markers are not inserted into the trace.
6	RW	HTMSC_CTRL_DBG0_STOP: Stop on local DBG_Trigger0 to PC. 1 = Stop on local trace debug trigger 0. 0 = Ignore debug trigger 0.
7	RW	HTMSC_CTRL_DBG1_STOP: Stop on local DBG_Trigger1 to PC. 1 = Stop on local trace debug trigger 1. 0 = Ignore debug trigger 1.
8	RW	HTMSC_CTRL_RUN_STOP: Stop on trace run falling. 1 = Stop trace on falling edge of tcdgb_tchtm_trace_run. 0 = Ignore signal tcdgb_tchtm_trace_run.
9	RW	HTMSC_CTRL_CHIP0_STOP: Stop on PC_TC_DBG_Trigger0. 1 = Stop trigger core debug trigger 0. 0 = Ignore core debug trigger 0.
10	RW	HTMSC_CTRL_CHIP1_STOP: Stop on PC_TC_DBG_Trigger1. 1 = Stop trigger on core debug trigger 1. 0 = Ignore core debug trigger 1.
11:12	RW	HTMSC_CTRL_SPARE1112: Spare bits.
13	RW	HTMSC_CTRL_XSTOP_STOP: Stop on checkstop. 1 = Stop trigger on chiplet checkstop. 0 = Ignore chiplet checkstop.
14:15	RW	HTMSC_CTRL_SPARE1415: Spare bits.
16:63	RO	constant = 0b000000000000000000000000000000000000000000000000

Register Name	HTM IMA Status Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CHTMLBS0.CHTM.SC.HTM_IMA_STATUS
Address	000000001301220A (SCOM)
Description	HTM IMA status

Bits	SCOM	Field Mnemonic: Description
0	ROX	HTMSC_IMA_ERROR: IMA ERROR: NCU transfer error. Deasserted after performing the CHTM HPMC-IMA reset sequence.
1	ROX	HTMSC_IMA_TRACE_ACTIVE: IMA idle indicator.
2	ROX	HTMSC_PDBAR_ERROR: PDBAR parity error. Deasserted after performing the CHTM HPMC-IMA reset sequence.
3:4	ROX	HTMSC_IMA_RESERVED: Reserved.

Bits	SCOM	Field Mnemonic: Description
5:11	ROX	HTMSC_IMA_FSM: Display current IMA FSM state. 01 Disabled. 02 Idle. 04 Clear. 08 Capture. 10 Write LDBAR. 20 Write PDBAR. 40 Error.
12:15	ROX	HTMSC_IMA_COUNT: Number of writes completed to LDBAR or PDBAR address. Counts 0 to 7.
16:55	RO	constant = 0b0000000000000000000000000000000000000000

Register Name	HTM IMA PDBAR Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME0.CHTMLBS0.CHTM.SC.HTM_IMA_PDBAR
Address	000000001301220B (SCOM)
Description	HTM IMA PDBAR

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1	RW	HTMSC_IMA_ENABLE_SPLIT_CORE: This bit controls the indexing of the PDBAR address for the starting address of the write to the PDBAR space. 0 = Big core mode. 1 = Split core mode.
2:4	RW	HTMSC_IMA_PDBAR_SPARE2TO4:
5:7	RW	HTMSC_IMA_PDBAR_SCOPE: Configure the scope used for direct memory write. The scope will be forced to a group minimum unless HTM_MODE(dis_force_group) = 1. Foreign scope is not supported.
8:50	RW	HTMSC_IMA_PDBAR: IMA Write physical base address PDBAR spare bit 2 to 4.
51:63	RO	constant = 0b0000000000000

Register Name	CME_SCOM CME LFIR Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_LFIR
Address	0000000013012400 (SCOM) 0000000013012401 (SCOM1) 0000000013012402 (SCOM2)
Description	CME_SCOM CME LFIR

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_INTERNAL_ERROR: PPE asserted an internally detected error condition that caused it to halt. This indication is intended to be reported to both core PPM macros to be forwarded to the OCC complex as an error interrupt.
1	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_EXTERNAL_ERROR: PPE detected an error condition on an external interface to the memory bolt-on that caused it to halt. This indication is intended to be reported to both core PPM macros to be forwarded to the OCC complex as an error interrupt.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
2	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_PROGRESS_ERROR: PPE detected a lack of forward progress that caused it to halt. This indication is intended to be reported to both core PPM macros to be forwarded to the OCC complex as an error interrupt.
3	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_BREAKPOINT_ERROR: PPE halted either upon a hardware debug or software-requested breakpoint event. This indication is intended to be reported to both core PPM macros to be forwarded to the OCC complex as an error interrupt.
4	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_WATCHDOG: PPE asserted a watchdog timeout condition. Will likely be masked. For debug information only.
5	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_HALTED: PPE asserted a halt condition. Will likely be masked since there are several sources of halt that may be valid.
6	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_PPE_DEBUG_TRIGGER: PPE asserted a debug trigger.
7	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_SRAM_UE: SRAM uncorrectable error. CME will get a MCHK. Should be marked as as a recoverable error for runtime diagnostics reporting.
8	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_SRAM_CE: SRAM correctable error. CME received corrected data, but SRAM content is bad until the next scrub to that line. (Should be masked in the product; unmasked and marked as a recoverable error in manufacturing test.)
9	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_SRAM_SCRUB_ERR: Scrub timer tick occurred when scrub is still pending.
10	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_BCE_ERROR: Block copy engine error. BCE received an error from L3 or NCU. This also causes an interrupt to the CME, if it is running.
11	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_SPARE11: Implemented but not used. Inputs tied to 0.
12	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_SPARE12: Implemented but not used. Inputs tied to 0.
13	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_C0_IVRM_DROPOUT: Dropout was detected on core 0 chiplet iVRM. Note that if IDCR[DROPOUT_NOTIFY_ENABLE] = 1, the UNMASKED value of this bit is ORed with the two subsequent dropout indication events and sent to the QPPM as a level signal.
14	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_C1_IVRM_DROPOUT: Dropout was detected on core 1 chiplet iVRM.
15	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_CACHE_IVRM_DROPOUT: Dropout was detected on cache chiplet iVRM.
16	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_EXTREME_DROOP_ERR: Extreme droop (as reported to the DPLL) over time exceeded the threshold in VCTR. Note that if VCCR[DROOP_NOTIFY_ENABLE] = 1, the UNMASKED value of this bit is ORed with the three subsequent droop indication events and sent to the QPPM as a level signal (ORed with the DROPOUT indications above).
17	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_LARGE_DROOP_ERR: Large droop (as reported to the DPLL) over time exceeded the threshold in VCTR.
18	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_SMALL_DROOP_ERR: Small droop (as reported to the DPLL) over time exceeded the threshold in VCTR.
19	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_UNEXPECTED_DROOP_ENCODE: Detected non-thermometer code that should not be caused by metastability (that is, b'0001', b'0011', b'0010', or b'0111'). For debug and characterization only.
20	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_FIR_PARITY_ERR_DUP: Internal FIR parity error duplicate (same as fir_parity_err).

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
21	RWX	WOX_AND	WOX_OR	CME_SCOM_LFIR_FIR_PARITY_ERR: Internal FIR parity error.
22:63	RO	RO	RO	constant = 0b000000000000000000000000000000000000000000

Address	0000000013012407 (SCOM)
Description	CME_SCOM CME LFIR action1

Bits	SCOM	Field Mnemonic: Description
0:21	RW	CME_SCOM_LFIRACT1_FIR_ACTION1: LSB of action select for corresponding bit in FIR.
22:63	RO	constant = 0b000000000000000000000000000000000000000000

Register Name	PPE Local SRAM Control Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CMEARB.CSCR
Address	000000001301240A (SCOM) 000000001301240B (SCOM1) 000000001301240C (SCOM2)
Description	PPE local SRAM control register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	CSCR_SRAM_ACCESS_MODE: SRAM access mode.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
1	RWX	WOX_CLEAR	WOX_OR	CSCR_SRAM_SCRUB_ENABLE: Enable background scrub (atomic read-write) to periodically check, and if needed correct, the data in the SRAM for bit flips due to alpha particles. This bit is cleared by the hardware when a UE is detected to assist with fault analysis.
2	RW	WO_CLEAR	WO_OR	CSCR_ECC_CORRECT_DIS: Do not correct the data coming out of the array on ECC detected correctable errors. This will cause CEs to report an error back to the PPE in addition to the usual UEs.
3	RW	WO_CLEAR	WO_OR	CSCR_ECC_DETECT_DIS: Do not flag an error back to PPE for ECC miscompares. Data from the SRAM is always treated as good. Note that errors are always detected and reported to the FIR and must be masked there independently from this bit.
4	RW	WO_CLEAR	WO_OR	CSCR_ECC_INJECT_TYPE: Used only when ECC_INJECT_ERR is set. When set to 1, causes an ECC error to be reported on every SRAM read. When 0, causes a single ECC error to be indicated on the next SRAM read to occur, since it also clears ECC_INJECT_ERR when that happens.
5	RWX	WOX_CLEAR	WOX_OR	CSCR_ECC_INJECT_ERR: When set, the hardware will inject or cause a dummy uncorrectable error (UE) to be reported to both the PPE and the FIR on all SRAM reads. The SRAM contents are not modified. Type of error to inject is determined by the previous bit. If ECC_INJECT_TYPE = 1, then this bit clears when the first error is injected. Note that this bit can also be set by the PPE local register CFMSR.
6:7	RW	WO_CLEAR	WO_OR	CSCR_SPARE_6_7: Implemented but unused.
8:46	RO	RO	RO	constant = 0b000000000000000000000000000000000000000
47:59	RWX	WOX_CLEAR	WOX_OR	CSCR_SRAM_SCRUB_INDEX: 32 KB scrub index. This field is auto-incremented by hardware for every scrub operation. Upon a UE detection, this field is over-written with the index of the double word containing the error. **Note:** SRAM_SCRUB_ENABLE should be set to 0 when writing this field to prevent one cycle window from ignoring this write if a scrub update happens to occur concurrently.
60:63	RO	RO	RO	constant = 0b0000

Register Name	PPE Local SRAM Address Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CMEARB.CSAR
Address	000000001301240D (SCOM)
Description	PPE local SRAM address register

Bits	SCOM	Field Mnemonic: Description
0:15	RO	constant = 0b0000000000000000
16:28	RW	CSAR_SRAM_ADDRESS: Address of an 8-byte SRAM entry in the 32 KB SRAM array.
29:63	RO	constant = 0b00000000000000000000000000000000000

Register Name	PPE Local SRAM Data Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CMEARB.CSDR
Address	000000001301240E (SCOM)
Description	PPE local SRAM data register

Bits	SCOM	Field Mnemonic: Description
0:63	RWX	CSDR_SRAM_DATA: 8-byte SRAM data entry for the address given by the SRAM_ADDRESS. Reads cause this register to be written with data from the local SRAM. Writes cause the local SRAM to be written with the contents of this register.

Register Name	CME_SCOM CME Local BCE Control and Status Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_BCECSR
Address	000000001301240F (SCOM)
Description	CME_SCOM CME local BCE control and status register (BCECSR)

Bits	SCOM	Field Mnemonic: Description
0	ROX	CME_SCOM_BCECSR_BUSY: This field reads as '1' whenever the BCE is busy processing a transfer. This status bit is also routed to the CME external interrupt controller. It is an error to attempt to issue another start command to a busy BCE. This bit is cleared if an error occurs during the transaction.
1	RW_WCLEAR	CME_SCOM_BCECSR_ERROR: This bit is set if an error occurs during the transaction and locks this register until cleared, by writing this bit to a 1. All of the other fields of this register are ignored on a write when this bit is set.
2:3	RO	constant = 0b00
4	RW	CME_SCOM_BCECSR_RNW: Read, not write. 0 = The transfer is a write from SRAM into main memory. 1 = The transfer is a read from main memory into SRAM.
5	RW	CME_SCOM_BCECSR_BARSEL: Specifies which BCEBAR[n] to use for main memory addressing. 0 = Use BCEBAR[0] 1 = Use BCEBAR[1] **Note:** It is an error to issue a start command specifying a disabled or improperly initialized BAR (IPL host boot code requirement).
6	RW	CME_SCOM_BCECSR_PRIORITY: Specifies whether the transfer will be given priority on the processor bus over other units. Set only when block copy latency is important. 0 = Transfer will not have priority. 1 = Transfer will have priority. **Note:** Causes a trusted processor bus operation.
7	RW	CME_SCOM_BCECSR_INJECT_ERR: When set, causes the BCE to report a false error on the last block copy transaction.
8:12	RO	constant = 0b00000
13:15	RW	CME_SCOM_BCECSR_TYPE: Specifies the access mode (processor bus TTYPE) for writes from SRAM into main memory. 0 = Default mode (standard 8-byte coherent partial-DMA write). 1 = Atomic ADD. 2 = Atomic AND. 3 = Atomic OR. 4 = Atomic XOR. 5:7 = Illegal. This field is ignored for reads, but must specify a valid value for write transfers.
16	RO	constant = 0b0

Bits	SCOM	Field Mnemonic: Description
17:27	RW	CME_SCOM_BCECSR_NUM_BLOCKS: The number of 8-byte blocks to transfer for writes, or the number of 32-byte blocks to transfer for reads. This field is decremented after each block is successfully transferred. While BUSY this indicates which block is currently being copied and will always be 0 after a successfully completed transfer. After a STOP or ERROR this can be read to determine how many blocks have not yet been successfully copied. **Notes:** 1. Using a value of 0 will complete instantly and not transfer any data (for testing code). 2. Using a value greater than 0x400 is not advised because it will cause the BCE to transfer some blocks twice, potentially overwriting data.
28:39	RW	CME_SCOM_BCECSR_SBASE: Written with the SRAM block index of the first block of the transfer when the transfer is initiated, this field will be seen to increment (and possibly wrap) during the transfer. The SRAM address associated with SBASE is 0xFFFF8000 + ((SBASE * size) % 32 KB) where size is 32 bytes for reads and 8 bytes for writes. When BUSY clears without an ERROR, (that is, on a STOP or when the block copy completes), this index points to the block after the one successfully written.
40:41	RO	constant = 0b00
42:63	RW	CME_SCOM_BCECSR_MBASE: Written with the main memory block index of the first block of the transfer when the transfer is initiated, this field will be seen to increment (and possibly wrap) during the transfer. The main memory address associated with MBASE is pbase + ((MBASE * size) % extent) where pbase is the processor bus base address implied by the BCEBAR[n] register selected for the transfer, size is 32 bytes for reads and 8 bytes for writes, and extent is the BCEBAR[n] aperture size.

Register Name	PPE External Interface External Control Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CMEPPE.PPE.PPE_XIXCR
Address	0000000013012410 (SCOM)
Description	PPE External Interface external control

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1:3	WOX	PPE_XIXCR_XCR: PPE external control register CMD command. 000 = Clear debug status. 001 = Halt. 010 = Resume. 011 = Single-step. 100 = Toggle XSR[TRH]. 101 = Soft reset. 110 = Hard reset. 111 = Force halt.
4:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000

Register Name	**MIB External Interface MEM Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CMEPPE.MIB.MIB_XIMEM
Address	0000000013012417 (SCOM)
Description	MIB external interface MEM info

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	MIB_XIMEM_MEM_ADDR: MEM transaction buffer current or previous transaction byte address.
32	ROX	MIB_XIMEM_MEM_R_NW: MEM transaction buffer current or previous transaction type, read if '1' and write if '0'.
33	ROX	MIB_XIMEM_MEM_BUSY: Indicates if the transaction buffer is occupied with an ongoing transaction. Busy is cleared when the transaction is completed.
34	ROX	MIB_XIMEM_MEM_IMPRECISE_ERROR_PENDING: Indicates that the current or previous transaction had an imprecise error. Cleared when it is reported back to PPE. **Note:** The address of the erroneous transaction is copied into the SGB address latches such that the memory interface can continue to service instruction fetches.
35:42	ROX	MIB_XIMEM_MEM_BYTE_ENABLE: MEM transaction buffer current or previous transaction byte enables.
43	ROX	MIB_XIMEM_MEM_LINE_MODE: MEM transaction buffer current or previous transaction line mode. Indicates a 32-byte read request when set to '1'.
44:48	RO	constant = 0b00000
49:51	ROX	MIB_XIMEM_MEM_ERROR: MEM transaction buffer error code. Current or previous transaction got an error on the memory interface when non-zero.
52:61	RO	constant = 0b0000000000
62	ROX	MIB_XIMEM_MEM_IFETCH_PENDING: Indicates a instruction fetch is pending on the MEM interface when set to '1'.
63	ROX	MIB_XIMEM_MEM_DATAOP_PENDING: Indicates a data transaction is pending on the MEM interface when set to '1'.

Register Name	MIB External Interface Store Gather Buffer Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CMEPPE.MIB.MIB_XISGB
Address	0000000013012418 (SCOM)
Description	MIB external interface store gather buffer information

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	MIB_XISGB_STORE_ADDRESS: Contains either the SGB address 4-byte tag *or* the address of an imprecise store error that occurred when performing a previous data transaction.
32:34	RO	constant = 0b000
35	ROX	MIB_XIMEM_MEM_IMPRECISE_ERROR_PENDING: Indicates that the current or previous transaction had an imprecise error. Cleared when it is reported back to PPE. **Note:** The address of the erroneous transaction is copied into the SGB address latches such that the memory interface can continue to service instruction fetches.
36:39	ROX	MIB_XISGB_SGB_BYTE_VALID: Byte valid bits within the 4B tag. Cleared when the SGB contents are committed, meaning either flushed to memory *or* copied into the transaction buffer. **Note:** These bits can never be set if a MEM imprecise error is pending.
40:62	RO	constant = 0b00000000000000000000000
63	ROX	MIB_XISGB_SGB_FLUSH_PENDING: Indicates a store gather buffer flush to memory is pending on the MEM interface when set to '1'. This can happen only if MEM_BUSY in the MEM transaction buffer is '0'.

Register Name	MIB External Interface ICACHE Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CMEPPE.MIB.MIB_XIICAC
Address	0000000013012419 (SCOM)
Description	MIB external interface ICACHE information

Register Name	CME_SCOM CME Scratch 1 Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_SRTCH1
Address	0000000013012424 (SCOM)
Description	CME_SCOM CME scratch 1

Bits	SCOM	Field Mnemonic: Description
0:31	RW	CME_SCOM_SRTCH1_DATA: Scratch data.
32:63	RO	constant = 0b00000000000000000000000000000000

Register Name	CME_LCL CME Local External Interrupt Source Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_LCL_EISR
Address	0000000013012425 (SCOM)
Description	CME_LCL CME local external interrupt source register

Bits	SCOM	Field Mnemonic: Description
0	ROX	CME_LCL_EISR_DEBUGGER: Debugger software uses this bit to produce an interrupt. The physical input is tied low. The respective EITR bit must be set to edge so that a WOR to this register or pulse from the EIIR will produce an interrupt.
1	ROX	CME_LCL_EISR_DEBUG_TRIGGER: Asserted if the trace array logic analyzer logic has detected a trigger condition.
2	ROX	CME_LCL_EISR_QUAD_CHECKSTOP: QUAD checkstop present.
3	ROX	CME_LCL_EISR_PVREF_FAIL: The precision voltage reference circuit has failed and voltage regulation and VDM measurement is now in question.
4	ROX	CME_LCL_EISR_OCC_HEARTBEAT_LOST: OCC heartbeat lost indication from QPPM.
5	ROX	CME_LCL_EISR_CORE_CHECKSTOP: Core pair checkstop condition (recoverable).
6	ROX	CME_LCL_EISR_DROPOUT_DETECT: An iVRM dropout event occurred (pulse). May be used for characterization or tuning the iVRM dead zone where it is no longer able to regulate voltage.
7	ROX	CME_LCL_EISR_INTERCME_DIRECT_IN_0: Tied to INTERCME_DIRECT_IN bit 0. Used for general communication from the sibling CME.
8	ROX	CME_LCL_EISR_BCE_BUSY_HIGH: High priority block copy engine busy indication. (It has the same source as bit 23, but as low priority; only one of these two bits should ever be unmasked). Falling edge indicates completion or error.
9	ROX	CME_LCL_EISR_BCE_TIMEOUT: Notification that BCE has not made forward progress in the time period corresponding to two scrub timer pulses (regardless of scrub enable). The BCE remains active but CME can use this notification to communicate a problem to the OCC.
10	ROX	CME_LCL_EISR_DOORBELL3_C0: Core 0 doorbell 3. A non-zero value is present in core 0 PPM_CME_DOORBELL_REG3(0:7).
11	ROX	CME_LCL_EISR_DOORBELL3_C1: Core 1 doorbell 3. A non-zero value is present in core 1 PPM_CME_DOORBELL_REG3(0:7).
12	ROX	CME_LCL_EISR_PC_INTR_PENDING_C0: Core 0 interrupt pending (stop exit request) from PC. Mask when core is not in stop state.
13	ROX	CME_LCL_EISR_PC_INTR_PENDING_C1: Core 1 interrupt pending (stop exit request) from PC. Mask when core is not in stop state.
14	ROX	CME_LCL_EISR_SPECIAL_WAKEUP_C0: Core 0 special wake-up present (input from Core0 PPM). **Note:** Code should mask this bit when core is not in stop state.
15	ROX	CME_LCL_EISR_SPECIAL_WAKEUP_C1: Core 1 special wake-up present (input from Core1 PPM). **Note:** Code should mask this bit when core is not in stop state.
16	ROX	CME_LCL_EISR_REG_WAKEUP_C0: Core 0 external or malfunction alert interrupt wake-up source is present and enabled as a wake-up source. Code should mask this bit when core is not in stop state. **Note:** When WSR[PC_FUSED_CORE_MODE] = '1', the hardware maps external interrupts for even threads to this bit; otherwise threads 0:3.
17	ROX	CME_LCL_EISR_REG_WAKEUP_C1: Core 1 external or malfunction alert interrupt wake-up is present and enabled as a wake-up source. Code should mask this bit when core is not in stop state. **Note:** When WSR[PC_FUSED_CORE_MODE] = '1', the hardware maps external interrupts for odd threads to this bit; otherwise threads 4:7.

Bits	SCOM	Field Mnemonic: Description
18	ROX	CME_LCL_EISR_DOORBELL2_C0: Core 0 doorbell 2. A non-zero value is present in core 0 PPM_CME_DOORBELL_REG2(0:7).
19	ROX	CME_LCL_EISR_DOORBELL2_C1: Core 1 doorbell 2. A non-zero value is present in core 1 PPM_CME_DOORBELL_REG2(0:7).
20	ROX	CME_LCL_EISR_PC_PM_STATE_ACTIVE_C0: Core 0 PM state active, as controlled by FWMR. The direct signal will produce interrupts when the core chiplet enters *any* Stop state; the mode settings in FWMR allows for the entry into Stop 1 or all Stop Levels to be filtered to the CME.
21	ROX	CME_LCL_EISR_PC_PM_STATE_ACTIVE_C1: Core 1 PM state active, as controlled by FWMR. The direct signal will produce interrupts when the Core Chiplet enters *any* Stop state; the mode settings in FWMR allows for the entry into Stop 1 or all Stop Levels to be filtered to the CME.
22	ROX	CME_LCL_EISR_L2_PURGE_DONE: L2 purge done (level) in response to the SICR L2 PURGE or ABORT request.
23	ROX	CME_LCL_EISR_NCU_PURGE_DONE: NCU purge done (level) in response to the SICR L2 PURGE or ABORT request.
24	ROX	CME_LCL_EISR_CHTM_PURGE_DONE_C0: Core 0 hardware trace macro purge done pulse indication.
25	ROX	CME_LCL_EISR_CHTM_PURGE_DONE_C1: Core 1 hardware trace macro purge done pulse indication.
26	ROX	CME_LCL_EISR_BCE_BUSY_LOW: Lower priority block copy engine busy indication. (Same source as bit 6, but as high priority; only one of these two bits should ever be unmasked). Falling edge indicates completion or error.
27:28	ROX	CME_LCL_EISR_FINAL_VDM_DATA01: Final VDM data bits 0:1.
29	ROX	CME_LCL_EISR_COMM_RECVD: CME communication received. Indicates that ICRR has been updated by the partner CME.
30	ROX	CME_LCL_EISR_COMM_SEND_ACK: Indicates that the partner CME has affirmatively acknowledged the sent communication. Firmware must clear this bit (and cme_comm_send_nack) before writing to ICSR to ensure that acknowledgments are accurately recorded.
31	ROX	CME_LCL_EISR_COMM_SEND_NACK: Indicates that the partner CME has negatively acknowledged the sent communication. Firmware must clear this bit (and cme_comm_send_ack) before writing to ICSR to ensure that acknowledgments are accurately recorded.
32:33	ROX	CME_LCL_EISR_SPARE_32_33: Implemented but unused. The physical inputs are tied low.
34	ROX	CME_LCL_EISR_PMCR_UPDATE_C0: PMCR update received from core 0 (or via SCOM).
35	ROX	CME_LCL_EISR_PMCR_UPDATE_C1: PMCR update received from core 1 (or via SCOM).
36	ROX	CME_LCL_EISR_DOORBELL0_C0: Core 0 doorbell 0. A non-zero value is present in core 0 PPM_CME_DOORBELL_REG0(0:7).
37	ROX	CME_LCL_EISR_DOORBELL0_C1: Core 1 doorbell 0. A non-zero value is present in core 1 PPM_CME_DOORBELL_REG0(0:7).
38:39	ROX	CME_LCL_EISR_INTERCME_DIRECT_IN_1_2: Tied to INTERCME_DIRECT_IN(1:2). Used for general communication from the sibling CME.
40	ROX	CME_LCL_EISR_DOORBELL1_C0: Core 0 doorbell 1. A non-zero value is present in core 0 PPM_CME_DOORBELL_REG1(0:7).
41	ROX	CME_LCL_EISR_DOORBELL1_C1: Core 1 doorbell 1. A non-zero value is present in core 1 PPM_CME_DOORBELL_REG1(0:7).
42:43	ROX	CME_LCL_EISR_RESERVED_42_43: Implemented but unused. The physical inputs are tied low.
44:63	RO	constant = 0b00000000000000000000

Register Name	CME_LCL CME Local External Interrupt Mask Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_LCL_EIMR
Address	0000000013012426 (SCOM)
Description	CME_LCL CME local external interrupt mask register

Bits	SCOM	Field Mnemonic: Description
0:43	RO	CME_LCL_EIMR_INTERRUPT_MASK: (See the CME External Interrupt Source Register for bit definitions.) Masks the respective event from producing an interrupt to the CME. The events are still captured in the EISR but are not reported via interrupt signals. 0 = Not masked (Enabled). 1 = Masked.
44:63	RO	constant = 0b00000000000000000000

Register Name	CME_LCL CME Local External Interrupt Polarity Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_LCL_EIPR
Address	0000000013012427 (SCOM)
Description	CME_LCL CME local external interrupt polarity register

Bits	SCOM	Field Mnemonic: Description
0:43	RO	CME_LCL_EIPR_INTERRUPT_POLARITY: (See the CME External Interrupt Source Register for bit definitions.) Establishes the edge or polarity of an interrupt. 0 = Falling low. 1 = Rising high. When set the respective bit in the EITR is set to Level, then the Low and High meanings apply as follows: If this bit is set to Low, the respective EISR bit follows the inverted input to the OISR from the unit driving the signal. If this bit is set to High, the respective EISR bit follows the direct input to the EISR from the unit driving the signal. When the respective bit in the OITR[n] is set to Edge, then the Falling and Rising meanings apply as follows: If this bit is set to Falling, a transition from 1 to 0 of the input signal to the EISR sets the respective EISR bit. If this bit is set to Rising, a transition from 0 to 1 of the input signal to the EISR sets the respective EISR bit.
44:63	RO	constant = 0b00000000000000000000

Register Name	CME_LCL CME Local External Interrupt Type Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_LCL_EITR
Address	0000000013012428 (SCOM)
Description	CME_LCL CME Local External Interrupt Type Register

Bits	SCOM	Field Mnemonic: Description
0:43	RO	CME_LCL_EITR_INTERRUPT_TYPE: (See the CME External Interrupt Source Register for bit definitions.) Establishes the type of interrupt that is monitored. 0 = Level 1 = Edge When set to Level, the respective EISR bit follows the input to the EISR from the unit driving the signal but with the polarity defined by the EIPR. Specifically, if the respective EIPR bit is set to High, this register retains the polarity of the incoming signal; if the respective EIPR bit is set to Low, this register captures the inverted polarity of the incoming signal. When set to Edge, the respective EISR bit is asserted upon the transition defined by the EIPR of the input from the unit driving the signal. Specifically, if the respective EIPR bit is set to Rising, a transition from 0 to 1 sets the bit; if the respective EIPR bit is set to Falling, a transition from 1 to 0 sets the bit. Note: When set to Level, attempts to override the signal setting via W1CLR or WOR to the EISR will not stick as the signal input is the priority. Firmware must control the source of the Level signal to control the state of the EISR bit. When set to Edge, CLEAR and OR operations to the EISR will stick (clear or set respectively) in the EISR. **Engineering Note:** For firmware testing, a potential interrupt injection technique for Level interrupts is to override their definition to Edge and then use the OR register associated with the EISR. This will allow the injected transition to stick as the logic will not follow the input interrupt signal. However, if the firmware is expecting to find status in the driving unit, this technique may not be appropriate.
44:63	RO	constant = 0b00000000000000000000

Register Name	CME_LCL CME Local External Interrupt Status Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_LCL_EISTR
Address	0000000013012429 (SCOM)
Description	CME_LCL CME local external interrupt status register

Bits	SCOM	Field Mnemonic: Description
0:43	RO	Reserved field.

26:63	RO	constant = 0b00000000000000000000000000000000000000

Register Name	CME_SCOM CME VDM Count Configuration Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_VCCR
Address	000000001301242C (SCOM)
Description	CME_SCOM CME VDM count configuration register

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CME_SCOM_VCCR_SMALL_EVENT_THRESHOLD: Number of timer periods (or 4:1 cycle periods if DROOP_TIMER_MODE = 0) that a small droop event was seen. Used for event duration profiling (16b).
16:27	RW	CME_SCOM_VCCR_LARGE_EVENT_THRESHOLD: Number of timer periods (or 4:1 cycle periods if DROOP_TIMER_MODE = 0) that a large droop event was seen. Used for event duration profiling (12b).
28:35	RW	CME_SCOM_VCCR_EXTREME_EVENT_THRESHOLD: Number of timer periods (or 4:1 cycle periods if DROOP_TIMER_MODE = 0) that an extreme droop event was seen. Used for event duration profiling (8b).
36:37	RW	CME_SCOM_VCCR_DROOP_PROFILE_TYPE: Chooses profile type in the programmable VECR Event fields: 00 = Total droop duration (of that level or deeper) 01 = Only that level droop duration (without ever going deeper) 10 = That level-in-a-row duration (despite going deeper, before or after) 11 = Only that level in-a-row duration (without ever going deeper) **Note:** Setting an above threshold = 0x0 makes the DROOP_PROFILE(1) a *don't care*.
38	RW	CME_SCOM_VCCR_DROOP_TIMER_MODE: When '0', the VDCR counters increment their 1:1 precounter every cycle that droop level is active, and this precounter increments the corresponding 4:1 droop counter whenever it carries. When '1', the VDCR counters increment if its droop level input was ever active for one or more cache cycles between two timer input pulses (~31ns period) without a deeper droop in that same period.

Bits	SCOM	Field Mnemonic: Description
39	RW	CME_SCOM_VCCR_DROOP_CHAR_MODE: Enables Droop characterization mode. When set, this changes the behavior of the VDM sample counters (VDCR and VNCR, but not VECR) for lab characterization and disables run-time monitoring (threshold detects) from setting droop errors in the FIR. Based on this mode, the fields in VDCR and VNCR: 0 = Count how many times a droop state happened so far during the configured droop sample window, and clear at the beginning of each sample period 1 = Count how many times a droop has occurred since the last read to that register, which clears it. In this mode, code must read the QMFR register simultaneously to compare against the delta in either CYCLES or TIMEBASE pulses (dependent on DROOP_TIMER_MODE).
40	RW	CME_SCOM_VCCR_DROOP_NOTIFY_ENABLE: Causes VDM droop indication to notify the QPPM macro by enabling the UNMASKED FIR bits for the three dropout errors to OR with the (now misnamed) QPPM_IVRM_DROPOUT signal.
41:43	RW	CME_SCOM_VCCR_SPARE41_43: Implemented but not used.
44:58	RO	constant = 0b000000000000000
59:63	RW	CME_SCOM_VCCR_DROOP_SAMPLE_RATE: Sample rate used when DROOP_CHAR_MODE = 0, whose meaning is dependent on the value of DROOP_TIMER_MODE: 0 = This field specifies the rising edge of which bit of the QFMR[CYCLES] to use to start a new sample window. 1 = Bits (1:4) of this field are used as a TSEL using the PPE timer to select which output bit is used to start a new sample window (bit 0 unused). This delay is defined as $2^{(29 - \text{select})}$ / Nest_Frequency. The default value for this register corresponds to 262 µs (assuming a 2 GHz processor bus). Note that when this register is written, the first sample window will be truncated (smaller) than the selected value dependent on the relative value in the selected timer being used. An event threshold may still be reached despite the smaller window.

Register Name	**CME_SCOM CME iVRM Dropout Configuration Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_IDCR
Address	000000001301242D (SCOM)
Description	CME_SCOM CME iVRM dropout configuration register

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CME_SCOM_IDCR_DROPOUT_EVENT_THRESHOLD: Number of sustained dropout periods that must be counted before setting a dropout event. Setting this field to zero disables dropout event notifications when this field is non-zero, DROPOUT_CHAR_MODE == 0, and any of the three *_DROPOUT_EVENT_COUNT == the value of this field, the corresponding *_IVRM_DROPOUT bit is set in the FIR register and is ORed as a pulse with the DROPOUT_DETECT bit in the EISR.
24:31	RW	CME_SCOM_IDCR_DROPOUT_INAROW_THRESHOLD: Dropout count value used to determine a sustained dropout period has occurred. How many 4:1 cache cycles (or timer periods if DROPOUT_TIMER_MODE = 1) in a row the dropout must be present before being counted in the *_DROPOUT_EVENT_COUNT. Note that a value of '1' causes every dropout to be counted.
32	RW	CME_SCOM_IDCR_DROPOUT_TIMER_MODE: Dropout period timer select. Controls the dropout present condition used to increment the *_DROPOUT_INAROW_COUNT. When this field is: 0 = Every 4:1 cache cycle counts towards the droop count. (Implementation note: Dropout present is connected to the output of the dropout indication latch, which follows the value of dropout input.) 1 = Dropout indication must be asserted for an entire CME input timer pulse period to be counted (~31 ns). (Implementation note: Set-dominant sticky dropout indication latch running at 4:1 is set on every timer pulse and is reset whenever the dropout input = 0. Dropout present is the AND of the indication latch output and the timer pulse.)

Bits	SCOM	Field Mnemonic: Description
33	RW	CME_SCOM_IDCR_DROPOUT_CHAR_MODE: Enables dropout characterization mode. Changes the behavior of the *_DROPOUT_EVENT_COUNT for run time monitoring versus lab characterization of the iVRM dead zone. Based on this mode, the *_DROPOUT_EVENT_COUNT fields: 0 = Count how many times a sustained dropout period has been detected so far during the configured dropout sample window, and clear at the beginning of each sample window. 1 = Count how many times a sustained dropout period has occurred since the last read to that register, which clears it. In this mode, code must read the QFMR register simultaneously to compare against the delta in either CYCLES or TIMEBASE pulses (dependent on DROPOUT_TIMER_MODE).
34:35	RW	CME_SCOM_IDCR_SIBLING_CORE_DROPOUT_ENABLE: Connected to cme_dropout_enable_out(0:1). Used by the QUAD manager Hcode to control the dropout detection of the other pair of cores in the QUAD in the sibling CME. These bits must be set to '11' for the non-QUAD manager CME.
36:37	RW	CME_SCOM_IDCR_CORE_DROPOUT_ENABLE: These are ANDed with cme_dropout_enable_in(0:1) from the sibling CME to enable the C[01]_IVRM_DROPOUT function. These bits must be set to '11' for the non-QUAD manager CME.
38	RW	CME_SCOM_IDCR_CACHE_DROPOUT_ENABLE: Connected to cme_dropout_enable_out(2). This bit is also ANDed with cme_dropout_enable_in(2) to enable the CACHE_IVRM_DROPOUT function in this CME. This bit must also be set to '1' for the non-QUAD manager CME.
39	RW	CME_SCOM_IDCR_SPARE: Implemented but not used.
40	RW	CME_SCOM_IDCR_DROPOUT_NOTIFY_ENABLE: Causes dropout indication to notify the QPPM macro by enabling the UNMASKED FIR bits for the three Dropout errors to OR with the QPPM_IVRM_DROPOUT signal.
41:43	RW	CME_SCOM_IDCR_SPARE41_43: Implemented but not used.
44:58	RO	constant = 0b000000000000000
59:63	RW	CME_SCOM_IDCR_DROPOUT_SAMPLE_RATE: Sample rate used when DROOP_CHAR_MODE = 0, whose meaning is dependent on the value of DROOP_TIMER_MODE: 0 = This field specifies the rising edge of which bit of the QFMR[CYCLES] to use to start a new sample window. 1 = Bits (1:4) of this field are used as a TSEL using the PPE timer to select which output bit is used to start a new sample window (bit 0 unused). This delay is defined as $2^{(29 - \text{select})}$ / Nest_Frequency. The default value for this register corresponds to 262 µs (assuming a 2 GHz processor bus). Note that when this register is written, the first sample window will be truncated (smaller) than the selected value dependent on the relative value in the selected timer being used. An event threshold may still be reached despite the smaller window.

Register Name	**CME_SCOM CME Core iVRM Dropout Sample Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_CIDSR
Address	000000001301242E (SCOM)
Description	CME_SCOM CME Core IVRM Dropout Sample Register

Bits	SCOM	Field Mnemonic: Description
0:23	ROX	CME_SCOM_CIDSR_C0_DROPOUT_EVENT_COUNT: Count of how many sustained dropouts have been detected for the core chiplet 0 iVRM. This counter always saturates at 0xFFFFFF and clears when the IDCR is written. Additionally, the behavior of this field depends on the value of IDCR[DROPOUT_CHAR_MODE].
24:31	ROX	CME_SCOM_CIDSR_C0_DROPOUT_INAROW_COUNT: Counter recording how many dropout indications for the core chiplet 0 iVRM have occurred in a row form a sustained dropout period. This field increments on each dropout present and resets when either: a) this field equals the DROPOUT_INAROW_THRESHOLD, b) the dropout present indicator = 0, or c) the IDCR register is written. Note that if a reset occurs on a cycle when dropout is present, the counter is set to a value of '1' else it resets to '0'. Also note when in CHAR_MODE, starting a new sample window does not affect this counter.

Bits	SCOM	Field Mnemonic: Description
32:55	ROX	CME_SCOM_CIDSR_C1_DROPOUT_EVENT_COUNT: Count of how many sustained dropouts have been detected for the core chiplet 1 iVRM. This field operates like the core chiplet 0 counter in the preceding fields.
56:63	ROX	CME_SCOM_CIDSR_C1_DROPOUT_INAROW_COUNT: Counter recording how many dropout indications for the core chiplet 1 iVRM have occurred in a row form a sustained dropout period. This field operates like the core chiplet 0 counter in the preceding fields.

Register Name	CME_SCOM CME QUAD/Cache iVRM Dropout Sample Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_QIDSR
Address	000000001301242F (SCOM)
Description	CME_SCOM CME QUAD/Cache iVRM dropout sample register

Bits	SCOM	Field Mnemonic: Description
0:23	ROX	CME_SCOM_QIDSR_CACHE_DROPOUT_EVENT_COUNT: Count of how many sustained dropouts have been detected for the cache chiplet iVRM. This field operates like the core chiplet counters in the preceding register.
24:31	ROX	CME_SCOM_QIDSR_CACHE_DROPOUT_INAROW_COUNT: Counter recording how many dropout indications for the cache chiplet iVRM have occurred in a row form a sustained dropout period. This field operates like the core chiplet counters in the preceding register.
32:34	ROX	CME_SCOM_QIDSR_DROPOUT_SAMPLE: Instantaneous values coming directly from the iVRM dropout signals. Bit0 = Core0 (Core2 for CME1). Bit1 = Core1 (Core3 for CME1). Bit2 = Cache.
35:61	RO	constant = 0b000000000000000000000000000

Register Name	CME_SCOM CME Block Copy Engine Base Address 0 Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_BCEBAR0
Address	0000000013012430 (SCOM)
Description	CME_SCOM CME block copy engine base address register0

Bits	SCOM	Field Mnemonic: Description
0:7	RO	constant = 0b00000000
8:43	RW	CME_SCOM_BCEBAR0_BASE: Specifies bits 8:43 of the processor bus base address of the mapping. If this mapping is enabled (BCEBAR[SIZE] is not 0), the base address is required to be aligned such that the BCEBAR[SIZE] - 1 low-order bits of the field are '0'.
44:56	RO	constant = 0b0000000000000
57:58	RW	CME_SCOM_BCEBAR0_RD_SCOPE: Scope for read transaction broadcasts across the processor bus to the system memory controllers. Used to optimize processor bus traffic and latency. **Note:** Should be set intelligently based on known physical memory mapping based on CME memory location affinity.
59	RW	CME_SCOM_BCEBAR0_WR_SCOPE: Scope for write transaction broadcasts. See above for definition. **Note:** Local node scope is not allowed for writes through the NCU.
60	RW	CME_SCOM_BCEBAR0_VG_TARGET_SEL: Selects the 16-bit target for vectored group transactions to use. **Note:** This bit is ignored for read transactions when RD_SCOPE != 01 or for write transactions when WR_SCOPE != 1, in which case the target is always 0x0000. This bit should only be set as a workaround for power bus issues.

Bits	SCOM	Field Mnemonic: Description
61:63	RW	CME_SCOM_BCEBAR0_SIZE: Specifies the size of the mapping: 0 = Mapping disabled 1 = 1 MB 2 = 2 MB 3 = 4 MB 4 = 8 MB 5 = 16 MB 6 = 32 MB 7 = 64 MB

Register Name	CME_SCOM CME Block Copy Engine Base Address 1 Register

0:7	RO	constant = 0b00000000
8:43	RW	CME_SCOM_BCEBAR1_BASE: Specifies bits 8:43 of the processor bus base address of the mapping. If this mapping is enabled (BCEBAR[SIZE] not 0), the base address is required to be aligned such that the BCEBAR[SIZE] - 1 low-order bits of the field are '0'.
44:56	RO	constant = 0b0000000000000
57:58	RW	CME_SCOM_BCEBAR1_RD_SCOPE: Scope for read transaction broadcasts across the processor bus to the system memory controllers. Used to optimize processor bus traffic and latency. **Note:** Should be set intelligently based on known physical memory mapping based on CME memory location affinity.
59	RW	CME_SCOM_BCEBAR1_WR_SCOPE: Scope for write transaction broadcasts. See above for definition. **Note:** Local node scope is not allowed for writes through the NCU.
60	RW	CME_SCOM_BCEBAR1_VG_TARGET_SEL: Selects the 16-bit target for vectored group transactions to use. **Note:** This bit is ignored for read transactions when RD_SCOPE != 01 or for write transactions when WR_SCOPE != 1, in which case the target is always 0x0000. This bit should only be set as a workaround for power bus issues.
61:63	RW	CME_SCOM_BCEBAR1_SIZE: Specifies the size of the mapping: 0 = Mapping disabled 1 = 1 MB 2 = 2 MB 3 = 4 MB 4 = 8 MB 5 = 16 MB 6 = 32 MB 7 = 64 MB

Register Name	CME_SCOM CME QUAD Frequency Measurement Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_QFMR
Address	0000000013012432 (SCOM)
Description	CME_SCOM CME QUAD frequency measurement register

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	CME_SCOM_QFMR_TIMEBASE: CME Timebase free-running counter whose least significant bit increments every CME timer input pulse, which will be configured to run at nest (processor bus) clock64. (At 2 GHz, this will increment every 32 ns, and this counter will wrap every 137 seconds.) Firmware must perform all delta calculations (including accounting for the wrap condition) to perform elapsed time functions.
32:63	ROX	CME_SCOM_QFMR_CYCLES: Free-running cycle counter, that accumulates number of QUAD cycles4. Delta of this field per unit time (using the TIMEBASE field in this register) allows for an accurate average frequency calculation. The calculation is made as follows: CoreFreqavg = (Freqnest 8) * delta(CYCLESA,CYCLESB) delta(TIMEBASEA,TIMEBASEB) where the delta(A,B) function includes counter wraproll-over correction as follows: delta(A,B) = (((D=B-A)<0) ? D+=232 : D).

Register Name	CME_SCOM CME Average Frequency Sample Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_AFSR
Address	0000000013012433 (SCOM)
Description	CME_SCOM CME average frequency sample register

Bits	SCOM	Field Mnemonic: Description
0:19	ROX	CME_SCOM_AFSR_INST_CYCLE_SAMPLE: Instantaneous count of the number of cycles that elapsed during the last sample period. Allows firmware to perform an average frequency calculation over the most recent sample period. The sample rate is controlled by FWMR[AVG_FREQ_TSEL]. The average frequency can then be calculated by firmware as: (Nest_Frequency* INST_CYCLE_SAMPLE 2^(29-FWMR[AVG_FREQ_TSEL])).
20:31	RO	constant = 0b000000000000
32:51	ROX	CME_SCOM_AFSR_AVG_CYCLE_SAMPLE: Running average of sampled cycles collected since the last read to this register. Allows firmware to perform a slightly longer term average frequency calculation. **Note:** Reads reset this field to INST_CYCLE_SAMPLE. For every INST_CYCLE_SAMPLE sample, the hardware performs the following calculation: AVG_CYCLE_SAMPLE = (3*AVG_CYCLE_SAMPLE + INST_CYCLE_SAMPLE)4. This means that after four samples this field will contain: 32% previous avg + 11% three samples ago + 14% two samples ago + 19% the last sample + 25% INST_CYCLE_SAMPLE, which is approximately: 13 *previous AVG_CYCLE_SAMPLE + 25 * average of last 3 samples + 14 INST_CYCLE_SAMPLE.
52:62	RO	constant = 0b00000000000
63	ROX_CLRPART	CME_SCOM_AFSR_SAMPLE_VALID: A sample has occurred and caused this register to be updated since the last time it was read.

Register Name	CME_SCOM CME Average Frequency Threshold Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_AFTR
Address	0000000013012434 (SCOM)
Description	CME_SCOM CME average frequency threshold register

Bits	SCOM	Field Mnemonic: Description
0:19	ROX	CME_SCOM_AFTR_MAX_CYCLE_SAMPLE: Largest INST_CYCLE_SAMPLE value that occurred since the last read to this register. **Note:** Reads reset this field to AFSR[INST_CYCLE_SAMPLE].

Bits	SCOM	Field Mnemonic: Description
20:31	RO	constant = 0b000000000000
32:51	ROX	CME_SCOM_AFTR_MIN_CYCLE_SAMPLE: Smallest INST_CYCLE_SAMPLE value that occurred since the last read to this register. **Note:** Reads reset this field to AFSR[INST_CYCLE_SAMPLE].
52:63	RO	constant = 0b000000000000

Register Name	**CME_SCOM CME VDM Droop Count Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_VDCR
Address	0000000013012435 (SCOM)
Description	CME_SCOM CME VDM Droop Count Register

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	CME_SCOM_VDCR_VDM_EXTREME_DROOP_CTR: Extreme droop threshold counter (16b). This counter always saturates at 0xFFFF and clears when the VDSR is written. Otherwise the behavior of this field depends on the value of DROOP_CHAR_MODE. (Increments when b'0xxx'.)
16:39	ROX	CME_SCOM_VDCR_VDM_LARGE_DROOP_CTR: Large droop threshold counter (24b). This counter always saturates at 0xFFFFFF and clears when the VDSR is written. Otherwise the behavior of this field depends on the value of DROOP_CHAR_MODE. (Increments when b'10xx'.)
40:63	ROX	CME_SCOM_VDCR_VDM_SMALL_DROOP_CTR: Small droop threshold counter (24b). This counter always saturates at 0xFFFFFF and clears when the VDSR is written. Otherwise the behavior of this field depends on the value of DROOP_CHAR_MODE. (Increments when b'110x'.)

Register Name	**CME_SCOM CME VDM No-Droop Count Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_VNCR
Address	0000000013012436 (SCOM)
Description	No-droop count register

Bits	SCOM	Field Mnemonic: Description
0:15	RO	constant = 0b0000000000000000
16:39	ROX	CME_SCOM_VNCR_VDM_NO_DROOP_CTR: No droop threshold counter (24b). This counter always saturates at 0xFFFFFF and clears when the VDSR is written. Otherwise the behavior of this field depends on the value of DROOP_CHAR_MODE and DROOP_TIMER_MODE. (Increments when b'1110'.)
40:63	ROX	CME_SCOM_VNCR_VDM_OVERVOLT_CTR: Over-volt threshold counter (24b). This counter always saturates at 0xFFFFFF and clears when the VDSR is written. Otherwise the behavior of this field depends on the value of DROOP_CHAR_MODE and DROOP_TIMER_MODE. (Increments when b'1111'.)

Register Name	**CME_SCOM CME VDM Data Sample Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_VDSR
Address	0000000013012437 (SCOM)
Description	CME_SCOM CME VDM data sample register

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	CME_SCOM_VDSR_INSTANT_VDM_CONTROL_SUMMARY: Instantaneous VDM summary to DPLL.

Bits	SCOM	Field Mnemonic: Description
4:7	ROX	CME_SCOM_VDSR_INSTANT_CACHE_VDM_DATA: Instantaneous cache VDM output.
8:11	ROX	CME_SCOM_VDSR_INSTANT_CORE0_VDM_DATA: Instantaneous core chiplet 0 VDM output.
12:15	ROX	CME_SCOM_VDSR_INSTANT_CORE1_VDM_DATA: Instantaneous core chiplet 1 VDM output.
16:19	ROX	CME_SCOM_VDSR_INSTANT_CORE2_VDM_DATA: Instantaneous core chiplet 2 VDM output.
20:23	ROX	CME_SCOM_VDSR_INSTANT_CORE3_VDM_DATA: Instantaneous core chiplet 3 VDM output.
24:31	RO	constant = 0b00000000
32:35	ROX	CME_SCOM_VDSR_STICKY_VDM_CONTROL_SUMMARY: Worst case VDM summary to DPLL per-cycle sticky-AND operation. Resets to 1111 on read.
36:39	ROX	CME_SCOM_VDSR_STICKY_CACHE_VDM_DATA: Worst case cache VDM output per-cycle sticky-AND operation. Resets to 1111 on read.
40:43	ROX	CME_SCOM_VDSR_STICKY_CORE0_VDM_DATA: Worst case core chiplet 0 VDM output per-cycle sticky-AND operation. Resets to 1111 on read.
44:47	ROX	CME_SCOM_VDSR_STICKY_CORE1_VDM_DATA: Worst case core chiplet 1 VDM output per-cycle sticky-AND operation. Resets to 1111 on read.
48:51	ROX	CME_SCOM_VDSR_STICKY_CORE2_VDM_DATA: Worst case core chiplet 2 VDM output per-cycle sticky-AND operation. Resets to 1111 on read.
52:55	ROX	CME_SCOM_VDSR_STICKY_CORE3_VDM_DATA: Worst case (sticky) core chiplet 3 VDM output per-cycle sticky-AND operation. Resets to 1111 on read.
56:63	RO	constant = 0b00000000

Register Name	**CME_SCOM CME VDM Event Count Register**
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_VECR
Address	0000000013012438 (SCOM)
Description	CME_SCOM CME VDM Event Count Register

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	CME_SCOM_VECR_TOTAL_DROOP_EVENT_CTR: Total number of droop events detected (starting from Overvolt or No-Droop condition, regardless of depth).
16:31	ROX	CME_SCOM_VECR_SMALL_EVENT_PROFILE_CTR: Number of small droop profiled events. Counts how often the small droop event > small threshold based on DROOP_PROFILE_TYPE. 00 = Total droop duration (small or deeper). 01 = Small-only droop duration (without ever going deeper). 10 = Small-in-a-row duration (despite going deeper, before or after). 11 = Small-only in-a-row duration (without ever going deeper).
32:43	ROX	CME_SCOM_VECR_LARGER_DROOP_EVENT_CTR: Number of large (or deeper) droop events detected (starting from over-volt or no-droop droop condition).
44:55	ROX	CME_SCOM_VECR_LARGE_EVENT_PROFILE_CTR: Number of large droop profiled events. Counts how often the large droop event > large threshold based on DROOP_PROFILE_TYPE. 00 = Total droop duration (large or deeper). 01 = Large-only droop duration (without ever going deeper). 10 = Large-in-a-row duration (despite going deeper, before or after). 11 = Large-only in-a-row duration (without ever going deeper).
56:63	ROX	CME_SCOM_VECR_EXTREME_DROOP_EVENT_CTR: Number of extreme droop profiled events, droop event > extreme threshold based on DROOP_PROFILE_TYPE. 00 or 01 = Total extreme droop duration (deeper not possible). 10 or 11 = Extreme-in-a-row duration (deeper not possible).

Register Name	CME_SCOM CME VDM Count Threshold Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_VCTR
Address	0000000013012439 (SCOM)
Description	CME_SCOM CME VDM count threshold register

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CME_SCOM_VCTR_VDM_EXTREME_DROOP_THRESHOLD: Extreme droop threshold. A value of all zeros disables this threshold. Otherwise, when DROOP_CHAR_MODE = '0', if this value matches the count value for this same field in VDCR, an LFIR[extreme_droop_err] is indicated.
16:39	RW	CME_SCOM_VCTR_VDM_LARGE_DROOP_THRESHOLD: Large droop threshold. A value of all zeros disables this threshold. Otherwise, when DROOP_CHAR_MODE = '0', if this value matches the count value for this same field in VDCR, an LFIR[large_droop_err] is indicated.
40:63	RW	CME_SCOM_VCTR_VDM_SMALL_DROOP_THRESHOLD: Small droop threshold. A value of all zeros disables this threshold. Otherwise, when DROOP_CHAR_MODE = '0', if this value matches the count value for this same field in VDCR, an LFIR[small_droop_err] is indicated.

Register Name	CME_SCOM CME Local Mode Control Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_LMCR
Address	000000001301243A (SCOM) 000000001301243B (SCOM1) 000000001301243C (SCOM2)
Description	CME_SCOM CME local mode control register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_PMCR_OVERRIDE_EN: Enables SCOM writes to both PMCRS registers for manual testing access. Disables core chiplet updates from the PMCR serial interface from PC. 0 = Core shifter updates are accepted; SCOM updates are blocked and return an invalid access return code. 1 = SCOM updates are accepted; core shifter updates are ignored. **Note:** This bit is intended to only be changed during IPL, not during run time.
1	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_PSCR_OVERRIDE_EN: Enables SCOM write to the PSCRS registers for manual testing access. Disables core chiplet updates from the PSCR serial interface from PC. Same behavior as the previous bit.
2	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_PMSR_OVERRIDE_EN: Enable SCOM control for the stop-GPE or manual testing to serially shift values into the processor cores. 0 = CME writes are accepted; SCOM updates are ignored and return an invalid access return code. 1 = SCOM writes are accepted; CME writes are blocked and timeout (PPE MCHK) will occur. **Note:** This bit is intended to only be changed during IPL, not during run time.
3	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_BCECSR_OVERRIDE_EN: Disables local register writes to the BCECSR to allow SCOM to perform block copy operations to the CME SRAM instead. Same behavior as the previous bit.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
4	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_IDR_LCL_SAMPLE_EN: Allow the CME local interface to control the iVRM Dropout Data and Configuration Registers. If this bit is set to 1 and SCOM attempts to read the CIDSR and QIDSR or to write the IDCR, an invalid access error code is returned on the SCOM interface. If this bit is 0, CME attempts to read the CIDSR and QIDSR or to write the IDCR local registers are ignored (will cause a timeout) and do not clear the sample registers.
5	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_VDM_LCL_SAMPLE_EN: Allow the CME local interface to sample the VDM sample registers. If this bit is set to 1 and SCOM attempts to read the VCSR or VDSR, an invalid access error code is returned on the SCOM interface. If this bit is 0, CME attempts to read the VCSR, and VDSR local registers are ignored (will cause a timeout) and do not clear the registers.
6	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_FREQ_LCL_SAMPLE_EN: Allow the CME local interface to sample the Frequency Sample Registers. If this bit is set to 1 and SCOM attempts to read the AFSR or AFTR, an invalid access error code is returned on the SCOM interface. If this bit is 0, CME attempts to read the AFSR, and AFTR local registers are ignored (will cause a timeout) and do not clear the registers.
7	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_LOCK_PCB_ON_ERR: When set, unmasked PCB errors will cause the PCB queue logic to lock or stop accepting new PCB requests from the memory bolt-on, in order to preserve debug data in the interface registers.
8	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_QUEUED_WR_EN: Enable CME to perform queued PCB write operations. If not set, attempts to store to queued PCB address encodes will return a DSI error to PPE.
9	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_QUEUED_RD_EN: Enable CME to perform queued PCB read operations. If not set, attempts to load from queued PCB address encodes will return a DSI error to PPE.
10	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_MASK_PURGE_INTERFACE: Suppress CME from sending and receiving purge request to the L2, NCU, and CHTM. When this bit is set, the PURGE and PURGE_ABORT bits in the SICR should be gated off to always output zero from the CME to those units, and mask off the PURGE_DONE inputs from those units into the EISR (but does not mask off the corresponding EIIR bits).
11	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_SPARE_11: Implemented but unused.
12	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_C0_AUTO_SPECIAL_WAKEUP_DISABLE: When set, do not automatically force PM_EXIT = 1 and PM_ENTRY_ACK = 0 to core 0 in response to special wake-up request, and do not automatically assert done back to the core PPM (instead use the values in the SICR). **Notes:** 1. This bit should be set by CME Hcode when core chiplet is in a STOP state > 1 or transitioning in or out of the STOP state. 2. When this mode is set, special wake-up interrupts in the EIMR must never be masked by code during run time (but otherwise, in auto mode, special wake-ups should only be unmasked when the core is in Stop state). This bit should be cleared by Hcode when the core is in a Stop state such that special wake-up transitions intersecting with regular wake-ups do not create blips on PM_EXIT and confuse the PC logic.
13	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_C1_AUTO_SPECIAL_WAKEUP_DISABLE: Same as previous bit, but for core chiplet 1.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
14	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_C0_HALTED_STOP_OVERRIDE_DISABLE: By default the POWER9 core chiplets should be allowed to automatically go in and out of STOP state when the PPE is halted and not available to service its STOP entry and exit requests (in effect converting all Stop requests to a Level 1). This allows the system to continue running when the CME is being halted for lab debug, or in the unlikely event that a CME error happens. This bit should be set by CME Hcode when either core chiplet is in a STOP state > 1 or transitioning in or out of STOP state. 1 = PPE halted has no effect on the PC STOP interface signals to core chiplet 0. 0 = PPE halted indication is ORed with the CME_SCOM_FWMR[STOP_OVERRIDE_MODE] functionality for core chiplet 0.
15	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_C1_HALTED_STOP_OVERRIDE_DISABLE: Same as previous bit, but for core chiplet 1.
16	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_STOP_OVERRIDE_MODE: Override to disable CME being involved in Stop sequencing, in effect converting all new stop requests into Stop Level 1. Setting this mode will prevent the core chiplets from hanging on STOP instructions if the CME doesn't respond. Available to software or simulation as a workaround. (Equivalent to setting both treat_sleep_as nap and treat_winkle_as_sleep in POWER8). **Note:** The user is responsible to first special wake-up the core chiplets corresponding to this CME before changing this bit. **Implementation note:** When set, always assert PM_ENTRY_ACK, PM_WAKE_UP, and deassert BLOCK_INTERRUPTS to both core chiplets, regardless of the values of these controls in SICR.
17	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_STOP_ACTIVE_MASK: This mode will gate off PC_PM_STATE_ACTIVE from both core chiplets from setting the EISR (using the interrupt bolt-on fence such that it is still visible in the EINR), allowing the EIMR to remain unchanged. **Note:** Must only be set if STOP_OVERRIDE_MODE = 1, otherwise PC (and therefore the core chiplet) will hang.
18	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_AUTO_STOP1_DISABLE: Disables instant entry and exit Nap mode for Stop 1 without CME code involvement. This bit must be set to enable auto-promote or CME hardware workarounds for the Stop 1 state. When this bit is set, the CME is responsible for controlling the Stop interface to PC via the SICR for Stop Level 1 transitions. **Note:** The user is responsible to first special wake-up the core chiplets corresponding to this CME before changing this bit. When this bit is set, STOP1_ACTIVE_ENABLE must also be set. **Implementation note:** When a Core Chiplet asserts PC_PM_STATE_ACTIVE with PC_PM_STATE = 1 (or = 0 although it should never occur), the hardware by default automatically asserts the Stop interface control signals to that core chiplet as described in STOP_OVERRIDE MODE without CME involvement. Setting this bit disables that hardware functionality.
19	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_STOP1_ACTIVE_ENABLE: This mode will enable PC_PM_STATE_ACTIVE from a core chiplet to set the EISR when a core chiplet asserts PC_PM_STATE_ACTIVE with PC_PM_STATE = 1 (or = 0 although it should never occur), allowing the EIMR to remain unchanged. Otherwise, the EISR for that core chiplet (using the interrupt bolt-on fence such that it is still visible in the EINR) is not set for this condition.
20	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_FENCE_EISR: Fence off all interrupt inputs from causing EISR bits to be set. May be used for workarounds to keep from having to clean up the EISR afterwards. **Note:** Implemented in hardware by asserting all fence inputs to the ICB.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
21	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_PC_DISABLE_DROOP: Assert disable droop signal to both cores. Used to temporarily disable instruction throttling for workarounds or reconfiguration. ORed with CME_LCL_LMCR to feed a single output of CME.
22:23	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_SPARE_22_23: Implemented but unused.
24:27	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_AVG_FREQ_TSEL: Sample rate used by the AFSR[INST_CYCLE_SAMPLE] calculation, using the PPE timer, defined as $2^{(29 - select)}$ / Nest_Frequency. This field selects which timer output bit is used to sample the sample cycle counter. **Note:** It is the user's responsibility to ensure that the value chosen never exceeds the equivalent of 2^{31} processor cycles, otherwise the sample will wrap and the calculation will be invalid. The default value for this register corresponds to 262 µs (assuming a 2 GHz processor bus).
28:31	RW	WO_CLEAR	WO_OR	CME_SCOM_LMCR_SPARE_28_31: Implemented but unused.
32	WO_4P	NCX	WO_4P	CME_SCOM_LMCR_RESET_IMPRECISE_QERR: Reset the PCB queue imprecise error, to unlock the CME core SIB interface after an error occurs on a queued transaction.
33	WO_4P	NCX	WO_4P	CME_SCOM_LMCR_SET_ECC_INJECT_ERR: Write 1 to this bit causes an SRAM error to be injected by setting ECC_INJECT_ERR in the CME_SCOM_FWMR. **Note:** The ECC_INJECT_TYPE of error injected is only controllable by firmware in the CMEFWM.
34:62	RO	RO	RO	constant = 0b00000000000000000000000000000

Register Name	CME_SCOM CME Local Core Stop Interface Control Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_SICR
Address	000000001301243D (SCOM) 000000001301243E (SCOM1) 000000001301243F (SCOM2)
Description	CME_SCOM CME local core stop interface control register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PM_ENTRY_ACK_C0: Core 0 STOP entry acknowledgment to PC. **Note:** Output may also be asserted automatically for STOP level1 or if the CME is halted as per LMCR bit 34.
1	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PM_ENTRY_ACK_C1: Core 1 STOP entry acknowledgment to PC. **Note:** Output may also be asserted automatically for STOP level1 or if the CME is halted as per LMCR bit 35.
2	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PM_BLOCK_INTERRUPTS_C0: Core 0 block interrupts from allowing PC to start instructions in STOP state. **Note:** Output may also be asserted automatically for STOP level1 or if the CME is halted as per LMCR bit 34.
3	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PM_BLOCK_INTERRUPTS_C1: Core 1 block interrupts from allowing PC to start instructions in STOP state. **Note:** Output may also be asserted automatically for STOP level1 or if the CME is halted as per LMCR bit 35.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
4	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PM_EXIT_C0: Core 0 request for PC to exit STOP state. **Note:** Output may also be asserted automatically for STOP level1 or if the CME is halted as per LMCR bit 34.
5	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PM_EXIT_C1: Core 1request for PC to exit STOP state. **Note:** Output may also be asserted automatically for STOP level1 or if the CME is halted as per LMCR bit 35.
6	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PCC_CORE_INTF_QUIESCE_C0: Core 0 processor common core logical fence.
7	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PCC_CORE_INTF_QUIESCE_C1: Core 1 processor common core logical fence.
8	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_L2_CORE_INTF_QUIESCE_C0: Core 0 logical fence to the L2.
9	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_L2_CORE_INTF_QUIESCE_C1: Core 1 logical fence to the L2.
10	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PCBMUX_REQ_C0: Core 0 PCB multiplexer request. See SISR for Grant.
11	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PCBMUX_REQ_C1: Core 1 PCB multiplexer request. See SISR for grant.
12:15	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_RESERVED_12_15: Implemented but unused.
16	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_SPECIAL_WKUP_DONE_C0: Connected to special wake-up done output to core 0 PPM only when LMCR[SPECIAL_WAKEUP_DONE_OVERRIDE] = 1.
17	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_SPECIAL_WKUP_DONE_C1: Connected to special wake-up done output to core1 PPM only when LMCR[SPECIAL_WAKEUP_DONE_OVERRIDE] = 1.
18	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_L2_PURGE: L2 purge request.
19	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_L2_PURGE_ABORT: L2 purge abort.
20	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PC_THROTTLE_REQ: Requests PC to engage instruction throttling to both core chiplets.
21	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_NCU_TLBIE_QUIESCE: Request NCU to start ignoring new incoming TLBIEs.
22	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_NCU_PURGE: NCU purge request (needed for QUAD STOP states).
23	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_NCU_PURGE_ABORT: NCU purge abort (needed for QUAD STOP states).
24	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_CHTM_PURGE_C0: Core 0 CHTM purge request (needed for for QUAD STOP states).
25	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_CHTM_PURGE_C1: Core 1 CHTM purge request (needed for QUAD STOP states).
26	WO_4P	NC	WO_4P	CME_SCOM_SICR_HMI_REQUEST_C0: Pulse that sets a bit in Core0 HMER register to send an interrupt to the hypervisor. Intended for debug or workarounds.
27	WO_4P	NC	WO_4P	CME_SCOM_SICR_HMI_REQUEST_C1: Pulse that sets a bit in Core1 HMER register to send an interrupt to the hypervisor. Intended for debug or workarounds.
28	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PPM_SPARE_OUT_C0: Spare output signal to Core 0 PPM.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
29	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_PPM_SPARE_OUT_C1: Spare output signal to Core 1 PPM.
30:31	RW	WO_CLEAR	WO_OR	CME_SCOM_SICR_RESERVED_30_31: Implemented but unused.

Address	0000000013012443 (SCOM)
Description	CME_SCOM power management control register shadow core1

Bits	SCOM	Field Mnemonic: Description
0:63	RWX	CME_SCOM_PMCRS1_DATA: Meaning is defined by firmware usage. Intended to communicate Pstate requests and hints to power management firmware.

Register Name	Processor Stop Control Core 0 Shadow Thread 0 Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_PSCRS00
Address	0000000013012444 (SCOM)
Description	Processor stop control register core 0 shadow thread 0

Bits	SCOM	Field Mnemonic: Description
0	RWX	CME_SCOM_PSCRS00_SPARE0: Implemented but unused.
1	RWX	CME_SCOM_PSCRS00_OS_STATUS_DISABLE_A_N: OS status disable. Corresponds to PSSCR[41]. When set to 1, causes the status field to return all 0's when read by OS.
2	RWX	CME_SCOM_PSCRS00_STATE_LOSS_ENABLE_A_N: Stop state loss enable. Corresponds to PSSCR[42]. When set, allows hardware to lose state, for example, to allocate core resource to the remaining threads.
3	RWX	CME_SCOM_PSCRS00_EXIT_CRITERION_A_N: Stop exit criterion. Corresponds to PSSCR[43]. 0 = Exit power-saving mode on any interrupt without any state loss. 1 = Exit power-saving mode only on LPCR PECE conditions and take system reset interrupt with HV = 1; state loss is allowed and implementation-dependent.
4:7	RWX	CME_SCOM_PSCRS00_POWER_SAVING_LIMIT_A_N: Power-saving level limit. Corresponds to PSSCR[44:47]. Causes an OS stop request greater than or equal to this value to take an interrupt to the hypervisor instead.
8	RWX	CME_SCOM_PSCRS00_HYP_VIRT_EXIT_ENABLE: Hypervisor virtualization exit enable. Corresponds to PECE[17], and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
9	RWX	CME_SCOM_PSCRS00_EXT_EBB_EXIT_ENABLE: External event-based branch exit enable. Corresponds to PECE[18], and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
10	RWX	CME_SCOM_PSCRS00_EXT_RESUME_EXIT_ENABLE: External resume exit enable. Corresponds to PECE[19], and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
11	RWX	CME_SCOM_PSCRS00_EXT_EXIT_ENABLE: External OS exit enable. Corresponds to PECE[49], and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
12	RWX	CME_SCOM_PSCRS00_DEC_EXIT_ENABLE: Decrementer exit enable. Corresponds to PECE[50]. Unused by CME since this exit event is handled inside the core directly. Available to CME only for potential workarounds or sampling.
13	RWX	CME_SCOM_PSCRS00_HMI_EXIT_ENABLE: Hypervisor maintenance interrupt exit enable. Corresponds to PECE[51] and enables the malfunction alert interrupt source in WSR[32] to cause an exit from STOP state.
14:15	RWX	CME_SCOM_PSCRS00_LEVEL_TRANSITION_RATE_A_N: Stop level transition rate field. Corresponds to PSSCR[54:55]. The requested rate of progression from initial to maximum power-saving level if stop promote is implemented. The rate of progression increases with the value of the level transition rate field. Actual rates corresponding to each value are defined by firmware and are TBD.
16:19	RWX	CME_SCOM_PSCRS00_MAX_PROMOTE_LEVEL_A_N: Maximum stop request level. Corresponds to PSSCR[56:59]. Allows hardware to auto-promote to deeper levels as the power-saved core ages (without waking up). Setting this field ≤ initial request level disables promotion. Setting this field to zero always disables auto-promotion. See STOP_REQUEST_LEVEL encoding in the following field.

Bits	SCOM	Field Mnemonic: Description
20:23	RWX	CME_SCOM_PSCRS00_STOP_REQUEST_LEVEL_A_N: Stop request level. Corresponds to PSSCR[60:63]. 0x0 = Stop 0 (Quiesce thread only). 0x1 = Stop 1 (legacy nap). 0x2 = Stop 2 (legacy fast sleep). 0x3 = Stop 3 (if supported, legacy fast sleep @V_{min} using iVRMs). 0x4 = Stop 4 (instant-on; legacy deep sleep without HV loss). 0x5 - 0x7 = Reserved. 0x8 = Stop 8 (legacy deep sleep plus shared L2 clock off). 0x9 = Stop 9 (legacy fast winkle, for lab and simulation only). 0xA = Reserved. 0xB = Stop 11 (legacy deep winkle). 0xC - 0xF = Reserved.

8	RWX	CME_SCOM_PSCRS12_HYP_VIRT_EXIT_ENABLE: Hypervisor virtualization exit enable. Corresponds to PECE[17], and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
9	RWX	CME_SCOM_PSCRS12_EXT_EBB_EXIT_ENABLE: External event-based branch exit enable. Corresponds to PECE[18], and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
10	RWX	CME_SCOM_PSCRS12_EXT_RESUME_EXIT_ENABLE: External resume exit enable. Corresponds to PECE[19], and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
11	RWX	CME_SCOM_PSCRS12_EXT_EXIT_ENABLE: External OS exit enable. Corresponds to PECE[49], and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
12	RWX	CME_SCOM_PSCRS12_DEC_EXIT_ENABLE: Decrementer exit enable. Corresponds to PECE[50]. Unused by CME since this exit event is handled inside the core directly. Available to CME only for potential workarounds or sampling.
13	RWX	CME_SCOM_PSCRS12_HMI_EXIT_ENABLE: Hypervisor maintenance interrupt exit enable. Corresponds to PECE[51] and enables the malfunction alert interrupt source in WSR[32] to cause an exit from STOP state.
14:15	RWX	CME_SCOM_PSCRS12_LEVEL_TRANSITION_RATE_A_N: Stop level transition rate field. Corresponds to PSSCR[54:55]. The requested rate of progression from initial to maximum power-saving level if stop promote is implemented. The rate of progression increases with the value of the level transition rate field. Actual rates corresponding to each value are defined by firmware and are TBD.
16:19	RWX	CME_SCOM_PSCRS12_MAX_PROMOTE_LEVEL_A_N: Maximum stop request level. Corresponds to PSSCR[56:59]. Allows hardware to auto-promote to deeper levels as the power-saved core ages (without waking up). Setting this field ≤ initial request level disables promotion. Setting this field to zero always disables auto-promotion. See STOP_REQUEST_LEVEL encoding in the following field.

Bits	SCOM	Field Mnemonic: Description
20:23	RWX	CME_SCOM_PSCRS12_STOP_REQUEST_LEVEL_A_N: Stop request level. Corresponds to PSSCR[60:63]. 0x0 = Stop 0 (Quiesce thread only). 0x1 = Stop 1 (legacy nap). 0x2 = Stop 2 (legacy fast sleep). 0x3 = Stop 3 (if supported, legacy fast sleep @V_{min} using iVRMs). 0x4 = Stop 4 (instant-on; legacy deep sleep without HV loss). 0x5 - 0x7 = Reserved. 0x8 = Stop 8 (legacy deep sleep plus shared L2 clock off). 0x9 = Stop 9 (legacy fast winkle, for lab and simulation only). 0xA = Reserved. 0xB = Stop 11 (legacy deep winkle). 0xC - 0xF = Reserved.
24:63	RO	constant = 0b0000000000000000000000000000000000000000

Register Name	Processor Stop Control Core 1 Shadow Thread 3 Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_SCOM_PSCRS13
Address	000000001301244B (SCOM)
Description	Processor stop control register core 1 shadow thread 3

Bits	SCOM	Field Mnemonic: Description
0	RWX	CME_SCOM_PSCRS13_SPARE0: Implemented but unused.
1	RWX	CME_SCOM_PSCRS13_OS_STATUS_DISABLE_A_N: OS status disable. Corresponds to PSSCR[41]. When set to 1, causes the status field to return all 0's when read by OS.
2	RWX	CME_SCOM_PSCRS13_STATE_LOSS_ENABLE_A_N: Stop state loss enable. Corresponds to PSSCR[42]. When set, allows hardware to lose state, for example, to allocate core resource to the remaining threads.
3	RWX	CME_SCOM_PSCRS13_EXIT_CRITERION_A_N: Stop exit criterion. Corresponds to PSSCR[43]. 0 = Exit power-saving mode on any interrupt without any state loss 1 = Exit power-saving mode only on LPCR PECE conditions and take system reset interrupt with HV = 1; state loss is allowed and implementation-dependent.
4:7	RWX	CME_SCOM_PSCRS13_POWER_SAVING_LIMIT_A_N: Power-saving level limit. Corresponds to PSSCR[44:47]. Causes an OS stop request greater than or equal to this value to take an interrupt to the hypervisor instead.
8	RWX	CME_SCOM_PSCRS13_HYP_VIRT_EXIT_ENABLE: Hypervisor virtualization exit enable. Corresponds to PECE[17], and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
9	RWX	CME_SCOM_PSCRS13_EXT_EBB_EXIT_ENABLE: External event-based branch exit enable. Corresponds to PECE[18], and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
10	RWX	CME_SCOM_PSCRS13_EXT_RESUME_EXIT_ENABLE: External resume exit enable. Corresponds to PECE[19], and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
11	RWX	CME_SCOM_PSCRS13_EXT_EXIT_ENABLE: External OS exit enable. Corresponds to PECE[49], and enables the corresponding interrupt source in WSR[0:31] to cause an exit from STOP state.
12	RWX	CME_SCOM_PSCRS13_DEC_EXIT_ENABLE: Decrementer exit enable. Corresponds to PECE[50]. Unused by CME since this exit event is handled inside the core directly. Available to CME only for potential workarounds or sampling.
13	RWX	CME_SCOM_PSCRS13_HMI_EXIT_ENABLE: Hypervisor maintenance interrupt exit enable. Corresponds to PECE[51] and enables the malfunction alert interrupt source in WSR[32] to cause an exit from STOP state.

Bits	SCOM	Field Mnemonic: Description
14:15	RWX	CME_SCOM_PSCRS13_LEVEL_TRANSITION_RATE_A_N: Stop level transition rate field. Corresponds to PSSCR[54:55]. Register Name	CME_LCL CME Local Stop Interface Status Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_LCL_SISR
Address	000000001301244C (SCOM)
Description	CME_LCL CME local stop interface status register

Bits	SCOM	Field Mnemonic: Description
0	ROX	CME_LCL_SISR_PM_ENTRY_ACK_C0_ACTUAL: Actual value being driven on the CME output to core 0 PC after all overrides have been applied.
1	ROX	CME_LCL_SISR_PM_ENTRY_ACK_C1_ACTUAL: Actual value being driven on the CME output to core 1 PC after all overrides have been applied.
2	ROX	CME_LCL_SISR_PM_BLOCK_INTERRUPTS_C0_ACTUAL: Actual value being driven on the CME output to core 0 PC after all overrides have been applied.
3	ROX	CME_LCL_SISR_PM_BLOCK_INTERRUPTS_C1_ACTUAL: Actual value being driven on the CME output to core 1 PC after all overrides have been applied.
4	ROX	CME_LCL_SISR_PM_EXIT_C0_ACTUAL: Actual value being driven on the CME output to core 0 PC after all overrides have been applied.
5	ROX	CME_LCL_SISR_PM_EXIT_C1_ACTUAL: Actual value being driven on the CME output to core 1 PC after all overrides have been applied.
6:8	ROX	CME_LCL_SISR_RESERVED_6_8: Not implemented.
9	ROX	CME_LCL_SISR_PC_FUSED_CORE_MODE: Input signal indicating that the fused core mode is on. **Note:** This bit is not valid (will be zero) when the L2 domain (which includes PC common core) is fenced.
10	ROX	CME_LCL_SISR_PCBMUX_GRANT_C0: Core 0 PCB multiplexer grant. See SICR for request.
11	ROX	CME_LCL_SISR_PCBMUX_GRANT_C1: Core 1 PCB multiplexer grant. See SICR for request.
12:15	ROX	CME_LCL_SISR_RESERVED_12_15: Not Implemented.

Bits	SCOM	Field Mnemonic: Description
16	ROX	CME_LCL_SISR_SPECIAL_WAKEUP_DONE_C0_ACTUAL: Actual value being driven on the CME output to C0PPM after all overrides have been applied.
17	ROX	CME_LCL_SISR_SPECIAL_WAKEUP_DONE_C1_ACTUAL: Actual value being driven on the CME output to C1PPM after all overrides have been applied.
18:29	ROX	CME_LCL_SISR_RESERVED_18_29: Not implemented.
30:31	ROX	CME_LCL_SISR_L2_INTF_QUIESCE_DONE_LVL_0_1: Indicates the L2 interface is quiesced per core.
32	ROX	CME_LCL_SISR_PC_UNMASKED_ATTN_C0: Core 0 unmasked special attention indication.
33	ROX	CME_LCL_SISR_PC_UNMASKED_ATTN_C1: Core 1 unmasked special attention indication.
34	ROX	CME_LCL_SISR_PM_STATE_ACTIVE_C0: Core 0 PM state active (raw value from PC). **Note:** May also conditionally cause an external interrupt.
35	ROX	CME_LCL_SISR_PM_STATE_ACTIVE_C1: Core 1 PM state active (raw value from PC). **Note:** May also conditionally cause an external interrupt.
36:39	ROX	CME_LCL_SISR_PM_STATE_C0: Core 0 PM state (stop level).
40:43	ROX	CME_LCL_SISR_PM_STATE_C1: Core 1 PM state (stop level).
44	ROX	CME_LCL_SISR_PM_STATE_ALL_HV_C0: Core 0 all threads in HV state.
45	ROX	CME_LCL_SISR_PM_STATE_ALL_HV_C1: Core 1 all threads in HV state.
46	ROX	CME_LCL_SISR_PC_INSTR_RUNNING_C0: Core 0 Instructions running on at least one thread.
47	ROX	CME_LCL_SISR_PC_INSTR_RUNNING_C1: Core 1 instructions running on at least one thread.
48:51	ROX	CME_LCL_SISR_PC_NON_HV_RUNNING_C0: Core 0 per thread 0..3 indication if it is running in non-HV mode (used only for instant-on latency measurement).
52:55	ROX	CME_LCL_SISR_PC_NON_HV_RUNNING_C1: Core 1 per thread 0..3 indication if it is running in non-HV mode.
56	ROX	CME_LCL_SISR_ALLOW_REG_WAKEUP_C0: Core 0 PPM allow regular wake-up (control for OCC power shifting).
57	ROX	CME_LCL_SISR_ALLOW_REG_WAKEUP_C1: Core 1 PPM allow regular wake-up (control for OCC power shifting).
58:63	RO	constant = 0b000000

Register Name	CME_LCL Inter-CME Local Communication Receive Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CME.CME_LCL_ICRR
Address	000000001301244D (SCOM)
Description	CME local communication receive register

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	CME_LCL_ICRR_CME_COMM_RECV: Data received from partner CME.
32:63	RO	constant = 0b00000000000000000000000000000000

Register Name	HTM Collection Mode Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS0.CHTM.SC.HTM_MODE
Address	0000000013012600 (SCOM)
Description	HTM collection mode register

Bits	SCOM	Field Mnemonic: Description
0	RW	HTMSC_MODE_HTM_ENABLE: HTM enable, set by software to start HTM trace.
1:2	RW	HTMSC_MODE_CONTENT_SEL: HTM MODE: Core instruction trace, LLAT trace, PPE trace, or Direct Memory Write.
3	RW	HTMSC_MODE_SPARE0: Unused bit.
4:9	RW	HTMSC_MODE_CAPTURE: HTM capture mode(0:5) has different meanings according to the Content Select: When htm_mode_q(1 TO 2) == 00, that is, Core Instruction Trace. 00xxxx : tc_pc_trace_active asserted when HTM_STAT[Tracing] = 1 to purge the ERAT when entering and exitting trace. 01xxxx : tc_pc_trace_active asserted when HTM_MODE[HTM_Trace_enable] = 1 to purge the ERAT only at the beginning. When htm_mode_q(1 TO 2) == 01, that is, LLAT Trace. 0xxxxx : capture on assertion of l2_htm_llat_disp_req, that is, any dispatch request. 1xxxxx : capture on assertion of l2_htm_llat_disp_req AND l2_llat_htm_rcdisp_occurred, that is, only on passed dispatch. x0xxxx : capture on assertion of l2_htm_llat_disp_req, that is, loads or stores. x1xxxx : capture on assertion of l2_htm_llat_disp_req AND l2_llat_htm_rcdisp_ld_not_st, that is, only loads. xx0xxx : capture on assertion of l2_llat_htm_pbl3hit_dval. xx1xxx : no capture on assertion of l2_llat_htm_pbl3hit_dval - enable embedded time stamp. When htm_mode_q(1 TO 2) == 11, that is, Direct Memory Write. 1xxxxx : Enable HPMC-IMA Mode.
10	RW	HTMSC_MODE_DD1EQUIV: POWER8 processor with NVLink technology DD1equiv for purge done not asserted bug HW238754.
11:12	RW	HTMSC_MODE_SPARE_1TO2: Spare bits.
13	RW	HTMSC_MODE_WRAP: 0 = Stop trace when reach top of trace memory. 1 = Trace will continue until a stop trigger is received. Wrap to beginning of trace memory when the top has been reached.
14	RW	HTMSC_MODE_DIS_TSTAMP: 0 = Write of time stamps enabled. 1 = Disable writing of time stamps.
15	RW	HTMSC_MODE_SINGLE_TSTAMP: 0 = Additional time stamp written on timer overflow. 1 = Time stamp only before new record (if enabled).
16	RW	HTMSC_MODE_DIS_STALL: 0 = Core execution stalls when buffer full, Core Trace only. 1 = Core instruction trace stall disabled.
17	RW	HTMSC_MODE_MARKERS_ONLY: 0 = Normal trace. 1 = Ave only markers and enabled stamps.
18	RW	HTMSC_MODE_DIS_GROUP: 0 = Send command as programmed. Convert nodal to group scope. 1 = If programmed to group or nodal, send as VGs.
19:23	RW	HTMSC_MODE_SPARES: Spares.
24:39	RW	HTMSC_MODE_VGTARGET: VG target bits used in VGs mode.
40:63	RO	constant = 0b000000000000000000000000

Register Name	HTM Trace Memory Configuration Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS0.CHTM.SC.HTM_MEM
Address	0000000013012601 (SCOM)
Description	HTM trace memory configuration register

Bits	SCOM	Field Mnemonic: Description
0	RW	HTMSC_MEM_ALLOC: 0 = Memory based address not configured. 1 = Memory address configured. This bit must be written to zero before setting because the HTM looks for the 0 => 1 transition to indicate the memory address has been updated.
1:3	RW	HTMSC_MEM_SCOPE: Configure the scope used when writing the HTM trace memory. If the scope is not large enough, the HTM will get an address error. If the scope is too large, HTM will experience excessive delay. Set scope to system if CHTM memory is on foreign link.
4	RW	HTMSC_MEM_PRIORITY: Configure the starting priority used when writing the HTM trace memory.
5	RW	HTMSC_MEM_SIZE_SMALL: 0 = Trace memory size from 512 MB to 256 GB. 1 = Trace memory size from 16 MB to 8 GB.
6:7	RW	HTMSC_MEM_SPARE: Spare bits.
8:39	RW	HTMSC_MEM_BASE: Trace memory base address (8:39). The trace memory base address must be aligned on a trace memory size boundary.
40:48	RW	HTMSC_MEM_SIZE: When htmsc_mem_size_small = 0, these bits define the mask to bits (26:35) of the trace memory base address and define the size of the trace memory between 512 MB and 256 GB. When htmsc_mem_size_small = 1, these bits define the mask to bits (31:39) of the trace memory base address and define the size of the trace memory between 16 MB and 8 GB.
49:56	RO	constant = 0b00000000

Register Name	HTM Trace Status Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS0.CHTM.SC.HTM_STAT
Address	0000000013012602 (SCOM)
Description	HTM trace status register

Bits	SCOM	Field Mnemonic: Description
0	ROX	HTMCO_STATUS_PURGE_IN_PROG: Purge in progress.
1	ROX	HTMCO_STATUS_PURGE_DONE: Purge completed.
2	ROX	HTMCO_STATUS_CRESP_OV: Not set in CHTM.
3	ROX	HTMCO_STATUS_REPAIR: Address repair. Asserted on the occurrence of an address error to indicate the need of software to clear and update HTM_MEM. Will stay high until HTM_MEM is updated.
4	ROX	HTMCO_STATUS_BUF_WAIT: Buffer waiting. Asserted on condition of data buffers full in tracing state. Any markers, stamps, and trace data will be lost.
5	ROX	STATUS_TRIG_DROPPED_Q: Buffer overrun trigger. Asserted on buffer overrun due to trigger lost. Cleared on the writing of 1 to the reset trigger bit, htmsc_trig_reset.
6	ROX	HTMCO_STATUS_ADDR_ERROR: Address error. Asserted on address error when write buffer was allocated. Need to set new address range.
7	ROX	STATUS_REC_DROPPED_Q: Buffer overrun data. Asserted on buffer overrun due to trace data lost. Cleared on the writing of 1 to the reset trigger bit, htmsc_trig_reset.

Bits	SCOM	Field Mnemonic: Description
8	ROX	HTMCO_STATUS_INIT: Asserted when htm_cofsm is in Init state.
9	ROX	HTMCO_STATUS_PREREQ: Asserted when htm_cofsm is in Pre-req state.
10	ROX	HTMCO_STATUS_READY: Asserted when htm_cofsm is in Ready state.
11	ROX	HTMCO_STATUS_TRACING: Asserted when htm_cofsm is in Tracing state.
12	ROX	HTMCO_STATUS_PAUSED: Asserted when htm_cofsm is in Paused state.
13	ROX	HTMCO_STATUS_FLUSH: Asserted when htm_cofsm is in Flush state.
14	ROX	HTMCO_STATUS_COMPLETE: Asserted when htm_cofsm is in Complete state.
15	ROX	HTMCO_STATUS_ENABLE: Asserted when htm_cofsm is in Enable state.
16	ROX	HTMCO_STATUS_STAMP: Asserted when htm_cofsm is in Stamp state.
17	ROX	STATUS_SCOM_ERROR: Asserted to indicate to the HTM that a SCOM error indication was received from the SCOM satellite. Cleared on the writing of 1 to the reset trigger bit, htmsc_trig_reset.
18:19	ROX	STATUS_UNUSED: NHTM only. Unused in CHTM.
20:63	RO	constant = 0b00000000000000000000000000000000000000000000

Register Name	HTM Last Address Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS0.CHTM.SC.HTM_LAST
Address	0000000013012603 (SCOM)
Description	HTM last address register

Bits	SCOM	Field Mnemonic: Description
0:7	RO	constant = 0b00000000
8:56	ROX	HTM_LAST_ADDRESS: The last cache line address of the memory trace. Valid only when HTM is in the Complete state.
57:63	RO	constant = 0b0000000

Register Name	HTM SCOM Trigger Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS0.CHTM.SC.HTM_TRIG
Address	0000000013012604 (SCOM)
Description	HTM SCOM trigger register

Bits	SCOM	Field Mnemonic: Description
0	RW	HTMSC_TRIG_START: Start trigger.
1	RW	HTMSC_TRIG_STOP: Stop trigger.
2	RW	HTMSC_TRIG_PAUSE: Pause trigger.
3	RW	HTMSC_TRIG_STOP_ALT: Stop trigger 2. This is a legacy bit that used to be the freeze trigger in POWER6 implementation.
4	RW	HTMSC_TRIG_RESET: Reset trigger.
5	RW	HTMSC_TRIG_MARK_VALID: Mark type valid.
6:15	RW	HTMSC_TRIG_MARK_TYPE: Mark type is put into the mark record when bit 5 is set.
16:63	RO	constant = 0b000000000000000000000000000000000000000000000000

Register Name	HTM Trigger Control Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS0.CHTM.SC.HTM_CTRL
Address	0000000013012605 (SCOM)
Description	HTM trigger control register

Bits	SCOM	Field Mnemonic: Description
0:1	RW	HTMSC_CTRL_TRIG: Local trigger forwarding. 00 = Local triggers are not forwarded to the processor bus; they are inserted into the trace when tracing. Both local and global triggers control the HTM. 01 = Local triggers are not forwarded to the processor bus; they are inserted into the trace when tracing. Only local triggers control the HTM. 1x = Local triggers are forwarded to the processor bus; they are not inserted into the trace when tracing. Only global triggers control the HTM.
2	RW	HTMSC_CTRL_MTSPR_TRIG: MTSPR Trigger Control. 0 = Ignore MTSPR trace triggers. 1 = Treat MTSPR trace triggers as local triggers.
3	RW	HTMSC_CTRL_MTSPR_MARK: MTSPR marker control. 0 = Ignore MTSPR trace markers. 1 = Treat MTSPR trace markers as local markers.
4:5	RW	HTMSC_CTRL_MARK: MTSPR marker forwarding/insertion. 00 = Local markers are not forwarded to the processor bus. Both local and global markers are inserted into the trace. 01 = Local markers are not forwarded to the processor bus. Only local markers are inserted into the trace. 10 = Local markers are forwarded to the processor bus. Only global markers are inserted into the trace. 11 = Local markers are forwarded to the processor bus. Markers are not inserted into the trace.
6	RW	HTMSC_CTRL_DBG0_STOP: Stop on local DBG trigger0 to PC. 1 = Stop on local trace debug trigger 0. 0 = Ignore debug trigger 0.
7	RW	HTMSC_CTRL_DBG1_STOP: Stop on local DBG trigger1 to PC. 1 = Stop on local trace debug trigger 1. 0 = Ignore debug trigger 1.
8	RW	HTMSC_CTRL_RUN_STOP: Stop on trace run falling. 1 = Stop trace on falling edge of tcdgb_tchtm_trace_run. 0 = Ignore signal tcdgb_tchtm_trace_run.
9	RW	HTMSC_CTRL_CHIP0_STOP: Stop on PC_TC_DBG_Trigger0. 1 = Stop trigger Core Debug Trigger 0. 0 = Ignore Core Debug Trigger 0.
10	RW	HTMSC_CTRL_CHIP1_STOP: Stop on PC_TC_DBG_Trigger1. 1 = Stop trigger on Core Debug trigger 1. 0 = Ignore Core debug Trigger 1.
11:12	RW	HTMSC_CTRL_SPARE1112: Spare bits.
13	RW	HTMSC_CTRL_XSTOP_STOP: Stop on checkstop. 1 = Stop trigger on chiplet checkstop. 0 = Ignore chiplet checkstop.
14:15	RW	HTMSC_CTRL_SPARE1415: Spare bits.
16:63	RO	constant = 0b000000000000000000000000000000000000000000000000

Register Name	HTM IMA Status Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS0.CHTM.SC.HTM_IMA_STATUS
Address	000000001301260A (SCOM)
Description	HTM IMA status

Bits	SCOM	Field Mnemonic: Description
0	ROX	HTMSC_IMA_ERROR: NCU transfer error. Deasserted after performing the CHTM HPMC-IMA reset sequence.
1	ROX	HTMSC_IMA_TRACE_ACTIVE: IMA idle indicator.
2	ROX	HTMSC_PDBAR_ERROR: PDBAR parity error. Deasserted after performing the CHTM HPMC-IMA reset sequence.
3:4	ROX	HTMSC_IMA_RESERVED: Reserved.
5:11	ROX	HTMSC_IMA_FSM: Display the current IMA FSM state. 01 = Disabled. 02 = Idle. 04 = Clear. 08 = Capture. 10 = Write LDBAR. 20 = Write PDBAR. 40 = Error.
12:15	ROX	HTMSC_IMA_COUNT: Number of writes completed to LDBAR or PDBAR address. Counts 0 to 7.
16:55	RO	constant = 0b0000000000000000000000000000000000000000

Register Name	HTM IMA PDBAR Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS0.CHTM.SC.HTM_IMA_PDBAR
Address	000000001301260B (SCOM)
Description	HTM IMA PDBAR

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1	RW	HTMSC_IMA_ENABLE_SPLIT_CORE: This bit controls the indexing of the PDBAR address for the starting address of the write to the PDBAR space. 0 = Big core mode. 1 = Split core mode.
2:4	RW	HTMSC_IMA_PDBAR_SPARE2TO4:
5:7	RW	HTMSC_IMA_PDBAR_SCOPE: Configure the scope used for direct memory writes. The scope is forced to a group minimum unless HTM_MODE(dis_force_group) = 1. Foreign scope is not supported.
8:50	RW	HTMSC_IMA_PDBAR: IMA Write Physical Base Address PDBAR spare bit 2 to 4.
51:63	RO	constant = 0b0000000000000

Register Name	HTM Collection Mode Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS1.CHTM.SC.HTM_MODE
Address	0000000013012700 (SCOM)
Description	HTM collection mode register

Bits	SCOM	Field Mnemonic: Description
0	RW	HTMSC_MODE_HTM_ENABLE: HTM enable, set by software to start HTM trace.
1:2	RW	HTMSC_MODE_CONTENT_SEL: HTM MODE: Core instruction trace, LLAT trace, PPE trace, or direct memory write.
3	RW	HTMSC_MODE_SPARE0: Unused bit.
4:9	RW	HTMSC_MODE_CAPTURE: HTM capture mode(0:5) has different meanings according to the Content Select field: When htm_mode_q(1 TO 2) == 00, that is, Core Instruction Trace: 00xxxx = tc_pc_trace_active asserted when HTM_STAT[Tracing] = 1 to purge the ERAT when entering and exitting trace. 01xxxx : tc_pc_trace_active asserted when HTM_MODE[HTM_Trace_enable] = 1 to purge the ERAT only at the beginning. When htm_mode_q(1 TO 2) == 01, that is, LLAT Trace. 0xxxxx : capture on assertion of l2_htm_llat_disp_req, that is, any dispatch request. 1xxxxx : capture on assertion of l2_htm_llat_disp_req AND l2_llat_htm_rcdisp_occurred, that is, only on passed dispatch. x0xxxx : capture on assertion of l2_htm_llat_disp_req, that is, loads or stores. x1xxxx : capture on assertion of l2_htm_llat_disp_req AND l2_llat_htm_rcdisp_ld_not_st, that is, only loads. xx0xxx : capture on assertion of l2_llat_htm_pbl3hit_dval. xx1xxx : no capture on assertion of l2_llat_htm_pbl3hit_dval - enable embedded time stamp. When htm_mode_q(1 TO 2) == 11, that is, Direct Memory Write. 1xxxxx : Enable HPMC-IMA Mode.
10	RW	HTMSC_MODE_DD1EQUIV: POWER8 processor with NVLink technology DD1equiv for purge done not asserted bug HW238754.
11:12	RW	HTMSC_MODE_SPARE_1TO2: Spare bits.
13	RW	HTMSC_MODE_WRAP: 0 = Stop trace when reach top of trace memory. 1 = Trace will continue until a stop trigger is received. Wrap to beginning of trace memory when the top has been reached.
14	RW	HTMSC_MODE_DIS_TSTAMP: 0 = Write of time stamps enabled. 1 = Disable writing of time stamps.
15	RW	HTMSC_MODE_SINGLE_TSTAMP: 0 = Additional time stamp written on timer overflow. 1 = Time stamp only before new record (if enabled).
16	RW	HTMSC_MODE_DIS_STALL: 0 = Core execution stalls when buffer full, Core Trace only. 1 = Core instruction trace stall disabled.
17	RW	HTMSC_MODE_MARKERS_ONLY: 0 = Normal trace. 1 = Ave only markers and enabled stamps.
18	RW	HTMSC_MODE_DIS_GROUP: 0 = Send the command as programmed. Convert nodal to group scope. 1 = If programmed to group or nodal, send as VGs.
19:23	RW	HTMSC_MODE_SPARES: Spares.
24:39	RW	HTMSC_MODE_VGTARGET: VG target bits used in VGs mode.
40:63	RO	constant = 0b000000000000000000000000

Register Name	HTM Trace Memory Configuration Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS1.CHTM.SC.HTM_MEM
Address	0000000013012701 (SCOM)
Description	HTM trace memory configuration register

Bits	SCOM	Field Mnemonic: Description
0	RW	HTMSC_MEM_ALLOC: This bit must be written to zero before setting since the HTM looks for the 0->1 transition to indicate the memory address has been updated. 0 = Memory based address not configured. 1 = Memory address configured.
1:3	RW	HTMSC_MEM_SCOPE: Configure the scope used when writing the HTM trace memory. If the scope is not large enough, the HTM receives an address error. If the scope is too large, HTM experiences excessive delay. Set the scope to system if CHTM memory is on a foreign link.
4	RW	HTMSC_MEM_PRIORITY: Configure the starting priority used when writing the HTM trace memory.
5	RW	HTMSC_MEM_SIZE_SMALL: 0 = Trace memory size from 512 MB to 256 GB. 1 = Trace memory size from 16 MB to 8 GB.
6:7	RW	HTMSC_MEM_SPARE: Spare bits.
8:39	RW	HTMSC_MEM_BASE: Trace memory base address (8:39). The trace memory base address must be aligned on a trace memory size boundary.
40:48	RW	HTMSC_MEM_SIZE: When htmsc_mem_size_small = 0, these bits define the mask to bits (26:35) of the trace memory base address and define the size of the trace memory between 512 MB and 256 GB. When htmsc_mem_size_small = 1, these bits define the mask to bits (31:39) of the trace memory base address and define the size of the trace memory between 16 MB and 8 GB.
49:56	RO	constant = 0b00000000

Register Name	HTM Trace Status Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS1.CHTM.SC.HTM_STAT
Address	0000000013012702 (SCOM)
Description	HTM trace status register

Bits	SCOM	Field Mnemonic: Description
0	ROX	HTMCO_STATUS_PURGE_IN_PROG: Purge in progress.
1	ROX	HTMCO_STATUS_PURGE_DONE: Purge completed.
2	ROX	HTMCO_STATUS_CRESP_OV: Not set in CHTM.
3	ROX	HTMCO_STATUS_REPAIR: Address repair. Asserted on the occurrence of an address error to indicate the need for software to clear and update HTM_MEM. Remains high until HTM_MEM is updated.
4	ROX	HTMCO_STATUS_BUF_WAIT: Buffer waiting. Asserted when data buffers are full in tracing state. Any markers, stamps, and trace data will be lost.
5	ROX	STATUS_TRIG_DROPPED_Q: Buffer overrun trigger. Asserted on a buffer overrun because of a lost trigger. Cleared on the writing of 1 to the reset trigger bit, htmsc_trig_reset.
6	ROX	HTMCO_STATUS_ADDR_ERROR: Address error. Asserted on address error when the write buffer was allocated. Need to set a new address range.
7	ROX	STATUS_REC_DROPPED_Q: Buffer overrun data. Asserted on buffer overrun due to trace data lost. Cleared on the writing of 1 to the reset trigger bit, htmsc_trig_reset.

Bits	SCOM	Field Mnemonic: Description
8	ROX	HTMCO_STATUS_INIT: Asserted when htm_cofsm is in Init state.
9	ROX	HTMCO_STATUS_PREREQ: Asserted when htm_cofsm is in Pre-req state.
10	ROX	HTMCO_STATUS_READY: Asserted when htm_cofsm is in Ready state.
11	ROX	HTMCO_STATUS_TRACING: Asserted when htm_cofsm is in Tracing state.
12	ROX	HTMCO_STATUS_PAUSED: Asserted when htm_cofsm is in Paused state.
13	ROX	HTMCO_STATUS_FLUSH: Asserted when htm_cofsm is in Flush state.
14	ROX	HTMCO_STATUS_COMPLETE: Asserted when htm_cofsm is in Complete state.
15	ROX	HTMCO_STATUS_ENABLE: Asserted when htm_cofsm is in Enable state.
16	ROX	HTMCO_STATUS_STAMP: Asserted when htm_cofsm is in Stamp state.
17	ROX	STATUS_SCOM_ERROR: Asserted to indicate to the HTM that a SCOM error indication was received from the SCOM satellite. Cleared on the writing of 1 to the reset trigger bit, htmsc_trig_reset.
18:19	ROX	STATUS_UNUSED: NHTM only. Unused in CHTM.
20:63	RO	constant = 0b00000000000000000000000000000000000000000000

Register Name	HTM Last Address Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS1.CHTM.SC.HTM_LAST
Address	0000000013012703 (SCOM)
Description	HTM last address register

Bits	SCOM	Field Mnemonic: Description
0:7	RO	constant = 0b00000000
8:56	ROX	HTM_LAST_ADDRESS: The last cache line address of the memory trace. Valid only when HTM is in the complete state.
57:63	RO	constant = 0b0000000

Register Name	HTM SCOM Trigger Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS1.CHTM.SC.HTM_TRIG
Address	0000000013012704 (SCOM)
Description	HTM SCOM trigger register

Bits	SCOM	Field Mnemonic: Description
0	RW	HTMSC_TRIG_START: Start trigger.
1	RW	HTMSC_TRIG_STOP: Stop trigger.
2	RW	HTMSC_TRIG_PAUSE: Pause trigger.
3	RW	HTMSC_TRIG_STOP_ALT: Stop trigger 2. This is a legacy bit that used to be the freeze trigger in POWER6 implementation.
4	RW	HTMSC_TRIG_RESET: Reset trigger.
5	RW	HTMSC_TRIG_MARK_VALID: Mark type valid.
6:15	RW	HTMSC_TRIG_MARK_TYPE: Mark type is put into the mark record when bit 5 is set.
16:63	RO	constant = 0b000000000000000000000000000000000000000000000000

Register Name	HTM Trigger Control Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS1.CHTM.SC.HTM_CTRL
Address	0000000013012705 (SCOM)
Description	HTM trigger control register

Bits	SCOM	Field Mnemonic: Description
0:1	RW	HTMSC_CTRL_TRIG: Local trigger forwarding. 00 = Local triggers are not forwarded to the processor bus; they are inserted into the trace when tracing. Both local and global triggers control the HTM. 01 = Local triggers are not forwarded to the processor bus; they are inserted into the trace when tracing. Only local triggers control the HTM. 1x = Local triggers are forwarded to the processor bus; they are not inserted into the trace when tracing. Only global triggers control the HTM.
2	RW	HTMSC_CTRL_MTSPR_TRIG: MTSPR trigger control. 0 = Ignore MTSPR trace triggers. 1 = Treat MTSPR trace triggers as local triggers.
3	RW	HTMSC_CTRL_MTSPR_MARK: MTSPR marker control. 0 = Ignore MTSPR trace markers. 1 = Treat MTSPR trace markers as local markers.
4:5	RW	HTMSC_CTRL_MARK: MTSPR marker forwarding and insertion. 00 = Local markers are not forwarded to the processor bus. Both local and global markers are inserted into the trace. 01 = Local markers are not forwarded to the processor bus. Only local markers are inserted into the trace. 10 = Local markers are forwarded to the processor bus. Only global markers are inserted into the trace. 11 = Local markers are forwarded to the processor bus. Markers are not inserted into the trace.
6	RW	HTMSC_CTRL_DBG0_STOP: Stop on local DBG_Trigger0 to PC. 1 = Stop on local trace debug trigger 0. 0 = Ignore debug trigger 0.
7	RW	HTMSC_CTRL_DBG1_STOP: Stop on local DBG_Trigger1 to PC. 1 = Stop on local trace debug trigger 1. 0 = Ignore debug trigger 1.
8	RW	HTMSC_CTRL_RUN_STOP: Stop on trace run falling. 1 = Stop trace on falling edge of tcdgb_tchtm_trace_run. 0 = Ignore signal tcdgb_tchtm_trace_run.
9	RW	HTMSC_CTRL_CHIP0_STOP: Stop on PC_TC_DBG_Trigger0. 1 = Stop trigger core debug trigger 0. 0 = Ignore core debug trigger 0.
10	RW	HTMSC_CTRL_CHIP1_STOP: Stop on PC_TC_DBG_Trigger1. 1 = Stop trigger on core debug trigger 1. 0 = Ignore core debug trigger 1.
11:12	RW	HTMSC_CTRL_SPARE1112: Spare bits.
13	RW	HTMSC_CTRL_XSTOP_STOP: Stop on checkstop. 1 = Stop trigger on chiplet checkstop. 0 = Ignore chiplet checkstop.
14:15	RW	HTMSC_CTRL_SPARE1415: Spare bits.
16:63	RO	constant = 0b000000000000000000000000000000000000000000000000

Register Name	HTM IMA Status Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS1.CHTM.SC.HTM_IMA_STATUS
Address	000000001301270A (SCOM)
Description	HTM IMA status

Bits	SCOM	Field Mnemonic: Description
0	ROX	HTMSC_IMA_ERROR: IMA ERROR : NCU transfer error. Deasserted after performing the CHTM HPMC-IMA reset sequence.
1	ROX	HTMSC_IMA_TRACE_ACTIVE: IMA trace active. IMA idle indicator.
2	ROX	HTMSC_PDBAR_ERROR: PDBAR parity error. Deasserted after performing the CHTM HPMC-IMA reset sequence.
3:4	ROX	HTMSC_IMA_RESERVED: Reserved.
5:11	ROX	HTMSC_IMA_FSM: Display the current IMA FSM state. 01 = Disabled. 02 = Idle. 04 = Clear. 08 = Capture. 10 = Write LDBAR. 20 = Write PDBAR. 40 = Error.
12:15	ROX	HTMSC_IMA_COUNT: Number of writes completed to LDBAR or PDBAR address. Counts 0 to 7.
16:55	RO	constant = 0b0000000000000000000000000000000000000000

Register Name	HTM IMA PDBAR Register
Mnemonic	TP.TCEP03.TPCL3.PPE.CME1.CHTMLBS1.CHTM.SC.HTM_IMA_PDBAR
Address	000000001301270B (SCOM)
Description	HTM IMA PDBAR

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1	RW	HTMSC_IMA_ENABLE_SPLIT_CORE: This bit controls the indexing of the PDBAR address for the starting address of the write to the PDBAR space. 0 = Big core mode. 1 = Split core mode.
2:4	RW	HTMSC_IMA_PDBAR_SPARE2TO4:
5:7	RW	HTMSC_IMA_PDBAR_SCOPE: Configure the scope used for direct memory write. The scope is forced to a group minimum unless HTM_MODE(dis_force_group) = 1. Foreign scope is not supported.
8:50	RW	HTMSC_IMA_PDBAR: IMA write physical base address PDBAR spare bit 2 to 4.
51:63	RO	constant = 0b0000000000000

14. CORE Chiplet

The POWER9 processor registers are listed alphabetically by mnemonic in the following address table.

Mnemonic	Address	Page
EX07.EC.C0.IFU.IFRE.IFCER0.ERR_INJ_REG	0x000000002E010C04	2296

The POWER9 processor registers are listed in the following tables.

Register Name	Chiplet Control Register 0
Mnemonic	TP.TCEC14.CORE.CPLT_CTRL0
Address	000000002E000000 (SCOM) 000000002E000010 (SCOM1) 000000002E000020 (SCOM2)
Description	This register contains the first set of vital chiplet controls.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_OR	WO_CLEAR	CTRL_CC_ABSTCLK_MUXSEL_DC: Select the ABIST clock source for arrays on a chiplet boundary. When set to 1, clocks are used from a chiplet with ABIST.
1	RW	WO_OR	WO_CLEAR	TC_UNIT_SYNCCLK_MUXSEL_DC: Select the synchronous clock for asynchronous latches. (The initial value is 1.)
2	RW	WO_OR	WO_CLEAR	CTRL_CC_FLUSHMODE_INH_DC: Prevent pipeline latches from going into flush mode. (The initial value is 1.)
3	RW	WO_OR	WO_CLEAR	CTRL_CC_FORCE_ALIGN_DC: Force an alignment signal to be sent. (The initial value is 1. Drop before dropping flushmode_inh.)
4	RW	WO_OR	WO_CLEAR	TC_UNIT_ARY_WRT_THRU_DC: Set the array into write-through mode. Used for LBIST.
5	RW	WO_OR	WO_CLEAR	TC_UNIT_AVP_MODE: AVP mode. Switches from refresh pulse to phase counter.
6	RW	WO_OR	WO_CLEAR	FREE_USAGE_6A: Free usage.
7	RW	WO_OR	WO_CLEAR	FREE_USAGE_7A: Free usage.
8	RW	WO_OR	WO_CLEAR	CTRL_CC_ABIST_RECOV_DISABLE_DC: New signal to disable recovery.
9	RW	WO_OR	WO_CLEAR	FREE_USAGE_9A: Free usage.
10	RW	WO_OR	WO_CLEAR	TC_UNIT_IOBIST_TX_WRAP_ENABLE_DC:
11	RW	WO_OR	WO_CLEAR	RESERVED_11A: Reserved.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
12	RW	WO_OR	WO_CLEAR	TC_SKIT_MODE_BIST_DC:
13	RW	WO_OR	WO_CLEAR	TC_UNIT_DETERMINISTIC_TEST_ENABLE_DC: Forces login into deterministic test mode. For example, for LBIST.
14	RW	WO_OR	WO_CLEAR	TC_UNIT_CONSTRAIN_SAFESCAN_DC: Safe scan of N1L latches. Prevent lock when switching SE.
15	RW	WO_OR	WO_CLEAR	TC_UNIT_RRFA_TEST_ENABLE_DC:
16	RW	WO_OR	WO_CLEAR	TC_NBTI_HDR_ENABLE_OVR_DC: NBTI.
17	RW	WO_OR	WO_CLEAR	TC_NBTI_PROBE_GATE_DC: NBTI.
18	RW	WO_OR	WO_CLEAR	RESERVED_18A: Reserved.
19	RW	WO_OR	WO_CLEAR	RESERVED_19A: Reserved.
20:27	RW	WO_OR	WO_CLEAR	TC_PSRO_SEL_DC: PSRO select.
28	RW	WO_OR	WO_CLEAR	TC_BSC_WRAPSEL_DC: Wrap select for BSC.
29	RW	WO_OR	WO_CLEAR	TC_BSC_INTMODE_DC: INT mode for BSC.
30	RW	WO_OR	WO_CLEAR	TC_BSC_INV_DC: INV for BSC mode.
31	RW	WO_OR	WO_CLEAR	TC_BSC_EXTMODE_DC: EXT mode for BSC.
32	RW	WO_OR	WO_CLEAR	TC_REFCLK_DRVR_EN_DC: Reference clock driver enable.
33	RW	WO_OR	WO_CLEAR	RESERVED_33A: Reserved.
34	RW	WO_OR	WO_CLEAR	RESERVED_34A: Reserved.
35	RW	WO_OR	WO_CLEAR	RESERVED_35A: Reserved.
36	RW	WO_OR	WO_CLEAR	TC_OELCC_EDGE_DELAYED_DC: Allows to delay the alignment by one fast cycle. Only used in dual mesh chiplets.
37	RW	WO_OR	WO_CLEAR	TC_OELCC_ALIGN_FLUSH_DC: Forces the alignment and odd/even toggling latch into a flush state. For DFT only.
38	RW	WO_OR	WO_CLEAR	RESERVED_38A: Reserved.
39	RW	WO_OR	WO_CLEAR	RESERVED_39A: Reserved.
40:41	RW	WO_OR	WO_CLEAR	CTRL_MISC_CLKDIV_SEL_DC: Clock divider select. 00 = 1024:1 01 = 64:1 10 = 16:1 11 = 4:1
42	RW	WO_OR	WO_CLEAR	RESERVED_42A: Reserved.
43	RW	WO_OR	WO_CLEAR	RESERVED_43A: Reserved.
44	RW	WO_OR	WO_CLEAR	CTRL_CC_DCTEST_DC: TE = 1 only. Enable DCTEST.
45	RW	WO_OR	WO_CLEAR	CTRL_CC_OTP_PRGMODE_DC: TE = 1 only. OTP ROM program mode.
46	RW	WO_OR	WO_CLEAR	CTRL_CC_SSS_CALIBRATE_DC: TE = 1 only. Sensors calibration.
47	RW	WO_OR	WO_CLEAR	CTRL_CC_PIN_LBIST_DC: TE = 1 only. PIN LBIST mode. The LBIST is controlled by the pin, not by the OPCG.
48	RW	WO_OR	WO_CLEAR	FREE_USAGE_48A: Free usage.
49	RW	WO_OR	WO_CLEAR	FREE_USAGE_49A: Free usage.
50	RW	WO_OR	WO_CLEAR	FREE_USAGE_50A: Free usage.
51	RW	WO_OR	WO_CLEAR	FREE_USAGE_51A: Free usage.
52	RW	WO_OR	WO_CLEAR	FREE_USAGE_52A: Free usage.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
53	RW	WO_OR	WO_CLEAR	FREE_USAGE_53A: Free usage.
54	RW	WO_OR	WO_CLEAR	FREE_USAGE_54A: Free usage.
55	RW	WO_OR	WO_CLEAR	FREE_USAGE_55A: Free usage.
56	RW	WO_OR	WO_CLEAR	FREE_USAGE_56A: Free usage.
57	RW	WO_OR	WO_CLEAR	FREE_USAGE_57A: Free usage.
58	RW	WO_OR	WO_CLEAR	FREE_USAGE_58A: Free usage.
59	RW	WO_OR	WO_CLEAR	FREE_USAGE_59A: Free usage.
60	RW	WO_OR	WO_CLEAR	FREE_USAGE_60A: Free usage.
61	RW	WO_OR	WO_CLEAR	FREE_USAGE_61A: Free usage.
62	RW	WO_OR	WO_CLEAR	FREE_USAGE_62A: Free usage.
63	RW	WO_OR	WO_CLEAR	FREE_USAGE_63A: Free usage.

Register Name	**Chiplet Control Register 1**
Mnemonic	TP.TCEC14.CORE.CPLT_CTRL1
Address	000000002E000001 (SCOM) 000000002E000011 (SCOM1) 000000002E000021 (SCOM2)
Description	This register contains the second set of vital chiplet controls.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_OR	WO_CLEAR	UNUSED_0B: Unused.
1	RW	WO_OR	WO_CLEAR	UNUSED_1B: Unused.
2	RW	WO_OR	WO_CLEAR	UNUSED_2B: Unused.
3	RW	WO_OR	WO_CLEAR	TC_VITL_REGION_FENCE: VITL fence. VITL fence. Protect the VITL region logic from pollution by other regions during LBIST, or when the chiplet is not initialized and running yet.
4	RW	WO_OR	WO_CLEAR	TC_PERV_REGION_FENCE: Fence for the pervasive region.
5	RW	WO_OR	WO_CLEAR	TC_REGION1_FENCE: Fence for region c00 (LSU, IFU, PC).
6	RW	WO_OR	WO_CLEAR	TC_REGION2_FENCE: Fence for region c01 (ISU, VSU).
7	RW	WO_OR	WO_CLEAR	UNUSED_7B: Unused.
8	RW	WO_OR	WO_CLEAR	UNUSED_8B: Unused.
9	RW	WO_OR	WO_CLEAR	UNUSED_9B: Unused.
10	RW	WO_OR	WO_CLEAR	UNUSED_10B: Unused.
11	RW	WO_OR	WO_CLEAR	UNUSED_11B: Unused.
12	RW	WO_OR	WO_CLEAR	UNUSED_12B: Unused.
13	RW	WO_OR	WO_CLEAR	UNUSED_13B: Unused.
14	RW	WO_OR	WO_CLEAR	UNUSED_14B: Unused.
15	RW	WO_OR	WO_CLEAR	RESERVED: Reserved.
16	RW	WO_OR	WO_CLEAR	TC_UNIT_MULTICYCLE_TEST_FENCE:
17	RW	WO_OR	WO_CLEAR	UNUSED_17B: Unused.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
18	RW	WO_OR	WO_CLEAR	UNUSED_18B: Unused.
19	RW	WO_OR	WO_CLEAR	UNUSED_19B: Unused.

31	RW	WO_OR	WO_CLEAR	UNUSED_31B: Unused.

Register Name	Chiplet Configuration Register 0
Mnemonic	TP.TCEC14.CORE.CPLT_CONF0
Address	000000002E000008 (SCOM) 000000002E000018 (SCOM1) 000000002E000028 (SCOM2)
Description	This register contains the first set of vital chiplet configuration functions.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:5	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE0_SEL_DC: Probe 0 select.
6	RW	WO_OR	WO_CLEAR	RESERVED_6C: Reserved.
7	RW	WO_OR	WO_CLEAR	RESERVED_7C: Reserved.
8:13	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE1_SEL_DC: Probe 1 select.
14	RW	WO_OR	WO_CLEAR	RESERVED_14C: Reserved.
15	RW	WO_OR	WO_CLEAR	RESERVED_15C: Reserved.
16:21	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE2_SEL_DC: Probe 2 select.
22	RW	WO_OR	WO_CLEAR	RESERVED_22C: Reserved.
23	RW	WO_OR	WO_CLEAR	RESERVED_23C: Reserved.
24:29	RW	WO_OR	WO_CLEAR	CTRL_MISC_PROBE3_SEL_DC: Probe 3 select.
30	RW	WO_OR	WO_CLEAR	RESERVED_30C: Reserved.
31	RW	WO_OR	WO_CLEAR	RESERVED_31C: Reserved.
32	RW	WO_OR	WO_CLEAR	CTRL_CC_OFLOW_FEH_SEL_DC: Enables ABIST overflow or failure indication.
33	RW	WO_OR	WO_CLEAR	CTRL_CC_SCAN_PROTECT_DC: Enables scan protection and the scan collision error mechanism.
34	RW	WO_OR	WO_CLEAR	CTRL_CC_SDIS_DC_N: Disables the scan diagnostic scan path.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
35	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_35C: Reserved for test control.
36	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_36C: Reserved for test control.
37	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_37C: Reserved for test control.
38	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_38C: Reserved for test control.
39	RW	WO_OR	WO_CLEAR	RESERVED_TEST_CONTROL_39C: Reserved for test control.
40	RW	WO_OR	WO_CLEAR	CTRL_EPS_MASK_VITL_PCB_ERR_DC: Mask VITL PCB errors from CC or CPLT_CTRL.
41	RW	WO_OR	WO_CLEAR	CTRL_CC_MASK_VITL_SCAN_OPCG_ERR_DC: Mask VITL errors in CC, which are not PCB related.
42	RW	WO_OR	WO_CLEAR	RESERVED_42C: Reserved.
43	RW	WO_OR	WO_CLEAR	RESERVED_43C: Reserved.
44	RW	WO_OR	WO_CLEAR	FREE_USAGE_44C: Free usage.
45	RW	WO_OR	WO_CLEAR	FREE_USAGE_45C: Free usage.
46	RW	WO_OR	WO_CLEAR	FREE_USAGE_46C: Free usage.
47	RW	WO_OR	WO_CLEAR	FREE_USAGE_47C: Free usage.
48:51	RW	WO_OR	WO_CLEAR	TC_UNIT_GROUP_ID_DC: Group ID.
52:54	RW	WO_OR	WO_CLEAR	TC_UNIT_CHIP_ID_DC: Chip ID.
55	RW	WO_OR	WO_CLEAR	RESERVED_ID_55C: Reserved ID.
56:60	RW	WO_OR	WO_CLEAR	TC_UNIT_SYS_ID_DC: System ID.
61	RW	WO_OR	WO_CLEAR	RESERVED_ID_61C: Reserved ID.
62	RW	WO_OR	WO_CLEAR	RESERVED_ID_62C: Reserved ID.
63	RW	WO_OR	WO_CLEAR	RESERVED_ID_63C: Reserved ID.

Register Name	**Chiplet Configuration Register 1**
Mnemonic	TP.TCEC14.CORE.CPLT_CONF1
Address	000000002E000009 (SCOM) 000000002E000019 (SCOM1) 000000002E000029 (SCOM2)
Description	This register contains the second set of vital chiplet configuration functions.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_OR	WO_CLEAR	UNUSED_0D: Unused.
1	RW	WO_OR	WO_CLEAR	UNUSED_1D: Unused.
2	RW	WO_OR	WO_CLEAR	UNUSED_2D: Unused.
3	RW	WO_OR	WO_CLEAR	UNUSED_3D: Unused.
4	RW	WO_OR	WO_CLEAR	IOVALID_4D:
5	RW	WO_OR	WO_CLEAR	IOVALID_5D:
6	RW	WO_OR	WO_CLEAR	IOVALID_6D:
7	RW	WO_OR	WO_CLEAR	IOVALID_7D:
8	RW	WO_OR	WO_CLEAR	IOVALID_8D:
9	RW	WO_OR	WO_CLEAR	IOVALID_9D:

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
10	RW	WO_OR	WO_CLEAR	IOVALID_10D:
11	RW	WO_OR	WO_CLEAR	IOVALID_11D:
12	RW	WO_OR	WO_CLEAR	FREE_USAGE_12D: Free usage.
13	RW	WO_OR	WO_CLEAR	FREE_USAGE_13D: Free usage.
14	RW	WO_OR	WO_CLEAR	FREE_USAGE_14D: Free usage.
15	RW	WO_OR	WO_CLEAR	FREE_USAGE_15D: Free usage.
16	RW	WO_OR	WO_CLEAR	FREE_USAGE_16D: Free usage.
17	RW	WO_OR	WO_CLEAR	FREE_USAGE_17D: Free usage.
18	RW	WO_OR	WO_CLEAR	FREE_USAGE_18D: Free usage.
19	RW	WO_OR	WO_CLEAR	FREE_USAGE_19D: Free usage.
20	RW	WO_OR	WO_CLEAR	FREE_USAGE_20D: Free usage.
21	RW	WO_OR	WO_CLEAR	FREE_USAGE_21D: Free usage.
22	RW	WO_OR	WO_CLEAR	FREE_USAGE_22D: Free usage.
23	RW	WO_OR	WO_CLEAR	FREE_USAGE_23D: Free usage.
24	RW	WO_OR	WO_CLEAR	FREE_USAGE_24D: Free usage.
25	RW	WO_OR	WO_CLEAR	FREE_USAGE_25D: Free usage.
26	RW	WO_OR	WO_CLEAR	FREE_USAGE_26D: Free usage.
27	RW	WO_OR	WO_CLEAR	FREE_USAGE_27D: Free usage.
28	RW	WO_OR	WO_CLEAR	FREE_USAGE_28D: Free usage.
29	RW	WO_OR	WO_CLEAR	FREE_USAGE_29D: Free usage.
30	RW	WO_OR	WO_CLEAR	FREE_USAGE_30D: Free usage.
31	RW	WO_OR	WO_CLEAR	FREE_USAGE_31D: Free usage.

Register Name	Chiplet Status Register
Mnemonic	TP.TCEC14.CORE.CPLT_STAT0
Address	000000002E000100 (SCOM)
Description	An interrupt is sent out on a bit change if not masked by the Chiplet Mask Register. A mask only masks the interrupt, not the status register.

Bits	SCOM	Field Mnemonic: Description
0	ROX	SRAM_ABIST_DONE_DC: SRAM and eDRAM ABIST done.
1	ROX	DRAM_ABIST_DONE_DC: Unused in POWER9 DD1.
2	ROX	RESERVED_2E: Reserved.
3	ROX	RESERVED_3E: Reserved.
4	ROX	TC_DIAG_PORT0_OUT: Diagnostic output port.
5	ROX	TC_DIAG_PORT1_OUT: Diagnostic output port.
6	ROX	RESERVED_6E: Reserved.
7	ROX	PLL_DESTOUT: Reserved.
8	ROX	CC_CTRL_OPCG_DONE_DC: OPCG done. For LBIST, ABIST, or other OPCG runs.
9	ROX	CC_CTRL_CHIPLET_IS_ALIGNED_DC: Indicates that a chiplet is aligned.

Bits	SCOM	Field Mnemonic: Description
10	ROX	PC_TC_VALID_NOT_HV_MODE: Chiplet specific.
11	ROX	PC_TC_AVP_OUT: Chiplet specific.
12	ROX	FREE_USAGE_12E: Free usage.
13	ROX	FREE_USAGE_13E: Free usage.
14	ROX	FREE_USAGE_14E: Free usage.
15	ROX	FREE_USAGE_15E: Free usage.
16	ROX	FREE_USAGE_16E: Free usage.
17	ROX	FREE_USAGE_17E: Free usage.
18	ROX	FREE_USAGE_18E: Free usage.
19	ROX	FREE_USAGE_19E: Free usage.
20	ROX	FREE_USAGE_20E: Free usage.
21	ROX	FREE_USAGE_21E: Free usage.
22	ROX	FREE_USAGE_22E: Free usage.
23	ROX	FREE_USAGE_23E: Free usage.

Register Name	Chiplet Mask Register
Mnemonic	TP.TCEC14.CORE.CPLT_MASK0
Address	000000002E000101 (SCOM)
Description	This register masks an interrupt when a bit changes in the Chiplet Status Register. It does not mask the status itself.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CPLTMASK0: Bitwise masking of the Chiplet Status Register.

Register Name	Control Protect Mode Register
Mnemonic	TP.TCEC14.CORE.CTRL_PROTECT_MODE_REG
Address	000000002E0003FE (SCOM)
Description	This register enables read and write protection.

Bits	SCOM	Field Mnemonic: Description
0	RW	CTRL_READ_PROTECT_ENABLE: Enable read protection.
1	RW	CTRL_WRITE_PROTECT_ENABLE: Enable write protection.

Register Name	Atomic Lock Register
Mnemonic	TP.TCEC14.CORE.CTRL_ATOMIC_LOCK_REG
Address	000000002E0003FF (SCOM)
Description	This register enables an atomic lock and an atomic lock counter.

Bits	SCOM	Field Mnemonic: Description
0	RW	CTRL_ATOMIC_LOCK_ENABLE: Enable atomic lock.

Bits	SCOM	Field Mnemonic: Description
1:4	ROX	CTRL_ATOMIC_ID: Atomic ID.
5:7	RO	constant = 0b000
8:15	ROX	CTRL_ATOMIC_ACTIVITY: Atomic lock counter.

Register Name	PSCOMLE Mode Register
Mnemonic	TP.TCEC14.CORE.EPS.PSC.PSC.PSCOM_MODE_REG
Address	000000002E010000 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) mode register.

Bits	SCOM	Field Mnemonic: Description
0	RW	ABORT_ON_PCB_ADDR_PARITY_ERROR: Abort on PCB address parity error.
1	RW	ABORT_ON_PCB_WDATA_PARITY_ERROR: Abort on PCB write data parity error.
2	RW	ABORT_ON_DL_RETURN_P0_ERROR: Unused.
3	RW	ABORT_ON_DL_RETURN_WDATA_PARITY_ERROR: Abort on DL return write data parity error.
4	RW	WATCHDOG_ENABLE: Enable watchdog.
5:6	RW	SCOM_HANG_LIMIT: 0b11 = 256 0b10 = 512 0b01 = 768 0b00 = 1023
7	RW	FORCE_ALL_RINGS: Set to a logical 1 if all rings should be enabled independent of the ring address.
8	RW	FSM_SELFRESET_ON_STATEVEC_PARITYERROR_ENABLE: FSM self reset on statevec parity error enable.
9:11	RW	RESERVED_PSCOM_MODE_LT: Reserved.

Register Name	PSCOMLE Error Register
Mnemonic	TP.TCEC14.CORE.EPS.PSC.PSC.PSCOM_STATUS_ERROR_REG
Address	000000002E010001 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) error register.

Bits	SCOM	Field Mnemonic: Description
0	RWX	ACCUMULATED_PCB_WDATA_PARITY_ERROR: Accumulated PCB write data parity error.
1	RWX	ACCUMULATED_PCB_ADDRESS_PARITY_ERROR: Accumulated PCB address parity error.
2	RWX	ACCUMULATED_DL_RETURN_WDATA_PARITY_ERROR: Accumulated DL return write data parity error.
3	RWX	ACCUMULATED_DL_RETURN_P0_ERROR: Accumulated DL return P0 error.
4	RWX	ACCUMULATED_UL_RDATA_PARITY_ERROR: Accumulated UL read data parity error.
5	RWX	ACCUMULATED_UL_P0_ERROR: Accumulated UL P0 error.
6	RWX	ACCUMULATED_PARITY_ERROR_ON_INTERFACE_MACHINE: Accumulated parity error on interface machine.
7	RWX	ACCUMULATED_PARITY_ERROR_ON_P2S_MACHINE: Accumulated parity error on p2s machine.
8	RWX	ACCUMULATED_TIMEOUT_WHILE_WAITING_FOR_ULCCH: Accumulated timeout while waiting for ULCCH.

Bits	SCOM	Field Mnemonic: Description
9	RWX	ACCUMULATED_TIMEOUT_WHILE_WAITING_FOR_DLDCH_RETURN: Accumulated timeout while waiting for DLDCH return.
10	RWX	ACCUMULATED_TIMEOUT_WHILE_WAITING_FOR_ULDCH: Accumulated timeout while waiting for ULDCH.
11	RWX	ACCUMULATED_PSCOM_PARALLEL_WRITE_NVLD: Accumulated PSCOM parallel write NVLD.
12	RWX	ACCUMULATED_PSCOM_PARALLEL_READ_NVLD: Accumulated PSCOM parallel read NVLD.
13	RWX	ACCUMULATED_PSCOM_PARALLEL_ADDR_INVALID: Accumulated PSCOM parallel address invalid.
14	RWX	ACCUMULATED_PCB_COMMAND_PARITY_ERROR: Accumulated PCB command parity error.
15	RWX	ACCUMULATED_GENERAL_TIMEOUT: Accumulated general timeout.
16	RWX	ACCUMULATED_SATELLITE_ACKNOWLEDGE_ACCESS_VIOLATION: Accumulated satellite acknowledge access violation.
17	RWX	ACCUMULATED_SATELLITE_ACKNOWLEDGE_INVALID_REGISTER: Accumulated satellite acknowledge invalid register.
18	RWX	TRAPPED_PCB_WDATA_PARITY_ERROR: Trapped PCB write data parity error.
19	RWX	TRAPPED_PCB_ADDRESS_PARITY_ERROR: Trapped PCB address parity error.
20	RWX	TRAPPED_DL_RETURN_WDATA_PARITY_ERROR: Trapped DL return write data parity error.
21	RWX	TRAPPED_DL_RETURN_P0_ERROR: Trapped DL return P0 error.
22	RWX	TRAPPED_UL_RDATA_PARITY_ERROR: Trapped UL read data parity error.
23	RWX	TRAPPED_UL_P0_ERROR: Trapped UL P0 error.
24	RWX	TRAPPED_PARITY_ERROR_ON_INTERFACE_MACHINE: Trapped parity error on interface machine.
25	RWX	TRAPPED_PARITY_ERROR_ON_P2S_MACHINE: Trapped parity error on p2s machine.
26	RWX	TRAPPED_TIMEOUT_WHILE_WAITING_FOR_ULCCH: Trapped timeout while waiting for ULCCH.
27	RWX	TRAPPED_TIMEOUT_WHILE_WAITING_FOR_DLDCH_RETURN: Trapped timeout while waiting for DLDCH return.
28	RWX	TRAPPED_TIMEOUT_WHILE_WAITING_FOR_ULDCH: Trapped timeout while waiting for ULDCH.
29	RWX	TRAPPED_PSCOM_PARALLEL_WRITE_NVLD: Trapped PSCOM parallel write NVLD.
30	RWX	TRAPPED_PSCOM_PARALLEL_READ_NVLD: Trapped PSCOM parallel read NVLD.
31	RWX	TRAPPED_PSCOM_PARALLEL_ADDR_INVALID: Trapped PSCOM parallel address invalid.
32	RWX	TRAPPED_PCB_COMMAND_PARITY_ERROR: Trapped PCB command parity error.
33	RWX	TRAPPED_GENERAL_TIMEOUT: Trapped general timeout.
34	RWX	TRAPPED_SATELLITE_ACKNOWLEDGE_ACCESS_VIOLATION: Trapped satellite acknowledge access violation.
35	RWX	TRAPPED_SATELLITE_ACKNOWLEDGE_INVALID_REGISTER: Trapped satellite acknowledge invalid register.

Register Name	PSCOMLE Error Mask Register
Mnemonic	TP.TCEC14.CORE.EPS.PSC.PSC.PSCOM_ERROR_MASK
Address	000000002E010002 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) error mask register.

Bits	SCOM	Field Mnemonic: Description
0	RW	MASK_PCB_WDATA_PARITY_ERROR: Mask PCB write data parity error.

Bits	SCOM	Field Mnemonic: Description
1	RW	MASK_PCB_ADDRESS_PARITY_ERROR: Mask PCB address parity error.
2	RW	MASK_DL_RETURN_WDATA_PARITY_ERROR: Mask DL return write data parity error.
3	RW	MASK_DL_RETURN_P0_ERROR: Mask DL return P0 error.
4	RW	MASK_UL_RDATA_PARITY_ERROR: Mask UL read data parity error.
5	RW	MASK_UL_P0_ERROR: Mask UL P0 error.
6	RW	MASK_PARITY_ERROR_ON_INTERFACE_MACHINE: Mask parity error on interface machine.
7	RW	MASK_PARITY_ERROR_ON_P2S_MACHINE: Mask parity error on p2s machine.
8	RW	MASK_TIMEOUT_WHILE_WAITING_FOR_ULCCH: Mask timeout while waiting for ULCCH.
9	RW	MASK_TIMEOUT_WHILE_WAITING_FOR_DLDCH_RETURN: Mask timeout while waiting for DLDCH return.
10	RW	MASK_TIMEOUT_WHILE_WAITING_FOR_ULDCH: Mask timeout while waiting for ULDCH.
11	RW	MASK_PSCOM_PARALLEL_WRITE_NVLD: Mask PSCOM parallel write NVLD.
12	RW	MASK_PSCOM_PARALLEL_READ_NVLD: Mask PSCOM parallel read NVLD.
13	RW	MASK_PSCOM_PARALLEL_ADDR_INVALID: Mask PSCOM parallel address invalid.
14	RW	MASK_PCB_COMMAND_PARITY_ERROR: Mask PCB command parity error.
15	RW	MASK_GENERAL_TIMEOUT: Mask general timeout.
16	RW	MASK_SATELLITE_ACKNOWLEDGE_ACCESS_VIOLATION: Mask satellite acknowledge access violation.
17	RW	MASK_SATELLITE_ACKNOWLEDGE_INVALID_REGISTER: Mask satellite acknowledge invalid register.

Register Name	PSCOMLE Address Trap Register
Mnemonic	TP.TCEC14.CORE.EPS.PSC.PSC.ADDR_TRAP_REG
Address	000000002E010003 (SCOM)
Description	This is the parallel-to-serial communication light edition (PSCOMLE) address trap register.

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	PCB_ADDRESS_OF_LAST_TRANSACTION_WITH_ERROR: PCB address of the last transaction with an error.
16	ROX	PCB_READ_NOTWRITE_OF_LAST_TRANSACTION_WITH_ERROR: PCB read, not write, of the last transaction with an error.
17	ROX	RESERVED_ADDR_LAST_TRAP_LT: Reserved_0.
18:30	ROX	SERIAL2PARALLEL_STATE_MACHINE_AT_TIME_OF_ERROR: Serial2 parallel state machine at the time of the error.
31	ROX	SATELLITE_ACKNOWLEDGE_BIT_RETURN_PARITY: This bit is set to 1 if no parity error is detected in the satellite number or acknowledgment bits.
32	ROX	SATELLITE_ACKNOWLEDGE_BIT_WRITE_PARITY_ERROR: Set if a write parity error is detected by the satellite.
33	ROX	SATELLITE_ACKNOWLEDGE_BIT_ACCESS_VIOLATION: Set if an invalid read or write access is detected by the satellite.
34	ROX	SATELLITE_ACKNOWLEDGE_BIT_INVALID_REGISTER: Set if an invalid register address is detected by the satellite.

Register Name	Ring Lock Enable Register
Mnemonic	TP.TCEC14.CORE.EPS.PSC.PSC.WRITE_PROTECT_ENABLE_REG
Address	000000002E010005 (SCOM)
Description	This register enables the ring lock.

Bits	SCOM	Field Mnemonic: Description
0	RW	ENABLE_RING_LOCKING: General enable of ring locking upon a write to a specific ring.
1	RW	RESERVED_RING_LOCKING: Reserved.

Register Name	Write Protect Rings Register
Mnemonic	TP.TCEC14.CORE.EPS.PSC.PSC.WRITE_PROTECT_RINGS_REG
Address	000000002E010006 (SCOM)
Description	This register writes ring protect bit maps.

Bits	SCOM	Field Mnemonic: Description
0:15	RW	WRITE_PROTECT_RINGS: Write a protect bit map for each ring.

Register Name	Atomic Lock Mask Register
Mnemonic	TP.TCEC14.CORE.EPS.PSC.PSC.ATOMIC_LOCK_MASK_LATCH_REG
Address	000000002E010007 (SCOM)
Description	This register provides a bit mask for atomic locking.

Bits	SCOM	Field Mnemonic: Description
0:15	RW	ATOMIC_LOCK_MASK: A bit mask for atomic locking on a ring-by-ring basis.

Register Name	Ring Fence Enable Mask Register
Mnemonic	TP.TCEC14.CORE.EPS.PSC.PSC.RING_FENCE_MASK_LATCH_REG
Address	000000002E010008 (SCOM)
Description	This register provides a bit mask for ring fencing.

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b0
1:15	RW	RING_FENCE_ENABLE_MASK: Enable bit mask for ring fencing on a ring-by-ring basis.

Register Name	Debug Mode Register
Mnemonic	TP.TCEC14.CORE.EPS.DBG.DBG_MODE_REG
Address	000000002E0107C0 (SCOM)
Description	This is debug macro configuration register 0 for the configuration component.

Bits	SCOM	Field Mnemonic: Description
0:2	RW	GLB_BRCST_MODE: Global broadcast mode (0 to 2): 100 = dbg_trace_run and dbg_trace_freeze. 101 = pc_tcdbg_trace_run_fncd and dbg_trace_freeze. 110 = dbg_triggers_out (0 to 1). 111 = pc_tcdbg_triggers (0 to 1) (from core).
3:5	RW	TRACE_SEL_MODE: Select source for trace run and bank. 001 = Core trace run and bank. 010 = tp broadcast run and 0. 011 = tc_dbg_inter_brcst latched. 100 = tc_dbg_dbg_sync_brcst_rcv. else = dbg_trace_run and dbg_trace_bank.
6:7	RW	TRIG_SEL_MODE: Select source for tcdbg trigger (0). 10 = Global broadcast. 11 = pc_tcdbg_trigger (from core). else = dbg_triggers_out (0:1).
8	RW	STOP_ON_XSTOP_SELECTION: Enable trace stop on checkstop.
9	RW	STOP_ON_RECOV_ERR_SELECTION: Enable trace stop on recoverable error.
10	RW	STOP_ON_SPATTN_SELECTION: Enable trace stop on special attention.
11	RW	FREEZE_SEL_MODE: Select freeze source: 0 = Local debug freeze. 1 = Via broadcast: tp_tcdbg_glb_brcst(1).
12:13	RW	SYNC_BRCST_MODE: Originally used for synchronous broadcast mode. Currently obsolete. See trace_sel_mode.
14	RO	constant = 0b0 sync_brcst_mode.
15	RO	constant = 0b0.
16:31	ROX	dbg_status.
32:63	RO	constant = 0b00000000000000000000000000000000

Register Name	Debug Instance 1 Condition 1 Register
Mnemonic	TP.TCEC14.CORE.EPS.DBG.DBG_INST1_COND_REG_1
Address	000000002E0107C1 (SCOM)
Description	This is debug macro configuration register 1 for front-end component 1.

Bits	SCOM	Field Mnemonic: Description
0:7	RW	INST1_COND1_SEL_A: Multiplexer for cond1_trig_in(0). 000 = Select constant 0 001 = Select constant 1 -- CONDITION FEEDBACK -- 002 = Select inst1_dbg_cond1. 003 = Select inst1_dbg_cond2. 004 = Select inst1_dbg_cond3. 005 = Select inst1_dbg_cond2timeout. 006 = Select inst2_dbg_cond1. 007 = Select inst2_dbg_cond2. 008 = Select inst2_dbg_cond3. 009 = Select inst2_dbg_cond2timeout. 010 = Select inst3_dbg_cond1. Unused, tied down. 011 = Select inst3_dbg_cond2. Unused, tied down. 012 = Select inst3_dbg_cond3. Unused, tied down. 013 = Select inst3_dbg_cond2timeout. Unused, tied down. 014 = Select inst4_dbg_cond1. Unused, tied down. 015 = Select inst4_dbg_cond2. Unused, tied down. 016 = Select inst4_dbg_cond3. Unused, tied down. 017 = Select inst4_dbg_cond2timeout. Unused, tied down. 018 = Select inst1_dbg_trig_sp. 019 = Select inst2_dbg_trig_sp. 020 = Select inst3_dbg_trig_sp. Unused, tied down. 021 = Select inst4_dbg_trig_sp. 42:47	RO	constant = 0b000000
48:50	RW	INST1_CHECKSTOP_MODE_LT: Select additional condition with fir_error_lt for dbg_fir_xstop_on_trig output: 000 = inst1_condition1_lt. 001 = inst1_condition2_lt. 010 = inst1_condition3_lt. 011 = inst1_cond2_timeout_lt. 1XX = Disable checkstop_mode.

Bits	SCOM	Field Mnemonic: Description
51	RW	INST1_CHECKSTOP_MODE_SELECTOR: Enable_fir_trig_xstop; enable checkstop on debug trigger: 0 = Disable checkstop on debug trigger. 1 = Enable checkstop on debug trigger.
52:54	RW	INST2_CHECKSTOP_MODE_LT: Select additional condition with fir_error_lt for dbg_fir_xstop_on_trig output: 000 = inst2_condition1_lt. 001 = inst2_condition2_lt. 010 = inst2_condition3_lt. 011 = inst2_cond2_timeout_lt. 1XX = Disable checkstop mode.
55	RW	INST2_CHECKSTOP_MODE_SELECTOR: enable_fir_error_xstop; enable checkstop on FIR error: 0 = Disable checkstop on FIR error. 1 = Enable checkstop on FIR error.
56:63	RO	constant = 0b00000000

Register Name	Debug Trace Mode 2 Register
Mnemonic	TP.TCEC14.CORE.EPS.DBG.DBG_TRACE_MODE_REG_2
Address	000000002E0107CF (SCOM)
Description	This is debug macro configuration register 2 for the back-end component.

Bits	SCOM	Field Mnemonic: Description
0:15	RW	RUNN_COUNT_COMPARE_VALUE: Compare value for the RUNN counter used in trace modes RUNN and WAITN.
16	RW	IMM_FREEZE_MODE: Immediate freeze mode.
17	RW	STOP_ON_ERR: Stop and freeze on checkstop.
18	RW	BANK_ON_RUNN_MATCH: Bank switch on run match.
19	RW	FORCE_TEST_MODE: Force RUNN condition to be true.
20	RW	ACCUM_HIST_MODE: Accumulate history mode; do not clear history mode when trace_run active.
21	RW	FRZ_COUNT_ON_FRZ: Freeze condition counters on trace freeze.

Register Name	Debug Trace Control Register
Mnemonic	TP.TCEC14.CORE.EPS.DBG.DEBUG_TRACE_CONTROL
Address	000000002E0107D0 (SCOM)
Description	This is the trace start/stop/rest using SCOM command register. Use write data(0/1/2) = 1. This is a reserved register.

Bits	SCOM	Field Mnemonic: Description
0	WOX	Reserved field.
1	WOX	Reserved field.
2	WOX	Reserved field.

Register Name	Extra Trace Mode Register
Mnemonic	TP.TCEC14.CORE.EPS.DBG.XTRA_TRACE_MODE
Address	000000002E0107D1 (SCOM)
Description	This register provides an extra or dedicated trace mode register for core triggers.

Bits	SCOM	Field Mnemonic: Description
0:37	RW	XTRA_TRACE_MODE_DATA: Contents of the extra or dedicated trace mode register for core triggers.

Register Name	Hang Control Register
Mnemonic	EX07.EC.C0.PC.THRCTL.TCTLCOM.HANG_CONTROL
Address	000000002E010A00 (SCOM)
Description	Hang control register

Bits	SCOM	Field Mnemonic: Description
0:7	RW	CORE_HANG_LIMIT: Core hang limit. 3_hang_pulses => 0x9F (default). 5_hang_pulses => 0x27. 10_hang_pulses => 0xA1. 50_hang_pulsed => 0x99. 100_hang_pulses => 0x2D. 150_hang_pulses => 0xF6. 200_hang_pulses => 0x64.
8:15	RW	NEST_HANG_LIMIT: Nest hang limit. 20_hang_pulses => 0x5F. 50_hang_pulses => 0x99. 100_hang_pulses => 0x2D (default). 150_hang_pulses => 0xF6. 200_hang_pulses => 0x64.
16	RW	RETURN_GOOD_ON_COMP: Return good on completion without waiting for a hang_pulse.
17:24	RW	COMP_CNT_LIMIT: Completion count mode.
25:27	RW	HANG_REC_LIMIT: Hang record limit.
28	RW	USE_HANG_REC_LIMIT: Use hang record limit.
29:33	RW	ACTIVE_MASK: Active mask latch for hang condition enable/disable.
34:41	RW	Reserved field.
42:63	RO	constant = 0b0000000000000000000000

Register Name	HID Register
Mnemonic	EX07.EC.C0.PC.THRCTL.TCTLCOM.HID
Address	000000002E010A01 (SCOM)
Description	HID register

Bits	SCOM	Field Mnemonic: Description
0	RW	ONE_PPC: One PowerPC instruction is sent out of the iBUFFERs and decoded at a time.
1	RW	EN_INSTRUC_TRACE: Enable enhanced tracing (hardware instruction trace).
2	RW	FLUSH_IC: Flush the ICACHE directory and the IEADIR on a transition from 0 to 1.

Bits	SCOM	Field Mnemonic: Description
3	RW	EN_ATTN: Enable the support processor attention instruction.
4	RW	HILE: The contents of this bit are copied into the MSR[LE] by interrupts that set MSR[HV] = '1'.
5	RW	DIS_RECOVERY: Disable the processor recovery mechanism.
6	RW	MEGAMOUTH: Store ordering for adapters.
7	RW	PREFETCH_RESET: Reset the prefetch queues.
8	RW	LSU_SPARE: LSU spare.
9:63	RO	constant = 0b0000000000000000000000000000000000000000000000000000000

Register Name	RAS Status Register
Mnemonic	EX07.EC.C0.PC.THRCTL.TCTLCOM.RAS_STATUS
Address	000000002E010A02 (SCOM)
Description	RAS status register

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.
1	ROX	Reserved field.
2	ROX	Reserved field.
3	ROX	Reserved field.
4	ROX	Reserved field.
5:7	RO	constant = 0b000
8	ROX	Reserved field.

23	RW	WO_AND	WO_OR	MASK_UNUSED_23: Reserved.
24	RW	WO_AND	WO_OR	MASK_VS_LOG_REC_ERROR: VSU logic recoverable error.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
25	RW	WO_AND	WO_OR	MASK_VS_LOG_XSTOP_ERROR: VSU logic core checkstop.
26	RW	WO_AND	WO_OR	MASK_PC_RECOV_IN_MAINT_ERROR: Thread in maintenance mode and receives recovery request.
27	RW	WO_AND	WO_OR	MASK_VS_DU_LOG_REC_ERROR: VSU DFU logic recoverable error.
28	RW	WO_AND	WO_OR	MASK_PC_SYS_XSTOP_ERROR: PC system checkstop; recoverable error received when recovery is disabled.
29	RW	WO_AND	WO_OR	MASK_LS_SRAM_PARITY_ERROR: LSU SRAM recoverable error (DCACHE parity error, ERAT parity error, TLB parity error, SLB parity error, and so on).
30	RW	WO_AND	WO_OR	MASK_LS_SETDELETE_ERROR: LSU set deleted.
31	RW	WO_AND	WO_OR	MASK_LS_RFILE_REC_ERROR: LSU register file recoverable error.
32	RW	WO_AND	WO_OR	MASK_LS_RFILE_XSTOP_ERROR: LSU register file core checkstop.
33	RW	WO_AND	WO_OR	MASK_LS_TLB_MULTIHIT_ERROR: LSU TLB multiple hit error occurred.
34	RW	WO_AND	WO_OR	MASK_LS_SLB_MULTIHIT_ERROR: LSU SLB multiple hit error occurred.
35	RW	WO_AND	WO_OR	MASK_LS_DERAT_MULTIHIT_ERROR: LSU ERAT multiple hit error occurred.
36	RW	WO_AND	WO_OR	MASK_PC_FWD_PROGRESS_ERROR: PC forward progress error.
37	RW	WO_AND	WO_OR	MASK_LS_LOG_REC_ERROR: LSU logic recoverable error.
38	RW	WO_AND	WO_OR	MASK_LS_LOG_XSTOP_ERROR: LSU logic core checkstop.
39	RW	WO_AND	WO_OR	MASK_LS_NOT_MT_REC_ERROR: LSU recoverable if not in an MT window.
40	RW	WO_AND	WO_OR	MASK_UNUSED_40: Reserved.
41	RW	WO_AND	WO_OR	MASK_LS_SYS_XSTOP_ERROR: LSU system checkstop.
42	RW	WO_AND	WO_OR	MASK_UNUSED_42: Reserved.
43	RW	WO_AND	WO_OR	MASK_PC_THREAD_HANG_REC_ERROR: PC thread hang recoverable error.
44	RW	WO_AND	WO_OR	MASK_UNUSED_44: Reserved.
45	RW	WO_AND	WO_OR	MASK_PC_LOG_XSTOP_ERROR: PC logic checkstop.
46	RW	WO_AND	WO_OR	MASK_UNUSED_46: Reserved.
47	RW	WO_AND	WO_OR	MASK_PC_TFAC_XSTOP_ERROR: PC Timebase facility checkstop.
48	RW	WO_AND	WO_OR	MASK_PC_HYP_RES_ERROR: Hypervisor resource error.
49	RW	WO_AND	WO_OR	MASK_UNUSED_49: Reserved.
50	RW	WO_AND	WO_OR	MASK_UNUSED_50: Reserved.
51	RW	WO_AND	WO_OR	MASK_UNUSED_51: Reserved.
52	RW	WO_AND	WO_OR	MASK_PC_HANG_RECOVERY_FAILED: Hang recovery failed.
53	RW	WO_AND	WO_OR	MASK_PC_CORE_HANG_DETECT_ERROR: Core hang detected.
54	RW	WO_AND	WO_OR	MASK_UNUSED_54: Reserved.
55	RW	WO_AND	WO_OR	MASK_PC_NEST_HANG_DETECT_ERROR: Nest hang detected.
56	RW	WO_AND	WO_OR	MASK_PC_OTHER_CORE_CHIPLET_REC_ERROR: Other core chiplet recoverable error.
57	RW	WO_AND	WO_OR	MASK_PC_OTHER_CORE_CHIPLET_XSTOP_ERROR: Other core chiplet core checkstop.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
58	RW	WO_AND	WO_OR	MASK_PC_OTHER_CORE_CHIPLET_SYS_XSTOP_ERROR: Other core chiplet system checkstop.
59	RW	WO_AND	WO_OR	MASK_PC_SCOM_ERROR: SCOM satellite error detected.
60	RW	WO_AND	WO_OR	MASK_PC_XSTOP_ON_DBG_TRIGGER_ERROR: Debug trigger error inject.
61	RW	WO_AND	WO_OR	MASK_PC_FW_INJ_REC_ERROR: SCOM or firmware recoverable error inject.
62	RW	WO_AND	WO_OR	MASK_PC_FW_INJ_XSTOP_ERROR: Firmware checkstop error inject.
63	RW	WO_AND	WO_OR	MASK_PC_PHYP_XSTOP_ERROR: Hypervisor checkstop via SPRC/SPRD.

Register Name	Core FIR Action 0 Register
Mnemonic	EX07.EC.C0.PC.FIR.CORE_ACTION0
Address	000000002E010A46 (SCOM)
Description	Core FIR Action 0 Register

Bits	SCOM	Field Mnemonic: Description
0	RW	ACTION_IF_SRAM_REC_ERROR: IFU SRAM recoverable error (ICACHE parity error, and so on).
1	RW	ACTION_TC_FIR_XSTOP_ERROR: TC checkstop.
2	RW	ACTION_IF_RFILE_REC_ERROR: IFU register file recoverable error.
3	RW	ACTION_IF_RFILE_XSTOP_ERROR: IFU register file core checkstop.
4	RW	ACTION_IF_LOG_REC_ERROR: IFU logic recoverable error.
5	RW	ACTION_IF_LOG_XSTOP_ERROR: IFU logic core checkstop.
6	RW	ACTION_UNUSED_6: Reserved.
7	RW	ACTION_UNUSED_7: Reserved.
8	RW	ACTION_PC_RECOV_XSTOP_ERROR: Recovery core checkstop.
9	RW	ACTION_SD_RFILE_REC_ERROR: ISU register file recoverable error (GPR/VRF).
10	RW	ACTION_SD_RFILE_XSTOP_ERROR: ISU register file core checkstop (mapper error).
11	RW	ACTION_SD_LOG_REC_ERROR: ISU logic recoverable error.
12	RW	ACTION_SD_LOG_XSTOP_ERROR: ISU logic core checkstop.
13	RW	ACTION_SD_NOT_MT_CI_REC_ERROR: ISU recoverable if not in MT window.
14	RW	ACTION_SD_MCHK_AND_ME_EQ_0_ERROR: MCHK received while ME = 0, nonrecoverable.
15	RW	ACTION_SD_L2_UE_ERROR: UE from L2.
16	RW	ACTION_SD_L2_UE_OVER_THRES_ERROR: Number of UEs from L2 above the threshold.
17	RW	ACTION_SD_CI_UE_ERROR: UE on CI load.
18	RW	ACTION_UNUSED_18: Reserved.
19	RW	ACTION_UNUSED_19: Reserved.
20	RW	ACTION_SD_SYS_XSTOP_ERROR: ISU system checkstop (MSR corrupted).
21	RW	ACTION_UNUSED_21: Reserved.
22	RW	ACTION_UNUSED_22: Reserved.
23	RW	ACTION_UNUSED_23: Reserved.

Bits	SCOM	Field Mnemonic: Description
24	RW	ACTION_VS_LOG_REC_ERROR: VSU logic recoverable error.
25	RW	ACTION_VS_LOG_XSTOP_ERROR: VSU logic core checkstop.
26	RW	ACTION_PC_RECOV_IN_MAINT_ERROR: Thread in maintenance mode and receives recovery request.
27	RW	ACTION_VS_DU_LOG_REC_ERROR: VSU DFU logic recoverable error.
28	RW	ACTION_PC_SYS_XSTOP_ERROR: PC system checkstop. Recoverable error received when recovery was disabled.
29	RW	ACTION_LS_SRAM_PARITY_ERROR: LSU SRAM recoverable error (DCACHE parity error, ERAT parity error, TLB parity error, SLB parity error, and so on).
30	RW	ACTION_LS_SETDELETE_ERROR: LSU set deleted.
31	RW	ACTION_LS_RFILE_REC_ERROR: LSU register file recoverable error.
32	RW	ACTION_LS_RFILE_XSTOP_ERROR: LSU register file core checkstop.
33	RW	ACTION_LS_TLB_MULTIHIT_ERROR: LSU TLB multiple-hit error occurred.
34	RW	ACTION_LS_SLB_MULTIHIT_ERROR: LSU SLB multiple-hit error occurred.
35	RW	ACTION_LS_DERAT_MULTIHIT_ERROR: LSU ERAT multiple-hit error occurred.
36	RW	ACTION_PC_FWD_PROGRESS_ERROR: PC forward progress error.
37	RW	ACTION_LS_LOG_REC_ERROR: LSU logic recoverable error.
38	RW	ACTION_LS_LOG_XSTOP_ERROR: LSU logic core checkstop.
39	RW	ACTION_LS_NOT_MT_REC_ERROR: LSU recoverable if not in MT window.

55	RW	ACTION_PC_NEST_HANG_DETECT_ERROR: Nest hang detected.
56	RW	ACTION_PC_OTHER_CORE_CHIPLET_REC_ERROR: Other core chiplet recoverable error.
57	RW	ACTION_PC_OTHER_CORE_CHIPLET_XSTOP_ERROR: Other core chiplet core checkstop.
58	RW	ACTION_PC_OTHER_CORE_CHIPLET_SYS_XSTOP_ERROR: Other core chiplet system checkstop.
59	RW	ACTION_PC_SCOM_ERROR: SCOM satellite error detected.
60	RW	ACTION_PC_XSTOP_ON_DBG_TRIGGER_ERROR: Debug trigger error inject.
61	RW	ACTION_PC_FW_INJ_REC_ERROR: SCOM or firmware recoverable error inject.

Bits	SCOM	Field Mnemonic: Description
62	RW	ACTION_PC_FW_INJ_XSTOP_ERROR: Firmware checkstop error inject.
63	RW	ACTION_PC_PHYP_XSTOP_ERROR: Hypervisor checkstop via SPRC/SPRD.

Register Name	Core FIR Action 1 Register
Mnemonic	EX07.EC.C0.PC.FIR.CORE_ACTION1
Address	000000002E010A47 (SCOM)
Description	Core FIR Action 1 Register

Bits	SCOM	Field Mnemonic: Description
0	RW	ACTION_IF_SRAM_REC_ERROR: IFU SRAM recoverable error (ICACHE parity error, and so on).
1	RW	ACTION_TC_FIR_XSTOP_ERROR: TC checkstop.
2	RW	ACTION_IF_RFILE_REC_ERROR: IFU register file recoverable error.
3	RW	ACTION_IF_RFILE_XSTOP_ERROR: IFU register file core checkstop.
4	RW	ACTION_IF_LOG_REC_ERROR: IFU logic recoverable error.
5	RW	ACTION_IF_LOG_XSTOP_ERROR: IFU logic core checkstop.
6	RW	ACTION_UNUSED_6: Reserved.
7	RW	ACTION_UNUSED_7: Reserved.
8	RW	ACTION_PC_RECOV_XSTOP_ERROR: Recovery core checkstop.
9	RW	ACTION_SD_RFILE_REC_ERROR: ISU register file recoverable error (GPR/VRF).
10	RW	ACTION_SD_RFILE_XSTOP_ERROR: ISU register file core checkstop (mapper error).
11	RW	ACTION_SD_LOG_REC_ERROR: ISU logic recoverable error.
12	RW	ACTION_SD_LOG_XSTOP_ERROR: ISU logic core checkstop.
13	RW	ACTION_SD_NOT_MT_CI_REC_ERROR: ISU recoverable if not in an MT window.
14	RW	ACTION_SD_MCHK_AND_ME_EQ_0_ERROR: MCHK received while ME = 0, nonrecoverable.
15	RW	ACTION_SD_L2_UE_ERROR: UE from L2.
16	RW	ACTION_SD_L2_UE_OVER_THRES_ERROR: Number of UEs from L2 above the threshold.
17	RW	ACTION_SD_CI_UE_ERROR: UE on CI load.
18	RW	ACTION_UNUSED_18: Reserved.
19	RW	ACTION_UNUSED_19: Reserved.
20	RW	ACTION_SD_SYS_XSTOP_ERROR: ISU system checkstop (MSR corrupted).
21	RW	ACTION_UNUSED_21: Reserved.
22	RW	ACTION_UNUSED_22: Reserved.
23	RW	ACTION_UNUSED_23: Reserved.
24	RW	ACTION_VS_LOG_REC_ERROR: VSU logic recoverable error.
25	RW	ACTION_VS_LOG_XSTOP_ERROR: VSU logic core checkstop.
26	RW	ACTION_PC_RECOV_IN_MAINT_ERROR: Thread in maintenance mode receives recovery request.
27	RW	ACTION_VS_DU_LOG_REC_ERROR: VSU DFU logic recoverable error.
28	RW	ACTION_PC_SYS_XSTOP_ERROR: PC system checkstop. Recoverable error received when recovery was disabled.

Bits	SCOM	Field Mnemonic: Description
29	RW	ACTION_LS_SRAM_PARITY_ERROR: LSU SRAM recoverable error (DCACHE parity error, ERAT parity error, TLB parity error, SLB parity error, and so on).
30	RW	ACTION_LS_SETDELETE_ERROR: LSU set deleted.
31	RW	ACTION_LS_RFILE_REC_ERROR: LSU register file recoverable error.
32	RW	ACTION_LS_RFILE_XSTOP_ERROR: LSU register file core checkstop.
33	RW	ACTION_LS_TLB_MULTIHIT_ERROR: LSU TLB multiple-hit error occurred.
34	RW	ACTION_LS_SLB_MULTIHIT_ERROR: LSU SLB multiple-hit error occurred.
35	RW	ACTION_LS_DERAT_MULTIHIT_ERROR: LSU ERAT multiple-hit error occurred.
36	RW	ACTION_PC_FWD_PROGRESS_ERROR: PC forward progress error.
37	RW	ACTION_LS_LOG_REC_ERROR: LSU logic recoverable error.
38	RW	ACTION_LS_LOG_XSTOP_ERROR: LSU logic core checkstop.
39	RW	ACTION_LS_NOT_MT_REC_ERROR: LSU recoverable if not in MT window.
40	RW	ACTION_UNUSED_40: Reserved.
41	RW	ACTION_LS_SYS_XSTOP_ERROR: LSU system checkstop.
42	RW	ACTION_UNUSED_42: Reserved.
43	RW	ACTION_PC_THREAD_HANG_REC_ERROR: PC thread hang recoverable error.
44	RW	ACTION_UNUSED_44: Reserved.
45	RW	ACTION_PC_LOG_XSTOP_ERROR: PC logic checkstop.
46	RW	ACTION_UNUSED_46: Reserved.
47	RW	ACTION_PC_TFAC_XSTOP_ERROR: PC Timebase facility checkstop.
48	RW	ACTION_PC_HYP_RES_ERROR: Hypervisor resource error.
49	RW	ACTION_UNUSED_49: Reserved.
50	RW	ACTION_UNUSED_50: Reserved.
51	RW	ACTION_UNUSED_51: Reserved.
52	RW	ACTION_PC_HANG_RECOVERY_FAILED: Hang recovery failed.
53	RW	ACTION_PC_CORE_HANG_DETECT_ERROR: Core hang detected.
54	RW	ACTION_UNUSED_54: Reserved.
55	RW	ACTION_PC_NEST_HANG_DETECT_ERROR: Nest hang detected.
56	RW	ACTION_PC_OTHER_CORE_CHIPLET_REC_ERROR: Other core chiplet recoverable error.
57	RW	ACTION_PC_OTHER_CORE_CHIPLET_XSTOP_ERROR: Other core chiplet core checkstop.
58	RW	ACTION_PC_OTHER_CORE_CHIPLET_SYS_XSTOP_ERROR: Other core chiplet system checkstop.
59	RW	ACTION_PC_SCOM_ERROR: SCOM satellite error detected.
60	RW	ACTION_PC_XSTOP_ON_DBG_TRIGGER_ERROR: Debug trigger error inject.
61	RW	ACTION_PC_FW_INJ_REC_ERROR: SCOM or firmware recoverable error inject.
62	RW	ACTION_PC_FW_INJ_XSTOP_ERROR: Firmware checkstop error inject.
63	RW	ACTION_PC_PHYP_XSTOP_ERROR: Hypervisor checkstop via SPRC/SPRD.

Register Name	Core Who's on First Register
Mnemonic	EX07.EC.C0.PC.FIR.CORE_WOF
Address	000000002E010A48 (SCOM)
Description	Who's-on-first register

Bits	SCOM	Field Mnemonic: Description
0	RWX_WCLRREG	Reserved field.
1	RWX_WCLRREG	Reserved field.
2	RWX_WCLRREG	Reserved field.
3	RWX_WCLRREG	Reserved field.
4	RWX_WCLRREG	Reserved field.
5	RWX_WCLRREG	Reserved field.
6	RWX_WCLRREG	Reserved field.

62	RWX_WCLRREG	Reserved field.
63	RWX_WCLRREG	Reserved field.

Register Name	Reset Keeper Register
Mnemonic	EX07.EC.C0.PC.FIR.RESET_KEEPER
Address	000000002E010A4A (SCOM)
Description	Resets the error hold latches on the error report macros.

Bits	SCOM	Field Mnemonic: Description
0	WOX_1P	Reserved field.
1:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000000

Register Name	Recovery Forward Progress Control Register
Mnemonic	EX07.EC.C0.PC.FIR.RECOV_FWD_PROG_CTRL
Address	000000002E010A4B (SCOM)
Description	Recovery forward progress control

Bits	SCOM	Field Mnemonic: Description
0	RW	Reserved field.
1:3	RW	Reserved field.
4:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000

Register Name	Recovery Threshold Register
Mnemonic	EX07.EC.C0.PC.FIR.RECOV_THOLD
Address	000000002E010A4C (SCOM)
Description	Recovery threshold

Bits	SCOM	Field Mnemonic: Description
0:7	RW	Reserved field.
8:9	RW	THRESHOLD_RESET: 00 = Disable 01 = Reset after one hang pulse 10 = Reset after two hang pulses
10:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000

Register Name	FIR Error Injection Register
Mnemonic	EX07.EC.C0.PC.FIR.FIR_ERR_INJ
Address	000000002E010A4D (SCOM)
Description	Error injection control register

Bits	SCOM	Field Mnemonic: Description
0	RW	ERR_INJ_TO_LSU: Error injection to the LSU.
1	RW	ERR_INJ_TO_IFU: Error injection to the IFU.
2	RW	ERR_INJ_TO_ISU: Error injection to the ISU.
3	RW	ERR_INJ_TO_VSU: Error injection to the VSU.
4	RW	ERR_INJ_TO_PC: Error injection to the PC.
5	RW	Reserved field.
6	RW	ERROR_PULSE_OR_LEVEL: 0 = Injections is a pulse. 1 = Injection is a level.
7	RW	CLEAR_STICKY_LEVEL: Clear sticky latch used for level.
8	RW	ERR_INJ_SCOM_WRITE: SCOM write.
9	RW	ERR_INJ_TRIGGER: Trigger 0.

Bits	SCOM	Field Mnemonic: Description
10	RW	ERR_INJ_TRIGGER1: Trigger 1.
11	RW	ERR_INJ_TOD_TAP: TOD-tap.
12:13	RW	ERR_INJ_BLOCK: Block select 00 = Disable block by HV mode. 01 = Block if any thread is in HV mode. 10 = Block if all threads are in HV mode.
14	RW	ERR_INJ_DELAY_AFTER_BLOCK: Injection is delayed for 32 cycles after a block.
15	RW	ERR_INJ_RECOVERY_BLK: Injection is blocked while recovery is active.
16	RW	ERR_INJ_RECOVERY_BLK_EXTEND: Extend recovery block until there is forward progress.
17:20	RW	ERR_INJ_TAP_SEL: Tap select: 0000 => .5 ms. 0001 => 1.0 ms. 0010 => 2.0 ms. 0011 => 4.1 ms. 0100 => 8.2 ms. 0101 => 16.4 ms. 0110 => 32.8 ms. 0111 => 65.5 ms. 1000 => 131.0 ms. 1001 => 262.1 ms. 1010 => 524.3 ms. 1011 => 1.0 s. 1100 => 2.0 s. 1101 => 4.2 s. 1110 => 8.4 s. 1111 => 16.8 s.
21:23	RW	ERR_INJ_HYP_BLOCK: 0xx => Ignore HV and PR bits. 1HP => Block inject if MSR(HV) = H and MSR(PR) = P for any active thread.
24:63	RO	constant = 0b0000000000000000000000000000000000000000

Register Name	RAM Mode Register
Mnemonic	EX07.EC.C0.PC.FIR.RAM_MODEREG
Address	000000002E010A4E (SCOM)
Description	RAM instruction mode register

Bits	SCOM	Field Mnemonic: Description
0	RWX	RAM_MODE_ENABLE: RAM mode enable.
1:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000000

Register Name	FIR RAM Control Register
Mnemonic	EX07.EC.C0.PC.FIR.RAM_CTRL
Address	000000002E010A4F (SCOM)
Description	RAM instruction control register

Bits	SCOM	Field Mnemonic: Description
0:1	RWX	Reserved field.

Bits	SCOM	Field Mnemonic: Description
2:5	RWX	Reserved field.
6:7	RWX	Reserved field.
8:39	RWX	Reserved field.
40:63	RO	constant = 0b000000000000000000000000

Register Name	**RAM Status Register**
Mnemonic	EX07.EC.C0.PC.FIR.RAM_STATUS
Address	000000002E010A50 (SCOM)
Description	RAM instruction status register

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.
1	ROX	Reserved field.
2	ROX	Reserved field.
3	ROX	Reserved field.
4:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000

Register Name	**FIR Hold Out Register**
Mnemonic	EX07.EC.C0.PC.FIR.FIR_HOLD_OUT
Address	000000002E010A51 (SCOM)
Description	FIR/RECOV error report hold out register

Bits	SCOM	Field Mnemonic: Description
0:21	ROX	Reserved.
22:63	RO	constant = 0b000000000000000000000000000000000000000000

Register Name	**SCOM Control Register**
Mnemonic	EX07.EC.CC.PCC0.COMMON.SPR_COMMON.SCOMC
Address	000000002E010A80 (SCOM)
Description	SCOM control register

Bits	SCOM	Field Mnemonic: Description
0:53	RO	constant = 0b000000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
54:60	RW	MODE_CX_SCOMC: 0000xxx = SCRATCH xx SPR. 0001xxx = TFMR xx SPR. 0010xxx = PURR xx SPR. 0011xxx = SPURR xx SPR. 0100xxx = DEC xx SPR. 0111000 = SPR_MODE. 0111001 = AVP output pin. 0111010 = Core checkstop request. 0111011 = SPATTN SPR. 0111100 = Core thread state. 1xxxxxx = Emmpath counters.
61:63	RO	constant = 0b000

Register Name	**OCC SCOM Control Register**
Mnemonic	EX07.EC.CC.PCC0.COMMON.SPR_COMMON.OCC_SCOMC
Address	000000002E010A82 (SCOM)
Description	OCC SCOM Control Register

Bits	SCOM	Field Mnemonic: Description
0:53	RO	constant = 0b000000000000000000000000000000000000000000000000000000
54:60	RW	MODE_CX_OCC_SCOMC: 1xxxxxx = Emmpath counters.
61:63	RO	constant = 0b000

Register Name	**SPR Mode Register**
Mnemonic	EX07.EC.CC.PCC0.COMMON.SPR_COMMON.SPR_MODE
Address	000000002E010A84 (SCOM)
Description	SPR_MODE register

Bits	SCOM	Field Mnemonic: Description
0:9	RO	constant = 0b0000000000
10:15	WO_1P	SPR_MODEREG_TFAC_ERR_INJ: Timebase facility error inject.
16:19	RO	constant = 0b0000
20	RW	SPR_MODEREG_SPRC_LT0_SEL: Allows SCOMC write of bits 54:60 of logical T0 SPRC.
21	RW	SPR_MODEREG_SPRC_LT1_SEL: Allows SCOMC write of bits 54:60 of logical T1 SPRC.
22	RW	SPR_MODEREG_SPRC_LT2_SEL: Allows SCOMC write of bits 54:60 of logical T2 SPRC.
23	RW	SPR_MODEREG_SPRC_LT3_SEL: Allows SCOMC write of bits 54:60 of logical T3 SPRC.
24	RW	SPR_MODEREG_SPRC_LT4_SEL: Allows SCOMC write of bits 54:60 of logical T4 SPRC.
25	RW	SPR_MODEREG_SPRC_LT5_SEL: Allows SCOMC write of bits 54:60 of logical T5 SPRC.
26	RW	SPR_MODEREG_SPRC_LT6_SEL: Allows SCOMC write of bits 54:60 of logical T6 SPRC.
27	RW	SPR_MODEREG_SPRC_LT7_SEL: Allows SCOMC write of bits 54:60 of logical T7 SPRC.
28:63	RO	constant = 0b000000000000000000000000000000000000

Register Name	Control Register	
Mnemonic	EX07.EC.CC.PCC0.COMMON.SPR_COMMON.CTRL	
Address	000000002E010A85 (SCOM)	
Description	Control register	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant = 0b000000000000000000000000000000000000000000000000
48	ROX	CTRL_T0_RUN_Q: Logical thread 0 run latch.
49	ROX	CTRL_T1_RUN_Q: Logical thread 1 run latch.
50	ROX	CTRL_T2_RUN_Q: Logical thread 2 run latch.
51	ROX	CTRL_T3_RUN_Q: Logical thread 3 run latch.
52	ROX	CTRL_T4_RUN_Q: Logical thread 4 run latch.
53	ROX	CTRL_T5_RUN_Q: Logical thread 5 run latch.
54	ROX	CTRL_T6_RUN_Q: Logical thread 6 run latch.
55	ROX	CTRL_T7_RUN_Q: Logical thread 7 run latch.
56:62	RO	constant = 0b0000000
63	NCX	Reserved field.

Register Name	Scratch 0 Register
Mnemonic	EX07.EC.CC.PCC0.COMMON.SPR_COMMON.SCR0
Address	000000002E010A86 (SCOM)
Description	Scratch register 0

Bits	SCOM	Field Mnemonic: Description
0:63	RW	Reserved.

Register Name	Scratch 1 Register
Mnemonic	EX07.EC.CC.PCC0.COMMON.SPR_COMMON.SCR1
Address	000000002E010A87 (SCOM)
Description	Scratch Register 1

Bits	SCOM	Field Mnemonic: Description
0:63	RW	Reserved.

Register Name	Scratch 2 Register
Mnemonic	EX07.EC.CC.PCC0.COMMON.SPR_COMMON.SCR2
Address	000000002E010A88 (SCOM)
Description	Scratch Register 2

Bits	SCOM	Field Mnemonic: Description
0:63	RW	Reserved.

Register Name	Scratch 3 Register
Mnemonic	EX07.EC.CC.PCC0.COMMON.SPR_COMMON.SCR3
Address	000000002E010A89 (SCOM)
Description	Scratch Register 3

Bits	SCOM	Field Mnemonic: Description
0:63	RW	Reserved.

Register Name	Virtual Thread 0 HMER Register
Mnemonic	EX07.EC.CC.PCC0.COMMON.SPR_COMMON.V0_HMER
Address	000000002E010A8E (SCOM2) 000000002E010A92 (SCOM1)
Description	Virtual thread 0 HMER register

Bits	SCOM2	SCOM1	Field Mnemonic: Description
0	WOX_OR	RWX_WAND	V0_HMER_MALFUNCTION_ALERT: A processor core in the system has encountered a checkstop error (broadcast signal).
1	WOX_OR	RWX_WAND	V0_HMER_CME_REQUEST: CME requested a hypervisor interrupt.
2	WOX_OR	RWX_WAND	V0_HMER_PROC_RCVY_DONE: A recovery has occurred for error bits that are not masked.
3	WOX_OR	RWX_WAND	Reserved field.
4	WOX_OR	RWX_WAND	V0_HMER_TFAC_ERR: Error for other registers in Timebase facility details in the TFMR.
5	WOX_OR	RWX_WAND	V0_HMER_TFMR_PARITY_ERR: Parity error for the TFMR register in the Timebase facility.
6	WOX_OR	RWX_WAND	Reserved field.
7	WOX_OR	RWX_WAND	Reserved field.
8	WOX_OR	RWX_WAND	V0_HMER_XSCOM_FAIL: An XSCOM operation ended with bad status.
9	WOX_OR	RWX_WAND	V0_HMER_XSCOM_DONE: An XSOM operation ended.
10	WOX_OR	RWX_WAND	Reserved field.
11	WOX_OR	RWX_WAND	V0_HMER_PROC_RCVY_AGAIN: Recovery occurred while bit 2 is still set.
12	WOX_OR	RWX_WAND	Reserved field.
13	WOX_OR	RWX_WAND	Reserved field.
14	WOX_OR	RWX_WAND	Reserved field.
15	WOX_OR	RWX_WAND	Reserved field.
16	WOX_OR	RWX_WAND	V0_HMER_SCOM_FIR_HMI: SCOM set FIR bit to cause recovery.
17	WOX_OR	RWX_WAND	V0_HMER_TRIG_FIR_HMI: Debug trigger set FIR bit to cause recovery.
18	WOX_OR	RWX_WAND	Reserved field.
19	WOX_OR	RWX_WAND	Reserved field.

Bits	SCOM2	SCOM1	Field Mnemonic: Description
20	WOX_OR	RWX_WAND	V0_HMER_HYP_RECOURCE_ERR: Parity error on a hypervisor resource register.
21:23	WOX_OR	RWX_WAND	V0_HMER_XSCOM_STATUS: 000 = No error. 001 = XSCOM blocked due to pending error. 010 = Chiplet offline. 011 = Partial good. 100 = Invalid address / address error. 101 = Clock error. 110 = Parity error. 111 = Time out.
24:63	RO	RO	constant = 0b0000000000000000000000000000000000000000

Register Name	Virtual Thread 1 HMER Register
Mnemonic	EX07.EC.CC.PCC0.COMMON.SPR_COMMON.V1_HMER
Address	000000002E010A8F (SCOM2) 000000002E010A93 (SCOM1)
Description	Virtual thread 1 HMER register

Bits	SCOM2	SCOM1	Field Mnemonic: Description
0	WOX_OR	RWX_WAND	V1_HMER_MALFUNCTION_ALERT: A processor core in the system has encountered a checkstop error (broadcast signal).
1	WOX_OR	RWX_WAND	V1_HMER_CME_REQUEST: The CME requested a hypervisor interrupt.
2	WOX_OR	RWX_WAND	V1_HMER_PROC_RCVY_DONE: A recovery has occurred for error bits that are not masked.
3	WOX_OR	RWX_WAND	Reserved field.
4	WOX_OR	RWX_WAND	V1_HMER_TFAC_ERR: Error for other registers in the Timebase facility.

Register Name	SPURR Frequency Detection Cycle Count Register
Mnemonic	EX07.EC.CC.PCC0.TFDP.TFP.SPURR_FREQ_DETECT_CYC_CNT
Address	000000002E010A9F (SCOM)
Description	Scale detect cycle count SCOM

Bits	SCOM	Field Mnemonic: Description
0:7	ROX	CYCLE_COUNT: The cycle count used by the automatic frequency scale detector represents the upper eight bits of a 13-bit cycle counter that counts the number of core clock cycles in the last interval of 16 TOD steps.
8:63	RO	constant = 0b00000000000000000000000000000000000000000000000000000000

Register Name	SPURR Frequency Scale Register
Mnemonic	EX07.EC.CC.PCC0.TFDP.TFP.SPURR_FREQ_SCALE
Address	000000002E010AA0 (SCOM)
Description	SPURR frequency scale SCOM

Bits	SCOM	Field Mnemonic: Description
0	RW	SCALE_OVERRIDE_EN: Frequency scale override enable (default=0b1). Reading this bit returns the value that was written.
1:7	RW	SCALE_FACTOR: Frequency scale factor in 64ths (default=0b1000000). Reading these bits returns the value that was written.
8:63	RO	constant = 0b00000000000000000000000000000000000000000000000000000000

Register Name	SPURR Frequency Reference Register
Mnemonic	EX07.EC.CC.PCC0.TFDP.TFP.SPURR_FREQ_REF
Address	000000002E010AA1 (SCOM)
Description	SPURR frequency reference SCOM

Bits	SCOM	Field Mnemonic: Description
0:7	RW	FREQUENCY_REFERENCE: The frequency reference override. Represents the reference cycle count in twos complement form for 16 TOD step intervals, dropping the five LSBs before forming the complement. Reading these bits returns the value that was written.
8:63	RO	constant = 0b00000000000000000000000000000000000000000000000000000000

Register Name	POWER Management Events Register
Mnemonic	EX07.EC.CC.PCC0.TFDP.TFP.PWM_EVENTS

56	RW	PWM_EVENTS_RESERVED_56: Reserved.
57	RW	PWM_EVENTS_RESERVED_57: Reserved.
58:59	RW	EVENT_MUX_SELECTS: Event multiplexer select 00 = Frequency threshold compares A and B (against scale used by SPURR before PMCR fraction) 01 = P-state threshold compares A and B (against value in PMCR) 10 = PMCM threshold compare (from PMCR) || Max PSAV Mode (from PMCR) 11 = PMCM threshold compare (from PMCR) || PMCM compare (actual).
60	RW	PWM_EVENTS_RESERVED_60: Reserved.
61	RW	PWM_EVENTS_RESERVED_61: Reserved.
62:63	RW	PMCM_THRESHOLD: PMCM threshold.

Register Name	Timebase Read from Chip TOD Register
Mnemonic	EX07.EC.CC.PCC0.TOD_READ
Address	000000002E010AA3 (SCOM)
Description	Timebase read from chip TOD

Bits	SCOM	Field Mnemonic: Description
0:59	ROX	TIMEBASE: Timebase register.
60:63	RO	constant = 0b0000

Register Name	Time Of Day Synchronization 0 Register
Mnemonic	EX07.EC.CC.PCC0.TOD_SYNC000
Address	000000002E010AA3 (SCOM1)
Description	Time of day (mttod) for sync_bit_sel = 000. Note: The TOD_SYNCxxx registers cannot be tested together by register check in one run.

Bits	SCOM1	Field Mnemonic: Description
0:54	WOX	TIMEBASE: Timebase register.
55:59	RO	Not implemented.
60:63	WOX	CHIP_TOD_STATUS: Chip time of day status.

Register Name	Time Of Day Synchronization 1 Register
Mnemonic	EX07.EC.CC.PCC0.TOD_SYNC001
Address	000000002E010AA3 (SCOM1)
Description	Time of day (mttod) for sync_bit_sel = 001. Note: The TOD_SYNCxxx registers cannot be tested together by register check in one run.

Bits	SCOM1	Field Mnemonic: Description
0:53	WOX	TIMEBASE: Timebase register.
54:59	RO	Not implemented.
60:63	WOX	CHIP_TOD_STATUS: Chip time of day status.

Register Name	Time Of Day Synchronization 2 Register
Mnemonic	EX07.EC.CC.PCC0.TOD_SYNC010
Address	000000002E010AA3 (SCOM1)
Description	Time of day (mttod) for sync_bit_sel = 010. Note: The TOD_SYNCxxx registers cannot be tested together by register check in one run.

Bits	SCOM1	Field Mnemonic: Description
0:52	WOX	TIMEBASE: Timebase register.
53:59	RO	Not implemented.
60:63	WOX	CHIP_TOD_STATUS: Chip time of day status.

Register Name	Time Of Day Synchronization 3 Register
Mnemonic	EX07.EC.CC.PCC0.TOD_SYNC011
Address	000000002E010AA3 (SCOM1)
Description	Time of day (mttod) for sync_bit_sel=011. Note: The TOD_SYNCxxx registers cannot be tested together by register check in one run.

Bits	SCOM1	Field Mnemonic: Description
0:51	WOX	TIMEBASE: Timebase register.
52:59	RO	Not implemented.
60:63	WOX	CHIP_TOD_STATUS: Chip time of day status.

Register Name	Time Of Day Synchronization 4 Register
Mnemonic	EX07.EC.CC.PCC0.TOD_SYNC100
Address	000000002E010AA3 (SCOM1)
Description	Time of day (mttod) for sync_bit_sel = 100. Note: The TOD_SYNCxxx registers cannot be tested together by register check in one run.

Bits	SCOM1	Field Mnemonic: Description
0:50	WOX	TIMEBASE: Timebase register.
51:59	RO	Not implemented.
60:63	WOX	CHIP_TOD_STATUS: Chip time of day status.

Register Name	Time Of Day Synchronization 5 Register
Mnemonic	EX07.EC.CC.PCC0.TOD_SYNC101
Address	000000002E010AA3 (SCOM1)
Description	Time of day (mttod) for sync_bit_sel = 101. Note: The TOD_SYNCxxx registers cannot be tested together by register check in one run.

Bits	SCOM1	Field Mnemonic: Description
0:49	WOX	TIMEBASE: Timebase register.
50:59	RO	Not implemented.
60:63	WOX	CHIP_TOD_STATUS: Chip time of day status.

Register Name	Time Of Day Synchronization 6 Register
Mnemonic	EX07.EC.CC.PCC0.TOD_SYNC110
Address	000000002E010AA3 (SCOM1)
Description	Time of day (mttod) for sync_bit_sel=110. Note: The TOD_SYNCxxx registers cannot be tested together by register check in one run.

Bits	SCOM1	Field Mnemonic: Description
0:48	WOX	TIMEBASE: Timebase register.
49:59	RO	Not implemented.

Bits	SCOM1	Field Mnemonic: Description
60:63	WOX	CHIP_TOD_STATUS: Chip time of day status.

Register Name	Time Of Day Synchronization 7 Register
Mnemonic	EX07.EC.CC.PCC0.TOD_SYNC111
Address	000000002E010AA3 (SCOM1)
Description	Time of day (mttod) for sync_bit_sel = 111. Note: The TOD_SYNCxxx registers cannot be tested together by register check in one run.

Bits	SCOM1	Field Mnemonic: Description
0:47	WOX	TIMEBASE: Timebase register.
48:59	RO	Not implemented.
60:63	WOX	CHIP_TOD_STATUS: Chip time of day status.

Register Name	Time of Day Step Check Register
Mnemonic	EX07.EC.CC.PCC0.COMMON.TFC.TOD_STEP_CHECK
Address	000000002E010AA4 (SCOM)
Description	Time of day step check register

Bits	SCOM	Field Mnemonic: Description

15	ROX	Reserved field.

Register Name	Error Injections Register
Mnemonic	EX07.EC.C0.LS.ERR_INJ_REG
Address	000000002E010CBF (SCOM)
Description	Error injections on LSU checkers

Bits	SCOM	Field Mnemonic: Description
0	RW	Reserved field.
1	RW	Reserved field.
2	RW	Reserved field.
3	RW	Reserved field.
4	RW	Reserved field.
5	RW	Reserved field.
6	RW	Reserved field.
7	RW	Reserved field.
8	RW	Reserved field.
9	RW	Reserved field.

Bits	SCOM	Field Mnemonic: Description
10	RW	Reserved field.
11	RW	Reserved field.
12	RW	Reserved field.
13	RW	Reserved field.
14	RW	Reserved field.
15	RW	Reserved field.

Register Name	Trace Array High Data Register
Mnemonic	EX07.EC.C0.PC.TRACE1.TR.TR0.TRACE_HI_DATA_REG
Address	000000002E011440 (SCOM)
Description	This register provides the high trace array data.

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	TRACE_HI_DATA: Trace array data 0:63.

Register Name	Trace Array Low Data Register
Mnemonic	EX07.EC.C0.PC.TRACE1.TR.TR0.TRACE_LO_DATA_REG
Address	000000002E011441 (SCOM)
Description	This register provides the low trace array data.

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	TRACE_LO_DATA: Trace array data 64:95.
32:41	ROX	TRACE_ADDRESS: Trace address.
42:50	ROX	TRACE_LAST_BANK: Trace last bank.
51	ROX	TRACE_LAST_BANK_VALID: Trace last bank valid.
52	ROX	TRACE_WRITE_ON_RUN: Trace write-on-run indicator.
53	ROX	TRACE_RUNNING: Trace run indicator.
54:63	ROX	TRACE_HOLD_ADDRESS: Trace hold address (pointing to last entry).

Register Name	Trace Control Configuration Register
Mnemonic	EX07.EC.C0.PC.TRACE1.TR.TR0.TRACE_TRCTRL_CONFIG
Address	000000002E011442 (SCOM)
Description	This register contains trace control configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	Reserved field.
1	RW	WRITE_ON_RUN_MODE: Write on run mode.
2:9	RW	EXTENDED_STORE_ON_TRIG_MODE: Extended trigger mode.
10	RW	BANK_MODE: Bank mode.

Bits	SCOM	Field Mnemonic: Description
11	RW	ENH_TRACE_MODE: Enhanced trace mode.
12	RW	LOCAL_CLOCK_GATE_CONTROL: When this bit is set, internal clock gating is disabled. The trace control logic and the trace data pipeline are always clocked.
13	RW	UNUSED_13B: Unused.
14:21	RW	Reserved field.

Register Name	Trace Data Configuration Register 0
Mnemonic	EX07.EC.C0.PC.TRACE1.TR.TR0.TRACE_TRDATA_CONFIG_0
Address	000000002E011443 (SCOM)
Description	This register contains a trace data compare mask for bits 0 – 63.

Bits	SCOM	Field Mnemonic: Description
0:63	RW	CMP_MSK_LT_B_0_TO_63: Trace data compare mask for bits 0 to 63.

Register Name	Trace Data Configuration Register 1
Mnemonic	EX07.EC.C0.PC.TRACE1.TR.TR0.TRACE_TRDATA_CONFIG_1
Address	000000002E011444 (SCOM)
Description	This register contains a trace data compare mask for bits 64 – 87.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CMP_MSK_LT_B_64_TO_87: Trace data compare mask for bits 64 to 87.

Register Name	Trace Data Configuration Register 2
Mnemonic	EX07.EC.C0.PC.TRACE1.TR.TR0.TRACE_TRDATA_CONFIG_2
Address	000000002E011445 (SCOM)
Description	This register contains patterns A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNA: pattern_match_pata_0_to_23.
24:47	RW	PATTERNB: pattern_match_patb_0_to_23.

Register Name	Trace Data Configuration Register 3
Mnemonic	EX07.EC.C0.PC.TRACE1.TR.TR0.TRACE_TRDATA_CONFIG_3
Address	000000002E011446 (SCOM)
Description	This register contains patterns C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNC: pattern_match_patc_0_to_23.
24:47	RW	PATTERND: pattern_match_patd_0_to_23.

Register Name	Trace Data Configuration Register 4
Mnemonic	EX07.EC.C0.PC.TRACE1.TR.TR0.TRACE_TRDATA_CONFIG_4
Address	000000002E011447 (SCOM)
Description	This register contains masks A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKA: mska.
24:47	RW	MASKB: mskb.

Register Name	Trace Data Configuration Register 5
Mnemonic	EX07.EC.C0.PC.TRACE1.TR.TR0.TRACE_TRDATA_CONFIG_5
Address	000000002E011448 (SCOM)
Description	This register contains masks C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKC: mskc.
24:47	RW	MASKD: mskd.

Register Name	Trace Data Configuration Register 9
Mnemonic	EX07.EC.C0.PC.TRACE1.TR.TR0.TRACE_TRDATA_CONFIG_9
Address	000000002E011449 (SCOM)
Description	This register contains trace data configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	DISABLE_COMPRESSION: Disable trace data compression (store data on every cycle).
1	RW	ERROR_BIT_COMPRESSION_CARE_MASK: Take into account changes in the error bit for trace data compression (default = 0).
2:3	RW	MATCHA_MUXSEL: Match PATTERNA against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
4:5	RW	MATCHB_MUXSEL: Match PATTERNB against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
6:7	RW	MATCHC_MUXSEL: Match PATTERNC against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.

Bits	SCOM	Field Mnemonic: Description
8:9	RW	MATCHD_MUXSEL: Match PATTERND against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
10:13	RW	TRIG0_OR_MASK: The OR of all selected MATCHes is ORed with the result of TRIG0_AND. 0b1XXX = Selects MATCHA OR 0bX1XX = Selects MATCHB OR 0bXX1X = Selects MATCHC OR 0bXXX1 = Selects MATCHD OR 0b0000 = Selects to not OR any MATCHes.
14:17	RW	TRIG0_AND_MASK: The AND of following selected MATCHes is ORed with the result of TRIG0_OR. 0b1XXX = Selects MATCHA AND 0bX1XX = Selects MATCHB AND 0bXX1X = Selects MATCHC AND 0bXXX1 = Selects MATCHD AND 0b0000 = Selects to not AND any MATCHes together to form TRIG0.
18:21	RW	TRIG1_OR_MASK: The OR of all selected MATCHes is ORed with the result of TRIG1_AND. 0b1XXX = Selects MATCHA OR 0bX1XX = Selects MATCHB OR 0bXX1X = Selects MATCHC OR 0bXXX1 = Selects MATCHD OR 0b0000 = Selects to not OR any MATCHes to form TRIG1.
22:25	RW	TRIG1_AND_MASK: The AND of following selected MATCHes is ORed with the result of TRIG1_OR. 0b1XXX = Selects MATCHA AND 0bX1XX = Selects MATCHB AND 0bXX1X = Selects MATCHC AND 0bXXX1 = Selects MATCHD AND 0b0000 = Selects to not AND any MATCHes together to form TRIG1.
26	RW	TRIG0_NOT_MODE: Invert TRIG0 before using it.
27	RW	TRIG1_NOT_MODE: Invert TRIG1 before using it.
28:31	RW	MATCH_NOT_MODE: Invert the match polarity before using it to form a trigger. 0b1000 = Inverts MATCHA. 0b0100 = Inverts MATCHB. 0b0010 = Inverts MATCHC. 0b0001 = Inverts MATCHD.
32:35	RW	Reserved field.
36:39	RW	Reserved field.

Register Name	Trace Array High Data Register
Mnemonic	EX07.EC.C0.PC.TRACE2.TR.TR0.TRACE_HI_DATA_REG
Address	000000002E011480 (SCOM)
Description	This register provides the high trace array data.

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	TRACE_HI_DATA: Trace array data 0:63.

Register Name	Trace Array Low Data Register
Mnemonic	EX07.EC.C0.PC.TRACE2.TR.TR0.TRACE_LO_DATA_REG
Address	000000002E011481 (SCOM)
Description	This register provides the low trace array data.

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	TRACE_LO_DATA: Trace array data 64:95.
32:41	ROX	TRACE_ADDRESS: Trace address.
42:50	ROX	TRACE_LAST_BANK: Trace last bank.
51	ROX	TRACE_LAST_BANK_VALID: Trace last bank valid.
52	ROX	TRACE_WRITE_ON_RUN: Trace write-on-run indicator.
53	ROX	TRACE_RUNNING: Trace run indicator.
54:63	ROX	TRACE_HOLD_ADDRESS: Trace hold address (pointing to last entry).

Register Name	Trace Control Configuration Register
Mnemonic	EX07.EC.C0.PC.TRACE2.TR.TR0.TRACE_TRCTRL_CONFIG
Address	000000002E011482 (SCOM)
Description	This register contains trace control configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	Reserved field.
1	RW	WRITE_ON_RUN_MODE: Write-on-run mode.
2:9	RW	EXTENDED_STORE_ON_TRIG_MODE: Extended trigger mode.
10	RW	BANK_MODE: Bank mode.
11	RW	ENH_TRACE_MODE: Enhanced trace mode.
12:13	RW	LCL_CLK_GATE_CTRL: Application note: Do not set lcl_clk_gate_ctrl to '00'; always keep at '11' as a workaround for incorrect clock gating.
14:21	RW	Reserved field.

Register Name	Trace Data Configuration Register 0
Mnemonic	EX07.EC.C0.PC.TRACE2.TR.TR0.TRACE_TRDATA_CONFIG_0
Address	000000002E011483 (SCOM)
Description	This register contains a trace data compare mask for bits 0 – 63.

Bits	SCOM	Field Mnemonic: Description
0:63	RW	CMP_MSK_LT_B_0_TO_63: Trace data compare mask for bits 0 to 63.

Register Name	Trace Data Configuration Register 1
Mnemonic	EX07.EC.C0.PC.TRACE2.TR.TR0.TRACE_TRDATA_CONFIG_1
Address	000000002E011484 (SCOM)
Description	This register contains a trace data compare mask for bits 64 – 87.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CMP_MSK_LT_B_64_TO_87: Trace data compare mask for bits 64 to 87.

Register Name	Trace Data Configuration Register 2
Mnemonic	EX07.EC.C0.PC.TRACE2.TR.TR0.TRACE_TRDATA_CONFIG_2
Address	000000002E011485 (SCOM)
Description	This register contains patterns A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNA: pattern_match_pata_0_to_23.
24:47	RW	PATTERNB: pattern_match_patb_0_to_23.

Register Name	Trace Data Configuration Register 3
Mnemonic	EX07.EC.C0.PC.TRACE2.TR.TR0.TRACE_TRDATA_CONFIG_3
Address	000000002E011486 (SCOM)
Description	This register contains patterns C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNC: pattern_match_patc_0_to_23.
24:47	RW	PATTERND: pattern_match_patd_0_to_23.

Register Name	Trace Data Configuration Register 4
Mnemonic	EX07.EC.C0.PC.TRACE2.TR.TR0.TRACE_TRDATA_CONFIG_4
Address	000000002E011487 (SCOM)
Description	This register contains masks A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKA: mska.
24:47	RW	MASKB: mskb.

Register Name	Trace Data Configuration Register 5
Mnemonic	EX07.EC.C0.PC.TRACE2.TR.TR0.TRACE_TRDATA_CONFIG_5
Address	000000002E011488 (SCOM)
Description	This register contains masks C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKC: mskc.
24:47	RW	MASKD: mskd.

Register Name	Trace Data Configuration Register 9
Mnemonic	EX07.EC.C0.PC.TRACE2.TR.TR0.TRACE_TRDATA_CONFIG_9
Address	000000002E011489 (SCOM)
Description	This register contains trace data configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	DISABLE_COMPRESSION: Disable trace data compression (store data on every cycle).
1	RW	ERROR_BIT_COMPRESSION_CARE_MASK: Take into account changes in the error bit for trace data compression (default = 0).
2:3	RW	MATCHA_MUXSEL: Match PATTERNA against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
4:5	RW	MATCHB_MUXSEL: Match PATTERNB against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
6:7	RW	MATCHC_MUXSEL: Match PATTERNC against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
8:9	RW	MATCHD_MUXSEL: Match PATTERND against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
10:13	RW	TRIG0_OR_MASK: The OR of all selected MATCHes is ORed with the result of TRIG0_AND. 0b1XXX = Selects MATCHA OR 0bX1XX = Selects MATCHB OR 0bXX1X = Selects MATCHC OR 0bXXX1 = Selects MATCHD OR 0b0000 = Selects to not OR any MATCHes.
14:17	RW	TRIG0_AND_MASK: The AND of following selected MATCHes is ORed with the result of TRIG0_OR. 0b1XXX = Selects MATCHA AND 0bX1XX = Selects MATCHB AND 0bXX1X = Selects MATCHC AND 0bXXX1 = Selects MATCHD AND 0b0000 = Selects to not AND any MATCHes together to form TRIG0.
18:21	RW	TRIG1_OR_MASK: The OR of all selected MATCHes is ORed with the result of TRIG1_AND. 0b1XXX = Selects MATCHA OR 0bX1XX = Selects MATCHB OR 0bXX1X = Selects MATCHC OR 0bXXX1 = Selects MATCHD OR 0b0000 = Selects to not OR any MATCHes to form TRIG1.

Bits	SCOM	Field Mnemonic: Description
22:25	RW	TRIG1_AND_MASK: The AND of following selected MATCHes is ORed with the result of TRIG1_OR. 0b1XXX = Selects MATCHA AND 0bX1XX = Selects MATCHB AND 0bXX1X = Selects MATCHC AND 0bXXX1 = Selects MATCHD AND 0b0000 = Selects to not AND any MATCHes together to form TRIG1.
26	RW	TRIG0_NOT_MODE: Invert TRIG0 before using it.
27	RW	TRIG1_NOT_MODE: Invert TRIG1 before using it.
28:31	RW	MATCH_NOT_MODE: Invert the match polarity before using it to form a trigger. 0B1000 = Inverts MATCHA. 0b0100 = Inverts MATCHB. 0b0010 = Inverts MATCHC. 0b0001 = Inverts MATCHD.
32:35	RW	Reserved field.
36:39	RW	Reserved field.

Register Name	Trace Array High Data Register
Mnemonic	EX07.EC.C0.SD.TRA_01.TR.TR0.TRACE_HI_DATA_REG
Address	000000002E011C00 (SCOM)
Description	This register provides the high trace array data.

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	TRACE_HI_DATA: Trace array data 0:63.

Register Name	Trace Array Low Data Register
Mnemonic	EX07.EC.C0.SD.TRA_01.TR.TR0.TRACE_LO_DATA_REG
Address	000000002E011C01 (SCOM)
Description	This register provides the low trace array data.

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	TRACE_LO_DATA: Trace array data 64:95.
32:41	ROX	TRACE_ADDRESS: Trace address.
42:50	ROX	TRACE_LAST_BANK: Trace the last bank.
51	ROX	TRACE_LAST_BANK_VALID: Trace the last valid bank.
52	ROX	TRACE_WRITE_ON_RUN: Trace the write-on-run indicator.
53	ROX	TRACE_RUNNING: Trace the run indicator.
54:63	ROX	TRACE_HOLD_ADDRESS: Trace the hold address (pointing to last entry).

Register Name	Trace Control Configuration Register
Mnemonic	EX07.EC.C0.SD.TRA_01.TR.TR0.TRACE_TRCTRL_CONFIG
Address	000000002E011C02 (SCOM)
Description	This register contains trace control configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	Reserved field.
1	RW	WRITE_ON_RUN_MODE: Write-on-run mode.
2:9	RW	EXTENDED_STORE_ON_TRIG_MODE: Extended trigger mode.
10	RW	BANK_MODE: Bank mode.
11	RW	ENH_TRACE_MODE: Enhanced trace mode.
12:13	RW	LCL_CLK_GATE_CTRL: Application note: Do not set lcl_clk_gate_ctrl to '00'; always keep at '11' as a workaround for incorrect clock gating.
14:21	RW	Reserved field.

Register Name	Trace Data Configuration Register 0
Mnemonic	EX07.EC.C0.SD.TRA_01.TR.TR0.TRACE_TRDATA_CONFIG_0
Address	000000002E011C03 (SCOM)
Description	This register contains a trace data compare mask for bits 0 – 63.

Bits	SCOM	Field Mnemonic: Description
0:63	RW	CMP_MSK_LT_B_0_TO_63: Trace data compare mask for bits 0 to 63.

Register Name	Trace Data Configuration Register 1
Mnemonic	EX07.EC.C0.SD.TRA_01.TR.TR0.TRACE_TRDATA_CONFIG_1
Address	000000002E011C04 (SCOM)
Description	This register contains a trace data compare mask for bits 64 – 87.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	CMP_MSK_LT_B_64_TO_87: Trace data compare mask for bits 64 to 87.

Register Name	Trace Data Configuration Register 2
Mnemonic	EX07.EC.C0.SD.TRA_01.TR.TR0.TRACE_TRDATA_CONFIG_2
Address	000000002E011C05 (SCOM)
Description	This register contains patterns A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	PATTERNA: pattern_match_pata_0_to_23.
24:47	RW	PATTERNB: pattern_match_patb_0_to_23.

Register Name	Trace Data Configuration Register 3
Mnemonic	EX07.EC.C0.SD.TRA_01.TR.TR0.TRACE_TRDATA_CONFIG_3
Address	000000002E011C06 (SCOM)
Description	This register contains patterns C and D.

Bits	SCOM	Field Mnemonic: Description

Bits	SCOM	Field Mnemonic: Description
24:47	RW	PATTERND: pattern_match_patd_0_to_23.

Register Name	Trace Data Configuration Register 4
Mnemonic	EX07.EC.C0.SD.TRA_01.TR.TR0.TRACE_TRDATA_CONFIG_4
Address	000000002E011C07 (SCOM)
Description	This register contains masks A and B.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKA: mska.
24:47	RW	MASKB: mskb.

Register Name	Trace Data Configuration Register 5
Mnemonic	EX07.EC.C0.SD.TRA_01.TR.TR0.TRACE_TRDATA_CONFIG_5
Address	000000002E011C08 (SCOM)
Description	This register contains masks C and D.

Bits	SCOM	Field Mnemonic: Description
0:23	RW	MASKC: mskc.
24:47	RW	MASKD: mskd.

Register Name	Trace Data Configuration Register 9
Mnemonic	EX07.EC.C0.SD.TRA_01.TR.TR0.TRACE_TRDATA_CONFIG_9
Address	000000002E011C09 (SCOM)
Description	This register contains trace data configuration fields.

Bits	SCOM	Field Mnemonic: Description
0	RW	DISABLE_COMPRESSION: Disable trace data compression (store data on every cycle).
1	RW	ERROR_BIT_COMPRESSION_CARE_MASK: Take into account changes in the error bit for trace data compression (default = 0).
2:3	RW	MATCHA_MUXSEL: Match PATTERNA against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
4:5	RW	MATCHB_MUXSEL: Match PATTERNB against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
6:7	RW	MATCHC_MUXSEL: Match PATTERNC against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.

Bits	SCOM	Field Mnemonic: Description
8:9	RW	MATCHD_MUXSEL: Match PATTERND against: 0b00 = Debug bus bits(00:23). 0b01 = Debug bus bits(24:47). 0b10 = Debug bus bits(48:71). 0b11 = Debug bus bits(72:87) | 8 zeroes.
10:13	RW	TRIG0_OR_MASK: The OR of all selected MATCHes is ORed with the result of TRIG0_AND. 0b1XXX = Selects MATCHA OR 0bX1XX = Selects MATCHB OR 0bXX1X = Selects MATCHC OR 0bXXX1 = Selects MATCHD OR 0b0000 = Selects to not OR any MATCHes.
14:17	RW	TRIG0_AND_MASK: The AND of following selected MATCHes is ORed with the result of TRIG0_OR. 0b1XXX = Selects MATCHA AND 0bX1XX = Selects MATCHB AND 0bXX1X = Selects MATCHC AND 0bXXX1 = Selects MATCHD AND 0b0000 = Selects to not AND any MATCHes together to form TRIG0.
18:21	RW	TRIG1_OR_MASK: The OR of all selected MATCHes is ORed with the result of TRIG1_AND. 0b1XXX = Selects MATCHA OR 0bX1XX = Selects MATCHB OR 0bXX1X = Selects MATCHC OR 0bXXX1 = Selects MATCHD OR 0b0000 = Selects to not OR any MATCHes to form TRIG1.
22:25	RW	TRIG1_AND_MASK: The AND of following selected MATCHes is ORed with the result of TRIG1_OR. 0b1XXX = Selects MATCHA AND 0bX1XX = Selects MATCHB AND 0bXX1X = Selects MATCHC AND 0bXXX1 = Selects MATCHD AND 0b0000 = Selects to not AND any MATCHes together to form TRIG1.
26	RW	TRIG0_NOT_MODE: Invert TRIG0 before using it.
27	RW	TRIG1_NOT_MODE: Invert TRIG1 before using it.
28:31	RW	MATCH_NOT_MODE: Invert the match polarity before using it to form a trigger. 0b1000 = Inverts MATCHA. 0b0100 = Inverts MATCHB. 0b0010 = Inverts MATCHC. 0b0001 = Inverts MATCHD.
32:35	RW	Reserved field.
36:39	RW	Reserved field.

Register Name	Synchronous Configuration Register
Mnemonic	TP.TCEC14.CORE.SYNC_CONFIG
Address	000000002E030000 (SCOM)
Description	Configuration of CC counters.

Bits	SCOM	Field Mnemonic: Description
0:3	RW	SYNC_PULSE_DELAY: Delay the incoming synchronous pulse. The default is 8 latches including asynchronous. 0000 = Delay by 8 latches (default). 0001 = Delay by 2 latches. 0010 = Delay by 3 latches. 0011 = Delay by 4 latches. 0100 = Delay by 5 latches. 0101 = Delay by 6 latches. 0110 = Delay by 7 latches. 0111 = Delay by 8 latches. 1000 = Delay by 9 latches. 1001 = Delay by 10 latches. 1010 = Delay by 11 latches. 1011 = Delay by 12 latches. 1100 = Delay by 13 latches. 1101 = Delay by 14 latches. 1110 = Delay by 15 latches. 1111 = Delay by 16 latches.
4	RW	LISTEN_TO_SYNC_PULSE_DIS: Disable phase counter synchronization by sync_pulse signal (default is enabled). Note: When listen_to_sync is enabled, the chiplet becomes corrupted for 200 cycles.
5	RW	SYNC_PULSE_INPUT_SEL: The default is 0. When set to 1, the alternative input of the sync_pulse will be used. Note: When toggling the input select, the chiplet becomes corrupted for 200 cycles.
6	RW	USE_SYNC_FOR_SCAN: When set, use OPCG initial alignment for scan requests.
7	RW	CLEAR_CHIPLET_IS_ALIGNED: This bit clears the chiplet_is_aligned bit. See the Chiplet Status Register.
8	RW	UNIT_REGION_CLKCMD_ENABLE: Enable the unit interface to start or stop one dedicated region. Used for POWER9 cache/core.

Bits	SCOM	Field Mnemonic: Description
9	RW	DISABLE_PCB_ITR: Disable interrupt generation within CC. Interrupt sent on each HLD event.
10	RW	ENABLE_VITL_ALIGN_CHECK: Enable the VITL align check to compare alignment of incoming synchronous pulse with 2:1 VITL LCB.
11	RW	SYNC_PULSE_OUT_DIS: Disables sync_pulse output when set to 1. The master chiplet will no longer send synchronous pulses to slave chiplets.
12:19	RW	UNUSED1219: Unused.

Register Name	OPCG Alignment Register
Mnemonic	TP.TCEC14.CORE.OPCG_ALIGN
Address	000000002E030001 (SCOM)
Description	OPCG align

Bits	SCOM	Field Mnemonic: Description
0:3	RW	INOP_ALIGN: INOP phase alignment: 0 = None 1 = 2:1 2 = 3:1 3 = 4:1 4 = 6:1 5 = 8:1 6 = 12:1 7 = 16:1 8 = 24:1 9-15 = 48:1
4:7	RW	SNOP_ALIGN: SNOP phase alignment: 0 = None 1 = 2:1 2 = 3:1 3 = 4:1 4 = 6:1 5 = 8:1 6 = 12:1 7 = 16:1 8 = 24:1 9-15 = 48:1
8:11	RW	ENOP_ALIGN: ENOP phase alignment: 0 = None 1 = 2:1 2 = 3:1 3 = 4:1 4 = 6:1 5 = 8:1 6 = 12:1 7 = 16:1 8 = 24:1 9-15 = 48:1
12:19	RW	INOP_WAIT: INOP cycle delay (0-255).
20:31	RW	SNOP_WAIT: SNOP cycle delay (0-4095).
32:39	RW	ENOP_WAIT: ENOP cycle delay (0-255).
40	RW	INOP_FORCE_SG: Set SG high during INOP.
41	RW	SNOP_FORCE_SG: Set SG high during SNOP.

Bits	SCOM	Field Mnemonic: Description
42	RW	ENOP_FORCE_SG: Set SG high during ENOP (including LOOP phase).
43	RW	NO_WAIT_ON_CLK_CMD: 0 = A clock change request will first wait the OPCG_WAIT cycles. 1 = A clock change request will not wait, when not in flush.
44:45	RW	ALIGN_SOURCE_SELECT: 0 = Use inopa setting from opcg_reg0. 1 = Use rising edge of synchronous pulse. 2 = Use unit0_sync_lvl to align (for AVP: refresh0). 3 = Use unit1_sync_lvl to align (for AVP: refresh1).
46	RW	UNUSED46: Unused.
47:51	RW	SCAN_RATIO: Scan ratio. The default is 4:1 = 00011. 0 to 15 = (n+1):1 16 = 24:1 17 = 32:1 18 = 48:1 19 = 64:1 20 = 128:1
52:63	RW	OPCG_WAIT_CYCLES: Old PAD value; delay at the beginning and end of the OPCG run, to allow DC signals to be there at the right time (0-4095). The default is 0x020. Note: Must be higher than plat depth.

Register Name	OPCG Control 0 Register
Mnemonic	TP.TCEC14.CORE.OPCG_REG0
Address	000000002E030002 (SCOM)
Description	OPCG control register 0

Bits	SCOM	Field Mnemonic: Description
0	RW	RUNN_MODE: 0 = BIST-mode; used for LBIST. 1 = RUNN-mode; used for ABIST/IOBIST.
1	RWX	OPCG_GO: Start OPCG. The bit is cleared when OPCG completes. Poll for opcg_done in the Chiplet Status Register.
2	RWX	RUN_SCAN0: Run scan0 (overrides all BIST mode settings but the scan_ratio). Starts a scan0 run, and the bit is cleared when OPCG is done. Poll for opcg_done in the Chiplet Status Register.
3	RW	SCAN0_MODE: Sets PRPGs in scan0_mode but does not run the automatic scan0 sequence.
4	RWX	OPCG_IN_SLAVE_MODE: When selected, OPCG waits for the master chiplet to get started. When Keep_MS_Mode is 0, SLAVE_MODE is cleared after the incoming trigger.
5	RWX	OPCG_IN_MASTER_MODE: When selected, OPCG sends out a trigger to all slave chiplets. When Keep_MS_Mode is 0, MASTER_MODE is cleared after sending out one master trigger.
6	RW	KEEP_MS_MODE: When set to 1, OPCG in master and slave mode bits are not cleared after one incoming OPCG trigger. The default is to clear master and slave mode bits.
7	RW	TRIGGER_OPCG_ON_UNIT0_SYNC_LVL: Unit pin used for AVP can trigger OPCG (unit0_sync_lvl).
8	RW	TRIGGER_OPCG_ON_UNIT1_SYNC_LVL: Unit pin used for AVP can trigger OPCG (unit1_sync_lvl).
9	RWX	RUN_CHIPLET_SCAN0: Run scan0 on all regions and types; clears the chiplet at all regions and types.
10	RWX	RUN_CHIPLET_SCAN0_NO_PLL: Run scan0 on all regions and types; clears the chiplet at all exclude-PLL regions. PLL can continue to run.

Bits	SCOM	Field Mnemonic: Description
11	RW	RUN_OPCG_ON_UPDATE_DR: Start the OPCG engine when scan update (update_dr) is received (set pulse) Cronus requires this bit to be set at 1 for a set pulse WRITE.
12	RW	RUN_OPCG_ON_CAPTURE_DR: Start the OPCG engine when scan update (capture_dr) is received (set pulse). Cronus requires this bit to be set at 1 for a set pulse READ.
13	RW	STOP_RUNN_ON_XSTOP: RUNN mode. Stops RUNN on checkstop.
14	RW	OPCG_STARTS_BIST: RUNN mode. The OPCG engine controls start_bist for ABIST or IOBIST (see the BIST Register).
15:20	RW	UNUSED1520: Unused.
21:63	RWX	LOOP_COUNT: Loop counter for LBIST and RUNN. write = Target value. read = Current counter value. Counts from 0 to the target value.

Register Name	**OPCG Control 1 Register**
Mnemonic	TP.TCEC14.CORE.OPCG_REG1
Address	000000002E030003 (SCOM)
Description	OPCG control register 1

Bits	SCOM	Field Mnemonic: Description
0:11	RW	SCAN_COUNT: BIST mode: Channel scan count (s = 0-4095) RUNN-mode: start_bist match value (0:11)
12:23	RW	MISR_A_VAL: BIST mode: a value for MISR aperture RUNN-mode: start_bist match value (12:23)
24:35	RW	MISR_B_VAL: BIST mode: b value for MISR aperture RUNN-mode: start_bist match value (24:35)
36:47	RW	MISR_INIT_WAIT: BIST mode: delay MISR aperture; MISRs become active after this number of loops.
48	RW	OPCG_SUPPRESS_EVEN_CLK: OPCG creates only even, and not odd, clocks. Used for RUNN to create only one clock in fast domain. The default is 0.
49	RW	SCAN_CLK_USE_EVEN: Generate scan clock in even cycle instead of odd cycle. The default is 0 (odd cycle).
50:51	RW	UNUSED2: Unused.
52	RW	RTIM_THOLD_FORCE: Force rtim_thold low when not in test_dc mode (must be 0 at all times).
53	RW	DISABLE_ARY_CLK_DURING_FILL: LBIST and SCAN0. Prevent the firing of the ARY HLD bit during NSL fill.
54	RW	SG_HIGH_DURING_FILL: LBIST and SCAN0: Hold SG high during NSL fill.
55:56	RW	LBIST_SKITTER_CTL: BIST mode: 00 = Enable skitter during lbist_ip 01 = Enable skitter when misr_active; see misr_init_wait 10 = Skitter OPCG_GO mode; falling edge = start, rising edge = stop 11 = Unused
57	RW	MISR_MODE: BIST mode. MISR aperture mode (0: a-1 to b-1, 1: start to a and b to end).
58	RW	INFINITE_MODE: Infinite mode. RUNN and LBIST will run indefinitely and ignore the loop count.
59:63	RW	NSL_FILL_COUNT: BIST mode. NSL-fill count (0-31).

Register Name	OPCG Control 2 Register
Mnemonic	TP.TCEC14.CORE.OPCG_REG2
Address	000000002E030004 (SCOM)
Description	OPCG control register 2

Bits	SCOM	Field Mnemonic: Description
0	RWX	OPCG_GO2: Start OPCG for broadcast sequences (start sequence).
1:3	RW	PRPG_WEIGHTING: prpg_activate: 1/2, 1/4, 1/8, 1/16, 1/2, 3/4, 7/8, 15/16.
4:15	RWX	PRPG_VALUE: Set to 0 to keep PRPG always on, else seed.
16:27	RW	PRPG_A_VAL: a value for PRPG aperture.
28:39	RW	PRPG_B_VAL: b value for PRPG aperture.
40	RW	PRPG_MODE: PRPG aperture mode (0: a-1 to b-1, 1: start to a and b to end).
41:63	RW	UNUSED41_63: Unused.

Register Name	Scan Region and Type Register
Mnemonic	TP.TCEC14.CORE.SCAN_REGION_TYPE
Address	000000002E030005 (SCOM)
Description	Sets the scan region and type.

Bits	SCOM	Field Mnemonic: Description
0	RWX	SYSTEM_FAST_INIT: Default is 0. When set to 1, the MASK bits in the CMSK chain govern which part will be scanned or scan0. MASK = 1: scan0. MASK = 0: Partial or scan chain.
1:2	RO	constant = 0b00
3	NCX	SCAN_REGION_VITL: Scan clock region VITL (vital = clock).
4	RWX	SCAN_REGION_PERV: Scan clock region perv (pervasive).
5	RWX	SCAN_REGION_UNIT1: Scan clock region c00 (LSU, IFU, PC).
6	RWX	SCAN_REGION_UNIT2: Scan clock region c01 (ISU, VSU).
7	RWX	SCAN_REGION_UNIT3: Scan clock region unused.
8	RWX	SCAN_REGION_UNIT4: Scan clock region unused.
9	RWX	SCAN_REGION_UNIT5: Scan clock region unused.
10	RWX	SCAN_REGION_UNIT6: Scan clock region unused.
11	RWX	SCAN_REGION_UNIT7: Scan clock region unused.
12	RWX	SCAN_REGION_UNIT8: Scan clock region unused.
13	RWX	SCAN_REGION_UNIT9: Scan clock region unused.
14	RWX	SCAN_REGION_UNIT10: Scan clock region unused.
15:47	RO	constant = 0b000000000000000000000000000000000
48	RW	SCAN_TYPE_FUNC: Scan chain is functional.
49	RW	SCAN_TYPE_CFG: Scan chain mode (boot configuration and debug configuration).
50	RW	SCAN_TYPE_CCFG_GPTR: Scan chain ccfg / gptr (pervasive: CC configuration; others: GPTR).

Bits	SCOM	Field Mnemonic: Description
51	RW	SCAN_TYPE_REGF: Scan chain regf (register files).
52	RW	SCAN_TYPE_LBIST: Scan chain lbst (LBIST).
53	RW	SCAN_TYPE_ABIST: Scan chain abst (ABIST).
54	RW	SCAN_TYPE_REPR: Scan chain repr (array repair).
55	RW	SCAN_TYPE_TIME: Scan chain time (array timing).
56	RW	SCAN_TYPE_BNDY: Scan chain bndy (boundary IOs).
57	RW	SCAN_TYPE_FARR: Scan chain farr (fast array unload).
58	RW	SCAN_TYPE_CMSK: Scan chain cmsk (LBIST channel mask).
59	RW	SCAN_TYPE_INEX: Scan chain idex (c14 ASIC).
60:63	RO	constant = 0b0000

Register Name	Clock Region Register
Mnemonic	TP.TCEC14.CORE.CLK_REGION
Address	000000002E030006 (SCOM)
Description	Start and stop clocks.

Bits	SCOM	Field Mnemonic: Description
0:1	RWX	CLOCK_CMD: Command for clock control: 00 = NOP 01 = Start 10 = Stop 11 = Pulse (one pulse)
2	RWX	SLAVE_MODE: When selected, the clock command waits for the master chiplet to start. The bit is cleared after the incoming slave trigger and Keep_MS_Mode_after_trigger is set to 0.
3	RWX	MASTER_MODE: When selected, the clock command sends out a trigger to all slave chiplets. The bit is cleared after sending out one master trigger and Keep_MS_Mode_after_trigger is set to 0.
4	RWX	CLOCK_REGION_PERV: For clock region perv (pervasive).
5	RWX	CLOCK_REGION_UNIT1: For clock region c00 (LSU, IFU, PC).
6	RWX	CLOCK_REGION_UNIT2: For clock region c01 (ISU, VSU).
7	RWX	CLOCK_REGION_UNIT3: For clock region unused.
8	RWX	CLOCK_REGION_UNIT4: For clock region unused.
9	RWX	CLOCK_REGION_UNIT5: For clock region unused.
10	RWX	CLOCK_REGION_UNIT6: For clock region unused.
11	RWX	CLOCK_REGION_UNIT7: For clock region unused.
12	RWX	CLOCK_REGION_UNIT8: For clock region unused.
13	RWX	CLOCK_REGION_UNIT9: For clock region unused.
14	RWX	CLOCK_REGION_UNIT10: For clock region unused.
15:47	RO	constant = 0b000000000000000000000000000000000
48	RWX	SEL_THOLD_SL: Select SL tholds.
49	RWX	SEL_THOLD_NSL: Select NSL tholds.
50	RWX	SEL_THOLD_ARY: Select array thold.

Bits	SCOM	Field Mnemonic: Description
51	RO	constant = 0b0
52	RW	CLOCK_PULSE_USE_EVEN: For dual mesh support. The default for pulse is ODD phase. When this bit is set, pulse is applied on EVEN phase.
53:63	RO	constant = 0b00000000000

Register Name	Clock Status SL Register
Mnemonic	TP.TCEC14.CORE.CLOCK_STAT_SL
Address	000000002E030008 (SCOM)
Description	Clocks running SL.

Bits	SCOM	Field Mnemonic: Description
0:3	RO	constant = 0b1111
4	ROX	CLOCK_STATUS_PERV_SL: Status of pervasive SL HLD. 0 = Run. 1 = Stop.
5	ROX	CLOCK_STATUS_UNIT1_SL: Status of c00 (LSU, IFU, PC SL HLD). 0 = Run. 1 = Stop.
6	ROX	CLOCK_STATUS_UNIT2_SL: Status of c01 (ISU, VSU SL HLD). 0 = Run. 1 = Stop.
7	ROX	CLOCK_STATUS_UNIT3_SL: Status of unused SL HLD. 0 = Run. 1 = Stop.
8	ROX	CLOCK_STATUS_UNIT4_SL: Status of unused SL HLD. 0 = Run. 1 = Stop.
9	ROX	CLOCK_STATUS_UNIT5_SL: Status of unused SL HLD. 0 = Run. 1 = Stop.
10	ROX	CLOCK_STATUS_UNIT6_SL: Status of unused SL HLD. 0 = Run. 1 = Stop.
11	ROX	CLOCK_STATUS_UNIT7_SL: Status of unused SL HLD. 0 = Run. 1 = Stop.
12	ROX	CLOCK_STATUS_UNIT8_SL: Status of unused SL HLD. 0 = Run. 1 = Stop.
13	ROX	CLOCK_STATUS_UNIT9_SL: Status of unused SL HLD. 0 = Run. 1 = Stop.
14	ROX	CLOCK_STATUS_UNIT10_SL: Status of unused SL HLD. 0 = Run. 1 = Stop.
15:63	RO	constant = 0b1111111111111111111111111111111111111111111111111

Register Name	Clock Status NSL Register
Mnemonic	TP.TCEC14.CORE.CLOCK_STAT_NSL
Address	000000002E030009 (SCOM)
Description	Clocks running NSL.

Bits	SCOM	Field Mnemonic: Description
0:3	RO	constant = 0b1111
4	ROX	CLOCK_STATUS_PERV_NSL: Status of pervasive NSL HLD. 0 = Run. 1 = Stop.
5	ROX	CLOCK_STATUS_UNIT1_NSL: Status of c00 (LSU, IFU, PC NSL HLD). 0 = Run. 1 = Stop.
6	ROX	CLOCK_STATUS_UNIT2_NSL: Status of c01 (ISU, VSU NSL HLD). 0 = Run. 1 = Stop.
7	ROX	CLOCK_STATUS_UNIT3_NSL: Status of unused NSL HLD. 0 = Run. 1 = Stop.
8	ROX	CLOCK_STATUS_UNIT4_NSL: Status of unused NSL HLD. 0 = Run. 1 = Stop.
9	ROX	CLOCK_STATUS_UNIT5_NSL: Status of unused NSL HLD. 0 = Run. 1 = Stop.
10	ROX	CLOCK_STATUS_UNIT6_NSL: Status of unused NSL HLD. 0 = Run. 1 = Stop.
11	ROX	CLOCK_STATUS_UNIT7_NSL: Status of unused NSL HLD. 0 = Run. 1 = Stop.
12	ROX	CLOCK_STATUS_UNIT8_NSL: Status of unused NSL HLD. 0 = Run. 1 = Stop.
13	ROX	CLOCK_STATUS_UNIT9_NSL: Status of unused NSL HLD. 0 = Run. 1 = Stop.
14	ROX	CLOCK_STATUS_UNIT10_NSL: Status of unused NSL HLD. 0 = Run. 1 = Stop.
15:63	RO	constant = 0b1111111111111111111111111111111111111111111111111

Register Name	Clock Status Array Register
Mnemonic	TP.TCEC14.CORE.CLOCK_STAT_ARY
Address	000000002E03000A (SCOM)
Description	Clocks running ARY.

Bits	SCOM	Field Mnemonic: Description
0:3	RO	constant = 0b1111
4	ROX	CLOCK_STATUS_PERV_ARY: Status of pervasive ARY HLD. 0 = Run. 1 = Stop.
5	ROX	CLOCK_STATUS_UNIT1_ARY: Status of c00 (LSU, IFU, PC ARY HLD). 0 = Run. 1 = Stop.
6	ROX	CLOCK_STATUS_UNIT2_ARY: Status of c01 (ISU, VSU ARY HLD). 0 = Run. 1 = Stop.

Bits	SCOM	Field Mnemonic: Description
7	ROX	CLOCK_STATUS_UNIT3_ARY: Status of unused ARY HLD. 0 = Run. 1 = Stop.
8	ROX	CLOCK_STATUS_UNIT4_ARY: Status of unused ARY HLD. 0 = Run. 1 = Stop.

12	ROX	CLOCK_STATUS_UNIT8_ARY: Status of unused ARY HLD. 0 = Run. 1 = Stop.
13	ROX	CLOCK_STATUS_UNIT9_ARY: Status of unused ARY HLD. 0 = Run. 1 = Stop.
14	ROX	CLOCK_STATUS_UNIT10_ARY: Status of unused ARY HLD. 0 = Run. 1 = Stop.
15:63	RO	constant = 0b1111111111111111111111111111111111111111111111111

Register Name	ABIST and IOBIST Register
Mnemonic	TP.TCEC14.CORE.BIST
Address	000000002E03000B (SCOM)
Description	ABIST and IOBIST per region

Bits	SCOM	Field Mnemonic: Description
0	RW	TC_BIST_START_TEST_DC: Keep this at 0 during ABIST/IOBIST. It can be used to bypass the RUNN start. When this bit is set, the BIST_START_TEST goes high immediately without waiting for RUNN. BIST starts with the first HLD clock cycle.
1	RW	TC_SRAM_ABIST_MODE_DC: Select the ABIST engines for SRAMs.
2	RW	TC_EDRAM_ABIST_MODE_DC: Select the ABIST engines for EDRAMs.
3	RW	TC_IOBIST_MODE_DC: Select the IOBIST engines.
4	RW	BIST_PERV: Region pervasive: 1 = BIST_START_TEST for this region is triggered. 0 = The region is not part of the ABIST/IOBIST run.
5	RW	BIST_UNIT1: Region c00 (LSU, IFU, PC): 1 = BIST_START_TEST for this region is triggered. 0 = The region is not part of the ABIST/IOBIST run.
6	RW	BIST_UNIT2: Region c01 (ISU, VSU): 1 = BIST_START_TEST for this region is triggered. 0 = The region is not part of the ABIST/IOBIST run.

Bits	SCOM	Field Mnemonic: Description
7	RW	BIST_UNIT3: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = The region is not part of the ABIST/IOBIST run.
8	RW	BIST_UNIT4: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = The region is not part of the ABIST/IOBIST run.
9	RW	BIST_UNIT5: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = The region is not part of the ABIST/IOBIST run.
10	RW	BIST_UNIT6: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = The region is not part of the ABIST/IOBIST run.
11	RW	BIST_UNIT7: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = The region is not part of the ABIST/IOBIST run.
12	RW	BIST_UNIT8: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = The region is not part of the ABIST/IOBIST run.
13	RW	BIST_UNIT9: Region unused: 1 = BIST_START_TEST for this region is triggered. 0 = The region is not part of the ABIST/IOBIST run.
14	RW	BIST_UNIT10: Region unused: 1 = BIST_START_TEST for this region will be triggered. 0 = The region is not part of the ABIST/IOBIST run.
15:47	RO	constant = 0b000000000000000000000000000000000
48	RW	BIST_STROBE_WINDOW_EN: Enable strobe window only in TE = 1 mode. The OPCGGO tester pin enables the ABIST compare, once ABIST has been started. Special setup in the ABIST engine is required. The default is 0. System mode cannot enable this feature.
49:63	RO	constant = 0b000000000000000

Register Name	Checkstop 1 Register
Mnemonic	TP.TCEC14.CORE.XSTOP1
Address	000000002E03000C (SCOM)
Description	Checkstop per region

Bits	SCOM	Field Mnemonic: Description
0	RW	XSTOP1_MASK_B: Mask for checkstop to clockstop of select regions. (See xstop_perv, xstop_unit0..n.) 0 = Ignore checkstop. 1 = Stop on checkstop.
1	RW	XSTOP1_UNUSED: Unused.
2	RW	TRIGGER_OPCG_ON_XSTOP1: Trigger OPCG on checkstop instead of performing clockstop.
3	RW	XSTOP1_WAIT_ALLWAYS: When set to 1, checkstop waits independently of flush. The default is to not wait when flush is not set.
4	RW	XSTOP1_PERV: Region perv: 1 = The region is stopped. 0 = The region continues to run on checkstop.

Bits	SCOM	Field Mnemonic: Description
5	RW	XSTOP1_UNIT1: Region c00 (LSU, IFU, PC): 1 = The region is stopped. 0 = The region continues to run on checkstop.
6	RW	XSTOP1_UNIT2: Region c01 (ISU, VSU): 1 = The region is stopped. 0 = The region continues to run on checkstop.
7	RW	XSTOP1_UNIT3: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
8	RW	XSTOP1_UNIT4: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
9	RW	XSTOP1_UNIT5: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
10	RW	XSTOP1_UNIT6: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
11	RW	XSTOP1_UNIT7: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
12	RW	XSTOP1_UNIT8: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
13	RW	XSTOP1_UNIT9: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
14	RW	XSTOP1_UNIT10: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
15:47	RO	constant = 0b000000000000000000000000000000000
48:59	RW	XSTOP1_WAIT_CYCLES: Specifies how many cycles checkstop waits (0 - 4095) after dropping flush before tholds are dropped.
60:63	RO	constant = 0b0000

Register Name	**Checkstop 2 Register**
Mnemonic	TP.TCEC14.CORE.XSTOP2
Address	000000002E03000D (SCOM)
Description	Checkstop per region

Bits	SCOM	Field Mnemonic: Description
0	RW	XSTOP2_MASK_B: Mask for checkstop to clockstop of select regions (see xstop_perv, xstop_unit0..n). 0 = Ignore checkstop 1 = Stop on checkstop
1	RW	XSTOP2_UNUSED: Unused.
2	RW	TRIGGER_OPCG_ON_XSTOP2: Trigger OPCG on checkstop instead of performing clockstop.
3	RW	XSTOP2_WAIT_ALLWAYS: When set to 1, checkstop waits independently of flush. The default is to not wait when flush is not set.

Bits	SCOM	Field Mnemonic: Description
4	RW	XSTOP2_PERV: Region perv: 1 = The region is stopped. 0 = The region continues to run on checkstop.
5	RW	XSTOP2_UNIT1: Region c00 (LSU, IFU, PC): 1 = The region is stopped. 0 = The region continues to run on checkstop.
6	RW	XSTOP2_UNIT2: Region c01 (ISU, VSU): 1 = The region is stopped. 0 = The region continues to run on checkstop.
7	RW	XSTOP2_UNIT3: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
8	RW	XSTOP2_UNIT4: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
9	RW	XSTOP2_UNIT5: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
10	RW	XSTOP2_UNIT6: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
11	RW	XSTOP2_UNIT7: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
12	RW	XSTOP2_UNIT8: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
13	RW	XSTOP2_UNIT9: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
14	RW	XSTOP2_UNIT10: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
15:47	RO	constant = 0b000000000000000000000000000000000
48:59	RW	XSTOP2_WAIT_CYCLES: Specifies how many cycles checkstop waits (0 - 4095) after dropping flush before tholds are dropped.
60:63	RO	constant = 0b0000

Register Name	Checkstop 3 Register
Mnemonic	TP.TCEC14.CORE.XSTOP3
Address	000000002E03000E (SCOM)
Description	Checkstop per region

Bits	SCOM	Field Mnemonic: Description
0	RW	XSTOP3_MASK_B: Mask for checkstop to clockstop of select regions. (See xstop_perv, xstop_unit0..n). 0 = Ignore checkstop. 1 = Stop on checkstop.
1	RW	XSTOP3_UNUSED: Unused.

Bits	SCOM	Field Mnemonic: Description
2	RW	TRIGGER_OPCG_ON_XSTOP3: Trigger OPCG on checkstop instead of performing clockstop.
3	RW	XSTOP3_WAIT_ALLWAYS: When set to 1, checkstop waits independently of flush. The default is to not wait when flush is not set.
4	RW	XSTOP3_PERV: Region perv: 1 = The region is stopped. 0 = The region continues to run on checkstop.
5	RW	XSTOP3_UNIT1: Region c00 (LSU, IFU, PC): 1 = The region is stopped. 0 = The region continues to run on checkstop.
6	RW	XSTOP3_UNIT2: Region c01 (ISU, VSU): 1 = The region is stopped. 0 = The region continues to run on checkstop.
7	RW	XSTOP3_UNIT3: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
8	RW	XSTOP3_UNIT4: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
9	RW	XSTOP3_UNIT5: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
10	RW	XSTOP3_UNIT6: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
11	RW	XSTOP3_UNIT7: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
12	RW	XSTOP3_UNIT8: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
13	RW	XSTOP3_UNIT9: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
14	RW	XSTOP3_UNIT10: Region unused: 1 = The region is stopped. 0 = The region continues to run on checkstop.
15:47	RO	constant = 0b000000000000000000000000000000000
48:59	RW	XSTOP3_WAIT_CYCLES: Specifies how many cycles checkstop waits (0 - 4095) after dropping flush before tholds are dropped.
60:63	RO	constant = 0b0000

Register Name	**Error Status Register**
Mnemonic	TP.TCEC14.CORE.ERROR_STATUS
Address	000000002E03000F (SCOM)
Description	Error status of the CC.

Bits	SCOM	Field Mnemonic: Description
0	RWX	PCB_WRITE_NOT_ALLOWED_ERR: A write was attempted on a read only register.

Bits	SCOM	Field Mnemonic: Description
1	RWX	PCB_READ_NOT_ALLOWED_ERR: A read is not allowed; the register might be write only.
2	RWX	PCB_PARITY_ON_CMD_ERR: A parity error on the command.
3	RWX	PCB_ADDRESS_NOT_VALID_ERR: Invalid address.
4	RWX	PCB_PARITY_ON_ADDR_ERR: Parity error on the address.
5	RWX	PCB_PARITY_ON_DATA_ERR: Parity error on data.
6	RWX	PCB_PROTECTED_ACCESS_INVALID_ERR: Protection violation.
7	RWX	PCB_PARITY_ON_SPCIF_ERR: Parity error on SPCIF.
8	RWX	PCB_WRITE_AND_OPCG_IP_ERR: A PCB write was attempted while OPCG is running.
9	RWX	SCAN_READ_AND_OPCG_IP_ERR: A scan read was attempted while OPCG is running.
10	RWX	CLOCK_CMD_CONFLICT_ERR: A clock command is in progress.
11	RWX	SCAN_COLLISION_ERR: Scan region was selected on a running region.
12	RWX	PREVENTED_SCAN_COLLISION_ERR: PCB request to set a scan region that is running.
13	RWX	OPCG_TRIGGER_ERR: OPCG was triggered while OPCG is running.
14	RWX	PHASE_CNT_CORRUPTION_ERR: The phase counters inside the chiplet are out of sync.
15	RWX	CLOCK_CMD_PREVENTED_ERR: Security or scan collision prevented a clock start.
16	RWX	PARITY_ON_OPCG_SM_ERR: Parity error on the OPCG state machine.
17	RWX	PARITY_ON_CLOCK_MUX_REG_ERR: Parity error on scan/clock region/type or clock status register.
18	RWX	PARITY_ON_OPCG_REG_ERR: Parity error on OPCG registers.
19	RWX	PARITY_ON_SYNC_CONFIG_REG_ERR: Parity error on sync configuration register.
20	RWX	PARITY_ON_XSTOP_REG_ERR: Parity error on checkstop register.
21	RWX	PARITY_ON_GPIO_REG_ERR: Parity error on GP0,4,5,6 registers.
22	RWX	CLKCMD_REQUEST_ERR: Region clkcmd has one request pending but received a second one.
23	RWX	CBS_PROTOCOL_ERR: CBS protocol error. The REQ / ACK sequence is wrong.
24	RWX	VITL_ALIGN_ERR: VITL alignment is out of sync to the sync pulse.
25	RWX	UNIT_SYNC_LVL_ERR: Unit0 and Unit1 sync lvl pulse are not in sync. AVP is broken.
26	RWX	PARITY_ON_SELFBOOT_CMD_STATE_ERR: Parity error on SELFBOOT command state.
27	RWX	UNUSED_ERROR27: Unused.
28	RWX	UNUSED_ERROR28: Unused.
29	RWX	UNUSED_ERROR29: Unused.
30	RWX	UNUSED_ERROR30: Unused.
31	RWX	UNUSED_ERROR31: Unused.

Register Name	OPCG Capture 1 Register
Mnemonic	TP.TCEC14.CORE.OPCG_CAPT1
Address	000000002E030010 (SCOM)
Description	OPCG capture 1 control.

Bits	SCOM	Field Mnemonic: Description
0:3	RW	COUNT: 0000 = 12 cycles 0001 – 1100 = Cycles 1-12 1101-1111 = 24 cycles for normal, slow regions
4:8	RW	SEQ_01: Sequence cycle 1 for normal/slow region (SL, NSL, ARY, SE, FCE).
9:13	RW	SEQ_02: Sequence cycle 2 for normal/slow region (SL, NSL, ARY, SE, FCE).
14:18	RW	SEQ_03: Sequence cycle 3 for normal/slow region (SL, NSL, ARY, SE, FCE).
19:23	RW	SEQ_04: Sequence cycle 4 for normal/slow region (SL, NSL, ARY, SE, FCE).
24:28	RW	SEQ_05: Sequence cycle 5 for normal/slow region (SL, NSL, ARY, SE, FCE).
29:33	RW	SEQ_06: Sequence cycle 6 for normal/slow region (SL, NSL, ARY, SE, FCE).
34:38	RW	SEQ_07: Sequence cycle 7 for normal/slow region (SL, NSL, ARY, SE, FCE).
39:43	RW	SEQ_08: Sequence cycle 8 for normal/slow region (SL, NSL, ARY, SE, FCE).
44:48	RW	SEQ_09: Sequence cycle 9 for normal/slow region (SL, NSL, ARY, SE, FCE).
49:53	RW	SEQ_10: Sequence cycle 10 for normal/slow region (SL, NSL, ARY, SE, FCE).
54:58	RW	SEQ_11: Sequence cycle 11 for normal/slow region (SL, NSL, ARY, SE, FCE).
59:63	RW	SEQ_12: Sequence cycle 12 for normal/slow region (SL, NSL, ARY, SE, FCE).

Register Name	OPCG Capture 2 Register
Mnemonic	TP.TCEC14.CORE.OPCG_CAPT2
Address	000000002E030011 (SCOM)
Description	OPCG control capture 2.

Bits	SCOM	Field Mnemonic: Description
0:3	RW	UNUSED_CAPT2:
4:8	RW	SEQ_13_01EVEN: Sequence cycle 1 is even for fast region or cycle 13 for normal region (SL, NSL, ARY, SE, FCE).
9:13	RW	SEQ_14_01ODD: Sequence cycle 1 is odd for fast region or cycle 14 for normal region (SL, NSL, ARY, SE, FCE).
14:18	RW	SEQ_15_02EVEN: Sequence cycle 2 is even for fast region or cycle 15 for normal region (SL, NSL, ARY, SE, FCE).
19:23	RW	SEQ_16_02ODD: Sequence cycle 2 is odd for fast region or cycle 16 for normal region (SL, NSL, ARY, SE, FCE).
24:28	RW	SEQ_17_03EVEN: Sequence cycle 3 is even for fast region or cycle 17 for normal region (SL, NSL, ARY, SE, FCE).
29:33	RW	SEQ_18_03ODD: Sequence cycle 3 is odd for fast region or cycle 18 for normal region (SL, NSL, ARY, SE, FCE).

39:43	RW	SEQ_20_04ODD: Sequence cycle 4 is odd for fast region or cycle 20 for normal region (SL, NSL, ARY, SE, FCE).
44:48	RW	SEQ_21_05EVEN: Sequence cycle 5 is even for fast region or cycle 21 for normal region (SL, NSL, ARY, SE, FCE).
49:53	RW	SEQ_22_05ODD: Sequence cycle 5 is odd for fast region or cycle 22 for normal region (SL, NSL, ARY, SE, FCE).

Bits	SCOM	Field Mnemonic: Description
54:58	RW	SEQ_23_06EVEN: Sequence cycle 6 is even for fast region or cycle 23 for normal region (SL, NSL, ARY, SE, FCE).
59:63	RW	SEQ_24_06ODD: Sequence cycle 6 is odd for fast region or cycle 24 for normal region (SL, NSL, ARY, SE, FCE).

Register Name	OPCG Capture 3 Register
Mnemonic	TP.TCEC14.CORE.OPCG_CAPT3
Address	000000002E030012 (SCOM)
Description	OPCG control capture 3.

Bits	SCOM	Field Mnemonic: Description
0:3	RW	UNUSED_CAPT3:
4:8	RW	SEQ_07EVEN: Sequence cycle 7 is even for fast region (SL, NSL, ARY, SE, FCE).
9:13	RW	SEQ_07ODD: Sequence cycle 7 is odd for fast region (SL, NSL, ARY, SE, FCE).
14:18	RW	SEQ_08EVEN: Sequence cycle 8 is even for fast region (SL, NSL, ARY, SE, FCE).
19:23	RW	SEQ_08ODD: Sequence cycle 8 is odd for fast region (SL, NSL, ARY, SE, FCE).
24:28	RW	SEQ_09EVEN: Sequence cycle 9 is even for fast region (SL, NSL, ARY, SE, FCE).
29:33	RW	SEQ_09ODD: Sequence cycle 9 is odd for fast region (SL, NSL, ARY, SE, FCE).
34:38	RW	SEQ_10EVEN: Sequence cycle 10 is even for fast region (SL, NSL, ARY, SE, FCE).
39:43	RW	SEQ_10ODD: Sequence cycle 10 is odd for fast region (SL, NSL, ARY, SE, FCE).
44:48	RW	SEQ_11EVEN: Sequence cycle 11 is even for fast region (SL, NSL, ARY, SE, FCE).
49:53	RW	SEQ_11ODD: Sequence cycle 11 is odd for fast region (SL, NSL, ARY, SE, FCE).
54:58	RW	SEQ_12EVEN: Sequence cycle 12 is even for fast region (SL, NSL, ARY, SE, FCE).
59:63	RW	SEQ_12ODD: Sequence cycle 12 is odd for fast region (SL, NSL, ARY, SE, FCE).

Register Name	Debug CBS CC Register
Mnemonic	TP.TCEC14.CORE.DBG_CBS_CC
Address	000000002E030013 (SCOM)
Description	Debug CBS CC Register

Bits	SCOM	Field Mnemonic: Description
0	ROX	DBG_RESET_EP: Reset endpoint.
1	ROX	DBG_OPCG_IP: OPCG in progress, not in idle state.
2	ROX	DBG_VITL_CLKOFF: VITL HLD stopped. When enabled, plat-depth cycles are needed to switch this latch.
3	ROX	DBG_TEST_ENABLE: Test enable.
4	ROX	DBG_CBS_REQ: CBS Interface. Request (latched).
5:7	ROX	DBG_CBS_CMD: CBS Interface. Command (latched).
8:12	ROX	DBG_CBS_STATE: CBS Command State Machine; 00000 = Idle.
13	ROX	DBG_SECURITY_DEBUG_MODE: Status of the security mode bit.

Bits	SCOM	Field Mnemonic: Description
14	ROX	DBG_CBS_PROTOCOL_ERROR: CBS protocol error. Request raised, although state machine is not in idle state. Need reset_ep to clear this bit. No impact on IPL.
15	ROX	DBG_PCB_IDLE: PCB Interface in idle state.
16:19	ROX	DBG_CURRENT_OPCG_MODE: The current (latest) OPCG mode: 0 = NOP 1 = LBIST 2 = ABIST 3 = RUNN 4 = SCAN0 5 = SCAN 6 = SCAN rotate 7 = SCAN with UpdateDR 8 = SCAN with CaptureDR 9 = CLK Change Request 10-15 = Unused
20:23	ROX	DBG_LAST_OPCG_MODE: Previous OPCG mode.
24	ROX	DBG_PCB_ERROR: PCB interface error. Read the CC error register or set CBS_CMD = 001 to switch the FSI CBS debug information to the CC error register.
25	ROX	DBG_PARITY_ERROR: Any parity error, non-PCB parity. Read the CC error register or set CBS_CMD = 001 to switch the FSI CBS debug information to the CC error register.
26	ROX	DBG_CC_ERROR: Any other CC error. Read the CC error register or set CBS_CMD = 001 to switch the FSI CBS debug information to the CC error register.
27	ROX	DBG_CHIPLET_IS_ALIGNED: Set to 1 when a valid align pulse was sent out.
28	ROX	DBG_PCB_REQUEST_SINCE_RESET: Reset clears this bit, and the first PCB request sets it.
29	ROX	DBG_PARANOIA_TEST_ENABLE_CHANGE: Rising or falling edge on test enable, after reset. Need reset_ep to clear. No impact on IPL.
30	ROX	DBG_PARANOIA_VITL_CLKOFF_CHANGE: Rising or falling edge on vitl_clkoff, after reset. Need reset_ep to clear. No impact on IPL.
31	ROX	TP_TPFSI_CBS_ACK: This is the only representation of the CC acknowledge signal that is sent to FSI.

Register Name	CC Protect Mode Register
Mnemonic	TP.TCEC14.CORE.CC_PROTECT_MODE_REG
Address	000000002E0303FE (SCOM)
Description	Enables read and write protection.

Bits	SCOM	Field Mnemonic: Description
0	RW	CC_READ_PROTECT_ENABLE: Enables read protection.
1	RW	CC_WRITE_PROTECT_ENABLE: Enables write protection.

Register Name	Atomic Lock Register
Mnemonic	TP.TCEC14.CORE.CC_ATOMIC_LOCK_REG
Address	000000002E0303FF (SCOM)
Description	Enables an atomic lock and an atomic lock counter.

Bits	SCOM	Field Mnemonic: Description
0	RW	CC_ATOMIC_LOCK_ENABLE: Enables atomic lock.
1:4	ROX	CC_ATOMIC_ID: Atomic ID.
5:7	RO	constant = 0b000
8:15	ROX	CC_ATOMIC_ACTIVITY: Atomic lock counter.

Register Name	Global Checkstop FIR Register
Mnemonic	TP.TCEC14.CORE.XFIR
Address	000000002E040000 (SCOM)
Description	Global checkstop FIR

Bits	SCOM	Field Mnemonic: Description
0	RWX	XFIR_IN0: Summary bit (any checkstop).
1	RWX	XFIR_IN1: Checkstop broadcast via OOB.
2	RWX	XFIR_IN2: Unused.
3	RWX	XFIR_IN3: Checkstop from pervasive unit.
4	RWX	XFIR_IN4: Checkstop from CX.
5:25	RWX	XFIR_IN5: Unused.
26	RWX	XFIR_IN26: Checkstop on debug trigger.

Register Name	Global Recoverable FIR Register
Mnemonic	TP.TCEC14.CORE.RFIR
Address	000000002E040001 (SCOM)
Description	Global recoverable FIR

Bits	SCOM	Field Mnemonic: Description
0	ROX	RFIR_IN0: Local checkstop from NX and CXA0.
1	ROX	LFIR_RECOV_ERR: Recoverable error from pervasive unit.
2	ROX	RFIR_IN4: Recovery from CX.
3:23	ROX	RFIR_IN5: Unused.

Register Name	FIR Mask Register
Mnemonic	TP.TCEC14.CORE.FIR_MASK
Address	000000002E040002 (SCOM)
Description	FIR mask

Bits	SCOM	Field Mnemonic: Description
0	RW	FIR_MASK_IN0: Mask for XFIR/RFIR summary bit.
1	RW	FIR_MASK_IN1: Mask for XFIR broadcast via OOB.
2	RW	FIR_MASK_IN2: Unused.

Bits	SCOM	Field Mnemonic: Description
3	RW	FIR_MASK_IN3: Mask for XFIR/RFIR from pervasive unit.
4	RW	FIR_MASK_IN4: Mask for CX, XFIR, and RFIR.
5:25	RW	FIR_MASK_IN5: Unused.
26	RW	FIR_MASK_IN26: Mask for debug trigger and local checkstop to recoverable error.

Register Name	Special Attention Register
Mnemonic	TP.TCEC14.CORE.SPATTN
Address	000000002E040004 (SCOM) 000000002E040005 (SCOM1) 000000002E040006 (SCOM2)
Description	Special attention

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	ROX	NCX	NCX	SPATTN_IN0: Special attention in 0.
1	ROX	NCX	NCX	SPATTN_IN1: Special attention in 1.
2	ROX	NCX	NCX	SPATTN_IN2: Special attention in 2.
3	ROX	NCX	NCX	SPATTN_IN3: Special attention in 3.
4	ROX	NCX	NCX	SPATTN_IN4: Unused special attentions.
5	ROX	NCX	NCX	SPATTN_IN5: Unused special attentions.
6	ROX	NCX	NCX	SPATTN_IN6: Unused special attentions.
7	ROX	NCX	NCX	SPATTN_IN7: Unused special attentions.
8	ROX	NCX	NCX	SPATTN_IN8: Unused special attentions.
9	ROX	NCX	NCX	SPATTN_IN9: Unused special attentions.

Register Name	Special Attention Mask Register
Mnemonic	TP.TCEC14.CORE.SPA_MASK
Address	000000002E040007 (SCOM)
Description	Special attention mask

Bits	SCOM	Field Mnemonic: Description
0:9	RW	SPA_MASK_IN: Special attention mask.

Register Name	Mode Register
Mnemonic	TP.TCEC14.CORE.EPS.FIR.MODE_REG
Address	000000002E040008 (SCOM)
Description	FIR mode register.

Bits	SCOM	Field Mnemonic: Description
0	RW	MODE_IN0: Unused.
1	RW	MODE_IN1: Unused.

Bits	SCOM	Field Mnemonic: Description
2	RW	MODE_IN2: Unused.
3	RW	MODE_IN3: Unused.
4	RW	MODE_IN4: Stop chip TOD on checkstop. (Unused in POWER9.)
5	RW	MODE_IN5: Stop chip TOD on recoverable. (Unused in POWER9.)
6	RW	MODE_IN6: Disable propagation of checkstop to other chips.
7	RW	MODE_IN7: Unused.
8	RW	MODE_IN8: Enable checkstop on special attention.
9	RW	MODE_IN9: mask_direct / local_error.
10	RW	MODE_IN10: Unused.
11	RW	MODE_IN11: Unused.
12:15	RW	MODE_IN: Unused.

Register Name	Host Attention Register
Mnemonic	TP.TCEC14.CORE.HOSTATTN
Address	000000002E040009 (SCOM)
Description	Host attention summary.

Bits	SCOM	Field Mnemonic: Description
0	ROX	HOSTATTN_IN0: Host attention summary bit.
1	ROX	HOSTATTN_IN1: Unused.
2	ROX	HOSTATTN_IN2: Unused.
3	ROX	HOSTATTN_IN3: Unused.
4	ROX	HOSTATTN_IN4: Unused.
5	ROX	HOSTATTN_IN5: Unused.
6	ROX	HOSTATTN_IN6: Unused.
7	ROX	HOSTATTN_IN7: Unused.
8	ROX	HOSTATTN_IN8: Unused.
9	ROX	HOSTATTN_IN9: Unused.
10	ROX	HOSTATTN_IN10: Unused.
11	ROX	HOSTATTN_IN11: Unused.

Register Name	Local FIR Mask Register
Mnemonic	TP.TCEC14.CORE.EPS.FIR.LOCAL_FIR_MASK
Address	000000002E04000D (SCOM) 000000002E04000E (SCOM1) 000000002E04000F (SCOM2)
Description	Local FIR mask

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:41	RW	WO_AND	WO_OR	LFIR_MASK_IN: Mask for LEM error collection vector.

Register Name	Local FIR Action 0 Register
Mnemonic	TP.TCEC14.CORE.EPS.FIR.LOCAL_FIR_ACTION0
Address	000000002E040010 (SCOM)
Description	Local FIR action 0

Bits	SCOM	Field Mnemonic: Description
0:41	RW	FIR_ACTION0_IN: action0 mask.

Register Name	Local FIR Action 1 Register
Mnemonic	TP.TCEC14.CORE.EPS.FIR.LOCAL_FIR_ACTION1
Address	000000002E040011 (SCOM)
Description	Local FIR action 1

Bits	SCOM	Field Mnemonic: Description
0:41	RW	FIR_ACTION1_IN: action1 mask.

Register Name	Group Checkstop Trigger Register
Mnemonic	TP.TCEC14.CORE.EPS.FIR.GXSTOP_TRIG_REG
Address	000000002E040013 (SCOM)
Description	Group checkstop mask

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP_TRIG_IN0: Mask bit for system checkstop.
1	RW	GXSTP_TRIG_IN1: Mask bit for recoverable error.
2	RW	GXSTP_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP_TRIG_IN3: Mask bit for local checkstop.
4	RW	GXSTP_TRIG_IN4: Mask bit for type 4 error (host attention).
5	RW	GXSTP_TRIG_IN5: Mask bit for OOB sys_checkstop input (0).
6	RW	GXSTP_TRIG_IN6: Mask bit for OOB sys_checkstop input (1).
7	RW	GXSTP_TRIG_IN7: Mask bit for group checkstop input (0).
8	RW	GXSTP_TRIG_IN8: Mask bit for group checkstop input (1).
9	RW	GXSTP_TRIG_IN9: Mask bit for debug checkstop on trigger.
10	RW	GXSTP_TRIG_IN10: Unused.
11	RW	GXSTP_TRIG_IN11: Unused.

Register Name	Group 0 Checkstop Mask Register
Mnemonic	TP.TCEC14.CORE.EPS.FIR.GXSTOP0_MASK_REG
Address	000000002E040014 (SCOM)
Description	Group 0 checkstop mask

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP0_TRIG_IN0: Mask bit for system checkstop.
1	RW	GXSTP0_TRIG_IN1: Mask bit for recoverable error.
2	RW	GXSTP0_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP0_TRIG_IN3: Mask bit for local checkstop.
4	RW	GXSTP0_TRIG_IN4: Mask bit for type 4 error (host attention).
5	RW	GXSTP0_TRIG_IN5: Mask bit for OOB sys_checkstop Input (0).
6	RW	GXSTP0_TRIG_IN6: Mask bit for OOB sys_checkstop Input (1).
7	RW	GXSTP0_TRIG_IN7: Mask bit for group checkstop input (0).
8	RW	GXSTP0_TRIG_IN8: Mask bit for group checkstop input (1).
9	RW	GXSTP0_TRIG_IN9: Mask bit for debug checkstop on trigger.
10	RW	GXSTP0_TRIG_IN10: Unused.
11	RW	GXSTP0_TRIG_IN11: Unused.

Register Name	Group 1 Checkstop Mask Register
Mnemonic	TP.TCEC14.CORE.EPS.FIR.GXSTOP1_MASK_REG
Address	000000002E040015 (SCOM)
Description	Group 1 checkstop mask

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP1_TRIG_IN0: Mask bit for system checkstop.
1	RW	GXSTP1_TRIG_IN1: Mask bit for recoverable error.
2	RW	GXSTP1_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP1_TRIG_IN3: Mask bit for local checkstop.
4	RW	GXSTP1_TRIG_IN4: Mask bit for type 4 error (host attention).
5	RW	GXSTP1_TRIG_IN5: Mask bit for OOB sys_checkstop Input (0).
6	RW	GXSTP1_TRIG_IN6: Mask bit for OOB sys_checkstop Input (1).
7	RW	GXSTP1_TRIG_IN7: Mask bit for group checkstop input (0).
8	RW	GXSTP1_TRIG_IN8: Mask bit for group checkstop input (1).
9	RW	GXSTP1_TRIG_IN9: Mask bit for debug checkstop on trigger.
10	RW	GXSTP1_TRIG_IN10: Unused.
11	RW	GXSTP1_TRIG_IN11: Unused.

Register Name	Group 2 Checkstop Mask Register
Mnemonic	TP.TCEC14.CORE.EPS.FIR.GXSTOP2_MASK_REG
Address	000000002E040016 (SCOM)
Description	Group 2 checkstop mask

Bits	SCOM	Field Mnemonic: Description
0	RW	GXSTP2_TRIG_IN0: Mask bit for system checkstop.
1	RW	GXSTP2_TRIG_IN1: Mask bit for recoverable error.
2	RW	GXSTP2_TRIG_IN2: Mask bit for special attention.
3	RW	GXSTP2_TRIG_IN3: Mask bit for local checkstop.
4	RW	GXSTP2_TRIG_IN4: Mask bit for type 4 error (host attention).
5	RW	GXSTP2_TRIG_IN5: Mask bit for OOB sys_checkstop Input (0).
6	RW	GXSTP2_TRIG_IN6: Mask bit for OOB sys_checkstop Input (1).
7	RW	GXSTP2_TRIG_IN7: Mask bit for group checkstop input (0).
8	RW	GXSTP2_TRIG_IN8: Mask bit for group checkstop input (1).
9	RW	GXSTP2_TRIG_IN9: Mask bit for debug checkstop on trigger.
10	RW	GXSTP2_TRIG_IN10: Unused.
11	RW	GXSTP2_TRIG_IN11: Unused.

Register Name	Summary Mask Register
Mnemonic	TP.TCEC14.CORE.EPS.FIR.SUM_MASK_REG
Address	000000002E040017 (SCOM)
Description	FIR summary mask register

Bits	SCOM	Field Mnemonic: Description
0	RW	SMASK_IN0: System checkstop summary bit.
1	RW	SMASK_IN1: Recoverable summary bit.
2	RW	SMASK_IN2: Special attention summary bit.
3	RW	SMASK_IN3: Local checkstop summary bit.
4	RW	SMASK_IN4: Type4 (host attention) summary bit.

Register Name	Local Checkstop Error Register
Mnemonic	TP.TCEC14.CORE.LOCAL_XSTOP_ERR
Address	000000002E040018 (SCOM)
Description	Local checkstop error

Bits	SCOM	Field Mnemonic: Description
0	ROX	LOCAL_XSTOP_IN0: Local checkstop summary bit.
1	ROX	LOCAL_XSTOP_IN1: Local checkstop from core.
2	ROX	LOCAL_XSTOP_IN2: Unused.
3	ROX	LOCAL_XSTOP_IN3: Unused.
4	ROX	LOCAL_XSTOP_IN4: Unused.
5	ROX	LOCAL_XSTOP_IN5: Unused.
6	ROX	LOCAL_XSTOP_IN6: Unused.
7	ROX	LOCAL_XSTOP_IN7: Unused.
8	ROX	LOCAL_XSTOP_IN8: Unused.
9	ROX	LOCAL_XSTOP_IN9: Unused.
10	ROX	LOCAL_XSTOP_IN10: Unused.
11	ROX	LOCAL_XSTOP_IN11: Unused.
12	ROX	LOCAL_XSTOP_IN12: Unused.
13	ROX	LOCAL_XSTOP_IN13: Unused.
14	ROX	LOCAL_XSTOP_IN14: Unused.
15	ROX	LOCAL_XSTOP_IN15: Unused.
16	ROX	LOCAL_XSTOP_IN16: Unused.
17	ROX	LOCAL_XSTOP_IN17: Unused.
18	ROX	LOCAL_XSTOP_IN18: Unused.
19	ROX	LOCAL_XSTOP_IN19: Unused.
20	ROX	LOCAL_XSTOP_IN20: Unused.
21	ROX	LOCAL_XSTOP_IN21: Unused.

Bits	SCOM	Field Mnemonic: Description
22	ROX	LOCAL_XSTOP_IN22: Unused.

Register Name	Local Checkstop Mask Register
Mnemonic	TP.TCEC14.CORE.LOCAL_XSTOP_MASK
Address	000000002E040019 (SCOM)
Description	Local checkstop mask

Bits	SCOM	Field Mnemonic: Description
0:21	RW	LOCAL_XSTOP_MASK_IN: Local checkstop mask.

Register Name	Host Attention Mask Register
Mnemonic	TP.TCEC14.CORE.HOSTATTN_MASK
Address	000000002E04001A (SCOM)
Description	Host attention mask.

Bits	SCOM	Field Mnemonic: Description
0:21	RW	HOSTATTN_MASK_IN: Host attention mask.

Register Name	DTS Thermal Sensor Results 0 Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.DTS_RESULT0
Address	000000002E050000 (SCOM)
Description	DTS thermal sensor loop1 results.

Bits	SCOM	Field Mnemonic: Description
0:15	ROX	DTS_0_RESULT: Calibrated DTS result of sensor with ID 0.
16:31	ROX	DTS_1_RESULT: Calibrated DTS result of sensor with ID 1.
32:63	RO	constant = 0b00000000000000000000000000000000

Register Name	DTS Trace Results Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.DTS_TRC_RESULT
Address	000000002E050003 (SCOM)
Description	DTS trace results

Bits	SCOM	Field Mnemonic: Description
0:43	ROX	TIMESTAMP_COUNTER_VALUE: Time stamp counter value during DTS trace mode.
44	ROX	TIMESTAMP_COUNTER_OVERFLOW_ERR: Overflow error bit of the time stamp counter value during DTS trace mode.
45:47	RO	constant = 0b000
48:63	ROX	DTS_1_RESULT: Calibrated DTS result of sensor with ID 1.

Register Name	Thermal Mode Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.THERM_MODE_REG
Address	000000002E05000F (SCOM)
Description	Enables and controls CPM and DTS.

Bits	SCOM	Field Mnemonic: Description
0	RW	THERM_DIS_CPM_BUBBLE_CORR: Critical path result bubble correction active.
1	RW	THERM_FORCE_THRES_ACT: Forces tpc_therm_thres_mac clock gating off and activates clocks.
2:4	RW	THERM_THRES_TRIP_ENA: Enables therm_thres_trip compare. 1xx = trip0, warning. x1x = trip1, critical. xx1 = trip2, fatal.
5	RW	THERM_DTS_SAMPLE_ENA: 0 = No DTS sampling. 1 = DTS sampling is enabled and a below-counter compare match can occur.
6:9	RW	THERM_SAMPLE_PULSE_CNT: A 16 MHz sample pulse is fed into an 18-bit counter. therm_sample_pulse_cnt enables the selection of a high order bit of the counter to enable resolution of sampling DTSs between 2.5 ms and 80 ms. An edge detection circuit detects the rising edge of the selected counter bit and this triggers a DTS sample. 0000 = 16 ms. 0001 = 8 ms. 0010 = 4 ms. 0011 = 2 ms. 0100 = 1 ms. 0101 = 0.5 ms. 0110 = 250 ms. 0111 = 125 ms. 1000 = 62 .5 ms. 1001 = 31.3 ms. 1010 = 15.6 ms. 1011 = 7.8 ms. 1100 = 3.9 ms. 1101 = 2 ms. 1110 = 1 ms. 1111 = 0.5 ms.
10:11	RW	THERM_THRES_MODE_ENA: Forces maximum or minimum mode in the threshold unit: 00 = Off. 11 = Illegal. 10 = Maximum mode. 01 = Minimum mode.
12	RW	DTS_TRIGGER_MODE: Unused.
13	RW	DTS_TRIGGER_SEL: Unused.
14	RW	THERM_THRES_OVERFLOW_MASK: 0 = therm_overflow_err is enabled. 1 = therm_overflow_err is disabled.
15	RW	THERM_MODE_UNUSED: Unused.
16:19	RW	THERM_DTS_READ_SEL: Selects which DTS result will be provided with PCB read addr_v(4): 0000 = DTS 0. 0001 = DTS 1. 0010 = DTS 2. 0100 = DTS 4. 1111 = Worst case sensor.

Bits	SCOM	Field Mnemonic: Description
20:21	RW	THERM_DTS_ENABLE_L1: Loop1 DTS enables: 1x = DTS 0 available. x1 = DTS 1 available.
22:34	RO	constant = 0b0000000000000
35:36	RW	Reserved field.

Register Name	Skitter Mode Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.SKITTER_MODE_REG
Address	000000002E050010 (SCOM)
Description	Skitter control register

Bits	SCOM	Field Mnemonic: Description
0	RW	SKITTER_HOLD_SAMPLE: Forces skitter to hold the current sample.
1	RW	DISABLE_SKITTER_STICKINESS: A value of '0' specifies accumulation mode. A value of '1' samples a new value on each cycle and resets the sticky value.
2:3	RW	SKITTER_MODE_UNUSED1: Unused.
4:5	RW	SKITTER_HOLD_DBGTRIG_SEL: bit0 = hold_on_trigger0 bit1 = hold_on_trigger1
6:7	RW	SKITTER_RESET_TRIG_SEL: bit0 = reset_sticky_on_trigger0 bit1 = reset_sticky_on_trigger1
8:9	RW	SKITTER_SAMPLE_GUTS: Selects which guts to measure: 00 = guts1. 01 = guts2. 10 = guts3. 11 = guts4.
10:43	RO	constant = 0b0000000000000000000000000000000000
44	ROX	SKITTER_HOLD_SAMPLE_WITH_TRIGGER: Forces skitter to hold the current sample on debug trigger; this has highest priority.
45	ROX	SKITTER_DATA_V_LT: If set to '1', the data requested by a skitter force read register has finished and data is present in the skitter data register in the collector macro. The data be read by any combination of V25/V26/V27 PCB reads.

Register Name	Error Injection Control Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.INJECT_REG
Address	000000002E050011 (SCOM)
Description	Error injection control register

Bits	SCOM	Field Mnemonic: Description
0:1	RW	THERM_INJECT_TRIP: 00 = No injection. 01 = Warning trip level injection. 10 = Critical trip level injection. 11 = Fatal trip level injection.

Bits	SCOM	Field Mnemonic: Description
2:3	RW	THERM_INJECT_MODE: 00 = No injection. 01 = Injection on the next DTS sample. 10 = Solid injection for the next DTS samples until bit setting changes. 11 = Not used.

Register Name	Thermal Control Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.CONTROL_REG
Address	000000002E050012 (SCOM)
Description	Control / force reset register

Bits	SCOM	Field Mnemonic: Description
0	WO_1P	Reserved field.
1	WO_1P	Reserved field.
2	WO_1P	Reserved field.
3	WO_1P	Reserved field.
4	WO_1P	Reserved field.
5	WO_1P	Reserved field.
6	WO_1P	Reserved field.
7	WO_1P	Reserved field.
8	WO_1P	Reserved field.
9	WO_1P	Reserved field.
10	WO_1P	Reserved field.
11	WO_1P	Reserved field.
12	WO_1P	Reserved field.

Register Name	Thermal Error Status Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.ERR_STATUS_REG
Address	000000002E050013 (SCOM)
Description	Thermal error status register

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.
1	ROX	Reserved field.
2	ROX	Reserved field.
3	ROX	Reserved field.
4	ROX	Reserved field.
5	ROX	Reserved field.
6	ROX	Reserved field.
7	ROX	Reserved field.
8	ROX	Reserved field.

Bits	SCOM	Field Mnemonic: Description
9	ROX	Reserved field.
10	ROX	Reserved field.
11	ROX	Reserved field.
12	ROX	Reserved field.
13	ROX	Reserved field.
14	ROX	Reserved field.
15	ROX	Reserved field.
16	ROX	SERIAL_SHIFTCNT_MODEREG_PARITY_ERR_MASK: Serial shift count parity error mask.
17	ROX	THERM_MODEREG_PARITY_ERR_MASK: Thermal Mode Register parity error mask.
18	ROX	SKITTER_MODEREG_PARITY_ERR_MASK: Skitter Mode Register parity error mask.
19	ROX	SKITTER_FORCEREG_PARITY_ERR_MASK: Skitter Force Register parity error mask.
20	ROX	SCAN_INIT_VERSION_REG_PARITY_ERR_MASK: Scan Initial Version Register parity error mask.
21	ROX	VOLT_MODEREG_PARITY_ERR_MASK: Volt Mode Register parity error mask.
22	RO	constant = 0b0
23	ROX	COUNT_STATE_ERR_MASK: Count state machine error mask.
24	ROX	RUN_STATE_ERR_MASK: Run state machine error mask.
25	ROX	THRES_STATE_ERR_MASK: Threshold state machine error mask.
26	ROX	OVERFLOW_ERR_MASK: DTS calibration calculation overflow error mask.
27	ROX	SHIFTER_PARITY_ERR_MASK: Shifter parity error mask.
28	ROX	SHIFTER_VALID_ERR_MASK: Shifter valid error mask.
29	ROX	TIMEOUT_ERR_MASK: Timeout error mask.
30	ROX	F_SKITTER_READ_ERR_MASK: Force skitter read error mask.
31	ROX	PCB_ERR_MASK: Pervasive control bus error mask.
32:39	RO	constant = 0b00000000
40:43	ROX	Reserved field.
44:46	ROX	Reserved field.
47	ROX	Reserved field.
48	ROX	Reserved field.
49:50	ROX	Reserved field.
51:54	ROX	Reserved field.
55	ROX	Reserved field.
56	ROX	Reserved field.
57	ROX	Reserved field.
58	ROX	Reserved field.
59	ROX	Reserved field.
60:63	RO	constant = 0b0000

Register Name	Skitter Force Read Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.SKITTER_FORCE_REG
Address	000000002E050014 (SCOM)
Description	Skitter force read register

Bits	SCOM	Field Mnemonic: Description
0	RW	F_SKITTER_READ: Forces the read of a particular skitter.

Register Name	Skitter Clock Source Control Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.SKITTER_CLKSRC_REG
Address	000000002E050016 (SCOM)
Description	Skitter clock source control register

Bits	SCOM	Field Mnemonic: Description
0:2	RW	SKITTER0_CLKSRC: Selects the clock to measure: 000 = Local mesh clock. 001 = External pin skitter_c1_1_in. 010 = Local d1clk only if d_mode = 1. 011 = External pin skitter_c1_2_in. 100 = Local lclk only if d_mode = 1. 101 = External pin skitter_c1_3_in. 110 = Unused. 111 = External pin skitter_c1_4_in.
3:35	RO	constant = 0b000000000000000000000000000000000
36:37	RW	SKITTER0_DELAY_SELECT: Selects the delay to be added between the skitter0 clock source multiplexer and the inverter chain. The base line delay is 12.2 psec. 00 = No delay. 01 = 0.6 psec. 10 = 1.8 psec. 11 = 5 psec.

Register Name	Skitter Data 0 Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.SKITTER_DATA0
Address	000000002E050019 (SCOM)
Description	Skitter data register read bit0:63.

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Skitter Data 1 Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.SKITTER_DATA1
Address	000000002E05001A (SCOM)
Description	Skitter data 1 register read bit32:95.

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Skitter Data 2 Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.SKITTER_DATA2
Address	000000002E05001B (SCOM)
Description	Skitter data 2 register read bit64:127.

Bits	SCOM	Field Mnemonic: Description
0:63	ROX	Reserved.

Register Name	Timestamp Counter Read Register
Mnemonic	TP.TCEC14.CORE.EPS.THERM.TIMESTAMP_COUNTER_READ
Address	000000002E05001C (SCOM)
Description	Timestamp counter read

Bits	SCOM	Field Mnemonic: Description
0:43	ROX	TIMESTAMP_COUNTER_VALUE: Time stamp counter value during DTS trace mode.
44	ROX	TIMESTAMP_COUNTER_OVERFLOW_ERR: Overflow error bit of the time stamp counter value during DTS trace mode.

15. CORE Chiplet PCB Slave

The POWER9 processor registers are listed alphabetically by mnemonic in the following address table.

Mnemonic	Address	Page
TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_COMMON_REGS.PPM_CGCR	0x000000002E0F0164	2370

The POWER9 processor registers are listed in the following tables.

Register Name	**Primary Address Register**
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.PRIMARY_ADDRESS_REG
Address	000000002E0F0000 (SCOM)
Description	This register contains the primary address of a slave.

Bits	SCOM	Field Mnemonic: Description
0:5	RO	Reserved field.

Register Name	Multicast Group 1 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.MULTICAST_GROUP_1
Address	000000002E0F0001 (SCOM)
Description	Multicast group 1

Bits	SCOM	Field Mnemonic: Description
0:2	RO	constant = 0b111
3:5	RW	MULTICAST1_GROUP: Multicast group1 setting.

Register Name	Multicast Group 2 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.MULTICAST_GROUP_2
Address	000000002E0F0002 (SCOM)
Description	Multicast group 2

Bits	SCOM	Field Mnemonic: Description
0:2	RO	constant = 0b111
3:5	RW	MULTICAST2_GROUP: Multicast group2 setting.

Register Name	Multicast Group 3 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.MULTICAST_GROUP_3
Address	000000002E0F0003 (SCOM)
Description	Multicast group 3

Bits	SCOM	Field Mnemonic: Description
0:2	RO	constant = 0b111
3:5	RW	MULTICAST3_GROUP: Multicast group3 setting.

Register Name	Multicast Group 4 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.MULTICAST_GROUP_4
Address	000000002E0F0004 (SCOM)
Description	Multicast group 4

Bits	SCOM	Field Mnemonic: Description
0:2	RO	constant = 0b111
3:5	RW	MULTICAST4_GROUP: Multicast group4 setting.

Register Name	Timeout Select Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.TIMEOUT_REG
Address	000000002E0F0010 (SCOM)
Description	Timeout select register

Bits	SCOM	Field Mnemonic: Description
0:1	RW	Reserved field.

Register Name	Assist Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.ASSIST_INTERRUPT_REG
Address	000000002E0F0011 (SCOM)
Description	Assist interrupt register

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.
1	ROX	Reserved field.
2	ROX	Reserved field.

Register Name	Vital Scan Out Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.VITAL_SCAN_OUT
Address	000000002E0F0017 (SCOM)
Description	Vital scan out

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved.

Register Name	Chiplet Heartbeat Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.HEARTBEAT_REG
Address	000000002E0F0018 (SCOM)
Description	Chiplet heartbeat register

Bits	SCOM	Field Mnemonic: Description
0	ROX	HEARTBEAT_DEAD: The chiplet heartbeat is not detected.

Register Name	PLL Lock Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.PLL_LOCK_REG
Address	000000002E0F0019 (SCOM)
Description	Lock indications from PLLs.

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	Reserved field.

Register Name	Attention Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.ATTN_INTERRUPT_REG
Address	000000002E0F001A (SCOM)
Description	Attention interrupt

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.

Register Name	Recovery Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.RECOV_INTERRUPT_REG
Address	000000002E0F001B (SCOM)
Description	Recovery interrupt

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.

Register Name	Checkstop Interrupt Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.XSTOP_INTERRUPT_REG
Address	000000002E0F001C (SCOM)
Description	Checkstop interrupt

Bits	SCOM	Field Mnemonic: Description
0	ROX	Reserved field.

Register Name	Slave Configuration Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.SLAVE_CONFIG_REG
Address	000000002E0F001E (SCOM)
Description	Slave configuration register

Bits	SCOM	Field Mnemonic: Description
0	RW	CFG_DISABLE_PERV_THOLD_CHECK: Disables the pervasive thold check.
1	RW	CFG_DISABLE_MALF_PULSE_GEN: Disables pulse generation for malfunction alert. Switches back to level.
2	RW	CFG_STOP_HANG_CNT_SYS_XSTP: Disables the hang counter stop for system checkstop.
3	RW	CFG_DISABLE_CL_ATOMIC_LOCK: Disables the atomic lock for chiplet accesses.
4	RW	CFG_DISABLE_HEARTBEAT: Disables a check for voltage and grid clock in the chiplet.
5	RW	CFG_DISABLE_FORCE_TO_ZERO: Disables force to zero for error cases.

Bits	SCOM	Field Mnemonic: Description
6	RW	CFG_PM_DISABLE: Disables the power management set/reset interface for the NET CNTRLx Registers.
7	RW	CFG_PM_MUX_DISABLE: Disables the power management multiplexer request signal.
8:13	RW	ERROR_MASK: Mask bits for slave error reporting.
14:15	RW	Reserved.

Register Name	Error Capture Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.ERROR_REG
Address	000000002E0F001F (SCOM)
Description	Error capture register

Bits	SCOM	Field Mnemonic: Description
0	RWX_WCLEAR	CE_ERROR: Correctable error on the PCB bus.
1:3	RWX_WCLEAR	CHIPLET_ERRORS: Errors reported by chiplet. This register is for debug purposes only. It holds meaningful data only if it is cleared after each error. 000 = No error. 001 = XSCOM command blocked due to pending errors. 010 = Chiplet offline. 011 = Partial good. 100 = Invalid address / address error / bad access type. 101 = Clock error. 110 = Parity error / received unexpected packet / wrong packet number. 111 = Timeout.
4	RWX_WCLEAR	PARITY_ERROR: Parity error on the PCB interface.
5	RWX_WCLEAR	DATA_BUFFER_ERROR: Parity error in the data buffer.
6	RWX_WCLEAR	ADDR_BUFFER_ERROR: Parity error in the address buffer.
7	RWX_WCLEAR	PCB_FSM_ERROR: Invalid state error in the PCB FSM.
8	RWX_WCLEAR	CL_FSM_ERROR: Invalid state error in the chiplet FSM.
9	RWX_WCLEAR	INT_RX_FSM_ERROR: Invalid state error in the interrupt RX FSM.
10	RWX_WCLEAR	INT_TX_FSM_ERROR: Invalid state error in the interrupt TX FSM.
11	RWX_WCLEAR	INT_TYPE_ERROR: Invalid interrupt type.
12	RWX_WCLEAR	CL_DATA_ERROR: Parity error on the chiplet interface.
13	RWX_WCLEAR	INFO_ERROR: Parity error on the chiplet information lines.
14	RWX_WCLEAR	UNUSED_0:
15	RWX_WCLEAR	CHIPLET_ATOMIC_LOCK_ERROR: Chiplet atomic lock error.
16	RWX_WCLEAR	PCB_INTERFACE_ERROR: Error of the PCB interface component for the internal endpoint.
17	RWX_WCLEAR	CHIPLET_OFFLINE: Heartbeat check indicated that the chiplet is offline.
18	RWX_WCLEAR	EDRAM_SEQUENCE_ERR: Error in the eDRAM power up sequence.
19	RWX_WCLEAR	CTRL_REG_PARITY_ERROR: Control register parity is bad.
20	RWX_WCLEAR	ADDRESS_REG_PARITY_ERROR: Address register parity is bad.
21	RWX_WCLEAR	TIMEOUT_REG_PARITY_ERROR: Timeout select register parity is bad.
22	RWX_WCLEAR	CONFIG_REG_PARITY_ERROR: Slave configuration register parity is bad.
23	RWX_WCLEAR	UNUSED_1:

Bits	SCOM	Field Mnemonic: Description
24	RWX_WCLEAR	DIV_REG_PARITY_ERROR: Register parity is bad.
25:28	RWX_WCLEAR	PLL_UNLOCK_ERROR: Unlock error from a chiplet PLL.

Register Name	Hang Pulse Generation 0 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.HANG_PULSE_0_REG
Address	000000002E0F0020 (SCOM)
Description	Hang pulse generation register 0

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_0: Value of hang pulse 0. Time period = 2value x (precounter_reg + 1) / pcb_freq, where 34 ³ value > 0.
6	RW	SUPPRESS_HANG_0: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation 1 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.HANG_PULSE_1_REG
Address	000000002E0F0021 (SCOM)
Description	Hang pulse generation register 1

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_1: Value of hang pulse 1. Time period = 2value x (precounter_reg + 1) / pcb_freq, where 34 ³ value > 0.
6	RW	SUPPRESS_HANG_1: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation 2 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.HANG_PULSE_2_REG
Address	000000002E0F0022 (SCOM)
Description	Hang pulse generation register 2

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_2: Value of hang pulse 2. Time period = 2value x (precounter_reg + 1) / pcb_freq, where 34 ³ value > 0.
6	RW	SUPPRESS_HANG_2: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation 3 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.HANG_PULSE_3_REG
Address	000000002E0F0023 (SCOM)
Description	Hang pulse generation register 3

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_3: Value of hang pulse 3. Time period = 2value x (precounter_reg + 1) / pcb_freq, where 34 ³ value > 0.

Bits	SCOM	Field Mnemonic: Description
6	RW	SUPPRESS_HANG_3: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation 4 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.HANG_PULSE_4_REG
Address	000000002E0F0024 (SCOM)
Description	Hang pulse generation register 4

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_4: Value of hang pulse 4. Time period = 2value x (precounter_reg + 1) / pcb_freq, where 34 ³ value > 0.
6	RW	SUPPRESS_HANG_4: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation 5 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.HANG_PULSE_5_REG
Address	000000002E0F0025 (SCOM)
Description	Hang pulse generation register 5. This hang counter is used exclusively to generate the malfunction alert pulse.

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_5: Value of hang pulse 5. Time period = 2value x (precounter_reg + 1) / pcb_freq, where 34 ³ value > 0.
6	RW	SUPPRESS_HANG_5: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Hang Pulse Generation 6 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.HANG_PULSE_6_REG
Address	000000002E0F0026 (SCOM)
Description	Hang pulse generation register 6. This hang counter is used exclusively for heartbeat generation.

Bits	SCOM	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_6: Value of hang pulse 6. Time period = 2value x (precounter_reg + 1) / pcb_freq, where 34 ³ value > 0.
6	RW	SUPPRESS_HANG_6: If set to 1, hang pulses are suppressed in case of a checkstop.

Register Name	Pre-Counter Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.PRE_COUNTER_REG
Address	000000002E0F0028 (SCOM)
Description	Divider for hang counter clock

Bits	SCOM	Field Mnemonic: Description
0:7	RW	PRE_COUNTER: Divider for hang counter clock. Divides clock by n + 1. The default value for n = 0.

Register Name	eDRAM Status Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.EDRAM_STATUS
Address	000000002E0F0029 (SCOM)
Description	eDRAM control status register

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	EDRAM_STAT: eDRAM control status.

Register Name	NET CTRL0 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.NET_CTRL0
Address	000000002E0F0040 (SCOM) 000000002E0F0041 (SCOM1) 000000002E0F0042 (SCOM2)
Description	NET CTRL0 register. (N/A in pervasive chiplet.)

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	RWX_WAND	RWX_WOR	CHIPLET_ENABLE: Set if chiplet is good.
1	RWX	RWX_WAND	RWX_WOR	PCB_EP_RESET: Output is ORed to the global EP reset.
2	RWX	RWX_WAND	RWX_WOR	CLK_ASYNC_RESET: For a POWER9 cache chiplet, the EQ skew adjustment is reset. For a POWER9 core chiplet, the core duty cycle adjustment is reset. For a POWER9 memory chiplet, the memory asynchronous glitchless multiplexer is reset.
3	RWX	RWX_WAND	RWX_WOR	PLL_TEST_EN: Test enable for chiplet PLL.
4	RWX	RWX_WAND	RWX_WOR	PLL_RESET: Reset for chiplet PLL.
5	RWX	RWX_WAND	RWX_WOR	PLL_BYPASS: Enable bypass for chiplet PLL.
6	RWX	RWX_WAND	RWX_WOR	VITAL_SCAN: Scan control for chiplet vital domain.
7	RWX	RWX_WAND	RWX_WOR	VITAL_SCAN_IN: Scan in for the chiplet vital domain.
8	RWX	RWX_WAND	RWX_WOR	VITAL_PHASE: Phase for vital domain.
9	RWX	RWX_WAND	RWX_WOR	FLUSH_ALIGN_OVR: Override flush, flush_nto1, align in chiplet to 1.
10	RWX	RWX_WAND	RWX_WOR	VITAL_AL: Align for vital domain.
11	RWX	RWX_WAND	RWX_WOR	ACT_DIS: LCB control signal for vital logic.
12	RWX	RWX_WAND	RWX_WOR	MPW1: LCB control signal for vital logic.
13	RWX	RWX_WAND	RWX_WOR	MPW2: LCB control signal for vital logic.
14	RWX	RWX_WAND	RWX_WOR	MPW3: LCB control signal for vital logic.
15	RWX	RWX_WAND	RWX_WOR	DELAY_LCLKR: LCB control signal for vital logic.
16	RWX	RWX_WAND	RWX_WOR	VITAL_THOLD: Thold for the chiplet vital domain.
17	RWX	RWX_WAND	RWX_WOR	FLUSH_SCAN_N: Flush scan control.
18	RWX	RWX_WAND	RWX_WOR	FENCE_EN: Fencing signal for chiplet.
19	RWX	RWX_WAND	RWX_WOR	CPLT_RCTRL: Chiplet receiver enable.
20	RWX	RWX_WAND	RWX_WOR	CPLT_DCTRL: Chiplet driver enable.
21	RWX	RWX_WAND	RWX_WOR	Reserved field.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
22	RWX	RWX_WAND	RWX_WOR	ADJ_FUNC_CLKSEL: POWER9 cache chiplet: Clock select for skew adjustment/duty cycle adjustment logic. POWER9 core chiplet: Skew sense to skew adjustment fencing.
23:24	RWX	RWX_WAND	RWX_WOR	Reserved field.
25	RWX	RWX_WAND	RWX_WOR	TP_FENCE_PCB: Fence the chiplet from the PCB bus. If set, PCB slave reports Chiplet Offline.
26	RWX	RWX_WAND	RWX_WOR	LVLTRANS_FENCE: Fence control for level translators.
27	RWX	RWX_WAND	RWX_WOR	ARRAY_WRITE_ASSIST_EN: Array write assist.
28	RWX	RWX_WAND	RWX_WOR	HTB_INTEST: HTB in test mode.
29	RWX	RWX_WAND	RWX_WOR	HTB_EXTEST: HTB in test mode.
30	RWX	RWX_WAND	RWX_WOR	Reserved field.
31	RWX	RWX_WAND	RWX_WOR	PLLFORCE_OUT_EN: PLL force out enable.

Register Name	**NET CTRL1 Register**
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.NET_CTRL1
Address	000000002E0F0044 (SCOM) 000000002E0F0045 (SCOM1) 000000002E0F0046 (SCOM2)
Description	NET CTRL1 Register. (N/A in pervasive chiplet.)

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	RWX_WAND	RWX_WOR	PLL_CLKIN_SEL: PLL clkin select.
1	RWX	RWX_WAND	RWX_WOR	CLK_DCC_BYPASS_EN: POWER9 cache chiplet: L2-0, L2-1, L3 duty cycle control bypass. POWER9 core chiplet: Core duty cycle control bypass. POWER9 memory chiplet: Memory duty cycle control bypass.
2	RWX	RWX_WAND	RWX_WOR	CLK_PDLY_BYPASS_EN: POWER9 cache chiplet: L2-0, L2-1, L3 progdly bypass. POWER9 core chiplet: Core progdly bypass. POWER9 memory chiplet: Memory progdly bypass.
3	RWX	RWX_WAND	RWX_WOR	CLK_DIV_BYPASS_EN: Enables clock divider bypass.
4	RWX	RWX_WAND	RWX_WOR	REFCLK_CLKMUX0_SEL: Select for reference clock mux0.
5	RWX	RWX_WAND	RWX_WOR	REFCLK_CLKMUX1_SEL: Select for reference clock mux1.
6	RWX	RWX_WAND	RWX_WOR	PLL_BNDY_BYPASS_EN: Bypass for IOP PLL.
7	RWX	RWX_WAND	RWX_WOR	Reserved field.
8:15	RWX	RWX_WAND	RWX_WOR	DPLL_TEST_SEL: DPLL testout multiplexing.
16:19	RWX	RWX_WAND	RWX_WOR	SB_STRENGTH: Sector buffer driver strength.
20	RWX	RWX_WAND	RWX_WOR	ASYNC_TYPE:
21	RWX	RWX_WAND	RWX_WOR	ASYNC_OBS:
22	RWX	RWX_WAND	RWX_WOR	CPM_CAL_SET: CPM calibrate.
23	RWX	RWX_WAND	RWX_WOR	SENSEADJ_RESET0: POWER9 cache chiplet: L2-0 duty cycle adjustment reset.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
24	RWX	RWX_WAND	RWX_WOR	SENSEADJ_RESET1: POWER9 cache chiplet: L2-1 duty cycle adjustment reset.
25	RWX	RWX_WAND	RWX_WOR	CLK_PULSE_EN: Clock pulse mode enable.
26:27	RWX	RWX_WAND	RWX_WOR	CLK_PULSE_MODE: Clock pulse mode setting.
28:31	RWX	RWX_WAND	RWX_WOR	Reserved field.

Register Name	**PPM General Power Management Mode Register**
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_COMMON_REGS.PPM_GPMMR
Address	000000002E0F0100 (SCOM) 000000002E0F0101 (SCOM1) 000000002E0F0102 (SCOM2)
Description	PPM general power management mode register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RWX	WOX_CLEAR	WOX_OR	Reserved field.
1	ROX	NCX	NCX	Reserved field.
2	ROX	NCX	NCX	Reserved field.
3	ROX	NCX	NCX	Reserved field.

5	ROX	NCX	NCX	Reserved field.
6	RW	WO_CLEAR	WO_OR	Reserved field.
7	RW	WO_CLEAR	WO_OR	Reserved field.
8	RW	WO_CLEAR	WO_OR	Reserved field.
9	RW	WO_CLEAR	WO_OR	Reserved field.
10	RW	WO_CLEAR	WO_OR	Reserved field.
11	RO	NC	NC	Reserved field.
12:14	RW	WO_CLEAR	WO_OR	Reserved field.
15	RW	WO_CLEAR	WO_OR	Reserved field.
16:63	RO	RO	RO	constant = 0b000000000000000000000000000000000000000000000000

Register Name	**CPPM Core Power Management Mode Register**
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_CPMMR
Address	000000002E0F0106 (SCOM) 000000002E0F0107 (SCOM1) 000000002E0F0108 (SCOM2)
Description	CPPM core power management mode register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	CPPM_CPMMR_PPM_WRITE_DISABLE: Power management macro write access control. If set, PIB-sourced PCB writes to all core PPM registers except this register will return the resource-occupied PCB response code 0x1. Only CME PCB writes are allowed to the other core PMM registers. If clear, all core PPM register writes are permitted. Reads are not affected by the setting of this bit. Engineering Note: This bit blocks non-CME firmware from interfering with CME control of the PPM.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
1	RW	WO_CLEAR	WO_OR	CPPM_CPMMR_PPM_WRITE_OVERRIDE: Power management macro write override. If set, core PPM accesses are allowed from the PCB network even if PPM_WRITE_DISABLE is set. If clear, PPM_WRITE_DISABLE functionality is honored. Engineering Note: This bit is intended for lab use only as a means to handle potential CME hardware or firmware issues. If this bit is set, you must ensure that CME functionality is not compromised by writes from the PCB that disrupt CME operation.
2:8	RW	WO_CLEAR	WO_OR	CPPM_CPMMR_RESERVED_2_9: Implemented but not used.
9	RW	WO_CLEAR	WO_OR	CPPM_CPMMR_FUSED_CORE_MODE: A fused core mode input signal from the core pervasive unit. (Note that this bit also exists in the CPPM CME PECE Shadow Register.) Modifies interrupt mapping to physical core chiplets. This remapping is done by PPM hardware before applying the PECE bits in this register to them, such that the core PPM corresponding to the actual physical core chiplet being interrupted signals an interrupt to the CME or Stop GPE. 0 = The logic to physical core mapping is sequential (that is, Thread[0,1,2,3] is routed to Core0; and Thread[4,5,6,7] is routed to Core1). 1 = Even threads are routed to Core0 and odd threads are routed to Core1. The interrupts are routed as follows: Thread[0,2,4,6] to Core0; Thread[1,3,5,7] to Core1.
10	RW	WO_CLEAR	WO_OR	CPPM_CPMMR_STOP_EXIT_TYPE_SEL: Use type 3 instead of type 2 interrupts for stop exit interrupt generation (reference to the PIG register).
11	RW	WO_CLEAR	WO_OR	CPPM_CPMMR_BLOCK_INTR_INPUTS: When set, this bit blocks incoming interrupts from causing interrupts from being REQUESTED as wake-up sources but allows them to be sampled as PRESENT.
12	RW	WO_CLEAR	WO_OR	CPPM_CPMMR_CME_ERR_NOTIFY_DIS: By default, PPM sends notification to the OCC complex upon the rising edge of a CME error indication. When this bit is set, no action is taken by PPM in response to the CME error input.
13	RW	WO_CLEAR	WO_OR	CPPM_CPMMR_WKUP_NOTIFY_SELECT: Causes all enabled wake-up events (special and regular) to cause a wake-up notification to be automatically generated by PPM hardware to the OCC complex. When this bit is not set, no notification is sent to OCC because the events will instead be sent to CME.
14	RW	WO_CLEAR	WO_OR	CPPM_CPMMR_ENABLE_PECE: When zero, all regular wake-up interrupt sources cause the QUAD to wake up regardless of the PECE settings.
15	RWX	WOX_CLEAR	WOX_OR	CPPM_CPMMR_CME_SPECIAL_WKUP_DONE_DIS: When not set and when WKUP_NOTIFY_SELECT = 0, GPMMR[SPECIAL_WKUP_DONE] follows the signal input from CME and cannot be written by SCOM. When set (or when WKUP_NOTIFY_SELECT = 1), GPMMR[SPECIAL_WKUP_DONE] is only controllable through SCOM.
16:63	RO	RO	RO	constant = 0b000000000000000000000000000000000000000000000000

Register Name	PPM PFET Control State Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_COMMON_REGS.PPM_PFCS
Address	000000002E0F0118 (SCOM) 000000002E0F0119 (SCOM1) 000000002E0F011A (SCOM2)
Description	PPM PFET control state register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:1	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_FORCE_STATE: Domain VDD PFET force state. Provides a means for firmware to force the domain VDD PFETs to well known end states using the hardware sequencing mechanisms: b00 = No operation. b01 = Force Voff. b10 = No operation (reserved). b11 = Force Von. This field is valid only if bits 4:5 = 00 (that is, both vdd_pfet_val_override and vdd_pfet_sel_override are disabled).
2:3	RW	WO_CLEAR	WO_OR	PPM_PFCS_VCS_PFET_FORCE_STATE: Domain VCS PFET force state. This field is used only in QUAD PPM; it is unused in Core PPM. It provides a means for firmware to force the domain VCS PFETs to well known end states using the hardware sequencing mechanisms: b00 = No operation. b01 = Force Voff. b10 = No operation (reserved). b11 = Force Von. This field is valid only if bits 6:7 = 00 (that is, both vcs_pfet_val_override and vcs_pfet_sel_override are disabled).
4	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_VAL_OVERRIDE: Domain VDD PFET value override.
5	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_SEL_OVERRIDE: Domain VDD PFET stage select override.
6	RW	WO_CLEAR	WO_OR	PPM_PFCS_VCS_PFET_VAL_OVERRIDE: Domain VCS PFET value override. For QUAD PPM use only. Unused in Core PPM.
7	RW	WO_CLEAR	WO_OR	PPM_PFCS_VCS_PFET_SEL_OVERRIDE: Domain VCS PFET stage select override. For QUAD PPM use only. Unused in Core PPM.
8	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_REGULATION_FINGER_EN: Domain VDD PFET regulation finger enable. Intended to be used to control the regulation PFET enable when iVRMs are enabled. If this bit is asserted, the value of the PFET finger (pfet_enable(0)) is controlled by vdd_pfet_regulation_finger_value. If this bit is not asserted, the PFET finger is controlled by the PFET FSM and/or any relevant overrides in place.
9	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_REGULATION_FINGER_VALUE: Domain VDD PFET regulation finger value. Intended to be used to control the regulation PFET enable when IVRMs are enabled. If vdd_pfet_regulation_finger_enable = 1, a write to this bit sets the state of the VDD PFET enable(0) regardless of the setting of the regular pfet_enable FSM. If it is not asserted, the PFET sequencer controls this finger with the vdd_pfet_enable_value.
10:11	RW	WO_CLEAR	WO_OR	PPM_PFCS_RESERVED_10_11: Implemented but unused.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
12:19	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_ENABLE_VALUE: VDD PFET enable value. Intended for manual control override usage. A write to this field sets the state of the Core Domain PFET Enables directly. If vdd_pfet_val_override = 1, a write to this field sets the state of the core PFET Enables until core_vdd_pfet_val_override is cleared. If vdd_pfet_val_override = 0, a write to this field takes on the value for one cycle and then returns to the value produced by the core_vdd_pfet_valN hard-coded facilities. A write of this type is not recommended and might produce undefined results. Reads will return the present state.

20:23	RW	WO_CLEAR	WO_OR	PPM_PFCS_VDD_PFET_SEL_VALUE: VDD PFET select value. Intended for manual control override usage. A write to this field will index value N into the vdd_power_enable register, where N is 0 to 8, if vdd_pfet_sel_override = 1. If vdd_pfet_sel_override = 0, the field is written but no further action is taken. 0x0 = 0b11111111 # On.
				0x1 = 0b01111111.
				0x2 = 0b00111111.
				0x3 = 0b00011111.
				0x4 = 0b00001111.
				0x5 = 0b00000111.
				0x6 = 0b00000011.
				0x7 = 0b00000001.
				0x8 = 0b00000000 # Off.
				0x9 to 0xF = Reserved reads will return the present state of the field.

24:31	RW	WO_CLEAR	WO_OR	PPM_PFCS_VCS_PFET_ENABLE_VALUE: VCS PFET enable value. This field is used only in QUAD PPM; it is unused in Core PPM. It is intended for manual control override usage. A write to this field sets the state of the VCS PFET Enables directly. If vcs_pfet_val_override = 1, a write to this field sets the state of the VCS PFET Enables until vcs_pfet_val_override is cleared. If eco_vdd_pfet_val_override = 0, a write to this field takes on the value for one cycle and then returns to the value produced by the eco_vdd_pfet_valN_slat registers. A write of this type is not recommended and might produce undefined results. Reads will return the present state.

32:35	RW	WO_CLEAR	WO_OR	PPM_PFCS_VCS_PFET_SEL_VALUE: VCS PFET select value. This field is used only in QUAD PPM; it is unused in Core PPM. It is intended for manual control override usage. A write to this field will index value N into the vcs_power_enable register, where N is 0 to 8, if vcs_pfet_sel_override = 1. If vcs_pfet_sel_override = 0, the field is written but no further action is taken.
				0x0 = 0b11111111 # On.
				0x1 = 0b01111111.
				0x2 = 0b00111111.
				0x3 = 0b00011111.
				0x4 = 0b00001111.
				0x5 = 0b00000111.
				0x6 = 0b00000011.
				0x7 = 0b00000001.
				0x8 = 0b00000000 # Off.
				0x9 to 0xF = Reserved. Reads will return the present state of the field.

Description	PPM PFET off register

Bits	SCOM	Field Mnemonic: Description
0:3	RW	PPM_PFOFF_VDD_VOFF_SEL: Pointer to the stage representing the Voff value for the VDD PFETs. Power down sequences will stop after enabling this stage. Valid values: 0x0 through 0x8.
4:7	RW	PPM_PFOFF_VCS_VOFF_SEL: Pointer to the stage representing the Voff value for the VCS PFETs. Power down sequences will stop after enabling this stage. Valid values: 0x0 through 0x8. This field is used only in QUAD PPM; it is unused in Core PPM.
8:63	RO	constant = 0b00000000000000000000000000000000000000000000000000000000

Register Name	PPM SCRATCH0 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_COMMON_REGS.PPM_SCRATCH0
Address	000000002E0F011E (SCOM)
Description	PPM SCRATCH0 register

Bits	SCOM	Field Mnemonic: Description
0:63	RW	PPM_SCRATCH0_DATA: Scratch Data 0.

Register Name	PPM SCRATCH1 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_COMMON_REGS.PPM_SCRATCH1
Address	000000002E0F011F (SCOM)
Description	PPM SCRATCH1 register

Bits	SCOM	Field Mnemonic: Description
0:63	RW	PPM_SCRATCH1_DATA: Scratch Data 1.

Register Name	CPPM PERRSUM Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_PERRSUM
Address	000000002E0F0120 (SCOM)
Description	CPPM PERRSUM register

Bits	SCOM	Field Mnemonic: Description
0	RWX_WCLEAR	CPPM_PERRSUM_CPPM_ERROR: Indicates a CPPM error is present. Intended for use by special PCB multicast to see the error state of all chiplets with a single read.
1:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000000

Register Name	CPPM Error Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_ERR
Address	000000002E0F0121 (SCOM)
Description	CPPM error register

Bits	SCOM	Field Mnemonic: Description
0	RWX_WCLEAR	CPPM_ERR_PCB_INTERRUPT_PROTOCOL_ERR: Firmware wrote the PIG to request a PCB interrupt before its previously requested interrupt had been completed (that is, PIG[PENDING_SOURCE(0)] = 1 OR (PIG[INTR_GRANTED] AND [GRANTED_SOURCE](0)) = 1).
1	RWX_WCLEAR	CPPM_ERR_SPECIAL_WKUP_PROTOCOL_ERR: Firmware cleared its special wake-up request (indicated by GPMMR[SPECIAL_WKUP_REQUESTED] before GPMMR[SPECIAL_WKUP_DONE] was set. This violates the agreed upon protocol and potentially confuses the Hcode managing the state of the QUAD chiplets.
2	RWX_WCLEAR	CPPM_ERR_SPECIAL_WKUP_DONE_PROTOCOL_ERR: Hardware or firmware cleared the special wake-up done indicator after it was set although a special wake-up request was still active (indicated by GPMMR[SPECIAL_WKUP_REQUESTED]. This violates the agreed upon protocol and potentially confuses the Hcode managing the state of the QUAD (cache and core) chiplets.
3	RWX_WCLEAR	CPPM_ERR_PFET_SEQ_PROGRAM_ERR: The PFET sequencer reached an invalid state due to incorrect configuration by a program.
4	RWX_WCLEAR	CPPM_ERR_CLK_SYNC_ERR: The SKEWADJ macro violated the agreed protocol by changing the value of the CLK_SYNC_DONE without a corresponding CLK_SYNC_ENABLE change (that is, the rising edge of the DONE when ENABLE = 0 or the falling edge of the DONE when ENABLE = 1).
5	RWX_WCLEAR	CPPM_ERR_PECE_INTR_DISABLED: Any of the three core external interrupt wake-up sources (OS, HYP, and MSGSND) are present but disabled by the thread's PECE when it is in stop state. For lab use only to notify firmware that a PECE-masked interrupt is being sent without a core that is enabled to receive it. Note: This does not include the malfunction alert. Note: This can only logically occur when CPMMR[ENABLE_PECE] and USE_PECE for the corresponding thread are both set and chiplet enable is set and the corresponding PECE bit for that thread for that interrupt is 0.
6	RWX_WCLEAR	CPPM_ERR_DECONFIGURED_INTR: Any of the four core external interrupts (EBB, OS, HYP, or MSGSND) are present but the chiplet is deconfigured (based on the chiplet enable input from PCBSLAVE). Note: Does not include the malfunction alert.
7	RO	CPPM_ERR_RESERVED_7: Implemented but unused.
8:11	RO	CPPM_ERR_RESERVED_8_11: Implemented but unused.
12:63	RO	constant = 0b0000000000000000000000000000000000000000000000000000

Register Name	CPPM Error Mask Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_ERRMSK
Address	000000002E0F0122 (SCOM)
Description	CPPM error mask register

Bits	SCOM	Field Mnemonic: Description
0:11	RW	CPPM_ERRMSK_RESERVED_0_11: Mask for this error: 0 = Not masked. 1 = Masked. When set, the corresponding bit is set in the Error Register but masked from being reported in the ERRSUM Register and to the FIR.
12:63	RO	constant = 0b0000000000000000000000000000000000000000000000000000

Register Name	CPPM NC0 Indirect Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_NC0INDIR
Address	000000002E0F0130 (SCOM) 000000002E0F0131 (SCOM1) 000000002E0F0132 (SCOM2)
Description	CPPM NC0 indirect register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:31	RO	NC	NC	Reserved field.
32:63	RO	RO	RO	constant = 0b00000000000000000000000000000000

Register Name	CPPM NC1 Indirect Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_NC1INDIR
Address	000000002E0F0133 (SCOM) 000000002E0F0134 (SCOM1) 000000002E0F0135 (SCOM2)
Description	CPPM NC1 indirect register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:31	RO	NC	NC	Reserved field.
32:63	RO	RO	RO	constant = 0b00000000000000000000000000000000

Register Name	CPPM Core PPM Scratch Atomic Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_CSAR
Address	000000002E0F0138 (SCOM) 000000002E0F0139 (SCOM1) 000000002E0F013A (SCOM2)
Description	CPPM core PPM scratch atomic register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:31	RW	WO_CLEAR	WO_OR	CPPM_CSAR_SCRATCH_ATOMIC_DATA: Scratch atomic data.
32:63	RO	RO	RO	constant = 0b00000000000000000000000000000000

Register Name	PPM Clock Grid Control Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_COMMON_REGS.PPM_CGCR
Address	000000002E0F0164 (SCOM)
Description	PPM clock grid control register

Bits	SCOM	Field Mnemonic: Description
0	RW	PPM_CGCR_CLKGLM_ASYNC_RESET: Glitchless clock multiplexer asynchronous reset for this chiplet.
1:2	RW	PPM_CGCR_RESERVED_1_2: Implemented but not used.
3	RW	PPM_CGCR_CLKGLM_SEL: Glitchless clock multiplexer select for this chiplet. 0 = Reference clock. 1 = DPLL output (full speed Div1 for Core, half speed Div2 for Cache).
4:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000

Register Name	CPPM Core Analog Clock Control Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_CACCR
Address	000000002E0F0168 (SCOM) 000000002E0F0169 (SCOM1) 000000002E0F016A (SCOM2)
Description	CPPM core analog clock control register. Notes: 1. The first 8 bits (0:7) of this register are used if QUAD_CLK_SB_OVERRIDE is not set, otherwise use corresponding bits from the QACCR. 2. Bits 8 to 12 are used if QUAD_CLK_SW_OVERRIDE is not set, otherwise use corresponding bits from QACCR.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:3	RW	WO_CLEAR	WO_OR	CPPM_CACCR_CLK_SB_STRENGTH: Clock sector buffer strength(0:3) for this core chiplet.
4	RW	WO_CLEAR	WO_OR	CPPM_CACCR_CLK_SB_SPARE: Implemented but not used.
5	RW	WO_CLEAR	WO_OR	CPPM_CACCR_CLK_SB_PULSE_MODE_EN: Pulse mode enable to clock sector buffers for this core chiplet.
6:7	RW	WO_CLEAR	WO_OR	CPPM_CACCR_CLK_SB_PULSE_MODE: Pulse mode(0:1) to clock sector buffers for this core chiplet: 00 = Safest (Widest) Pulse. 01 = Wide Pulse. 10 = Narrow Pulse. 11 = Medium Pulse.
8:11	RW	WO_CLEAR	WO_OR	CPPM_CACCR_CLK_SW_RESCLK: Resonant clock inductor switch(0:3) for this core chiplet.
12	RW	WO_CLEAR	WO_OR	CPPM_CACCR_CLK_SW_SPARE: Implemented but not used.
13	RW	WO_CLEAR	WO_OR	CPPM_CACCR_QUAD_CLK_SB_OVERRIDE: Use input signals from QACCR(0:7) (instead of this register) to feed the clock sector buffer controls for this chiplet.
14	RW	WO_CLEAR	WO_OR	CPPM_CACCR_QUAD_CLK_SW_OVERRIDE: Use input signals from QACCR(8:12) (instead of this register) to feed the resonant clock switch controls for this chiplet.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
15	RW	WO_CLEAR	WO_OR	CPPM_CACCR_CLK_SYNC_ENABLE: Clock sync enable for this core chiplet to the analog clock SKEWADJ macro. Firmware must assert, then wait for the corresponding CACSR bit to assert, before enabling at-speed (non-reference clock) functional clocks on the grid. Likewise, firmware must must deassert, and wait for the corresponding CACSR bit to deassert, before switching the clock grid away from full speed clocks (that is, DPLL). This signal must remain asserted for the clock grid to remain synchronous with the other (L2 and L3) grids in the QUAD.
16:63	RO	RO	RO	constant = 0b000000000000000000000000000000000000000000000000

Register Name	CPPM Core Analog Clocking Status Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_CACSR
Address	000000002E0F016B (SCOM)
Description	CPPM core analog clocking status register

Bits	SCOM	Field Mnemonic: Description
0:3	ROX	CPPM_CACSR_ACTUAL_CLK_SB_STRENGTH: Actual value being driven on the sector buffer strength(0:3) output for this core chiplet.
4	ROX	CPPM_CACSR_ACTUAL_CLK_SB_SPARE: Spare (not used).
5	ROX	CPPM_CACSR_ACTUAL_CLK_SB_PULSE_MODE_EN: Actual value being driven on the pulse mode enable output for this core chiplet.
6:7	ROX	CPPM_CACSR_ACTUAL_CLK_SB_PULSE_MODE: Actual value being driven on the pulse mode(0:1) output for this core chiplet.
8:11	ROX	CPPM_CACSR_ACTUAL_CLK_SW_RESCLK: Actual value being driven on the resonant clock inductor switch(0:3) output for this core chiplet.
12	ROX	CPPM_CACSR_ACTUAL_CLK_SW_SPARE: Spare (not used).
13	ROX	CPPM_CACSR_CLK_SYNC_DONE: Clock sync done for this core chiplet. When changing the CACCR[CLK_SYNC_ENABLE] bit, code must wait for this bit to transition to the same value before proceeding. The SKEWADJ macro is not allowed to change the value of this signal unless the corresponding enable changes first, otherwise the corresponding ERR_REG[CLK_SYNC_ERR] will be set. Note: This signal will be asserted whenever SKEWADJ is in hold mode.
14:63	RO	constant = 0b00000000000000000000000000000000000000000000000000

Register Name	PPM PCB Interrupt Generation Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_COMMON_REGS.PPM_PIG
Address	000000002E0F0180 (SCOM)
Description	PPM PCB interrupt generation register

Bits	SCOM	Field Mnemonic: Description
0	RO	constant = 0b1
1:3	RW	PPM_PIG_REQ_INTR_TYPE: PCB interrupt request type (written by Hcode).
4:15	RW	PPM_PIG_REQ_INTR_PAYLOAD: PCB interrupt request payload (written by Hcode).

Bits	SCOM	Field Mnemonic: Description
16:31	ROX	PPM_PIG_GRANTED_PACKET: Granted interrupt packet content. If INTR_GRANTED is 1, this field contains the interrupt currently being sent; otherwise, this field contains the interrupt most recently sent. The format depends on the value of the GRANTED_SOURCE field: 01 = Copied from bits 0:15 of this register. 10 = Core = 0x[AB]YXW; QUAD = 0xE80W. 11 = Core = 0xD801; QUAD = 0xF80Z. where: [A or B] is decided by CPMMR[STOP_EXIT_TYPE_SEL]. Y = 0x8, or 0xC if malfunction alert is present. X = The state of the external interrupts (MSGSND, OS, HYP, '0'). W = The state of the four special wake-up sources (OTR, FSP, OCC, HYP). Z = Encoded hardware error indication (0; voltage droop; iVRM dropout; OCC heartbeat loss). Note: By convention, bit 4, when set, typically indicates a hardware-generated interrupt, although for the QUAD type 6 and 7, this bit is not latched in the OCB.
32	ROX	PPM_PIG_INTR_GRANTED: An interrupt request is in process. The value of this bit determines the meaning of the other bits in this register: 0 = Contains information about the most recent interrupt that was sent. 1 = Reflects the interrupt currently being sent. This bit is set when the arbiter issues a grant to the source reflected in the GRANTED_SOURCE field. This bit is cleared when the granted interrupt receives a Receive ACK.
33	RO	constant = 0b0
34:35	ROX	PPM_PIG_GRANTED_SOURCE: Interrupt source currently or most recently granted to place an interrupt on the PCB network (encoded). 00 = No interrupt has ever been processed. 01 = SCOM request (maps to PENDING_SOURCE 001). 10 = Hardware stop exit (maps to PENDING_SOURCE 010). 11 = Hardware error notification (maps to PENDING_SOURCE 100).
36	RO	constant = 0b0
37:39	ROX	PPM_PIG_PENDING_SOURCE: Bit per interrupt source indicating which are currently waiting for arbitration. xx1 = SCOM request from CME (in bits 0:15 of this register). x1x = Hardware stop exit. 1xx = Hardware error (CPPM: CME; QPPM: OCC heartbeat).
40	RWX_WCLEAR	PPM_PIG_NETWORK_RESET_OCCURRED: Sticky bit set when a network reset occurs (for debug use only) and cleared only on a SCOM write of this bit to one. Note: For indication only; network reset has no other effect on PPM.
41:63	RO	constant = 0b00000000000000000000000

Register Name	CPPM Core PPM CME Doorbell 0 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_CMEDB0
Address	000000002E0F0190 (SCOM) 000000002E0F0191 (SCOM1) 000000002E0F0192 (SCOM2)
Description	CPPM core PPM CME doorbell register 0

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:7	RW	WO_CLEAR	WO_OR	CPPM_CMEDB0_CME_MESSAGE_NUMBER0: CME message number. These bits are ORed together with the resulting logical value pulsing the cme_doorbell_0 CME interrupt on an SCOM write to this register. 0x00 = Does not pulse the cme_doorbell_0. Allows code to modify this register without generating an interrupt to the CME. 0x01 through 0xFF = Usage meaning is defined by CME and GPE firmware design.
8:63	RW	WO_CLEAR	WO_OR	CPPM_CMEDB0_CME_MESSAGE_HI: CME message high portion GPE and CME firmware design may use CME_MESSAGE_REG for any low portion of a message.

Register Name	CPPM CME Doorbell 1 Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_CMEDB1
Address	000000002E0F0194 (SCOM) 000000002E0F0195 (SCOM1) 000000002E0F0196 (SCOM2)
Description	CPPM CME doorbell register 1

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0:7	RW	WO_CLEAR	WO_OR	CPPM_CMEDB1_CME_MESSAGE_NUMBER_N: CME message number. These bits are ORed together with the resulting logical value pulsing the cme_doorbell_[n] CME interrupt on an SCOM write to this register. 0x00 = Does not pulse the cme_doorbell_[n]. Allows code to modify this register without generating an interrupt to the CME. 0x01 through 0xFF = Usage meaning is defined by CME and GPE firmware design.
8:63	RO	RO	RO	constant = 0b00000000000000000000000000000000000000000000000000000000

Register Name	PPM iVRM Control Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_COMMON_REGS.PPM_IVRMCR
Address	000000002E0F01B0 (SCOM) 000000002E0F01B1 (SCOM1) 000000002E0F01B2 (SCOM2)
Description	PPM iVRM Control Register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	PPM_IVRMCR_IVRM_VID_VALID: VID valid signal. 0 = Deassert valid signal. 1 = Assert valid signal. Upon rising edge of this signal, the iVRM circuit samples the VID and PFET_STRENGTH values provided by the IVRMDVR. QUAD PPM usage: These bits are always sent to the cache iVRM and all core PPMs, where it is forwarded to each core chiplet iVRM unless it is locally overridden in its core PPM. Core PPM usage: If CIVRMLCR[IVRM_LOCAL_CONTROL] = 1, these values are driven to the Core iVRM. Otherwise, the value driven comes from input pins from the QUAD PPM IVRMDVR.
1	RW	WO_CLEAR	WO_OR	PPM_IVRMCR_IVRM_BYPASS_B: Internal VRM VDD bypass (negative active). QUAD PPM usage: These bits are always sent to the cache iVRM and all core PPMs, where it is forwarded to each core chiplet iVRM unless it is locally overridden in its core PPM. Core PPM usage: If CIVRMLCR[IVRM_LOCAL_CONTROL] = 1, these values are driven to the core iVRM. Otherwise, the value driven comes from input pins from the QUAD PPM IVRMDVR.
2	RW	WO_CLEAR	WO_OR	PPM_IVRMCR_IVRM_POWERON: Internal VRM VDD power on. QUAD PPM usage: These bits are always sent to the cache iVRM and all core PPMs, where it is forwarded to each core chiplet iVRM unless it is locally overridden in its core PPM. Core PPM usage: If CIVRMLCR[IVRM_LOCAL_CONTROL] = 1, these values are driven to the core iVRM. Otherwise, the value driven comes from input pins from the QUAD PPM IVRMDVR.
3	RW	WO_CLEAR	WO_OR	PPM_IVRMCR_IVRM_VREG_SLOW_DC: Must be set before doing rapid changes (for example, dropping to Vmin), even after turning off clocks. This is needed to avoid trying to get there too fast and losing stability of the internal iVRM VID movement loop. QUAD PPM usage: These bits are always sent to the cache iVRM and all core PPMs, where it is forwarded to each core chiplet iVRM unless it is locally overridden in its core PPM. Core PPM usage: If CIVRMLCR[IVRM_LOCAL_CONTROL] = 1, these values are driven to the core iVRM. Otherwise, the value driven comes input pins from the QUAD PPM IVRMDVR.
4:7	RW	WO_CLEAR	WO_OR	PPM_IVRMCR_RESERVED_4_7: Implemented but unused.
8:63	RO	RO	RO	constant = 0b00000000000000000000000000000000000000000000000000000000

Register Name	PPM iVRM Status Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_COMMON_REGS.PPM_IVRMST
Address	000000002E0F01B3 (SCOM)
Description	PPM iVRM status register

Bits	SCOM	Field Mnemonic: Description
0	ROX	PPM_IVRMST_IVRM_VID_DONE: VDD iVRM done indicator. Raises when the iVRM circuits are done processing a change request, triggered by a rising edge of IVRMCR[IVRM_VID_VALID], and stays set until the VALID is cleared.
1:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000000000000

Register Name	PPM iVRM Data Value Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_COMMON_REGS.PPM_IVRMDVR
Address	000000002E0F01B4 (SCOM)
Description	PPM iVRM data value register

Bits	SCOM	Field Mnemonic: Description
0:7	RW	PPM_IVRMDVR_IVRM_IVID: Writes to this field will drive the VID value representing the requested voltage to the QUAD iVRMs (4 Core VDD and Cache VDD) 0:7 = ivid(0:7). Encoded based on zero origin at 512 mV with 4 mV granularity. 0x00 = 512 mV. 0x01 = 516 mV. 0x7F = 1.532 mV. QUAD PPM usage: These bits are always sent to the cache iVRM and all core PPMs, where it is forwarded to each core chiplet iVRM unless it is locally overridden in its core PPM. Core PPM usage: If CIVRMLCR[IVRM_LOCAL_CONTROL] = 1, these values are driven to the core iVRM. Otherwise, the value driven comes from input pins from the QUAD PPM IVRMDVR.
8:10	RW	PPM_IVRMDVR_RESERVED_8_10: Implemented but not used.
11:15	RW	PPM_IVRMDVR_IVRM_PFET_STRENGTH_CORE: PFET strength value driven to this chiplet's iVRMs. This value written is dependent on the current input voltage, the requested output voltage (IVRM_IVID), and the ratio of the power needed at the requested voltage to the maximum power. See iVRM documentation for details. QUAD PPM usage: This value is sent to all core PPMs, where it is forwarded to each core chiplet iVRM unless it is locally overridden in its core PPM. Core PPM usage: If CIVRMLCR[IVRM_LOCAL_CONTROL] = 1, these values are driven to the core iVRM. Otherwise, the value driven comes from QUAD PPM IVRMDVR.
16:18	RW	PPM_IVRMDVR_RESERVED_16_18: Implemented but not used.
19:23	RW	PPM_IVRMDVR_IVRM_PFET_STRENGTH_CACHE: QUAD PPM usage: PFET strength value driven to the cache iVRMs. The written value is dependent on the current input voltage, the requested output voltage (IVRM_IVID), and the ratio of the power needed at the request voltage to the maximum power. See iVRM documentation for details. Core PPM usage: This field is unused.
24:63	RO	constant = 0b0000000000000000000000000000000000000000

Register Name	PPM iVRM Actual Value Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_COMMON_REGS.PPM_IVRMAVR
Address	000000002E0F01B5 (SCOM)
Description	PPM iVRM actual value register

Bits	SCOM	Field Mnemonic: Description
0:7	ROX	Reserved field.
8	ROX	Reserved field.
9:10	RO	constant = 0b00
11:15	ROX	Reserved field.
16:23	RO	constant = 0b00000000
24	ROX	Reserved field.
25	ROX	Reserved field.
26	ROX	Reserved field.
27	ROX	Reserved field.
28:63	RO	constant = 0b000000000000000000000000000000000000

Register Name	CPPM Core iVRM Local Control Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_CIVRMLCR
Address	000000002E0F01B7 (SCOM)
Description	CPPM Core iVRM local control register

Bits	SCOM	Field Mnemonic: Description
0	RW	CPPM_CIVRMLCR_IVRM_LOCAL_CONTROL: Controls the iVRM interface multiplexer to determine which value gets sent to the core iVRMs. 0 = Global (QUAD PPM) sourced controls from IVRMCR are selected to drive this core chiplet's iVRM. 1 = Local (Core PPM) sourced controls from IVRMCR are selected.
1:2	RW	CPPM_CIVRMLCR_RESERVED_1_2: Implemented but not used.
3	RW	CPPM_CIVRMLCR_IVRM_UREG_TEST_EN: Enables UREG test where UREGs will activate only if selected by UREG_TEST_ID. Used to ensure that each was manufactured correctly to supply the high power core voltage grid.
4:7	RW	CPPM_CIVRMLCR_IVRM_UREG_TEST_ID: Selects one of sixteen UREGs to test if UREG_TEST_EN = 1. The UREGs that do not match this field when UREG_TEST_EN = 1 will be turned off internally.
8:63	RO	constant = 0b00000000000000000000000000000000000000000000000000000000

Register Name	PPM VDM Control Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_COMMON_REGS.PPM_VDMCR
Address	000000002E0F01B8 (SCOM) 000000002E0F01B9 (SCOM1) 000000002E0F01BA (SCOM2)
Description	PPM VDM control register

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
0	RW	WO_CLEAR	WO_OR	PPM_VDMCR_VDM_POWERON: Enables analog circuits in the VDM for this chiplet to burn power (0.6 mW). Once this bit is set, it takes 10 ms for VDM output indicators to be valid.
1	RW	WO_CLEAR	WO_OR	PPM_VDMCR_VDM_DISABLE: VDM disable for this chiplet. Like a logical fence, setting this bit forces VDM droop indication outputs to all 1.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
2:63	RO	RO	RO	constant = 0b00000000000000000000000000000000000000000000000000000000000000

Register Name	CPPM Inter-PPM Command Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_IPPMCMD
Address	000000002E0F01C0 (SCOM)
Description	CPPM inter-PPM command register

Bits	SCOM	Field Mnemonic: Description
0:7	RW	CPPM_IPPMCMD_QPPM_REG: The QUAD PPM register offset to be accessed. All QUAD PPM registers are read accessible. Only a subset may be written.
8	RW	CPPM_IPPMCMD_QPPM_RNW: 0 = Write. 1 = Read.
9	RW	CPPM_IPPMCMD_RESERVED_9: Implemented but unused.
10:63	RO	constant = 0b000000000000000000000000000000000000000000000000000000

Register Name	CPPM Inter-PPM Status Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_IPPMSTAT
Address	000000002E0F01C1 (SCOM)
Description	CPPM inter-PPM status register

Bits	SCOM	Field Mnemonic: Description
0	ROX	CPPM_IPPMSTAT_QPPM_ONGOING: QPPM transfer ongoing. 0 = A transfer is not ongoing. 1 = A transfer is ongoing. Upon writing this register, hardware sets this bit and initiates the transfer from the Core PPM to the QUAD PPM. Upon completion of the transfer, this bit is cleared. Firmware should check for the clear state of this bit to ensure that the transfer is complete.
1:2	ROX	CPPM_IPPMSTAT_QPPM_STATUS: QPPM status(0:1). 00 = Operation success. 01 = Write operation not performed due to CME QPPM accesses not being enabled. See QUAD CPMMR[CME_INTERPPM_ENABLE] and CPMMR[CME_INTERPPM_SELECT]. 10 = Unsupported register. 11 = Fatal QPPM FSM error (Reserved). Upon writing this register, hardware clears this bit and, upon transfer completion, samples the status from the QUAD PPM. Firmware should check for the clear state of this field to ensure that the transfer has completed successfully.
3:63	RO	constant = 0b0000000000000000000000000000000000000000000000000000000000000

Register Name	CPPM Inter-PPM Write Data Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_IPPMWDATA
Address	000000002E0F01C2 (SCOM)
Description	CPPM inter-PPM write data register

Bits	SCOM	Field Mnemonic: Description
0:63	RW	CPPM_IPPMWDATA_QPPM_WDATA: Data to be written to the register defined in the CPPM Inter-PPM Command Register when a write command is executed.

Register Name	CPPM Inter-PPM Read Data Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMC.PPM_CORE_REGS.CPPM_IPPMRDATA
Address	000000002E0F01C3 (SCOM)
Description	CPPM inter-PPM read data register

Bits	SCOM	Field Mnemonic: Description
0:63	RW	CPPM_IPPMRDATA_QPPM_RDATA: Data read from register defined in the CPPM Inter-PPM Command Register when a read command is executed.

Register Name	Protect Mode Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.PROTECT_MODE_REG
Address	000000002E0F03FE (SCOM)
Description	Enables read and write protection.

Bits	SCOM	Field Mnemonic: Description
0	RW	READ_PROTECT_ENABLE: Enable read protection.
1	RW	WRITE_PROTECT_ENABLE: Enable write protection.

Register Name	Atomic Lock Register
Mnemonic	TP.TPCHIP.NET.PCBSLEC14.PPMPCBSLV.ATOMIC_LOCK_REG
Address	000000002E0F03FF (SCOM)
Description	A bit mask for atomic locking on a ring-by-ring basis.

Bits	SCOM	Field Mnemonic: Description
0	RW	ATOMIC_LOCK_ENABLE: Enable atomic lock.
1:4	ROX	ATOMIC_ID: Atomic ID.
5:7	RO	constant = 0b000
8:15	ROX	ATOMIC_ACTIVITY: Atomic lock counter.
